GUIDE TO THE OR21 WOLEAI FILE

[This file contains specific information on the central Caroline islands of Eauripik, Elato, Faraulep, Gaferut, Ifaluk (the sample), Lamotrek, Pikelot, West Fayu, Woleai and their inhabitants. They are located in the Yap District of the Caroline Group, south and east of Yap and Ulithi and west of Truk. There are 53 islands and atolls in the group, but only about 3.3 square miles of land surface. While islands of this group have been known to Europeans since 1678, prolonged contact did not occur until the beginning of the twentieth century. Since the seventeenth century, Micronesia has been controlled successively by Spain, Germany and Japan. It is presently administered by the United States as a United Nations trusteeship. The total population of the Woleai group was only 1339 persons in 1930. The language spoken on these islands is Woleian. It is part of the Trukic subfamily of the Austronesian family. Even with inter-island dialectical differences, it is mutually intelligible with that of Truk, but not with Yap. Coconuts and fish provide the principal food on almost all of the islands. Taro and breadfruit are nearly universally cultivated. Dogs, hogs, and chickens are the only domesticated animals, and are eaten only rarely. Since most of the islands are small, settlement patterns are little differentiated. Farms and villages are scattered throughout the islands, more often facing the interior lagoon than the open sea. In the past, travel for commerce was frequent and farranging, going as far as 600 miles to Guam, Truk, and Yap. Recently with the death of the old sea captains, small boat travel is limited to neighboring islands. All of the islands contain the same eight named, localized, exogamous matrilineal clans, the first four of which are ranked with hereditary chiefs. The component lineages, which are smaller and more unstable, are still however the most

important groups on the islands. They regulate and own property, organize economic activity and are the recognized religious units. Despite missionary influence, the native religion, including a large store of medical knowledge, has remained intact. Island to island cultural variability is not great, but variations due to geographic and population size differences do exist.

There are 41 sources in the Woleai file, 11 are in English (1, 15, 16, 24, 28, 29, 31, 32, 33, 40, and 41), one is a translation from Spanish (23), three are translations from Japanese (36, 37, and 38), four are translations from French (12, 13, 34, and 35), and the remaining 22 are translations from German. However, a number of the sources are brief and eight are no more than a page or a table excerpted from a larger work. Except for source 41, all of the sources are on typewritten file slips and lack the Outline of World Cultures designation. 1: Burrows is the best introduction to the file. It is a detailed ethnography of Ifaluk. Eight sources (5, 10, 12, 13, 24, 34, 35, and 40) are nineteenth century travelers' accounts of the islands and contain varying amounts of geographic, ethnographic and naturalistic data. Twelve sources (6-9, 11, 14, 18-22, and 39) are in one way or another results of the German administration of the area and reflect the varying interests, from politics to public health, of concern to colonial administrations. 11: Born, by a German government doctor, may be the most generally descriptive of Woleaian culture of all of these sources. Three other sources (2, 3, and 4), the reports of the 1908-1910 German ethnographic expedition to the Central Carolines, are more tangentially related to the colonial administration. Four brief sources (25, 26, 27, and 30) present climatic information on the area and two more (15 and 16) present geographic data and

sailing instructions. There are two articles (28 and 29) on culture and personality in the Woleai group. 41: Bates and Abbott is a nontechnical account of the 1953 Pacific Science Board expedition to Ifaluk. The expedition contained an anthropologist, biologist, geologist, hydrologist, ichthyologist, and zoologist. Interdisciplinary material is presented on daily life, food gathering and diet as well as the special interests of each scientist. The file contains a variety of material and may be compared easily to the other files on island groups in the area. Most of the file was processed between 1950 and 1951, with an additional source processed in 1962.]

"Ifalik is an atoll in the Caroline Islands at 7° 15' north latitude and 147° east longitude. It lies nearly midway between Yap, 400 miles to the west-northwest, and Truk, nearly due east. Guam, in the Marianas, administrative center for the whole Trust Territory of the Pacific Islands, is about 350 miles north of Ifalik. (Fig. 1).

The ocean for 100 miles around is dotted with other atolls and reefs, making up what has sometimes been called the Woleai district, though administered as part of Yap district. Woleai, 30 miles west of Ifalik, is considered the most important atoll of the group because it has the largest lagoon and largest population. Eight of these atolls are now inhabited: Woleai, Ifalik, Faraulep, Lamotrek, Elato, Satawal, Eaurupik, and Sorol. Olimarao was formerly inhabited, and some of the others may have been.

The people of all these islands seem to be so nearly alike in language and culture as to constitute a cultural unit which differs perceptibly, though slightly, even from Fais and Ulithi to the northwest. Differences between them and their closest neighbors are too slight to justify use of the term 'culture area' for the Woleai district. 'Sub-area' would be more precise. A hasty test of these similarities was possible during brief stops at several of the islands on the return trip from Ifalik. Dialect, clan names, and the more obvious features of material culture seemed to be the same until we came to Satawal, the easternmost island visited. Here differences began to appear. For instance, the 'tr' of Ifalik was replaced, at least in some words, by 'ch'; and several clan names were different. Sorol, westernmost of the atolls generally included in the

(1947-48)

sub-area, was not visited. It seems safe to say that this account of the native culture of Ifalik will hold true, in a general way, for the other atolls. But the similarity does not extend to all details. Sea-burial, for example, seems to be exclusively an Ifalik custom. The people of Faraulep are said to use for food a small land-shell not eaten on Ifalik. And so on.

For all practical purposes, the main differences probably reflect difference in contact with foreigners. Ifalik was chosen for study because it has had a minimum of outside influence. Woleai represents the maximum. A missionary worked there in the 19th Century. The Japanese built an air-strip there during World War II. The Americans bombed the air-strip, and for a time at the close of the war, a few Americans were stationed there to maintain a LORAN station. A useful supplement to the Ifalik material would be a study of change on Woleai due to this contact."

8: Senfft--284 (1905) 1906 Woleaians
116, 101, 175, 133, 136 Gaferut

This island [MR: Grimes] is known to the natives by the name of "Gaferut," but they have never visited it. They call it the "devil's island" and are afraid to come near it. Yet they were unable to explain their fear for not even any member of the crew of the ship had seen it. We reached the island on December 5 after dark and could not find any anchor ground. The captain sent some of his men on land who during the night were to maintain a fire in order that the ship could stay close to the land. At dawn I rowed ashore. The map of the Admiralty characterizes Grimes as an elevated island, but in reality it is a flat sandbank which in some places rises up to an elevation of 2 meters. The only type of vegetation is a species of mangrove. Apparently a strong storm hit the island a few months ago for most of the trees had lost their branches and many---including the strongest---had been completely uprooted. The fauna consists of innumerable sea birds, which had their loose nests either in the trees or on the level ground; furthermore there were coconut crabs and--to judge from the traces--large turtles, which do not visit the island but at night. The birds were so tame that they could be seized by hand. Gaferut, including the reef, has a length of about 1300 meters; exclusive of the reef it is 600 paces long and 300 paces wide. We could not find anchor ground during the day either.

11: Born--177 (1903) 1904 Woleaians
116, 142, 101 Woleai

In physical structure, dress, language, and customs, the Oleaï natives belong to the Central Carolinians. They are closely related to the natives of Truk, Ululssi, Lamutrik, Satuwal, Sorol, Sonsol, Atogui, and Merir.

For the most part, they are of medium size and slender build; their skin is lighter than that of the people of Jap, and their features are regular and attractive. Their iris is dark brown, the conjunctiva bulbi has a yellow tinge and pigmentary spots. The shades of hair vary from dark brown to almost black, but the children are often dark blond; many of them have curly hair. Many of the women are as tall as the men. Frequently they have beautiful, well-proportioned bodies. The men have only a very slight beard.

Ifaluk

FOREWORD

IFALUK is a small dot on the map: a half a square mile of land can hardly show much detail on any scale used for Pacific distances. Further, it is spelled "Ifalik" on most maps, through some accident in the history of official spelling for place names. The people who live there call their island in a way that might be rendered "Eefahlook" in a sort of English phonetic spelling. We figure that the people who live there ought to have the final say about the name of their island: hence our divergence from the map makers.

Ifaluk is one of the Caroline Islands, which form part of Micronesia. It is some 700 miles north of New Guinea, some 400 miles south of Guam, and about 1200 miles east of the Philippines. It is a part of the Trust Territory of the Pacific Islands, administered by the government of the United States.

Ifaluk is an atoll: a roughly circular reef, built by corals and other lime-secreting organisms, marking off a quiet lagoon in the open ocean, the reef in places piled up to form islets emerging a few feet above the level of the sea. Mr. E. H. Bryan, Jr., of the Bishop Museum, in Honolulu, has compiled a list of the islands of the world that could be classed as "atolls." He finds 409: 136 in Polynesia, 92 in Micronesia, 66 in Melanesia, 15 in Indonesia, 5 northwest of Australia, 68 in the rest of the Indian Ocean, 26 in the Caribbean Sea, and only one in the Atlantic. Atoll formation, then, is primarily a phenomenon of the tropical Pacific: and the word "atoll" carries with it the connotations of warm sun, of white beaches backed by graceful palms, of friendly dark-skinned people, and of an idyllic way of life.

Ifaluk, for us, lived up to these connotations, and we found our life there a continuously rewarding experience: an experience which, in writing this book, we are trying to share.

We tested several ways of meeting the problem of joint authorship. We tried being "we" which had a nice regal sound and worked well enough when we agreed. But we have a great talent for disagreeing,

Ifaluk

five chief) weighed 182 pounds with a height of 5' 7½". Wolpaitig came closest of any man on the island to having a paunch.

The women were considerably more under American averages for height or weight. They were generally only an inch or so over or under five feet, weighing not much over a hundred pounds. The heaviest, a matron named Ietili of the Garotrong household, weighed 150 pounds, and was 5' 1½" tall. Ted suspected that the small size and light weight of the women was a consequence of the fact that they carried out the regular toil of the island—the heavy gardening work of the taro swamps as well as the work around the houses.

The Ifalukians would be classed as Micronesians: but what that means is anybody's guess. "Micronesia" is a geographical term to cover the hundreds of "tiny islands" of the Marianas, the Carolines, the Marshalls and the Gilberts. The inhabitants of these island groups, the Micronesians, are hardly to be distinguished from the more famous Polynesians: a rapid survey of several anthropology texts shows that the two are more often classed together than not. The inhabitants of the various island groups of Micronesia are certainly more diverse, both culturally and physically, than the inhabitants of Polynesia: but the similarities among all of these light-skinned people of the Pacific are greater than their differences. And the problem of the origin and history of the Ifalukians, of the Caroline Islanders, of the Micronesians, cannot be separated from the much-discussed problem of the origin of the Polynesians.

I think part of the European fascination with Polynesia (which would apply equally to the people of the central Carolines) comes from the fact that these people look very much like ourselves. The features of the Ifalukians were very European, and I amused myself by noting resemblances in certain individuals, in features or apparent characters, to particular friends or acquaintances in the States. The people were not really dark-skinned: both Don and I acquired a skin color within a month that matched the Ifalukian average, as determined by frequent comparisons of arms placed side by side. A pair of naked legs walking by the Fan Nap, observed under the low over-hang of thatch, could not be identified as Ifalukian or American. The Ifalukians

2: Damm et al. --3 (1909) 1938 Woleaians
116, 103 Ifaluk

On their charts the natives called this island group: Faloc, Yfaluc or Ifeluc. After Wilson discovered this atoll in 1797, it was named for him for some time. Then Meinicke said that some other people called it Two Sisters. But these names did not last. Chamisso's authorities, the two natives Kadu and Edak, entitled this group Iviligk or Ibiliek. Lütke writes Ifalouk; the notorious dealer Cheyne likewise uses the native name Evalook, and his compatriot Russel Robertson, has Evalouk; all of these are equivalent to the German spelling: Ifaluk. Since this time the native name has been adopted much more widely. However, you also find Ifalik, which perhaps originated in Chamisso's accounts; this spelling was adopted for the Japanese Government Chart of 1925 (Number 772), and also for the Pacific Islands Pilot of 1933 (6th edition).

2: Damm et al. --111 (1909) 1938 Woleaians
116, 103 Aurupik

In addition to the native names Yaropie and Eurrupuc, which were the first ones known, there is also Lütke's spelling Eourypyg which Brigham turned into Eurupig; v. Miklucho-Maclay writes Auropik. However, the majority of the discoverers and whale fishermen gave the group new names; some of them were inspired by the distinguishing characteristics of the islands (Low Islands), while in other cases there was no connection (Kama, of Horsburgh). All of these names appeared in Meyer's Colonial Kingdom and in the Kolonial Lexicon. But both of them use the term of the Reichsmarineamt "Aŭrepik" as the principal cue. The Japanese Government Chart of 1925 gives Eauripik, however. The scientists of the Hamburg South Sea Expedition give the island name in the following manner: Aùrepik (Sarfert), Auripig (Hambruch), Aŭrupeg (Krämer), Jâurupek (Hellwig). In the text that I have before me, Sarfert's spelling is employed.

2: Damm et al. --153 (1909) 1938 Woleaians
116, 103 Faraulep

The island became known to Europeans under the native name: Piraulop. Von Chamisso attributes the spelling Farruelap and Faroilep to Luis de Torres, and Fatoilep to the native Kadu. Lütke also used the indigenous Farroilap. Finsch made this into Faraulap. Meinicke has Faroilap, but he selects Faraulep for the key word of his record. This spelling became adopted rather generally, and it finally changed into Faraulip; this is the way most of the members of the South Seas Expedition heard it, although they noted the following pronunciations: Faráulop and Faróilap (Hellwig), Faraûilöp, Faroîlep, Fa-tja-ü-napo and Fatjaunäpo (Hambruch), and Fadjáumaep (Krämer).

3: Thilenius and Hellwig--252 (1909-10) 1927 Woleaians
116, 103 Woleai

[AN: According to our native informant] the name Woleai (Wolea, Wolaa) is applied to the entire group by foreigners only, who name an island or an island group after the name of the village which they either visited first or most frequently - in this case, the island of Wolea -. The natives themselves, however, use just as often a second name for the group, namely, Fálálap.

In the east: a. Lamotrek. . . or Namotrek, correctly Lamodjek. . . from lámo or namo, "the lagoon"; it is called trek, tjek, "small," although it is the largest of the three and longer (7 nautical miles) than Oleai which has a length of only 5-1/2 nautical miles. But it is shorter than well known Mokemok in the west, which from south to north measures about 20 nautical miles. Sometimes it is said that rek is the same word as rak, the season, i.e. the season, because the weather is always good; in that case it remains unexplained.

b. Falaite. . . in the west of the atoll; more correctly called Faleit or in former times Faleitabut; the word is derived from feiabut "unlucky child," because in the past the people on the island were wild; at the present time Falaite is uninhabited.

c. Puch. . . Pik small island in the north of the ring and usually pronounced Búiug; the word is derived from buik "boy" (Palau) and also sounded like it. Puch is uninhabited. In the east of the island is the good entrance Taualibúiug and in the west the boat passage Metaliár. Between Pik and the main island there is another entrance which on map 93 [MR: of the Reichsmarineamt 1903] is called the "dangerous entrance" [MR: 4: Krämer 2] [17]

Sailing southeast in the lagoon on the reef east of this entrance and on the southern side one comes to a projection of the reef which is covered with sand. It is the sandy cape of Mongalepi. If one draws a line from here southward which crosses the inland water and

reaches the southern reef--formerly at the rock Faisar (which disappeared in the last typhoon)--one gets the sósor boundary... which is the western limit of the district of the island of Lamotrek. East of the line no taboos need to be observed, but west of it one must fast if one sails early in the morning westward across the boundary. Smoking, too, is forbidden under such circumstances.

4: Krämer--17 (1909) 1937 Woleaians
116, 103, 131 Elato

Elato, sometimes simply pronounced Elat, because that is the word used for the seaweed after which the atoll and the main island are called; the latter is located in the north of the reef. The reef is reniform and has a bay opening to the east with a boat entrance into a small lagoon, which occupies only the northern part (Japanese map [MR: of 1925 on which the Admiralty map 772 was based]). In the southern part, which is separated from the northern, there seems to be little inland water. At the southern end the sandy island of Falipi is located; in the center (East). The island of the German map [MR: map 93 of the Reichsmarineamt of 1903] in the middle (w)Oletel (Hambruch: Oletul). Kari (Hambruch: Kare Reef) and Tamas are not given on the Japanese map. Hambruch, in addition, mentions Merekang "sharp point," Toeirul "calm quiet water" and Oilipi "on the sand."

Lamolior is uninhabited and located 2 nautical miles south of the atoll of Elat. "Lagoon of the south" with the islands of Toas and Olor (German map: Ulor).

4: Krämer--17 (1909) 1937 Woleaians
116, 103, 161 Olimarao

4. Olimarau is uninhabited*; the name is derived from vol "opposite the blue sea" (Truk: madau). It is located 26 nautical miles northwest of Elato. The natives visit the island for turtle fishing. Hambruch learned that the last native of Olimarau had died in 1899 on Lamotrek.

* According to Freycinet Goulimarao around 1800 had 225 inhabitants

OLEAI

(Map 4) [VMM: See 4: Krämer 184]

Position: halfway between Lat. 7° 21' N. and Long. 143° 55' E.

Exact position: northern tip of Raur, Lat. 7° 21' 39" N. and Long. 143° 57' 30" E.

Südsee-Handbuch, page 36: The Oleai Islands (Oleai, Uleai, Wolea, Ulie, Anangai) are located approximately 130 nautical miles west of the Elato Islands. The group comprises two atolls which surround a western and an eastern lagoon. The former is larger, but the bigger islands are grouped around the eastern lagoon. The main island of Flalap, located on the northern side of the eastern lagoon, gradually is connected with the island of Marijong (Mariom) by means of a sand dune which follows in the west; this same sort of bridge exists also with Paliau located to the southeast, which in turn is linked to Raur in the south. The group is formed of 19 islands--some of them large and some of them small--only the eight largest are inhabited, whereas the others exhibit a luxuriant growth of coconut palms and tall breadfruit trees. The names of the inhabited islands are Raur, Flalap (Oleai), Marijong, Tagaulap, Saliap, Utagal and Falalis.

4: Krämer--188-189 (1909) 1937 Woleaians
116, 133, 175, 103 Woleai

The true shape of the atoll has finally become known through the new English map. [189] The name Voleai appeared for the first time in 1608 in a letter of Pater Clain who gave it as Valayay; in 1706 it was given as Ulier,* in 1710 as Olie, and 1721 as Ulee according to Cantova.

*On Clain's map the names of the islands are: Parivu (Paliau), Raor (Raur), Ulier (Volea), Marioc (Mariong), Tacaylap (Tagaulap), Alingaray (Votagai) and Farilies (Falalis).

4: Krämer--189
116, 103, 177

(1909) 1937

Woleaians
Woleai

The first visitor of Woleai was Torres, who went there in 1804 and who gave the name of Guliai and Ulea; Chamisso in 1817 gives Ulea, Lütke in 1828 Ouleyai, the Kolonialatlas of 1908 Oleai, Uleai and Woleai, and the report of the Hamburg Südsee Expedition in 1909 the atoll of Oleai and the island of Volea.

4: Krämer--202 (1909) 1937 Woleaians
116, 103 Woleai

The Südsee-handbuch gives the names of Oleai, Uleai, Wolea, Ulie, and Anangai.* Meinicke names Ulie, Ulea, Uleai, and according to Guliek it should really be Wolea. In the new Spanish Encyclopedea universal illustrada of 1929 we find Uli, Ulea, Uleay, Ulie, Woleai, and Oleai. These different names are naturally taken from the reports of the visitors. The following are listed: Clain, 1697, Valayay, 1706, Ulier, 1710 Olie, Cantova: Ulee,** Torres: Guliai, Chamisso: Ulea, Lütke: Ouleyai, Kolonialatlas 1908: Oleai, Hamburg Südsee Expedition: Volea, Japanese map: Woleai. Oleai as a German language transcription comes closest to the true name as exact recordings have shown. Various place names are given with and without "w" e.g., Onoun which is also pronounced Voloul with the meaning of "round." Olimarau is frequently pronounced Volimarau and on Pollap there are several examples, e.g., Vorieng ghost and inland water, and Volebuku are given in story 5, etc. Völepeg (peg sounding like pik) is a common name for the "small places" of the surrounding region such as Aurepik, Sorol etc. Especially the main island of Falalap, "the great land," the largest of them all is usually known as Volea, which is a fairly good distinction from the Oleai of the entire group. In the song of storm magic Valeoai has the meaning of "on my boat" (wa, oá, boat).

*This is the word the Yap islanders use for Oleai; I heard it myself and W. Müller substantiates it in his work on Yap.

**I myself distinctly heard Oleai pronounced Oleë on Mokemok where Cantova was.

4: Krämer--205-206 (1909) 1937 Woleaians-1-2
116, 103 Woleai

Voléa is the largest of the islands, having an area of almost one square kilometer; next in size is Votagái in the west with an area of more than 1/2 square kilometer; it is said that in the past it was the leading island of the group and Kadu assured us that this was a fact. Then we have Votagai, Soliap, Falális, Tagaulap, Mariong, Eangaligarail, Faraliés, etc.

The Names of the Islands of the Atoll of Oleai from East to West

116, 103, 131 Ifalik

Until the third of April we hunted for two coral islands, which were shown on the maps, and which the Captian thought might be the same one which the natives of some other islands called Ifaluk. In reality there were four islands, the largest of which was Ifaluk; it had apparently given its name to the rest, just as Lugunor and some others did.

9: Senfft--13-14 (1903) 1904 Woleaians
116, 103, 131 Woleai

Oleai is also an atoll; [14] it consists of 23 islands of which Raur, Palián, Oleai, Máriom, Tagánlap, Séliap, Olemari (Ot'thogan), and Falális are inhabited.

Kadu's Lamurrec and Cantova's Lamurrec, Torres' Mugnak, Krusenstein's Lamoursec, the Lamourca, Lamouirec or Falou of Father Legobien. Wilson called it Sweede Island.

1: Burrows--35 (1947-48) Woleaians
116, 245, 105 Ifalik

"We have seen that the coconut is meat and drink to the people of Ifalik; supplies most of the material for their houses; provides the cordage used to hold all composite wooden articles together; makes baskets, mats, fuel, and has a multitude of other uses, even acting as a symbol and agent of supernatural power. The list above does not pretend to be complete. Whether human life could be sustained on such an atoll without this plant is open to question. If it could, it would have to be a radically different life from that which the people lead there now."

1: Burrows--123-124 (1947-48) Woleaians 1-3
116, 476, 105 Ifalik

"The framework within which goods and services are distributed has been partly stated, partly implied, in the foregoing discussion. A summary of the main points follows:

Each individual shares in the use of the homestead and arable land of [124] his maternal lineage. This involves a claim, not only to shelter, but also to food from cultivated plants and domestic animals.

Claims of this kind are lifelong and inalienable. What we call real property changes hands only as individual claims are initiated by birth or adoption, or extinguished by death.

A man acquires an additional claim by marriage, when he joins the household of his wife. Thereafter he lives mainly on the produce of her land, but without losing his right to draw on his own heritage. In cases of residence other than matrilocal, all who take up residence on some homestead other than their maternal one assume similar claims to the new homestead and whatever property goes with it.

Collected food--fish (except yellow-fin tuna), other sea-food (except turtle), land crabs, terns--is shared among the households of those who get it, or distributed farther if there is a surplus. For example, fish caught by a district expedition are distributed among all households of the district. If any are left over, they go to other districts. The exceptions, delicacies reserved for the clans of highest rank, are also distributed beyond these clans as far as the supply will go.

Each individual is obliged to contribute services, according to sex, age, and physical condition, by taking part in the work of his household and in communal tasks carried out by his neighborhood, district, island, or by the whole population of the atoll.

Specialization, beyond the general division of labor by sex and age, is confined to a few occupations: government, navigation, supervision of carpentry on canoes and public buildings, tattooing, some forms of healing, and some religious activities.

This economic system provides, indeed imposes, approximate equality of wealth. Some lineages, to be sure, have more arable land than others. But none is landless. And none can benefit from more land than its members can cultivate, nor as a rule--since there is no market for staple products-- dispose of more than they can consume. Further distribution on special occasions which constitute exceptions to this rule, will be discussed later.

This situation offers very little opportunity or incentive for a prestige economy. Not only can no individual or group acquire much more property than others; there would be no advantage in doing so. Honor and status are not equated with possession or expenditure of material goods, except in a few cases, as canoe ownership and display at funerals.

Control of labor is almost as equalitarian as ownership of property. The chiefs, and, within the household, the senior individuals, can command to some extent the services of others. But tradition channels, and in effect limits, the purposes to which labor is

applied. It is used only for the common welfare, never to enrich one individual or group at the expense of others."

1: Burrows--198 (1947-48) Woleaians
116, 105 Ifalik

"These gaps in religious behavior can be summed up in the statement that the pattern of rites of passage in Ifalik is a scanty, broken one; and that the people do not use magic on each other. Healing magic may look like an exception to the latter statement. But it is not a real exception, for the magic is aimed at the evil spirits thought to inflict disease rather than at the patient. The gaps in the pattern call for explanation; but that can not be attempted here. The explanation would have to be either historical, or psychological, or both. A historical explanation would necessitate comparison of the customs practised on Ifalik with those of surrounding peoples, a task beyond the scope of this local ethnography. A psychological explanation would require fuller data, of a kind that may be afforded by Spiro's line of inquiry, but not by mine."

1: Burrows, Edwin Grant. The People of Ifalik: A Little-Disturbed Atoll Culture. Unpublished manuscript submitted as a final report, Coordinated Investigation of Micronesian Anthropology. Washington: Pacific Science Board, National Research Council, [1949].

Pp. 246 (of typescript); 24 figs.; 19 photographs.

Manuscript obtained by loan from Pacific Science Office, National Research Council, Washington, D. C.

[KS Mr. Burrows is a competent ethnographer and has had wide experience in field work on many Pacific Islands--as well as Ifalik.
This book contains an excellent descriptive account of the culture of a relatively unacculturated society. It covers in detail technology, house-building, canoe-building, navigation, social structure, economics, government, foreign relations, religion and ethics. Lists are given of flora, fauna, and stars (used in navigation) with native and scientific identification.
The field work was done mainly in 1947, carrying over into early 1948.]

2: Damm, Hans, et al. Zentralkarolinen, Part II: Ifaluk, Aurepik, Faraulip, Sorol, Mogemog [The Central Carolines, Part II: Ifaluk, Aurepik, Faraulip, Sorol, Mog-Mog]. Ergebnisse der Südsee-Expedition 1908-1910, Section B, Vol. X, Part 2. Hamburg: Friederichsen, De Gruyter and Co., 1938.

Ed. Georg Thilenius; pp. viii, 379.

Yale: Nkd91.+913h. II. B. 10(2.

[VMM: Although all undertaken in the same year (1909), the surveys for these reports were made by different investigators, as part of the South Seas Expedition of 1908-1910. Hanbruch spent two weeks in October on Ulithi, and two weeks on Faraulep in November; Sarfert spent 17 days in October on Sorol Island, four days on Aurepik, and 12 days in November, 1909, on Ifaluk. The briefness of the investigations naturally affected the amount of ethnographical data obtained, and "there was also an occasional lack of trustworthy" informants. Damm wrote up the notes of Hambruch and Sarfert. Translated by C. Sherman.]
[KS: This source has been reprocessed from slips and from Sherman's translation.]

3: Thilenius, Georg, and F. E. Hellwig. Allgemeines: Tagebuch der Expedition [Generalities: Journal of the Expedition.] Ergebnisse der Südsee-Expedition 1908-1910, Vol. I. Hamburg: L. Friederichsen und Co., 1927.

Edited by Georg Thilenius; pp. 489.

Yale: Nkd91.+913h.v.1.

[LEN: The log of the expedition ship "Peiho" is written by Hellwig, who also collected ethnographic specimens through trade with the natives; much of the narration is concerned with his trading experiences. Many observations were not made personally by Hellwig, but reflect the work of the other researchers, who occasionally left the expedition to investigate local cultures. The Micronesian phase of the trip, which began in Palau and extended throughout the Carolines to and including the Marshalls, was initiated in August 1909 and ended in April 1910. That part of the log which has been selectively translated and abstracted describes, for the most part, native culture, especially where contact with Europeans has occurred. The data, although duplicated, in part, in the formal ethnographic reports of the expedition, are more personal and more specific for locality in the log. A 3-page petrographic summary by Herzenberg details the general data on the

3: Thilenius and Hellwig

geology and mineralogy of Palau and the Carolines.]

[KS: This log has been reprocessed from the original markings. It was translated, at that time, by Alois M. Nagler.]

4: Krämer, Augustin Friedrich. Zentralkarolinen, Part 1: Lamotrek Gruppe, Oleai, Feis [The Central Carolines, Part 1: The Lamotrek Group, Woleai]. Ergebnisse der Südsee-Expedition 1908-1910, Vol. X, Pt. 1. Hamburg: Friederichsen, De Gruyter und Co., 1937.

Ed. Georg Thilenius; pp. 413.

Yale: Nkd91.+913h. II. B. 10(1.

[VMM: The material obtained by the 1908-10 Hamburg Südsee-Expedition to the West Central Carolines, under Krämer, was not written up for 26 years, and was not published until 1937. Probably for this reason, a number of abbreviations and remarks in the text are not clear. This volume has three parts: 1) the Lamotrek Group, in which Krämer includes Elato and Olimarao; 2) the Woleai Group; 3) the Fais Group. In the case of the first section, the material has all been filed under Lamotrek except where there are specific references to Elato. There were almost no specific references to Olimarao. In connection with the Woleai group, Krämer describes the typhoon of 1907 with its far-reaching effects, both as far as human life and the topography of the islands are concerned. In conclusion, there is a brief summary of cultural comparisons for the three

4: Krämer

groups.]

[KS: The section of this work dealing with Woleai has been reprocessed from the CCS file slips for the revised HRAF file. The original marking was done by VVM and the translation from the German by ER.]

5: Kittlitz, F. H. von. Denkwürdigkeiten einer Reise nach dem russischen Amerika, nach Mikronesien und durch Kamtschatka [Reminiscences of a Trip to Russian America, Micronesia, and Through Kamchatka]. Vol. II, pp. 1-190. Gotha: Justus Perthes, 1858.

Yale: S55.750v.2.

[MR: Kittlitz accompanied Admiral Lutke in 1827-28 on his expedition to the Bering Sea, Kamchatka, and Micronesia as a naturalist. He contributed Observations Zoologiques to Vol. III of Lutke's report. In publishing his own work he states that its purpose is quite different from Lutke's since it represents the interest and observations of a botanist and zoologist. He was able to supplement his material with information from the field notes of Dr. Mertens who had died earlier. Pages 1-190 which have been incorporated in the files deal with observations made during the trip through the Eastern Carolines, to Guam, back to the Western Carolines, and thence up through the Bonins. His observations are mainly on the flora and fauna of the islands visited, but he also includes comments on the inhabitants encountered, giving superficial details on their material culture and some customs. Translated by Sherman.]

Preface, pp. 241.

Yale: Ene.895.

[ECB: Preface by Valeriano Weyler.
Author, Pereiro, presents first-hand information and gives the following as his purpose in the writing of the book. [xii] Interested by the operations that were to be begun in the Island of Ponape [ECB: by the Spanish government] in which I had to be a presential witness because of my mission, begun as a memorandum, on leaving Manila, I wrote in simple notes the daily occurrences, as they happened, which have shown me the [xiii] erroneous concept current about our possessions in Micronesia. To remove errors, to give knowledge of the major and most important of our islands in the Caroline Archipelago, under the triple aspects of geography, ethnography, and history . . . are the only motives which have impelled me to write the present book . . .]
[KS: Only one excerpt, on location, has been used. Translated by ECB.]

24: Christian, F. W. The Caroline Islands, Travel in the Sea of the Little Islands. London: Methuen and Co., 1899.

Pp. 412.

Yale: Ene. 895C.

[LEM: Christian visited Micronesia with the express purpose of investigating the resources of the islands, human, animal, plant and mineral. He travelled leisurely from one group to another, working closely with the natives and gives very detailed descriptions of the physical environment of the individual islands. Ethnographic material is less in evidence, as Christian writes more about the circumstances of his observations than about the results. Very good for descriptive account of water routes, channels, reefs; paths and roadways from one community to another; and the type of vegetation and topography concerned.

[AN: In July 1913, Professor Brown paid a visit to the reef island of Woleai, where one of the chiefs squatted and wrote a sentence in the script of the island. Later on, Mr. Brown received a full list of Woleai characters. The Woleai script is syllabic, and the author maintains that the script which, in 1913, was known only to five men is probably a relic of a wide usage in the archipelago, where "it must have belonged to the ruling class of an empire of some extent."]

[KS: This source has been reprocessed for HRAF from the previously-used file slips.]

33: Hasebe, Kotondo. The Tattooing of the Micronesians. The Journal of the Anthropological Society of Tokyo, Vol. XLIII, No. 485, pp. 120-148. Tokyo: Faculty of Science, Tokyo Imperial University, 1928.

American Museum of Natural History.

[MR: At Korror, from September to November, 1927, Hasebe studied the tattooing on about 350 persons from Palau, Yap, Tobi, Merir, Pulo Anna, Songosor, Ulithi, Fais, Woleai, Eauripik, Ifalik, Elato, Lamotrek, and Satawal. The author states that of his drawings of 20 persons, three, Nos. 242, 243, and 244, were drawn by himself. Of the tattooing designs of the western Micronesian people, none of them which he used as reference was correct or complete except for Mr. Müller's. Hence, he supplemented them by the additional lines. Except for Yap and Palau, the islands have various names for the designs, which they use both privately and officially. Although it is difficult to standardize the names, the ones he uses are based upon Krämer, supplemented by other names and pronunciations of his own.]

[KS: A few passages have been excerpted for the revised files.]

34: Lesson, P. Voyage autour du monde entrepris par ordre du gouvernement sur la corvette "La Coquille," [Voyage Around the World on the Corvette "La Coquille" Undertaken by Order of the Government]. Vol. IV, pp. 121-175, 183-191, 197-201. Bruxelles: N.-J. Gregoir, V. Wouters and Co., 1839.

Yale: Ecd.822c.v.3-4.

[AN: On her voyage around the world the corvette "La Coquille" entered Micronesia through the Gilberts in May 1824. Lesson's account of his Micronesian explorations has been transcribed for the files. Chapter XXV is devoted to Kusaie; it is identical with Lesson's article in the Journal des voyages (Vol. XXVI, 1825). The "Coquille" proceeded to Pingelap, Mokil, Truk, Pulap, and Satawal. On Truk itself Lesson made no landing, and the author himself can therefore give but meager information on the customs of the Truk islanders. He reprints, however, in the appendix an anonymous account on Truk which had been published in the Westminster Review in 1827.]

FOREWORD

IFALUK is a small dot on the map: a half a square mile of land can hardly show much detail on any scale used for Pacific distances. Further, it is spelled "Ifalik" on most maps, through some accident in the history of official spelling for place names. The people who live there call their island in a way that might be rendered "Eefahlook" in a sort of English phonetic spelling. We figure that the people who live there ought to have the final say about the name of their island: hence our divergence from the map makers.

Ifaluk is one of the Caroline Islands, which form part of Micronesia. It is some 700 miles north of New Guinea, some 400 miles south of Guam, and about 1200 miles east of the Philippines. It is a part of the Trust Territory of the Pacific Islands, administered by the government of the United States.

Ifaluk is an atoll: a roughly circular reef, built by corals and other lime-secreting organisms, marking off a quiet lagoon in the open ocean, the reef in places piled up to form islets emerging a few feet above the level of the sea. Mr. E. H. Bryan, Jr., of the Bishop Museum, in Honolulu, has compiled a list of the islands of the world that could be classed as "atolls." He finds 409: 136 in Polynesia, 92 in Micronesia, 66 in Melanesia, 15 in Indonesia, 5 northwest of Australia, 68 in the rest of the Indian Ocean, 26 in the Caribbean Sea, and only one in the Atlantic. Atoll formation, then, is primarily a phenomenon of the tropical Pacific: and the word "atoll" carries with it the connotations of warm sun, of white beaches backed by graceful palms, of friendly dark-skinned people, and of an idyllic way of life.

Ifaluk, for us, lived up to these connotations, and we found our life there a continuously rewarding experience: an experience which, in writing this book, we are trying to share.

We tested several ways of meeting the problem of joint authorship. We tried being "we" which had a nice regal sound and worked well enough when we agreed. But we have a great talent for disagreeing,

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

114 128 despite the underlying similarity of our points of view. We tried writing in the third person—Marston did this or Don thought that—but wives, friends, editors, said this made pretty flat reading. Finally we decided to split the book: Marston Bates would write the account for the period he was on the atoll; then Donald Abbott would take over for the remaining two months. The reader can thus expect to do one mental somersault, where "I" changes from Bates to Abbott between Chapters IX and X: Bates and Ted Burrows sadly going off with the Trust Territory ship, leaving Abbott with new companions to finish the study.

It is, of course, extremely presumptuous of us—of Abbott and Bates—to write about a study that also involved five other people. But the problems of multiple authorship seem insurmountable in a non-technical book and we wanted, in any case, to write subjectively, to write about our own reactions and feelings as well as about the people and things that we observed. In a very real sense, however, all seven of us achieved a "team approach" in our study of the atoll so that, whether they like it or not, all members of the team must share some responsibility for both the observations and the thoughts that we have expressed here. And certainly there must be a total sharing of the credit for whatever good may have come out of the Ifaluk enterprise.

114 The Ifaluk team consisted of:

Donald P. Abbott, marine biologist, of the Hopkins Marine Station of Stanford University, on Ifaluk from June 22 to November 9, and leader of the expedition from September 12 to the end.

Theodore Arnow, geologist and hydrologist, of the U. S. Geological Survey, on Ifaluk June 22–24 and September 12–28.

Marston Bates, biologist, of the University of Michigan, on Ifaluk from June 22 to September 12.

Frederick M. Bayer, zoologist, of the U. S. National Museum, on Ifaluk from September 12 to November 9.

Edwin G. Burrows, anthropologist, of the University of Connecticut, on Ifaluk from June 22 to September 12, and leader during this time.

Robert R. Harry, ichthyologist, of the George Vanderbilt Foundation, on Ifaluk from September 12 to November 9.

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

Joshua I. Tracey, geologist, of the U. S. Geological Survey, on Ifaluk from September 12 to 28. 114

We came curiously and quickly to have a feeling of "belonging" on Ifaluk, and we found ourselves much involved with the people of the island in everything that we did. Inevitably, however, we were more closely associated with some than with others, and it may be helpful to identify here the people with whom we were most concerned, whose names appear most frequently in our narrative: 114 115 115

Fagolier, the paramount chief of Ifaluk.

Maroligar, the number two chief, guardian of the Fan Nap, where we lived.

Toroman, the number three chief and the official divider of food.

Lavausrung, the number four chief; a lady.

Wolpaitik, the number five chief (and the heaviest man on the island).

Totogoeiti (Tom), Ted's interpreter, and top ranking navigator (palu) of the island.

Yaniseman (Yani), "schoolteacher" and constant companion and advisor.

Bakalimar (Bakal), initially assigned as our special helper in camp and field, working later with Harry's fishing gang.

Tachiwelimeng (Tachim), neighbor, friend, and later one of Harry's fishing crew.

Letaweriur, Yani's wife and a composer of dance chants.

Gavileisei, master craftsman and canoe builder.

Gauaisig, an old man, navigator and canoe builder.

Talimeira, houseboy of Burrows and Spiro in 1948, now one of the two local "doctors."

Arueligar, "high priest" or "medicine man."

The Ifaluk study was made under the auspices of the Pacific Science Board, with a grant from the Office of Naval Research. We are particularly indebted to the Director of the Pacific Science Board, Dr. Harold J. Coolidge, and to the secretary of the Washington office, Mrs. Lenore Smith, and the secretary in Honolulu, the late Ernestine Akers, for help of all sorts. 122

CHAPTER II

MOSTLY ABOUT PEOPLE

THURSDAY, the first day after the NETTLE left, was overcast, with occasional drizzling rains. This was probably just as well because it cut down on the temptation to wander; so we could concentrate on the organization of camp at the Fan Nap.

The Fan Nap—the "Men's House"—was a large structure, some forty feet long and twenty wide, with a high thatched roof that sloped steeply to within a couple of feet of the ground on the sides. The ends were closed with matting down to within four feet of the ground, which meant that any adult must crouch on entering or leaving. The main cross-beams inside were higher, but still low enough to be a constant hazard. I never did learn to use the proper inside-of-house crouch, and kept battering my head all summer. Ted and Don were more alert—or at least better at dodging.

The front part of the Fan Nap, nearest the lagoon, was used for sleeping quarters. Ted and Don had their cots at the sides, under the stringers—beams that had been hewn out of huge breadfruit logs. The logs looked precariously balanced on the heavy coral blocks that served as the corner posts of the house. Collapse of the house would have caused the occupants of the cots to be instantly crushed. The great beams, so close above, were thus at first something of a mental hazard. But they had withstood the gales of many years and were clearly solidly placed—and they were very convenient for hanging mosquito nets.

Tables and boxes were arranged in the central area to make working space. The equipment included carpenter's tools, and with these some

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

of the wooden packing boxes were converted into sets of shelves. The cases of food were piled along the sides in the back part of the house, which became the kitchen area, cozily walled with cartons of sliced peaches and spam.

There was an altar in the back part of the Fan Nap that was a constant mental hazard because we did not want to offend the local people by desecrating this shrine with profane objects. The altar was a ramshackle affair, contrasting strongly with the usual Ifalukian workmanship, and this may have indicated that it was not taken very seriously; but we wanted to run no risk of giving offense. There was a large chest there, too, which we judged to be a sort of depository for the appurtenances of government. Among other things, the American flag was stored in the chest, to be hauled out and attached to a pole on the lagoon shore when a ship was sighted.

There was another sacred touch to the Fan Nap—a phallus attached to the main front center post and pointing out across the lagoon. The phallus, which pointed westward toward Woleai, the nearest neighboring atoll, commemorated an event of Ifaluk legend—or history. The story was one of violence and conquest and seemed curiously anomalous in the Ifalukian folklore, contrasting as it did with the present completely non-aggressive and peaceful character of the people. Ted thought that it might reflect memories of an actual conquest by the people of Ifaluk of earlier inhabitants of the neighboring atolls. Maur, the main character in the legend, was certainly the "culture hero" of the people of the island.

The phallus did not seem to be the object of any special veneration or cult—it was just there. Once, later in the summer, when we were trying to explain the money system of the United States, we were questioned about the portrait heads on the coins. Don explained Washington and Lincoln as long-dead "chiefs" thus commemorated.

Yani got the idea at once. "Ifaluk have picture of dead chief, too," he said, grinning, as he pointed toward the phallus of Maur on the Fan Nap.

The weather continued to interfere with the starting of field work. Friday it rained almost continuously all day—and of course the rain

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

were tucked in with some old clothes, and seemed contented enough.

In general, the people had fine physiques, and seemed very healthy. There was one woman who looked like an albino with freckles, and another old woman had her nose and upper lip completely eroded away, probably from yaws. Yaws was once prevalent in all of these islands, but it yields quickly to penicillin injections and during the post-war period of American control, the Navy medical service instituted an effective campaign of yaws control.

After the first three households had been completed, the party waded back across the shallow pass to "home" at the Fan Nap for lunch. The weather kept us in for the rest of the day. The sky had been completely overcast all morning, with occasional drizzling rains, but without strong wind. In the afternoon the wind became steadily stronger. It started to tear coconut fronds, even green ones, from the trees, and the coconuts themselves were being blown off in large numbers. Don noticed one coconut fall at an angle of about thirty degrees from the vertical in the wind, and he figured that the wind had the force of eight or nine on the Beaufort scale—gale force.

About four o'clock Maroligar and some other men came around to the Fan Nap and lashed poles and boards across the open western end, where it faced the lagoon. A tent that had been unpacked but not set up was dragged over and lashed to the poles, nicely cutting out the wind and rain and making the interior fairly snug and comfortable. But the noise of the wind and waves outside kept increasing. A typewriter could not be heard four feet away, even in this snug interior. (Ted was typing up his notes from the morning, impervious to typhoons.)

We kept worried eyes on the barometer and on the wildly swaying palms. Men everywhere were out battening down their house walls with matting, and running great ropes from the gables, making them fast to the bases of nearby palms. Maroligar, hovering about the Fan Nap with obvious concern about the guests on the island, made it clear that if things got much worse we should move in to one of the houses farther from the shore.

Then suddenly, about five o'clock, the worryings and speculations were disrupted by a wave of excitement. An airplane had been

whether they died in infancy (before they could walk) or later. The ninety-two women of childbearing age or older had had 255 children, of which 151 were still living. Of the 104 deaths, sixty were either stillbirths or infant deaths, which is a high infant mortality by modern Western standards, though probably lower than that of most of the crowded Oriental civilizations.

The menstrual history of every woman was public knowledge on Ifaluk because of the custom of retiring to the menstrual huts. Tufai for a woman, then, has the definite meaning that she has passed menopause, has completed her reproductive history. We got the reproductive history of twenty-eight of these elderly ladies. They had born a total of eighty children, or an average of 2.8 each. Eight of them had had no children; one of them had had ten; most had had two, three or four.

The Ifalukians, like most people who lack a written language or system of records, had amazing memories, and I think that our histories for these women are reasonably accurate. It is difficult to interpret them precisely, of course, because of our lack of data on movement to and away from the island, and the like. Clearly, however, the population is hardly maintaining itself. The Ifalukians loved children, seemed always to want children. I could not, however, get away from a suspicion that the low birth rate reflected some sort of deliberate contraceptive or control practice, beyond such conventional taboos as the prohibition of sexual intercourse during periods of fishing. The language problem, the delicacy of the subject and our reluctance to appear to be prying into personal matters, prevented us from getting any definite information.

The population question in the Pacific is a matter of general concern. All of the islands—Polynesian, Micronesian, Melanesian—showed a great decline in population through the 19th century. The islands had probably been almost free of contagious disease before the explorers, traders, whalers and other Westerners started roaming the Pacific, bringing smallpox, measles, venereal diseases, tuberculosis and the like along with them.

The consequences were devastating, and only in recent years have introduced medicine and sanitation started to counteract the effect of the introduced diseases. Until quite recently, I suspect that most cul-

OR21 Woleai OR21
Ifaluk

were surely as mixed up racially as the Europeans (none of us can afford to be stuffy about purity of race) but the mixture in the Ifalukians must have contained some of the same elements as the European mixture. But how did they get so far away?

Most anthropologists believe that the Pacific islanders moved out from southeast Asia, perhaps around the beginning of the Christian era, when the inhabitants of southeast Asia may have had a larger "Caucasian" component in their racial mixture than now. Despite his daring feat with the Kon-Tiki, few experts have much faith in Thor Heyerdahl's theory of American origin: he certainly proved that cross-Pacific contact is possible, but the evidence of language, culture and race points overwhelmingly to a Malayasian origin. One of the more probable migration routes for the Polynesians is from southeast Asia to the Philippines and through the Caroline islands to the central and south Pacific.

One gets the feeling, in this Polynesian-Micronesian area, of dealing with cultures far more complex than the technology would indicate: of dealing with the remnants of a high culture, of a "civilization." One feels that these same people, with the resources of a continent, could have built Angkor Vat or Copan: and they did produce some spectacular carving and building in places like Ponape and Easter Island. It is easy to understand the lure of the search for some "lost civilization" to account for these cultures; to understand the desire to create a mid-Pacific "continent of Mu" after the fashion of Atlantis. Maybe there is a general human tendency to explain the fascinating with the fabulous. Certainly the Pacific islanders are fascinating enough; but they have given us very few clear clues to either their origin or their history, and the few clues that we have are in part conflicting. Probably we shall never arrive at a clear and unequivocal reconstruction of their past.

But we were absorbed with the Present on Ifaluk. We had not yet acquired a proper Ifalukian shade of brown when we finally managed to finish our census of the people: but even with our strange color, we had already begun to feel at home, to feel "Micronesian" ourselves, a part of the island.

CHAPTER III

MAPPING THE BOONDOCKS

THE IDEA was to study the human ecology of Ifaluk: the interrelations of man, his culture, and the environment. For man and his culture there was the reservoir of information accumulated by Burrows and Spiro during their 1948 residence on the island: studies which Ted planned to continue during his second visit. Don and I, with the enthusiasm of amateurs, wanted to help in this anthropological work. But there was also the environment to be studied—the land, the reef, the lagoon, the sea, the plants and animals. This "simple" situation—260 people living on half of a square mile of coral rock and sand—was incredibly complex.

When we had finished the counting, weighing and measuring of *Homo sapiens*, the next step seemed to be a start with the environment. The logical first move here was a map, a topographic survey of the situation.

The map problem was greatly simplified by the fact that a little previously a Navy reconnaissance plane had made a series of vertical and oblique aerial photographs of the whole atoll. The Ifalukians were fascinated by these photographs. They seemed to have no trouble at all in grasping the significance of either the vertical or oblique shots, and most people easily recognized the major landmarks, even locating their particular family dwellings. They knew the atoll thoroughly, and the aerial photographs gave them a chance to stand off and look at the whole thing at once, for the first time.

41: Bates & Abbott N-5 (1953) 1958
OR21 Wǫleai OR21
Ifáluk

We picked up that word "boondock" in Guam, and very useful it proved to be. It became an important part of the Abbott-Bates vocabulary, and may well have also infected the Ifalukian speech. In Guam, it was used to refer to the wild tangle of miscellaneous vegetation that had taken over so much of the island after the disruption of the war.

The boondocks on Ifaluk were the parts of the atoll that were not clearly something else—that is, not coconut grove, not taro swamp, not household area. The boondocks were not exactly wild, because all sorts of useful things grew there, including planted coconuts and breadfruit trees. They were not exactly cultivated either. Such areas could thus hardly be called "jungle" or "scrub"; and "forest" seemed rather inappropriate. "Boondock" was just the word; though we could perhaps better have used the Ifalukian equivalent, niwel.

The boundary between the coconut grove and the boondocks was sharply defined: weeds and shrubs were kept cleared out of the coconuts only up to this definite line—the boondock line. This again roughly paralleled the lagoon shore, fifty or sixty yards in. We plotted it on our map, later, when the trail mapping seemed fairly well in hand.

The habitations, deep in the coconut grove and near the boondock line, were grouped into "households." The census showed that there were twenty-six such households on the atoll, eleven on the island of Falalap, and fifteen on Falarik. The Falarik households were not scattered evenly along the highway and lagoon, but formed two clusters or villages, one called Rauau, at the south end of the island—the Fan Nap was in the middle of this—and the other called "Falarik" (the address would probably be "Falarik, Falarik") with a gap of about a quarter of a mile along the broad highway between the two.

The whole system of land ownership of the island was built around these households, each of which had a name. Later in the summer we tried to map the holdings of one household, Falepenach. These holdings included not only the immediate vicinity of the living quarters, but also several patches of boondock and coconut grove on Falarik, and patches in the big taro swamp on Falalap. The patch arrangement seemed to provide that each household would "own" its share of each of the different kinds of land.

The households varied greatly in size, from one which included

Ifaluk

tempt at understanding man's relations with the world around him. With the census finished and the mapping well started, food study had next priority.

Each of us had somewhat different ideas about how to approach this difficult job. In the end, records were kept on four different households for a month each. Two of the studies were made by Ted and two by Don. I am not sure, looking back, why I stayed out of this, because food relations have long been one of my pet interests. I think it was chiefly a matter of economy of effort. Ted and Don had the matter well in hand and each had special advantages: Ted because of his familiarity with local customs and with the language, and Don because of his close association with the invaluable Yani. The daily record taking rapidly became routine, and a pattern formed very early by which each of us established his own special daily routines, thereby avoiding duplication of effort. When to collaborate and when to specialize is a nice problem in the team approach to scientific study. I think we handled the division of labor very well, though not always consciously.

Don and Ted have summarized the results of this food study. The details will be published in scientific papers, but perhaps I can give here a general summary.

The four households included a total of forty people, men, women and children: the average weight per person being 95 lbs. The average daily intake of staple food per person per day was: fresh breadfruit, 175 grams; ripe coconut meat, 130 grams; fish, 105 grams; taro, 70 grams; fermented breadfruit, 60 grams; fresh toddy (sap from coconut flower stalks), 415 cc.; milk from green coconuts, 75 cc.; green coconut meat, perhaps 35 grams.

Calculating food values for these materials is not easy, since most detailed nutritional studies have been made with northern foods. The foods of the tropical Pacific, however, have been studied in Hawaii, and there is a growing literature on nutrition in other parts of the Pacific. From this information, it appears that Ifaluk diet is inadequate in several respects, according to the usual dietary norms. The Ifalukians, however, gave every appearance of having an adequate diet—there were no obvious signs of their being undernourished. I have long

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

146 114 come to view with suspicion these tables giving comparative nutritional values for different parts of the world. Truly, much of the world suffers from malnutrition as compared with the United States or Western Europe; but also, I think, our nutritionists have failed to give adequate attention to possibly varying needs. The food needs of man in Ifaluk and of man in New York are not necessarily the same.

121 262 One problem with diet studies is the difficulty of keeping track of snacks, of occasional foods; yet such occasional or incidental food may be very important in relation to some vitamin or mineral requirement. We were very conscious of this problem, and Ted and Don made every effort to keep track of incidental food as well as of staples. Yani was particularly helpful in this, because he tried to remember and report all of the incidental things that he and his friends ate as they wandered about during the day. On this basis, there was considerable variety in the Ifalukian food. At least thirty kinds of plants were eaten in one way or another (not counting "medicines"). Don got records 267 136 of eighty-eight different kinds of fish that were eaten, and guesses that there must be many more. For animals, there were also sea turtles, chickens and other birds, and occasionally pigs and dogs. Some seventeen kinds of molluscs were eaten, eight kinds of crustaceans, and a few other things like sea anemones and one kind of sea urchin.

130 [136] We arrived at the height of the breadfruit season. Breadfruit trees grew everywhere, producing far more fruit than could be used; and the fallen, rotting fruits were probably the chief breeding places of the flies that so plagued us. As the breadfruit harvest dropped later in the summer, so did the numbers of flies.

130 262 Breadfruit in its season (June through September, with a second, smaller crop in February and March) is the staple food, the chief source of starch, for the people of Ifaluk. It is a staple on most of the islands of the tropical Pacific—the "bread" of Polynesia and Micronesia.

130 245 The big, starchy fruits grow on a handsome tree, probably native to Malaya. It may well be among the most anciently cultivated of plants and the main food varieties are seedless, completely dependent on man for reproduction. It is propagated from shoots which spring up around the base of the trunk, and the colonizers of the Pacific—

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

000 this or that. We might have done better if we had tried to adapt
[146] directly to the Ifalukian diet, because certainly the Ifalukians looked healthy and husky enough. Perhaps we couldn't have adapted to their varieties of starch in the time available, since changing food habits involves somewhat more than merely changing prejudices, and changing prejudices is not always easy, particularly when there are three people to interact on one another.

● 114 Clearly our own food behavior was not adapted to the atoll conditions, though I am not sure exactly what we did wrong. I always tend to have a skinny, underfed look, in the tropics. It bothers me to have people tell me how well I look after a winter in the north; and how bad I look after a period of tropical residence, because my feelings are exactly the opposite of my appearance. We weighed ourselves periodically on the bathroom scales that we had brought along for weighing the inhabitants of Ifaluk, and I worried a little as I watched the steady drop. But the worry wasn't enough to spoil the pleasure of living in the sun or lazily floating in the lagoon, or enough to jar me into any dietary experiments. We went on opening our cans while we weighed the food at Falepenach and Soumat, dietary intruders but having a wonderful time.

1: Burrows--2 (1947-48) Woleaians
116, 115 Ifalik

"Most helpful of all was Totogoeiti, who will be called hereafter by his English name, Tom. This he acquired in the days of his youth, when he worked on foreign ships from Honolulu to Singapore. During that period he spent six years in Manila, where he acquired a command of English which, once some of its peculiarities were mastered, was surprisingly adequate. He was at our beck and call the whole time. If he sometimes became impatient at our stupidity or persistence, he controlled himself admirably. He dictated all the incantations and other native lore of navigation which he, as ranking 'captain' (palū), knew better than anyone else. Much of this was private property, which he would only teach to another native in return for valuable presents. Toward the end, when our supplies were running short, he twice climbed coconut trees at night --a task usually left to younger men--and snared terns for our breakfast. So far as we knew, these were the only terns snared during our stay, as the birds were not abundant enough at the time to justify this arduous and risky job. To a considerable extent the following pages reflect the culture as seen through Tom's eyes."

17: Meincke--358 (Prior to 1875) 1876 Woleaians
116, 101, 115 Woleai

Ulie, (Ulea, Uleai, according to Gulick properly Wolea) was discovered by Wilson in 1797 who named it Thirteen Islands is one of the most important and best known of all the Carolines.

"When asked why the chiefs elicit this obedience, and no one else, the answer is immediate--because their lineages are 'more high.' This superiority of descent is accepted implicitly. It is not the person is personally superior, has greater ability or knowledge, but that he is descended from the 'royal family.' The obedience, then, is to the status, not the individual. When I asked, for example, how they felt about obeying a young chief, whom they had ordered around when he was a boy, and who now is their superior, though they probably have greater skills and knowledge than he, they expressed surprise. Why not? Isn't he a member of the lineage of chiefs?

No person could remember one instance of disobedience of a chief. 'Men afraid that chief. (If) one man no like talk for chief, very bad man. All people no like. Why he no like talk for chief?'

I might illustrate this point by one incident in which we were involved. One morning Tom, our interpreter, came to us saying that he would not work with us for a few days since the canoe, that he was building with the assistance of some other man, was not being completed rapidly enough because the other men were not indiligent [sic] in their work, and that he would have to devote more time to the work. Later in the day, he came to me, saying that the chiefs had heard of his not working with [20] us and were angry with him. I told him that I wanted him to complete his work as soon as possible and that

both Dr. Burrows and I would rather he worked on his canoe for a few days. But he looked at me very contritely, and in a very pathetic voice, he answered that the chiefs are 'too angry at me', and therefore he was afraid to work on his canoe because he was afraid of the chiefs. Now this is from a man who had lived in Manilla for four years, who was descended from a chiefly lineage himself, and was next in line for a chieftanship, and who often decried the chiefs to me, impugning their abilities, and calling them 'fool fellows' because they had not had the experiences that he had had."

28: Spiro--129 (1947-48) 1949 Woleaians
116, 831, 593, 115 Ifalik

"This puritanism goes great lengths. A man would never dream of kissing his wife goodbye, not because kissing does not constitute a form of displaying of affection, but because of the absolute shame of being seen engaging in a sexual activity. No man would even hold the hand of his wife in public for the same reason. Our adolescent pattern of hand-holding would shock any Ifalukian. Any overt form of sexual activity or display of fondness between the sexes is inhibited. The candid reference to the sexual anatomy and physiology in the love songs stands in glaring contrast to their public attitude of shame. This means that one never sees overt affection displayed between spouses. One might interpret this as lack of affection, but this would be an untenable interpretation. In the intimacy of their homes, affection is shown, and patently felt. A wife will serve her husband, with no expressed feeling of gratitude on his part in public. But in private this pattern is different. One afternoon, for example, Tom and I were administering a battery of tests, and his wife came up bringing us coconuts to drink. Tom was very pleased at this gesture, his face beamed with pleasure, and he exclaimed: 'My wife, my wife! Very good that my wife.' On another occasion, I was giving his wife one of the tests, and she did not respond very well. Tom became quite angry at her, so that her feelings were hurt. He was immediately sorry for his treatment of her, smiled at her, and all was forgiven."

29: Spiro--191-192 (1947-48) 1950 Woleaians
116, 159, 762, 115 Ifalik-1 - 7

"October 15, 1947. This morning Maroligar asked if he could use our [WPM: the author's] canoe. I, of course, gave him permission. When he returned, he explained that Tarev had tried to commit suicide by drowning. He had tied a rope around his neck, weighted stones to his feet, and was about to jump from his canoe into the lagoon when Maroligar and two other men stopped him. (This occurred a few days after the death of his wife.) Apparently he had had a trying night the night before, since he spent the entire night shouting and talking to himself. Among other things he had insisted that he was superior to the other people and that he was really an American. (8)

I asked Maroligar if I could speak to Tarev, and he was eager that I do so. When we arrived at the courtyard of his house, I noticed that all the women in the immediate area had departed because of their fear of him. When I peered into the house, he saw me immediately, and his face brightened. When I asked him to come out, saying that I

"8. The American is a person of high prestige and authority in this South Sea culture. It is difficult to say whether Tarev's insistence that he is an American is an outright delusion or rather a conscious attempt to identify with a 'reference group' of high status (the term is M. Sherif's)."

would like to speak with him, he immediately complied with my request. I offered him a cigarette and asked him if he were happy. He replied that he was very sad because of the death of his wife. I asked him why he had tried to commit suicide, and he explained that all the people were speaking 'bad' (9) to him. Maroligar interrupted him to say that he was lying. My grasp of the language was inadequate to continue the interview without the aid of an interpreter, and I asked Maroligar to call Tom, our interpreter. I tried to talk with Tarev in Maroligar's absence, but he seemed in a kind of stupor, and I could not get through to him. He regained contact with reality when Tom arrived, and the following interview ensued.[192]

Q. Why did you try to kill yourself?

A. Because the people talk bad to me.

"9. At this point, I could obtain no exact reference for the word 'bad.'

"Q. What do they say?

A. My mother talks bad. [Actually his 'mother' is his maternal aunt, which, in this culture, is his classificatory mother. His biological parents are dead.]

Q. What does she say?

A. She says that my wife does not like her or her sister.

Q. Why?

A. [No answer.]

Q. Were you very sad today?

A. My wife died. I feel like smashing everything in the house, because my mother and her sister do not like my wife. My wife died and I am very sad. (10)

Q. But other men's wives die and they do not try to commit suicide. Why should you?

A. I don't like my mother or father or sister.

Q. Don't they feed you?

A. Yes, they give me good food, but they talk too much.

Q. What do they say?

A. The children listen to what my parents say about me, and they repeat it to me.

Q. What do they say about you?

A. My parents say that I am a chief.

"10. The native term for sad is eratu dipei, which literally translated means, my stomach feels bad."

Q. Don't you like that?

A. I don't like what the children say to me.

Q. Don't you like to be called a chief?

A. They say that tree [pointing to it] does not belong to you, it belongs to us. The adults tell them to say that. [At this point, Maroligar interrupted to say that Tarev had accused him and his parents of wishing to fight him. He insisted that everything Tarev was saying was a lie. It was, of course, impossible to explain to him that Tarev was not 'lying' but was a victim of his own delusions.]

Q. Is it true, as people have told me, that an alus has possessed you?

A. Yes, the alus in the moon has entered my head and my stomach. [This convinced Tom and Maroligar even more that he was lying, because there is no alus in the moon.]

Q. How do you know that he has possessed you?

A. He came to my father. He [his father is actually dead] lives in another place. When he possessed my father, he possessed me.

Q. Where is your father?

A. Those pictures you showed me [the Rorschach cards], I like them very much. The place in the North, that's the place I see now.

Q. What place?

A. There's another one in the Northeast. This place in the North is very light.

29: Spiro--191-192 (1947-48) 1950 Woleaians
116, 159, 762, 115 Ifalik-5

When I sit in my house, it's very dark; then, that North place, the one I like very much, comes on top of my head.

Q. How does it feel when it comes on top of your head?

A. I like it very much. When I pull up the blanket, I look underneath the sleeping mat, and smoke comes out. I then lower the mat and look underneath another one, and smoke comes out from it, too.

Q. What happens to you when the alus of the moon possesses you?

A. That man inside that padre book [the Bible that a missionary had shown him] and his mother come inside me.

Q. What does it feel like when they come inside you?

A. I don't know.

Q. Did they come inside you this morning, when you tried to commit suicide?

A. No.

Q. Did they come inside you last night?

A. The alus gave me something--something very fine.

Q. What did he give you?

A. Smoke. He put smoke inside my mouth, but it did not enter my stomach.

Q. You like that smoke?

A. I like it very much.

Q. Why?
A. [No answer.]
Q. Does your head hurt you now?
A. I went to Falalap to wail for my wife. I waved my arms, and when I came back, I continued to do so.
Q. Don't you like it here?
A. Yes, I would like to remain. But I would like an American doll. (11)
Q. Why would you like one?
A. Because the Americans know everything. The people here are stupid.
Q. Do you want a carving of a man or a woman or a child?
A. Any kind.
Q. Would you like to go to America?
A. If you go, I want to go with you. I want to go any place you go.

"11. The native men carve small statuettes, which they trade for cigarettes and other trade-goods. By an American doll or statuette, he meant a similar carving of an American."

29: Spiro--191-192 (1947-48) 1950 Woleaians
116, 159, 762, 115 Ifalik-7

By this time Tom and Maroligar were completely impatient with this 'crazy lie talk' and insisted on terminating the interview. I told Tarev that I would be unhappy if he committed suicide, and that if he felt like doing it again, he should first come to see me. He replied that his wife had 'gone into the ocean [where she was buried] and I want to go too.' "

29: Spiro--194-195 (1947-48) 1950 Woleaians
116, 159, 115 Ifalik-I-6

"November 4, 1947. Yesterday I saw Tarev running towards the public meeting hall (atelu). He touched the front pillar, clutched it as if he wanted to take something from it, and then ran back to his home. A short time later, I saw him running past my tent, heading towards Falalap, being pursued by a number of men. The men asked if I would stop him, since their efforts were futile. I was reluctant to do so, since I felt that interference by me would destroy the rapport I had established, but I could ill afford to refuse their request. I caught up to him and persuaded him to return to his home and promised that I would come to see him. Tom and I went to see him today. (12)

"12. Tarev still had the habit of seizing the hands of Dr. Burrows and myself and of smelling them deeply. Dr. Burrows informed me that on this same day, Tarev attempted to smell his hands, but could not do so since he was typing. Instead he smelled his feet."

Q. Why did you go to the public meeting hall yesterday?

A. I was in my house and somebody told me to go there, because the chiefs are there holding a meeting.

Q. Where were you going when I saw you later?

A. I was afraid that a small alus was hiding near my house, so I left.

Q. Did you see the alus?

A. No, but I heard it moving inside the house.

Q. How are you feeling today?

A. My arm is very tired. When I walk, I feel that I am not walking on the ground. I feel as if my feet are walking on air.

Q. Why is that?

A. I don't know. When I attempt to walk, I fall down.

Q. Is anything bothering you today?

A. Wotrilitu [a relative by marriage] stole my wife.

Q. How do you know?

A. He stole her from me a long time ago.

Q. Are you angry with him for that?

A. I took care of his children, but he stole my wife.

Q. Are you feeling better today than the last time we spoke?

A. Ifeelhappier. But I can't stay in my sleeping mat because it is always moving.

Q. So you didn't sleep last night?

A. A little bit. But many people came to see me.

Q. Who were the people?

A. All the people of Ifaluk.

Q. What did they say to you?

A. Many people came; they spoke. It was bad talk. They spoke lies and gossip. Someone said that you and Ted called me. I went to see, but you were not there. Now I know they lied to me.

Q. What else did they say to you?

A. They said that a certain woman is menstruating, and she should not stay here, but should go to one of the menstrual huts in Falalap. Someone else said that we should not take stones from here to make an um [underground cooking pit], but we should take them from over there.

Q. Did they say anything else?

A. There were four pieces of taro on the side of my house. Someone took them and went to a menstrual hut with them.

Q. What did he want with the taro?

A. All the women went to the menstrual hut. Mr. Mel and Mr. Ted ordered the fish to enter the lagoon, and many fish came.

Q. Then what?

A. Many fish entered the lagoon. No, Mr. Ted and Mr. Mel did not order the fish, an alus ordered the fish.

Q. Why did he order the fish?

A. Many fish came, many people ate. [A long pause.] Day and night they spoke. A man came. He said that the fish would come.

Q. Then what happened?

A. Somebody told me yesterday, 'You will not get sick; no typhoon. Go to Mr. Mel and Mr. Ted.'

Q. Why?

A. Now I understand. It was not you who asked me to come, but someone else asked me. I want to take my grandchild.

Q. Why do you want your grandchild?

A. [No answer.] [195]

Q. Are people still speaking bad things to you?

A. People lie to me because they know I am a malebush.

Q. What do they say?

A. They say, 'You are malebush,' 'You are a thief,' 'You are a bad man.'

Q. Is what they say true?

A. They lie. Somebody said my wife went to another man. Some man stole my wife.

Q. Have you gone to that place in the North lately?

A. No.

Q. Is there anything you would like, now?

A. I thought I was happy. And then I heard many voices, and I became unhappy. Yesterday I wanted to go to the ocean and swim away, for I can't stand all that talk.

Q. What talk?

A. That someone stole my wife from me.

Q. Did you dream last night?

A. No.

Q. Has the alus come to you lately?

A. He comes very often, day and night.

Q. What does he do?

A. [He said nothing, but clasped his hands together, as in Christian prayer, and pointed them at me. He then put his hand on my head and rumpled my hair. He then put his finger on my head, then my stomach, and finally on my leg. Apparently he was demonstrating to me what the alus does to him.]

Q. Are you afraid of the alus?

A. No.

Q. Is it a male or female alus?

A. It dances. It bends and sways. I like to see it. I see the alus dance. Then I imitate the alus, I dance too.

By this time, Tom had become disgusted with the entire interview, and insisted that he could not continue because Tarev 'talk lie, only talk lie.'"

29: Spiro--197-199 (1947-48) 1950 Woleaians
116, 159, 681, 115 Ifalik-1

"November 27, 1947. Yesterday was the climax to a series of events involving Tarev. Maroligar came by in the afternoon, saying that he had some work in Falalap, but that when he returned, he was going to tie Tarev. When I asked why he had so decided, he said that Tarev had tried to strike him with a pole, and this was the end of his patience. When he returned in the afternoon, he called for me, and we proceeded to Tarev's house. On our way, a young man came running to inform Maroligar that Tarev had just attempted to set fire to his house, but had been caught just in time. As we approached the courtyard, we saw that it was surrounded by a host of people, most of whom were afraid to approach the house. Inside the house, Tarev was struggling with two men who were trying to drag him out of the house. They finally succeeded in doing so, and when Maroligar approached him with a rope, Tarev surrendered himself to him without a word. He voluntarily extended his hands, and Maroligar tied his hands and feet. After he was tied, the men attempted to take him into the house, but he fell to [198] the ground. He began to shout at Maroligar, calling him a wicked man, saying that he was no chief for him and that he would not obey him. (The previous day, Tarev had insisted that he himself was chief.) Two other men took him inside the house, where they spoke with him kindly and patiently, explaining that they did not at all like what they had done, but that they had no alternative, since the people were afraid of him. Further, they explained to him that the people were good and wished him no harm. They also made sure that the rope was not too tight and that it did not pain him. I, also, explained to him that no one wished

him harm, and that when he returned to his nonaggressive state, they would release him.

A group of men remained outside, and as we were talking we heard signs of disturbance inside the house. Maroligar went inside and found that Tarev had untied himself and accused Maroligar and the people of mistreating him. When Maroligar tried to retie him, Tarev would not permit him to do so, but said he would permit Letar (one of the other men) to do so. Letar tied him in my presence, but Maroligar had to leave the house, because the mere sight of him made Tarev violent. (Bothe Maroligar and Tom are Tarev's uncles.)

I returned to Tarev's house in the evening, and was told that he had been peaceful, though he had been talking to himself again. Later at night, however, Maroligar came to ask me if it would be all right if they tied Tarev's hands behind his back so that he could not untie the rope again. Otherwise the women would be afraid to sleep. I returned with Maroligar to Tarev's house. He seemed to be sleeping, and his mother was sitting by his side. It was obvious that he could break loose if he desired to do so, and I told Maroligar that if they wished to tie him, I would have no objections. Maroligar called two other men to help him. By this time, Tarev had awakened, but he became violent at the very sight of Maroligar and though he permitted him to untie his hands, he would not permit him to retie him. He offered his hands to one of the other men, but when the latter attempted to tie his hands behind his back, Tarev resisted. He appealed to me,

but I tried to explain to him that this man (Mageleisei) was only doing what was best for everybody and harbored no ill will against him; and I asked him to cooperate. At this, he became meek as a child, lost all his aggressiveness, and permitted himself to be tied. When we left him, he was smiling and wished us a goodnight.

Today I had an interview with Tarev, but it was quite brief, since Tom clearly did not find these interviews of any use and was entirely uncooperative.

Q. Why did you try to fight yesterday?

A. It was nothing. I just did not like the talk of Maroligar and my mother. She said to me, 'Everything is fine now. You no longer have a wife, so you can do anything you want.'

Q. Why did you hit Maroligar?

A. I don't like what my mother says. I want to put a rope around my neck.

Q. Why did you fight Maroligar?

A. I don't want to fight. I took the stick so Maroligar and my mother would be afraid of me.

Q. Why do you want them to be afraid of you?

A. I don't do anything. But Maroligar and my family talk bad to me--day and night.

Q. What do they say?

A. They talk bad. I became angry and tried to hit Maroligar and my mother.

Q. But what do they say?

A. Many days and nights, now, they've been speaking bad. They talk too much.

Q. What do they say?

A. Maroligar comes and asks, 'What is Tarev doing?' The family says, 'He is doing so-and-so.' I don't like it.

Q. Why don't you like it?

A. Maroligar told my mother, 'Talk bad to Tarev.' My mother told me, 'Maroligar said that I should talk bad to you.'

Q. Do you still think that you are chief?

A. I never said that.

Q. Why don't you like Maroligar?

A. Maroligar says, 'You can't take those coconuts. If you want coconuts you've got to go to Falalap.'

Q. Why did you try to burn your house?

A. I don't like their talk. I burned the house so there would no longer be a house.

Q. How do you feel about having your hands tied?

A. I don't know. It's like being a dog or a pig. [199]

Q. Is that alus you told me about still inside you?

A. No. Maroligar and Arogeligar [the priest] gave me an alus.

Q. Why did they do that?
A. They gave me one alus.
Q. You don't like that alus?
A. No. I like my own alus. My alus likes to dance. I like that.
Q. What does the other alus do?
A. If it's a good alus, I like it. If it's bad, I don't like it.
Q. What does the other alus do?
A. He always wants to talk. Much of my talk is not my talk, it is the alus talking in me. (15)
Q. Yesterday you said that Maroligar and some other men tried to beat you. When did this happen?
A. They beat me, and I died.

"15. This he picked up from Maroligar. Whenever Tarev becomes violent and accuses people of aggressive and malicious designs on him, Maroligar tells him that it is not he but the alus in him that is talking."

Q. When?
A. I don't know. They want to kill me.
Q. Why do they want to do that?
A. I don't like that talk. I want to die. I don't like that talk.

When I rose to leave, Tarev asked if I would remove his rope. I explained that I could not do so, since the decision had to be made by his family."

Ifaluk

Joshua I. Tracey, geologist, of the U. S. Geological Survey, on Ifaluk from September 12 to 26.

We came curiously and quickly to have a feeling of "belonging" on Ifaluk, and we found ourselves much involved with the people of the island in everything that we did. Inevitably, however, we were more closely associated with some than with others, and it may be helpful to identify here the people with whom we were most concerned, whose names appear most frequently in our narrative:

Fagolier, the paramount chief of Ifaluk.

Maroligar, the number two chief, guardian of the Fan Nap, where we lived.

Toroman, the number three chief and the official divider of food.

Lavausrung, the number four chief; a lady.

Wolpaitik, the number five chief (and the heaviest man on the island).

Totogoeiti (Tom), Ted's interpreter, and top ranking navigator (palu) of the island.

Yaniseman (Yani), "schoolteacher" and constant companion and advisor.

Bakalimar (Bakal), initially assigned as our special helper in camp and field, working later with Harry's fishing gang.

Tachiwelimeng (Tachim), neighbor, friend, and later one of Harry's fishing crew.

Letaweriur, Yani's wife and a composer of dance chants.

Gavileisei, master craftsman and canoe builder.

Gauaisig, an old man, navigator and canoe builder.

Talimeira, houseboy of Burrows and Spiro in 1948, now one of the two local "doctors."

Arueligar, "high priest" or "medicine man."

The Ifaluk study was made under the auspices of the Pacific Science Board, with a grant from the Office of Naval Research. We are particularly indebted to the Director of the Pacific Science Board, Dr. Harold J. Coolidge, and to the secretary of the Washington office, Mrs. Lenore Smith, and the secretary in Honolulu, the late Ernestine Akers, for help of all sorts.

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

Ted, of course, was in charge of the census operation. Tom acted as interpreter. Fagolier, the paramount chief, and Maroligar, the number two chief, went along, giving the highest possible official sanction to the procedure. The party also included a young man named Bakalimar—shortened to Bakal for ordinary purposes—who had been assigned by the chiefs to work with us, acting as general handyman and, most importantly, as dishwasher. (We did our own cooking; or, perhaps more accurately, our own can-opening.)

We were also accompanied by Tony. Tony was from the atoll of Ulithi, some 375 miles northwest of Ifaluk. He was a young man of perhaps eighteen, and had come to Ifaluk with his younger brother on the trade ship, some months before our arrival, to visit relatives. The Coast Guard had a station on Ulithi, where Tony had worked, and where he had learned fluent English. He was of no use as an interpreter in the census operation, however, because of his lack of familiarity with the Ifaluk household and clan arrangements, and because his youth made the questioning seem almost impertinent. The job required the maturity, dignity and local knowledge possessed by Tom. Tony's name, Antonio, was official, because Ulithi had been converted by a Roman Catholic Mission some years earlier—a process that included the adoption of Christian names.

The houses of Ifaluk were all on the two largest islets of the atoll, Falalap and Falarik, which were separated by a shallow and rather narrow pass. The Fan Nap, near the southern end of Falarik, was roughly in the center of the inhabited area. We started the census with the southernmost houses of Falalap, with the idea of working gradually northward until the count, household by household, was finished.

Three households—twenty-six people—were catalogued that first morning. Tom and Ted would lead the way into a household area, going inside if it was drizzling, or sitting on mats in the open during dry intervals. The available people of the household would gather about—and the available people included all of the men, all of the children except those who got scared at the strange activity and ran away, and all of the women except those under temporary quarantine in a menstrual hut.

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

the flies, and during the evening, to get away from the mosquitoes. Ted stuck to the Fan Nap for writing up his notes—but carefully protected with long trousers tied around the ankles, and with coils of Japanese "punk" burning to exorcise the mosquitoes. He had great faith in that burning punk.

We decided to start the plant collecting that afternoon, since the drying cabinet was ready. It was quite an expedition—Yani, Tony, Bakal, Don and me. The idea was to try to collect not only the plants, but information about them. Tony, as a Ulithi man, didn't know the local plant lore, but he was a good interpreter. Yani's English was rapidly gaining in fluency, however, and he and Don, particularly, were able to understand one another almost from the beginning without outside help. Yani did know the local plants—their names and their uses—and Don would jot down this information while I fussed with the plant press itself. Bakal, as usual, was general handy man.

The clean-up was continued next morning and pretty well finished by noon, when everyone on Falarik gathered on the lawn outside the Fan Nap for a communal meal. "Feast" is probably too strong a word for the meals that invariably followed any community activity. The food was lavish enough, contributed by all of the participating households, but it did not differ markedly from the everyday diet.

In this instance, Ted decided that the occasion was important enough for him to contribute one of the cases of corned beef that he had brought along for just such purposes. The canned beef was a greatly appreciated delicacy, called "carawao," which would seem to stem from the Spanish word for water-buffalo, carabao. Several Ifalukian words reflected Spain's dominance in the Carolines in the 19th century—the word "cat" for instance, which hardly differed from the Spanish gato.

The opened case of beef was put before Maroligar, the number two chief, but the distribution of the cans was carried out by Toroman, the number three chief, who always seemed to take over when there was anything to be divided among the island households. He called out the names of the households, tossing the cans to representatives of each; some cans were set aside for Falalap (which was having its own clean-up), and there was a small, separate pile for the chiefs.

1: Burrows--1 (1947-48) Woleaians
116, 131, 101, 171 Ifalik

"Ifalik is an atoll in the Caroline Islands at 7° 15' north latitude and 147° east longitude. It lies nearly midway between Yap, 400 miles to the west-northwest, and Truk, nearly due east. Guam, in the Marianas, administrative center for the whole Trust Territory of the Pacific Islands, is about 350 miles north of Ifalik. (Fig. 1).

The ocean for 100 miles around is dotted with other atolls and reefs, making up what has sometimes been called the Woleai district, though administered as part of Yap district. Woleai, 30 miles west of Ifalik, is considered the most important atoll of the group because it has the largest lagoon and largest population. Eight of these atolls are now inhabited: Woleai, Ifalik, Faraulep, Lamotrek, Elato, Satawal, Eaurupik, and Sorol. Olimarao was formerly inhabited, and some of the others may have been.

The people of all these islands seem to be so nearly alike in language and culture as to constitute a cultural unit which differs perceptibly, though slightly, even from Fais and Ulithi to the northwest. Differences between them and their closest neighbors are too slight to justify use of the term 'culture area' for the Woleai district. 'Sub-area' would be more precise. A hasty test of these similarities was possible during brief stops at several of the islands on the return trip from Ifalik. Dialect, clan names, and the more obvious features of material culture seemed to be the same until we came to Satawal, the easternmost island visited. Here differences began to appear. For instance, the 'tr' of Ifalik was replaced, at least in some words, by 'ch'; and several clan names were different. Sorol, westernmost of the atolls generally included in the

sub-area, was not visited. It seems safe to say that this account of the native culture of Ifalik will hold true, in a general way, for the other atolls. But the similarity does not extend to all details. Sea-burial, for example, seems to be exclusively an Ifalik custom. The people of Faraulep are said to use for food a small land-shell not eaten on Ifalik. And so on.

For all practical purposes, the main differences probably reflect difference in contact with foreigners. Ifalik was chosen for study because it has had a minimum of outside influence. Woleai represents the maximum. A missionary worked there in the 19th Century. The Japanese built an air-strip there during World War II. The Americans bombed the air-strip, and for a time at the close of the war, a few Americans were stationed there to maintain a LORAN station. A useful supplement to the Ifalik material would be a study of change on Woleai due to this contact."

(1947-48)

Woleaians
Ifalik

"The report that follows is based mainly on six months of residence on Ifalik, from July, 1947, to February, 1948. This field work was part of the project called CIMA (Co-ordinated Investigation of Micronesian Anthropology), sponsored by the National Research Council at the request of the U.S. Navy. There were two of us on Ifalik. Melford L. Spiro, then a graduate student in anthropology from Northwestern University, investigated the development of native personality. Aspects of the culture particularly vital to that project--child care, the individual life cycle, sexual life, and the detailed functioning of kinship--were left to him.

This report has two purposes: to record a good deal of the culture for comparative study, and to supply information useful to administrators. It is too much to hope that either purpose will be fulfilled to the satisfaction of all concerned. [2] Ethnologists who confine themselves to standard data are comparatively easy to please. But those who attempt new lines of inquiry--as they should, for the whole subject is in a pioneering stage--are bound to be disappointed in their sources. In the same way, some matters are obviously important to administrators; but nobody can tell what else may become so. There is only one remedy. Administrators must have the assistance of anthropologists, trained to make whatever fresh studies a changing situation demands.

For both purposes this account will be supplemented by Melford Spiro's analysis of personality development. A third report, now in preparation, will be a study of the arts

(1947-48)

most developed in Ifalik, -- songs, dances, and ritual--showing how they express the themes and sentiments that dominate native life."

1: Burrows--2 (1947-48) Woleaians
116, 121 Ifalik

"Expert help has been received from many sources. Commander Betts of the Fleet Weather Center at Guam helped to explain the climate. Edwin H. Bryan, Jr., Honolulu officer of the Pacific Science Board, supplied English and scientific names of a number of animal species. Dr. F. Raymond Fosberg explained the conditions that govern plant life. He and Mr. Bryan collaborated with Miss Marie Neal of Bishop Museum in identifying plant specimens. Dr. Maud Makemson of Vassar College, whose studies in Polynesian and Maya astronomy have pioneered a new field of research that might be called ethnoastronomy, identified, as far as possible from the rough data supplied her, the stars by which native navigators find their way to other islands. Melford L. Spiro supplemented and corrected the data at many points. Some of his help is acknowledged in the text, but as we exchanged data constantly, not all of it could be."

1: Burrows--2 (1947-48) Woleaians
116, 115 Ifalik

"Most helpful of all was Totogoeiti, who will be called hereafter by his English name, Tom. This he acquired in the days of his youth, when he worked on foreign ships from Honolulu to Singapore. During that period he spent six years in Manila, where he acquired a command of English which, once some of its peculiarities were mastered, was surprisingly adequate. He was at our beck and call the whole time. If he sometimes became impatient at our stupidity or persistence, he controlled himself admirably. He dictated all the incantations and other native lore of navigation which he, as ranking 'captain' (palū), knew better than anyone else. Much of this was private property, which he would only teach to another native in return for valuable presents. Toward the end, when our supplies were running short, he twice climbed coconut trees at night --a task usually left to younger men--and snared terns for our breakfast. So far as we knew, these were the only terns snared during our stay, as the birds were not abundant enough at the time to justify this arduous and risky job. To a considerable extent the following pages reflect the culture as seen through Tom's eyes."

1: Burrows--2 (1947-48) Woleaians
116, 123 Ifalik

"Special acknowledgment is due the hospitality and collaboration of the native people. They not only submitted patiently to our most impertinent inquiries, but gladly offered whatever help we asked for, or whatever occurred to them. The chiefs were particularly helpful, assembling to give us information whenever we asked for it and assigning to us as helpers young Talimeira, who picked up English so fast that before we left he could be used as an interpreter in some matters, and Totogoeiti ('Tom'), our interpreter. An unforgettable example of chiefly conduct was the last sentence addressed to me by Paliuilimar, the aged chief who died during our stay on the island. I called on him when he was far gone, and could only speak faintly. When he saw me he raised his head and asked 'Have you plenty of young coconuts to drink?' "

1: Burrows--3 (1947-48) Woleaians
116, 162 Ifalik

"The population of Ifalik in 1947-8 was about 250. While we were there it was actually a few less than that most of the time, because of almost continual visiting on Woleai, and the absence of two young men in Yap, one training with the medical officer there, the other studying to be a school-teacher. The ship that took us away brought these two back to the island.

Of the 250, 108 were male, 142 female. The excess of 34 women and girls amounts to 13.6%. Reasons for it are not clear. More travelling among the men, and some marrying and settling on other islands may have something to do with it. But there were also some husbands from other islands on Ifalik. Loss of a canoe at sea would nearly always cost the island more men than women, but canoes are not lost often enough to account for all the disparity between sexes."

1: Burrows--3-4 (1947-48) Woleaians
116, 161 Ifalik 1-5

"The following early figures on the population are presented by Damm:

1797	(Wilson) about	200
1828	(Lütke) about	150
1852	(Cheyne) about	140
1903/4	(Sievers)	281
1909	(Hamburg Expedition)	208
1914	(Finsch) about	300
1930	Pacific Is. Pilot	305

The first three are estimates, useless for indicating change in the course of time. The last four seem more trustworthy. That of the Hamburg Expedition is much smaller than the rest. This may be a result of the typhoon of 1907. Not many lives were lost in that disaster, but, judging by native accounts of all such occasions, the destruction of food-bearing plants probably led to emigration on a considerable scale. By 1914 most of the refugees may have returned.

One more figure, for 1937, is available from a Japanese source (Civ. p. 33). The total given is 388. It is of dubious value, to say the least. It is the sum of figures for

three islands: Flalap (76), Ifalik (269), and Pik (54). Now Flalap (Falālap) is indeed the name of one of the inhabited islands. Ifalik might be used for the other island, Falārik, though the natives use it only for the whole atoll; and the figure given is large for Falārik. But there is no such island as Pik. The third island on Ifalik is Ellā, and it has been uninhabited as far back as native tradition goes, except that during the American trusteeship, the atoll's one leper has been quarantined there. Moreover, the totals attributed to the three islands add up to 399, instead of the 388 given as the total. There is an islet called Pik on the nearby atoll of Faraulep. Subtracting the 54 attributed to Pik would give a total of 345 for the two inhabited islands of Ifalik. But the figures are in such a muddle that they can lead to nothing but guesswork.

Comparing the last four figures in Damm's list with the 250 of 1947-8 suggests a decrease in population during the 20th century. That suggestion, for what it is worth, supports the frequent assertion of natives that the population was much larger formerly than it is now. There are several other indications of depopulation: the number of old house sites now unoccupied; the constitution of some of the present households; the ratio of children to married couples in the present population. For lack of better evidence, these must be considered in some detail.

As for the abandoned house-sites, there is, of course, no assurance that all of them were ever occupied at one time. But on the island at Falārik there are two [4] clusters

of them long enough to show on the map (Fig. 2). One is between Rauau and Falārik districts. This now uninhabited stretch of road is lined with old house sites. The other is at the north end of the island; beyond what is now the last house. Two canoe-houses are still maintained there, though there are now no dwellings near; and the site of an old men's house (bachelors' dormitory and meeting-house) is pointed out near the northernmost canoe-house, far from any present dwelling. It seems unlikely that such considerable areas would have been left vacant just by casual moving about.

The constitution of some households which differ from the usual pattern also suggests a dwindling population. The household called Uaragin includes two married couples. Both are examples of patrilocal residence; that is, the wife has come to live at the husband's home. This is contrary to local custom. Of the members of this household, only one belongs to the lineage which traditionally owns the site. This is the husband in the elder generation. If he had gone to live at his wife's home, as is customary, the site would have been abandoned. His son, the husband in the younger generation, has also deviated from custom by bringing his wife home instead of going to live with her people. The household called Foraik is another example. The whole lineage that formerly lived there had died out. The present occupants moved in from Welipeien, the site next door. Finally, the only household on the island which has been newly established in the present generation is at Uluās. It consists of a single family, a married couple and their daughter. They went there to reoccupy an abandoned site

which belongs to the husband's clan. All these deviations from custom, then, are attributed to a wish to keep occupied, or to reoccupy, sites which by the customary pattern of residence would have been abandoned.

A third sign of depopulation is the fact that, although there are 60 married couples in the present population, there are only 81 children less than 20 years old. The latter figure, an estimate worked out by Spiro from relative ages, includes orphans and children of widows as well as children of the married couples. If the fertile part of the population was reproducing itself, the number of children would be at least 120.

Although none of these indications, taken by itself, is convincing, they add up to a probability that Ifalik has been sharing in the general depopulation of the Yap district. Reasons for this are by no means certain. Undoubtedly foreign contact, even in this remotest island of Micronesia, has had something to do with it, by means of introduced diseases if nothing else. Poor sanitation undoubtedly aggravates the damage done by disease. Inadequate diet, especially a shortage of Vitamin E, may play a part of reducing fertility. Disapproval of sexual intercourse between parents until the last baby can walk may cut down the birth rate. Yet if extra-marital intercourse is as prevalent as gossip makes it out to be, it should make up for that. Infant mortality is presumably high, though statistics are lacking to prove it.

Probably study of one island can contribute only a little toward a solution of this problem. Depopulation has been widespread in the Pacific. One encouraging feature

is that in many islands where foreign influence has been greater than in Ifalik, the population, after declining for a time, began to hold its own and then to increase. (Ref. Keesing). Another is the likelihood that American medical care will reduce the death rate."

1: Burrows--5 (1947-48) Woleaians
116, 153 Ifalik

" GEOGRAPHY

This section deals with what the people of Ifalik know about the resources of their island. It seemed possible to find out what they know by watching them and asking questions, without calling on the array of specialists that would have been necessary to describe the island in terms of what we know. Yet the expert help just acknowledged proved necessary in order to translate their knowledge into terms intelligible to our science. Besides, it proved possible now and then, with this help, to test the accuracy of their knowledge and find some of its limitations.

To begin with some concepts that form a framework for their knowledge, no general names were found for 'number', 'space', or 'time'. This suggests a boundary to the degree of abstraction which their tools for thinking allow them. Within these limits, they are at home with all three concepts."

1: Burrows--5-6 (1947-48) Woleaians
116, 802, 193 Ifalik 1-3

"The native system of enumeration is organized decimally. For numbers from one to ten, four sets of terms are used, according to what is being counted. Three of them have also their own interrogative forms. All are variants of one fundamental set of forms. Two add suffixes to the fundamental forms. The other reduces them to monosyllables, mainly by omitting second syllables. The monosyllables are used in counting aloud, as in distributing fish or measuring the length of a rope in fathoms.

	General	Human Beings and Fish ('Animate')	Trees and Canoes ('Long Objects')	Monosyllables for Counting Aloud
How many?	vitou?	veteman (u?	vetevar?	---------
1.	seu	seuman	sevar	ot
2.	ruou	rumen	ruovar	ru
3.	selũ	selimen	seluvar	en (sometimes 'sel')

4.		vɛ̈lou	vamen	vavar	vang
5.	(limou)	nimou	limen	lifar	lim
6.		wɛ̈lou	wɛ̈emen	olovar	ol
7.		vɛ̈sou	visimen	visivar	vis
8.		walou	walimen	walivar	wal
9.		tiwou	tiwemen	tiuvar	tiw
10.		seg	seik	seik	seg

From ten on, there is only one set of numerals. Eleven is 'seg ma seu'-- ten and one; twelve 'seg ma ruou', and so on. For multiples of ten the suffix 'eik' is added to the first syllable of the numerals from two to nine: [6]

20. rueik

30. seleik

40. faeik

50. nimeik

60. oleik

70. vèsik

80. walik

90. tuweik

The corresponding suffix for hundreds is 'bwugu'. The count by hundreds to a thousand is:

100. sebwugu

200.	rubwugu (once, in a song, recorded as 'lugubwugu')
300.	selubwugu
400.	văbwugu
500.	limoubwugu
600	olobwugu (wolobwugu)
700	visibwugu
800	walibwugu
900	tiwbwugu
1,000	senne

From this point the numerals given by Tom disagree with those in a list collected by Sarfert. Sarfert has sangalas for 1,000. For 10,000 Tom gave senne me sangares; Sarfert, sang. Tom said there is no word for 'million'; but Sarfert's list continues to 100,000,000. There seems to be no reason to doubt its correctness. The higher numerals, being little used, may be forgotten. At least Tom did not know them. Lacking a copy of Sarfert's list to suggest it, no search was made for others who may know more than he."

1: Burrows--6-7 (1947-48) Woleaians
116, 822, 193 Ifalik 12

"General recognition of distance is implied in terms like igei, 'here' and igelan, 'there'. Igan, also translated 'here', seems to indicate an intermediate [7] distance. Ei, following a noun, means approximately 'this'; i lal, 'that'. The same distinction appears in the pronouns melēn, 'this', and mennā, 'that'. There are two words for the direction upward: iät, implying a moderate distance, and wënang, a great one, as of clouds or stars. Relative measurement of space is accomplished rather precisely, in such work as canoe-building, by use of improvised measuring sticks, marked or broken off at the length desired, which then can be matched in another place. Measuring cords are used for the same purpose. A given length is halved or quartered by doubling or redoubling the cord.

More abstract units of measurement seem to be confined to the span and the fathom. The terms for both these units are used with numerical prefixes. One span is seang; two, ruang; three, selang, four, vang. One fathom is sengaf, and so on.

Greater distances are not measured with any exactness. Distances overland on Ifalik are so short, and so universally known, that there is little need to discuss them. For distances overseas there seems to be no native unit of measurement. In giving sailing directions in English, Tom named relatively short distances in miles. For example, 'because of currents, take first (the star) Tagalemailepalevang for 4 miles; then Tubwumailepalevang, for 1 mile; then Wolewol. After following Wolewol for 1 1/2

miles, you should be able to see Faraulep.' No corresponding native unit of distance was found. Apparently navigators have to judge such distances by experience. Total distances to other islands are commonly measured in terms of time, such as 'an overnight voyage.' "

"The people of Ifalik do not count the passing years. Nobody knows how old he is, except relatively, --that is, he knows only that he is younger than this one and older than that other. They know perfectly that many things in nature--stars, prevailing winds, the flowering and fruiting of some kinds of plants, and the coming and going of some kinds of fish and birds--recur in cycles. They even have 12 month names, which could be used to count years, with only the adjustment required by the fact that each of their months has 30 days. But they have no name for the 12-month period as a whole. The longest period they do have, the rag, will be discussed later.

Even the month names are little used. Many, it is said, do not know them. There is a good deal of reckoning by moons, but usually in terms of 'next moon' (ulubwaling), 'the moon after next' (uletegulun), or 'three months from now' (sepelaugal uletegulun).

The month names are names of stars, which again shows some awareness of a stellar (solar) cycle. Each may be used with or without the preface Fale. Fal or fan is a general term for 'house'. Each month is thought of as being 'in the house' of its particular star.

The five chiefs had no difficulty in remembering the month names and were confident that they had them in the right order. But Wolpetau, first chief, said that it was then the moon Aramaus. It was December by the European calendar; about a month after the trade wind became established. But in their list Aramaus was not second in the

trade-wind rag, but midway in the other rag, or about midsummer. (Such a discrepancy could come about, of course, because their 30-day moons do not [8] fit the solar cycle.) Moreover, the order of the names in their list does not correspond to that in a list Sarfert collected in 1909. The list as the chiefs gave it follows. The corresponding names from Sarfert's list are placed opposite, with their order in his list indicated by numbers in parentheses:

Month Names

(Five Chiefs, 1947)	(Sarfert, 1909)
1. (Fale) mairig	maidjik (7)
2. (Fale) mailap	mailap (8)
3. (Falu) eliel	eluol (1)
4. (Fal) ūl	ul (12)
5. (Fan) nag	lāki (10)

6.	(Fale) mal	malu (2)
7.	(Fale) gu(a	gū (11)
8.	(Fale) tumur	tumul (6)
9.	(Fal) aramaus	elemadj (5)
10.	(Fale) sarabwolu	djalewol (4)
11.	(Fal) itr	idj (3)
12.	(Fale) sotā	soda (9)

Concerning one of the months, the chiefs made what seems to be a traditional comment. During Falitr, they said, there is little food.

There are also names for the 30 nights in each moon. The first night is dark of the moon; or, as our interpreter put it, 'no can see in east; close to come up in west.' He said these terms had no meaning, 'only name'. The list follows:

1: Burrows--7-9 (1947-48) Woleaians-4
116, 805 Ifalik

1.	segouru	11.	epei	21.	kopelang
2.	eling	12.	olabwua	22.	koretaleavelag
3.	mejeling	13.	olmăo	23.	saper mai muli
4.	mesan	14.	măr	24.	kilei mei muli
5.	mezavus	15.	ur(u)	25.	komalo
6.	mezaman	16.	netū	26.	tromaleval
7.	mejatiu (e)	17.	ilăi	27.	arovu
8.	nametan	18.	alēwa	28.	iaū
9.	truawong	19.	sapas	29.	evāing
10.	arobwugu	20.	avelag(i)	30.	erapf(i) [9]

There are names also for main divisions of the day; morning (nijor); noon (ulelial); early afternoon (apeik o tangouel); mid-afternoon (lipelelian); late afternoon (nivegov); sunset (nivegov eror) and night (bwong). Finer designation of time is usually attempted by pointing, with arm and fingers extended in a line, at the position the sun is supposed to occupy at the time in question. Though there are names for stages of the tide, I never heard these used as designations of time.

The people have some interest in the remote past, but do not try to measure time in that area. They only tilt their heads back, point upward with wrinkled noses (the usual gesture of pointing), and say 'Musuwē, musuwē (long, long ago)'. They do not keep

genealogies. Most of them can give the names only of those ancestors whom they knew in life. Maroligar, No. 2 chief, managed in the course of several days to think back five generations. That was a unique feat. There is no reckoning time by generations. As for the remote future, I saw no indication that they ever think of it. In general, their time span is short, as compared with that of some other primitive peoples, particularly their distant neighbors in the Pacific, the Polynesians."

"One of the clearest units of time in the minds of the people of Ifalik seems to be the rag. A rag is a period of five months. There are two of them, seu e vang and seu rag (or simply vang and rag), which alternate. In giving the list of month names, the chiefs put the first five in vang; the sixth 'in between'; the next five in rag; and the twelfth again, in between.

This corresponds fairly well to one of the most striking features of their climate, the seasons; so that rag might be translated 'season.' The people are quite clear on several characteristics of each rag. The first is the difference in direction of the prevailing wind. During vang the prevailing wind is from the east. During rag it is from the west, though less steadily. The second difference is in the supply of breadfruit. During vang there is very little breadfruit; during rag, there is plenty. A third difference is that one of the important methods of fishing is seasonal. Vang is the time for going out after flying fish (mèngor) on moonless nights, with torches of dried coconut leaf and dip-nets. During rag this kind of fishing is not practised. A fourth, lesser difference is that when there is breadfruit, they say, there are no golden plover (kulohg). When the breadfruit disappears, the plover arrive.

Native month names do not correspond exactly to those of our calendar, and we have no names for their seasons. But the seasons can be distinguished clearly enough in our terminology. The summary below was made by comparing notes taken during our stay on Ifalik with 'A Climatic Summary of the Caroline Islands', issued in 1944 by the

Aerology Section of the Navy.

Vang is the season of northern-hemisphere trade winds, which blow from the east or a little north of east. It corresponds to the winter of more northerly latitudes. The easterly winds set in, light and fitful at first, about November. In 1947 they did not become established until nearly the end of that month, but the season was said to be rather late that year. The trade wind blows more and more steadily through December, and in January and February there are comparatively few [10] calms. It builds up during the day, reaching a maximum in early afternoon and dying down again in the evening. It is generally light, up to 12 miles per hour, rarely more than 18. Beginning about March it is more and more often interrupted by calms.

Rag is the season of calms and variable, prevailingly west winds. Commander Betts explained that these westerly winds are actually the southern-hemisphere trade winds, which reach this latitude when the sun is farthest north. Blowing from the east to southeast quarter in more southerly latitudes, they swing clockwise to the southwest of the Carolines and so reach this area from the west.

Temperature varies little from season to season. It is usually within five degrees of 80° Fahrenheit. The variation between day and night--10 degrees or so--is greater than that between seasons. Clouds often cover the sky and reduce insolation. Effective temperature, measured by rate of evaporation, is also lowered much of the time by

breeze. Only bright, still days feel oppressively hot even to Americans. The natives seem to enjoy these, but are then inclined, even more than ever, to sit in the shade.

Rainfall is heavy. The nearest island for which records are available, Lamotrek, had a mean annual precipitation of 104.6 inches during the four years covered by the record. The season of calms and westerly winds, (April to August), is the rainiest, averaging more than 10 inches a month. As a rule, September, October, and November are relatively dry; December and January a little rainier; February the driest month of the year (mean precipitation on Lamotrek 2.1 inches), and March the next driest. However, rainfall may be heavy at any time. On Lamotrek, every month except February and September had more than 10 inches of rain during at least one of the four years of record.

Humidity is also steadily high, though somewhat less so during the season of easterly trade wind. It is disconcerting at first to see the apparently reckless handling of lighted bits of punk, rope, coconut husk, etc., in houses whose floors and roofs are covered with dried coconut leaf. Yet everything is so damp that accidental fires are rare; I saw but one during six months. For the same reason, cooking fires, though made of such light fuel as dried leaves and coconut husks, do not blaze high. They are smudgy so much of the time that most of the cooked food has a smoky taste."

"Some of the native experts--which is to say, in this case, the 'captains' or navigators of seagoing canoes--have ways of driving off unpleasant or dangerous weather. One day when it looked very black to windward we heard the sound of a conch-shell horn. Out on a stone pier that projects into the lagoon, seated facing the storm, was our interpreter, acknowledged to be the leading navigator of the island. He was alternately blowing the horn and gesticulating as if waving the storm aside. Although we could hear nothing, it seemed that a spell or incantation ought to go with the gestures. It did, and long after he dictated it to me, --a great favor, for such incantations are not generally known, indeed are rather carefully kept secret, and taught only to fellow-captains who pay for them with suitable presents. A translation of part of the incantation follows:

Dark clouds, the horn!
My god-invoking horn!
My talk goes to the clouds like fire. [11]
Turn aside, wind and cloud!

Bad weather, turn aside!
Die away, move away!

The spell was supposed to act on the rain like fire, and drive it away. That time it worked 'like a charm', --which, of course, it was. The next time he tried it, it failed completely. He did not seem disturbed. Fire does not always win over water. His feeling seemed to be that the incantation had a certain amount of power, which might or might not be enough in a particular case. It was always worth trying.

In spite of magic, during the latter part of the west-wind season and sometimes the early part of the trade-wind season, wind sets in too strongly from the west, uprooting trees and taking the thatch off houses. At worst, it develops into a typhoon. A bad one sends waves clear over the island, carries away houses, and, what is worst, destroys food-bearing plants. The consequences of such a typhoon are vividly pictured in an old song:

Men are taking wing;
Flying in all directions
To islands where there is food, and trees standing.
. . . . . .

Let them go, we will stay on.
At least we will have rain to drink.
. . . . . .

Not many are staying.
The others can't stand it without shade.
Never mind, the rain will pour down on us,
And we'll find some shade
Under the little trees that are left.
Purak bushes will spring up on the beaches.
. . . . . .

Now the food is nearly gone.
We watch each other eat.
Look up, and there are no trees,
Here, where it used to be so fine."

1: Burrows--11 (1947-48) Woleaians
116, 132 Ifalik

"Four middle-aged men, asked how many typhoons they remembered, talked the matter over and reported a total of six. Only one of these was so severe that seas washed over the island. The inundation lasted for about two hours, they thought. The people all gathered in and around a house back from the shore. A rope was thrown around them, and all clung to it. Some did not manage to reach this place, and were washed away. All the breadfruit trees, they said, were blown down, most of the coconut trees, and the taro was washed out or destroyed. They remembered hearing of two particularly bad typhoons before their time. Sarfert's list of early chiefs includes mention of four memorable typhoons in the past. A resident of Ifalik, then, must expect to experience a number of typhoons during his lifetime; and one or more of them will probably endanger the lives of the population."

"Ifalik consists of a coral reef surrounding a nearly circular lagoon, whose area, according to the U.S. Commercial Company's Survey (Maps), is .939 of a statute square mile. (Photo). Four islets rise above high-water mark. Toward the south and west are two small ones, one of them a mere sandspit. Two large ones, separated by a narrow channel, run the length of the eastern side of the lagoon and extend somewhat beyond it to north and south. The total land area is .569 of a square mile. The population is concentrated on the lagoon side of the two larger islands, Falālap and Falārik.

Traditionally each of the eight main canoe-houses faces a pass. All but one of these, however, are too shallow for anything larger than a canoe. The steamer pass is on the south, between Falārik and Ellā, the larger of the uninhabited islets. Because of a few large coral heads the entrance is narrow and winding. Their removal would straighten it, and make it wide enough for large ships. In the lagoon there is ample room and depth for anchorage, sheltered during the trade-wind by the two larger islands. Outside the lagoon there is anchorage to the southwest, near the entrance to the pass, sheltered during trade-wind weather by the islet Ellā. Natives say that in a west wind ships used to anchor on the eastern side, off the channel between the two large islands. Landing there must have been difficult at any time, because the reef is steep-to and a high surf nearly always running.

On Falārik the land slopes up very gradually from the lagoon side. About half way across it is level, with some hollow places. Toward the seaward (eastern and northern)

side it rises again. The highest land, which appears to be not more than 20 feet above mean sea level, is close to the seaward beaches. From this low ridge the land slopes away much more steeply to a narrow fringing reef.

All around Falālap the beaches are narrow, the slope up from shore relatively abrupt, as on the seaward side of Falārik. A ring of comparatively high land surrounds a central depression which takes up something like half of the area of the island. This conformation, and the extension of Falālap away from the lagoon, give it the appearance of a very small, nearly separate atoll, a little higher than usual, so that the center is a swamp instead of a lagoon."

"Virtually all the land was built by coral polyps. The only igneous rock in sight anywhere on it is a single boulder on Falālap. This, the natives say, was brought by canoe in ancient times, as a whetstone for their adzes. Where it came from is no longer remembered.

Thin ledges of beach sandstone, compacted mainly from foramenifera, run along the seaward reef between high and low water mark in a number of places.

The consistency of the soil ranges from a fine muck in the taro swamps to piled blocks that form the highest land, just inshore from the seaward beaches. The lagoon shore of Falārik, and both sides of the channel between the two main islands, are [13] bordered by a broad strip of sand. Except where it is washed by the sea, this is colored gray by mixture with vegetable matter. All the houses on Falārik, and some of those on Falālap, are on this sandy strip. Between the sand of the lagoon side and the boulders of the seaward side, most of the soil consists of gravel of varying degrees of coarseness, mixed with some sand and humus.

The hollow center of Falālap is a quagmire. Stamping on the wet muck will make it quake perhaps 20 feet away. This swamp is the main source of taro for the people of both islands. Four little swampy depressions near the north end of Falārik are also planted to taro; but their contribution to the food supply is important only to a few households.

Although the land is too flat to form a watershed, drainage is rapid (except in the taro

swamp) because of the extremely porous character of the soil. Puddles formed by a heavy downpour soon disappear. However, water seems to lie only a few feet below the surface everywhere. Artificial water-holes are scattered about the interior of Falārik. Hollow places are boggy most of the time. A hole being dug for the corner-post of a canoe-house began to fill with water at a depth of about four feet."

"All the islets of the atoll are covered with a vegetation that thrives on this forbidding-looking soil. The beaches are narrow, and there are no natural clearings. The growth is low in only a few places, next to the beaches and in patches of the big taro swamp. Elsewhere trees give nearly unbroken shade.

Heavy rainfall and rapid drainage have two effects on the vegetation. An unfavorable one is to leach out the soluble part, which is to say much of the plant food, in any decaying vegetable matter that accumulates on the ground. While this may prevent the growth of some plants, it is more than offset by another effect of rainfall and drainage, the leaching out of excess salts. Dr. F. Raymond Fosberg, who participated as a botanist in the U.S. Commercial Company's economic survey of this area, kindly prepared the following explanation of how this works:

'The vegetation may be summarized by saying that it is heavier and more luxuriant in direct relation to the amount of rainfall and the area of the island. This is because, as is well known, salinity produces a condition of physiological drought. Saline areas are characterized by a sparse vegetation similar to that of deserts. Where the rainfall is sufficient and the area is large enough to maintain a permanent lens of fresh or almost fresh water the vegetation of the interior portions is more or less mesophytic and luxuriant.'

This effect is heightened by the muck of such places as the taro swamp that takes up the interior of Falālap. To quote Dr. Fosberg again: 'It is probable that this muck,

besides providing a more fertile substratum, retards the diffusion outward of the available fresh water, also retarding the diffusion inward of salt water that always accompanies dry periods.'

The number of plant species listed was 64, of which 26 were trees, three classified as shrubs, and the remaining 35, herbs. After spending several days in helping me collect the native names of plants, Tom assured me that I had all that grow on Ifalik. Of course, the statement was not accurate. In fact, several kinds [14] were added later, and no doubt some were missed. Still, the list probably gives a fair idea of native knowledge of the flora."

English or Hawaiian Name	Native Name	Scientific Name
coconut	lu, nu	Cocos nucifera
breadfruit	mai	Artocarpus altilis
banana	uir	Musa
pandanus	far	Pandanus
papaia	baiwai	Carica papaya
hau	gilivō	Hibiscus tiliaceus
kamani (tamanu)	ragūs, sevang, vitou	Calophyllum inophyllun Linn.
	wutu	Guettarda speciosa
	treli	Messerschmidia argentea(Linn.

squash (a summer squash or vegetable marrow)	kalebwäs	Cucurbita pepo
moss (all kinds ?)	lum	Musci
mushroom (all kinds)	talingilipat	Fungi"

1: Burrows--16 (1947-48) Woleaians
116, 137 Ifalik

"Coconut (lu or nu--the vowel sound variable, often liu or similar). Four varieties are distinguished. All are said to occur throughout the Carolines. The people say they can tell at once, by looking at a tree or ripening nut, to which variety it belongs. The difference, as they describe it, is in the shape, and more particularly, the color, of the husk when the fruit is ripening. The names of the varieties are used either like adjectives, following the generic name, or else as nouns, as when we call an apple a Baldwin.

The varieties are: garau(e)rau, husk brown when quite young; mau, husk green and round; tra, husk reddish; ial, yellowish. Of this last variety there are only a few trees on Ifalik. No distinction is made among the varieties in quality or suitability for particular uses."

1: Burrows--16 (1947-48) Woleaians
116, 137 Ifalik

"Specimens of some of the plants of less importance to the people were not collected, because of limited room in a plant press improvised out of empty cartons. Having been advised that artificial heat would be necessary to collect plants in this region, I gave up in advance any attempt to preserve specimens. Later, when the trade winds set in, collection seemed worth risking; but the amount was limited to the number of used cartons. Not until we returned to Honolulu did I learn that satisfactory collecting would have been feasible by painting the specimens with formaldehyde.

Native names of plants unidentified for lack of specimens follow:

Trees: livalus (possibly Vigna marina), kirali, marat, mot, sol, rangonax, faliap, kili, kuelabo.

Herbs: korax, ualomax, atogobwei, guruguru, kerriō, guan, bogo li le pa, atilt, keisi, kevakuel, nge.

The most useful plants occur in a number of varieties. Names of some of these indicate the island from which they are traditionally supposed to have come. Botanical comparison might check the accuracy of these traditions; at any rate, they give some indication of the range of contact with other islands."

1: Burrows--16-17 (1947-48) Woleaians
116, 137 Ifalik

"Breadfruit (mai): There are two main kinds, easily distinguishable by either the leaf or the fruit.

Mai vae--leaves very little indented; the young leaves not at all. Fruit comparatively small, with a number of large seeds (pukil).

Mai vau--leaves deeply indented. Fruit larger, with a fibrous core and no seeds. Seven sub-varieties of mai vau are distinguished: tagumelin, mai rau, mai mwarei, seuaiki, welige sol, mauli, tro malo.

Mai guiau--leaves deeply indented, like mai vau; fruit with seeds, like mai vae. Apparently this variety is comparatively unimportant.

No preference of one variety over another is expressed, so far as quality of fruit is concerned. The larger size of the fruit of mai vau and the absence of seeds are recognized as advantages. The seeds of mai vae can be eaten, but are often thrown away. Mai vae seems to bear earlier than mai vau, at least during the secondary crop, that which comes in early in the trade-wind season. The main practical difference [17] among the varieties seems to be that only two of the sub-varieties of mai vau, tagumelin and mai rau, are thought to have wood suitable for outrigger floats. It is said to be more buoyant than that of other varieties."

1: Burrows--17 (1947-48) Woleaians
116, 137 Ifalik

" 'Taro' (Pulax; Crytosperma chamissonis). Twelve varieties were pointed out: patsa, pulax e mau, pereliau, talinga mor (Mor's ear?), talinga nap (big ear), sia li ralo, pulax i sali, annīpenni, pulax e bwar, filal, pwololo, etl li bwulax, gor. There are considerable differences in color, texture, and flavor of the underground part, and some are considered choicer than others. The varieties are indistinguishable at sight to me, and so they are, Tom assured me, to him. Taro is in the woman's sphere, and only women are experts in it. The only distinguishing characteristic pointed out by his wife, Lagajarong, applied to the variety called etI li bwulax. If I understood her rightly, she said that if you plant the pistil (?) from the flower of this variety, it will grow.

True taro; wot; Colocasia esculenta. An impromptu committee of three women gave me the following list of 18 varieties, and assured me it is complete: elibwā, gaimwem, waligo, likerak, tarewai, sarewāk, mivou, tolipannēu, ganipwā, garimar, geratIgi, pei, rangoi, togōs, otumalu, outeriap (from Yap). The tubers vary in texture, flavor, and public esteem."

1: Burrows--17 (1947-48) Woleaians
116, 137 Ifalik

"Banana (Wir; Musa sapientum). Six varieties are recognized. No erect fruit clusters were seen. The fruit of all the varieties brought to us (I think this includes all there are except possibly the two Yap varieties) is sweet and can be eaten raw, though we preferred one or two of them cooked.

bwongĕr--this is considered the original variety, 'native' to the island. The fruit is large, the skin of an orange color, the flesh somewhat rosy. Fruit prized for eating, fiber for weaving, dried leaves for cigarette wrappers.

wIrIs Truk--supposedly from Truk. Fruit of medium size, pointed, yellow--our favorite. Fiber considered good for weaving, leaves for cigarette wrappers.

reiap--supposedly from Yap. This variety is used for all three purposes, but it is considered inferior.

melawalibwe--another variety ascribed to Yap. Fruit small and little eaten. Leaves not used for cigarette wrappers. This variety is chiefly valued for fiber from the trunk.

wIrIs Seipan--as the name indicates, supposedly introduced from Saipan. The bright yellow fruit is considered good (we preferred it cooked). Valued also for weaving fiber and cigarette wrappers.

wIri li Valupe--supposedly from Ponape. Short fruit in big bunches. Valued for all three uses. There are only a few plants of this variety on Ifalik."

1: Burrows--17-18 (1947-48) Woleaians
116, 137 Ifalik

"Pandanus--Three varieties are recognized.

far--considered the old native variety. Grows on relatively high, dry land. The favorite for mats. [18]

far en Nuta--supposedly introduced from 'Nuta', said to be in the Marianas--presumably what our charts call Rota. Cured leaves prized for sails.

pogū--grows in swampy places. Glossy leaves of enormous size. Valued only to wrap around coconut trunks to prevent rats from climbing."

"All three of the domesticated animals common in Pacific islands--dog, hog, and fowl--are present on Ifalik. There are also a few cats. All but the cats are used for food, but they do not make up an important part of the diet. Chickens are the most numerous, yet their flesh remains a delicacy. The eggs, which are very small, are rarely eaten.

Hogs are few. The little pigs are treated as pets, occasionally even suckled by the women. When they grow bigger their feeding seems to be rather haphazard. Indeed, except for coconuts and taro--of which they get the left-overs--there is not much food to spare for them. Some reach a good size, and look well fed. But pork is so highly prized, and meat of any kind so scarce, that they are a constant temptation. There seems to be little prospect of their number increasing greatly.

Dogs are not raised for food, but may be eaten on occasion. During our stay on the island, three were killed because they had bitten human beings. The first was driven into the lagoon and drowned there. The second was reported to have been eaten. Nothing was said about eating the third.

The people tell of rather recent introduction of all three species. In 1909, Sarfert found fowl and two dogs. There were no pigs. He was told that there had been a few cats, but all were lost in the typhoon of 1907.

The appearance of the hogs and chickens seems to bear out the story of recent introduction. The hogs are not long-snouted and razor-backed. Most of them look like

Berkshires. The fowls, too, are not long-legged and gamy, as an old native type might be expected to be. Many of them resemble our standard egg-producing breeds. Others are of less familiar colors, but these might develop from crossing.

The appearance of the dogs, though, is distinctive. All seem to be of the same breed. While there is some variation in size, they do not run to extremes either way. They average about the size of fox-hounds or a little less, but shorter in the barrel. The hind legs seem to be somewhat like those of a chow, --straighter than the form prevalent with us. They are short-haired, with pointed muzzles. The ears are pointed and partly erect, drooping over for about half their length. (One had bat ears.). The tails, feathered with somewhat longer hair, are carried high and curl over the back. In color most of them are black and tan, mainly black, with some tan on chest, belly, paws, face, and about the base of the tail. A minority are white with tan blotches; a very few, white all over."

1: Burrows--18-19 (1947-48) Woleaians
116, 231, 136

"The existence of native names, not obviously borrowed, for all three species (gelago, dog; sirō, hog; malōk, fowl) suggests that knowledge of all these animals may be ancient. One of the songs collected contains a mythical account of the introduction of fowls from heaven. A man named Galuai, carried up there by a huge bird, tied several fowls to his body just before he jumped back to earth. They softened his fall by flapping their wings. But apart from questions of historical accuracy, Galuai came from Yap, and returned there. Moreover, the whole story is so different from anything else collected on Ifalik that it looks like something borrowed from a different culture. [19]

One possibility is that the three domesticated species have indeed been known on Ifalik from ancient times, but have died off, perhaps more than once. A typhoon big enough to wash over the island might wipe out any or all of them. In that case, their re-introduction may well be recent. In the case of the dogs, if re-introduction was from another island, they could still be of an old native breed."

"As to wild fauna, the only small forms which the natives consider important are pests. They are beginning to be aware, through foreign instruction, of harmful bacteria. Lice infest their heads, and they may be seen delousing each other's hair as a friendly service.

Mosquitoes abound. Two varieties were noticed. One is a small black day-flying kind, common about houses and in other shady places. (Pipiens?) The other is larger, lighter in color, with striped legs, and is active at night. Mosquitoes can be blamed for filariasis, which is not very prevalent. It is probably unnecessary to add that all this part of the Pacific is free from malaria.

Flies are even more numerous than mosquitoes. They gather in swarms about food that attracts them, particularly fish and crustaceans. The commonest kind is black, the same to a layman's eye as the common house fly of America. Another is rusty in color, slimmer, with red eyes and wings that stand out from the body.

Nothing was seen or heard of centipedes or scorpions. Spiders of various kinds are common. None was pointed out as dangerous.

There are no snakes, but lizards of several kinds are pentiful. [sic] Common about the houses is the little dark knel (a geko, perhaps Lepidodactylus lugubris). The people are said to fear it because one moment you see it, the next you don't. This fear does not seem to trouble them much, though. Another small variety is the blue-tailed skink (Emoia cyanura--Lesson). Far from being feared, these have been seen to jump on a

man's bare leg and off again without attracting any apparent notice. A larger, glossy black lizzard, the tagurupai (not identified), is noticeable especially on the trunks of coconut trees. Big monitor lizards (galūf; probably Varanus indicus--Daudin) are found on Falālap, where they are said to have been introduced to prey on rats. The natives say they also eat eggs and young chickens. The people maintain that there are none on Falārik. No large ones were seen there. Smaller ones of similar color are said to be of a different kind."

"There are few varieties of land birds. The Micronesian starling (some sub-species of Aplonis opacus) is a common scavenger about the houses. Another is a versatile little songster (lltri), equally at home among the trees, where it catches flies with snapping bill, or on the ground, where it picks at crawling creatures or garbage. In color it is rusty brown on the back, light gray below. This color and its excellent singing suggest a small thrush or chat (turdus obscurus?).

Wading shore birds are more varied. The Pacific golden plover (kulóng; Pluvialis dominica fulva Gmelin) is a dooryard bird during that part of the year when it is to be found on Ifalik. Mention in songs and in conversation showed that the natives have a kind of fondness for it, as Americans and English have for the quite different species called 'robin' in their two countries. Other wading birds are turnstone (nigenrouru; probably Arenaria interpres Linn.); an unidentified species with long straight bill (bwongupalei; perhaps a dotterel, charadrius;) [20] wimbrel or curlew (liak; probably numenius phaeopus variegatus (Scopoli); another known only by name, garevāsh, but from the description quite like the curlew; and herons of three colors--white, 'blue' or slaty; and sooty, virtually black. All were called by the same name, (liapelIk), and all may be forms of the reef heron (Demigretta sacra).

Passing migrants included swallows, seen over the lagoon for a few evenings, and hawks of some broad-winged kind, a pair of which spend about a week on Falārik. Of all the birds mentioned, only the plover seemed to attract more notice among the people

than any other familiar bit of landscape.

Sea-birds are numerous and have some importance. One variety, the noddy tern (kurugao; Anous sp.) is used for food. Another common variety is the white fairy tern (giegie; Gygis alba). These two nest on Ifalik. Both indicate the presence of schools of fish by hovering over them and swooping to catch the small fry on which the school is feeding. Other kinds of tern are seen occasionally, among them the black-naped tern (sterna sumatrana; native name uncertain), but apparently do not nest on the island. The white tropic bird or bos'n bird (mālu; Phaethon lepturus) is not common, but is occasionally seen. It is said to be plentiful on uninhabited West Fayu. The same is true of the frigate bird or man o'war bird (getaf; Fregata sp.). The natives have an esthetic admiration for this bird and its soaring flight.

Names of other sea birds were collected, but the birds were not seen and could not be identified. The kemā or xemā, described as a large bird 'some of them white, some blue', might be a booby. 'Blue' is a poor name for the color of the brown ones, but Tom's English was far from precise about colors. No boobies nest on Ifalik, but brown ones were seen at sea not far from there. Koro is a long-tailed seabird, also in two colors; koro wet, a white one, and koro rol, black. Still other varieties mentioned in the lore of navigation are paiennai (white, larger than fairy tern); metalipangerale, with long tail feathers (possibly 'Captain's language' for some species with a different common

name); and gerap, a small black and red bird. (The description fits the cardinal honey-eater (Mysomela cardinalis) found on high islands in that part of the Pacific; but that is a land bird.)"

1: Burrows--20 (1947-48) Woleaians
116, 136 Ifalik

"No flying-fox or other bats were seen on Ifalik. The only mammal, other than the three domesticated ones already discussed, is the rat. For a time they overran our tents at night. We set traps and caught one every night for more than a week. After that, whether because of the traps or because a cat began to include a visit to us in its nightly rounds, they did not trouble us again until near the end of our stay. In general, while they were certainly common, they did not seem inordinately numerous. Those we caught were not very big; brownish on head and back, light gray underneath. Some larger and apparently grayer ones were seen among the coconut trees, but not clearly enough to give a definite impression as to whether they were of a different species. Rats are not eaten."

1: Burrows--20-21 (1947-48) Woleaians
116, 136 Ifalik

"There are several kinds of land crabs. Hermit crabs (yng) are common on the beaches and about the houses. They are not recognized as of any importance, though they may be useful as scavengers. A larger, dark kind (arIk) that digs holes about houses at night, is sometimes eaten, we were told; but apparently not highly regarded. Tom said he never ate them himself. The ragōm, that lives in the ground in the bush, is eaten, also crushed to make bait for fish-traps. The usela, not seen, is described as a slow-moving crab that [21] lives in the tops of coconut trees. The largest species, and one of the choicest delicacies, is the coconut crab (afe; Birgus latro Dana). These are only the most familiar kinds. In general, any that are big enough to be worth the trouble are eaten."

"Sea animals are far more important to the people than those of air or land. Nearly all varieties that are caught are eaten. Even the whale (ras), though never caught, is eaten on the rare and memorable occasions when one goes aground on the reef. Jaw-bones of several of them were kept behind the men's house as trophies.

Exceptions to the rule of eating everything are the shark (pagō) and octopus (sauevang? --name discussed next paragraph). This was explained as a mutual arrangement. The people do not eat shark and octopus, so that shark and octopus will not eat them. Once a small octopus-like creature, stuffed into a Japanese mess-kit so that its shape did not show, was brought to us as a gift. It had tentacles, and I now suppose it was a squid; but in asking Tom how to cook it I called it an octopus. With a contemptuous expression he told us to throw it away, saying that Japanese and Trukese eat octopus, but not the people of Ifalik. Later, after conferring with the chief who brought it, he said it was not an octopus but a gus, a rare delicacy. It was too late then for our gus to be cooked. I had not even looked at it carefully. Asked whether gus is the name for a small octopus, Tom said not. A gus, he explained, has no beak, and will not bite a hand thrust into a hole in the coral, as an octopus will. We never saw another gus.

Tom consistently gave the native name for octopus as sauevang. Some of his remarks about it, --for example, 'in the deep water they grow big, with arms like the roots of that tree'--indicated that he knew what the English word meant. Yet a group of natives

once identified as sauevang two pictures in Hosaka's 'Sport Fishing in Hawaii'; one of a conger or white eel, the other of a brown eel. They cannot have mistaken either for octopus, though they might for moray--not illustrated by Hosaka--which is common on the reef. This discrepancy was not noticed in time to clear it up.

Moray and sting-ray (fai) are apparently not eaten, though I have no verbal statement to that effect. A sting-ray brought ashore near our quarters was left hanging in a tree, then lying on the ground, for several days before it disappeared, presumably either eaten by dogs or thrown away.

In Tom's private prayer or incantation for success as a navigator, sting-ray is coupled with shark and giant clam as formidable creatures invoked to watch over him. In translating, he said that the giant clam, called trewai in the incantation, is found only on high islands. We saw no very large Tridacna, but small ones are common on the reefs. They seem not to be important as food. Large trumpet shells are found occasionally, the flesh eaten, and the shell used as a container or kept on the house platform as an ornament. Small shellfish of many kinds are gathered for food on the reef when the surf is not too high; among them sea-shails, limpets, Turbo, and at least one clam-like bivalve."

1: Burrows--21-22 (1947-48) Woleaians
116, 136, 262 Ifalik

"Far the most important source of animal food is fish. The list of varieties to follow was obtained by two procedures. One was to collect native names of fish brought to us as gifts, or brought ashore in our presence, and of others said to be important. The other was to show groups of natives the pictures of fish in Hosaka's book, mentioned above. Size and color, not shown in the pictures, were indicated by gestures and words. The people were confident that they knew which of the fish shown in the pictures were familiar to them and which were not. They had names for most of those illustrated, -- sometimes more than one name for one picture, which may indicate [22] a difference of opinion, or more than one variety of similar form, or--what is not uncommon--one name for a species when young, another when full grown. Eliminating known cases of that kind and obvious variants of essentially the same name, the total number of names collected is 74. Names obtained in the two ways were compared. Twice the book was taken out to where a pile of fish lay waiting to be distributed. So far as the catch on those days allowed, the pictures were compared with actual specimens. The identifications that follow can probably be trusted as far as larger categories are concerned. Where a single species is widespread, even the specific identification is probably correct. In view of the rough and ready method, some mistakes must be expected. But at least the list will give an idea of the range and character of the fish taken for food."

(1947-48)

"Classification by habitat seemed useful, but is bound to involve some overlapping, possibly some definite errors.

kihikihi	iwājōla	not given by Hoṣaka"

1: Burrows--26 (1947-48) Woleaians
116, 313, 137 Ifalik

"The supply of wood, whether for fuel or timber, is scanty. Breadfruit makes a good soft wood; but since the trees are needed to grow food, there is little of it to spare. Many species furnish hard wood; but on Ifalik none of them grow into large trees."

1: Burrows--26
116, 136, 262

(1947-48)

Woleaians
Ifalik

"Most prized of all animal foods is the meat of the sea turtle. Though the sight of one or two of them in the lagoon is not uncommon, they are not often taken. We knew of four being caught during our six months on Ifalik; three of them at one time. They are made still scarcer for most of the people by the fact that the highest chief has a right to all of them. He distributes first to his clan, Kovalū. Others get only what surplus he cares to distribute to them. For the lower orders, the taste of turtle is a rare delight."

1: Burrows--26 (1947-48) Woleaians
116, 262, 221 Ifalik

"On the whole, raw materials to be found on Ifalik and nearby atolls, whether supplied by nature or introduced by man, add up to a decidedly meager offering. Among foodstuffs, only coconuts, taro--more exactly, pulax--and breadfruit are plentiful. (Breadfruit is a seasonal crop but, as will be shown, is available between bearing seasons in preserved form. Seafood is present in great variety. The quantity available varies with the seasons and with other factors.

Some of these, such as the movements of fish that travel in schools, are so uncontrollable and unpredictable that they can only be classified as 'fishermen's luck.' Others include fishing equipment and techniques. Because of their importance, this matter will be considered again at the close of the account of fishing technology."

1: Burrows--26 (1947-48) Woleaians
116, 135 Ifalik

"Materials other than foodstuffs are also limited, except for coral. Without coral there would be no plants and no people, but it has few more specific uses."

1: Burrows--26 (1947-48) Woleaians
116, 176 Ifalik

"This environment, rather inhospitable as far as supply of raw materials is concerned, decidedly limits the development of native crafts and industries. The same effect is produced by the climate, a matter in which the environment is, most of the time, anything but severe. There is no need for elaborate development of shelter or clothing. Industry, particularly in building, is still further discouraged by the worst feature of the climate, the typhoons. They do not come often, but when they do, they destroy almost everything that men can make. Two more geographic factors make for simplicity in human works and ways. One, that so small an island can support but few people. The other, that stretches of sea isolate these few from other peoples. These factors keep to a minimum the stimulus of contact with other minds and their inventions."

1: Burrows--26 (1947-48) Woleaians
116, 136 Ifalik

"Native names of fish not otherwise identified:

fofo, an open-sea fish, may be a yard long, slim, caught in traps around drifting logs. Except for small size resembles Hawaiian ono (Acanthocybium solandri) but natives, shown the picture of ono, insisted it was a different kind.

lipwaix, a reef fish, caught by angling; eight inches to a foot long. Prominent pointed teeth. Color, blotched red and purple.

porosh--named, not seen; 'small mouth, fat inside skin.' (These characteristics resemble rel; another Kyphosus?)

ireileile--named, not seen; dorsal and ventral fins extend to tail.

orā--small yellow reef fish."

1: Burrows--27 (1947-48) Woleaians
116, 176 Ifalik

"TECHNOLOGY

This section deals with the natives' ways of putting to use the material resources outloned [sic] in preceding pages. Apparently the people of Ifalik, like most peoples, have invented very little of their technology themselves. Virtually all of it is shared with neighboring islands, and its fundamentals are known far and wide over the Pacific. No evidence of local invention was discovered, unless songs locally composed, or the custom of sea-burial which seems to be confined to Ifalik, can be attributed to local invention. Comparative study may indicate that this atoll has made come[sic] other contribution to the common stock of technology. Whether or no, this can not be determined by data from Ifalik alone. Here it is only possible to sum up the cultural resources or traditional techniques which enable the natives to make a living out of the rather slim stock of raw materials which their island affords them."

1: Burrows--27 (1947-48) Woleaians
116, 321, 342 Ifalik

"House floors and house platforms are graded and covered with waveworn coral gravel (faumax). Water drains through this rapidly, keeping the platforms relatively clean and dry in rainy weather. Commonly the gravel is outlined with a row of coral blocks, which keep it in place. Along the lower sides of platforms on sloping ground the blocks are piled to form a rudimentary retaining wall. Appearance was clearly the motive for an elaboration noted on one site. This has an outer and an inner platform, the latter a few inches higher. A similar bit of terracing, somewhat overgrown, marks one side of the platform at Katel where the men's house of Rauau district formerly stood. This decoration apparently served to enhance the dignity of the place.

Coral blocks are piled in several places to form piers that extend into the lagoon. Large blocks form walls around the outside. These are filled in with finer rubble. On some of the piers are little houses, which get more breeze than those set back in the coconut grove. These buildings, though, being correspondingly exposed to high winds, do not last long. Two were destroyed during our stay. Two piers near our tent had lost the buildings that once stood on them, and the seaward walls had been battered in by waves during some typhoon.

Coral blocks are also used to build the fishing weirs described later."

1: Burrows--27-28

(1947-48)

Woleaians
Ifalik

"A kind of stone, coralline in origin but of relatively dense, even texture and crystalline appearance, is obtained under water at a single location on the seaward side of the reef a little west of the pass, near the uninhabited island Ellā. From this are made pounders (faulipō), which are used by the women to mash taro and breadfruit. The pounders are of the same general shape as those of Polynesia. They have rounded vertical handles which flare outward at both ends: slightly at the top, to form a knob; much more at the bottom, forming a heavy base with round, slightly convex pounding surface. (See photograph, Fig. _____) Those used on Ifalik are comparatively small, perhaps because it is hard to find larger pieces of the stone without cracks or flaws. Most of them are about 8 inches high and 5 inches in diameter at the base. [28]

The workmanship is rough and simple. The only decoration seen consists of one or two little bosses left projecting on top of the handle. Pounders are made by either men or women. The implement used nowadays to make them is an old hatchet head without a handle. Holding the stone in the left hand and the hatchet head in the right, the craftsman hacks out crisscross lines on the places to be cut down, particularly what is to become the handle. Then he chips off the squares left projecting between the lines; pecks them off, rather, for most of the stone comes away as dust instead of chips. When the shape has been roughed out, the surface is finished by rubbing with another piece of stone. It is slow work. An elderly woman was seen busy at one nearly every morning for about two weeks."

1: Burrows--28 (1947-48) Woleaians
116, 245 Ifalik

"Human life on Ifalik depends on the coconut palm. The story of how much Pacific island peoples rely on this 'most useful of trees' has been told repeatedly. But this atoll culture can not be described without retelling their particular version.

The sandy strip around the lagoon side of the two larger islands, and on both sides of the channel between them, is virtually unbroken coconut grove. Old coconut plantings, more or less gone back to bush, run clear across the northern tip of Falārik, and extend southward beyond the houses on the eastern shore of Falālap. Coconut trees are mixed with the other vegetation everywhere except in the heart of the taro swamp that takes up the center of Falālap. Because of this mixture, no accurate estimate of the percentage of land taken up by coconuts seemed feasible. All that can be said is that the fraction must be large."

1: Burrows--28 (1847-48) Woleaians
116, 324, 333 Ifalik

"The beach sandstone (perou) found in ledges on the reef between high and low water mark is known to be harder and stronger than coral. But the people have few uses for it. The corner posts of a single building, the men's house, are of perou. Slabs long enough for this use are hard to find, still harder to haul into place. Their only advantage over wooden posts is that they do not rot in the ground. Four slabs, apparently once corner posts, are all that is left of the men's house that once stood just inland from the present site. The stone posts of the men's house, which itself symbolizes the authority of the chiefs, are symbols of strength and permanence. This is brought out in the name of one of the men's religious dances, sur perou (stone house post). The idea seems to be that everything rests on that firm base.

Slabs of perou, which has a smoother, straighter surface than coral, are used for the top course of the walls that surround the stone piers. An occasional one is seen as a backrest (mageru) on a house platform."

1: Burrows--28 (1947-48) Woleaians
116, 381 Ifalik

"Lime is made in Ifalik, as in many Pacific islands, by burning coral over a large wood fire in a pit. It forms the pigment for the white lines in the traditional design used for painting a canoe. Mixed with water and ashes of burned coconut husks, it makes a mortar or putty (bwèr) for sealing the holes about the lashings in canoe-hulls. Before the advent of foreign dyes, it was mixed with an infusion of bark of the lel tree to make a red dye for native cloth. The people of Ifalik do not use lime to clean and bleach their hair.

"To prepare for cooking with other vegetables, the flesh of the ripe nut is grated with a different instrument, the large grater in general use throughout the tropical Pacific. It consists of a toothed edge, curved to fit the inside of a coconut, and attached to a stick. The stick may be laid across a log, or may be cut from a bough or sapling near where two branches fork off. The butt of a main piece and short lengths of the branches form a tripod. The grating edge, lashed to the projecting end of the main piece, may be of coconut shell or even rough coral; but nowadays virtually every household has a grater with a cutting edge filed out of a piece of steel. The grater is straddled and a half coconut, held in both hands, rubbed over it by pushing away from the body. The grated meat is put in a bowl, water poured over it, and the creamyjuice squeezed out with the hands. Wringers of coconut husk fiber, which make a richer cream, but take more muscle, are not used in Ifalik.

The starchy vegetables which make up the bulk of the diet are commonly cooked in this coconut cream. Rarely is a meal served without either taro or breadfruit enriched with it. Coconut cream supplies most of the oil in the diet, though supplemented by oil from fish.

It would be a sad day in an Ifalik household if the morning and evening meals lacked one more coconut product, --the fresh toddy (garī) extracted from the flower stalks. Collecting toddy, morning and afternoon, is a daily task for the younger men. Climbing coconut trees is not expected of older ones."

"Perhaps the most important of all uses of coconut are drinking the juice of the young nuts and eating the meat, particularly of the ripe ones. Like most Pacific islanders, the Ifalik people have different names for the nut at different stages. A nut full-grown but green, full of good juice to drink, is called upu. When somewhat more mature, with sweeter juice but the flesh still soft, it is called seou. A ripe nut is mazou. A very ripe one, suitable for making copra, is trō; a sprouting nut, trō far.

Though some of the water in dug wells, or that collected in helmet shells or foreign metal drums, is used for drinking, the juice of young coconuts makes up far the greatest part of the drinking water. It is also used in a healing ritual which involves breaking open a young nut above the head of the patient, so that the juice pours over him.

The soft flesh of the young nut may be scooped out and eaten. Scoops are made, as generally in the tropical Pacific, by cutting off a bit of the green husk with a slanting blow of the knife, which gives it a sharp edge and a spoon-like shape. The hard flesh of the ripe nut may be split out of the shell and either eaten raw or roasted over an open fire. More commonly, though, it is removed by grating with an instrument like a spoon with a round bowl and a toothed edge where the point of one of our spoons would be. These are made of pieces of white metal like what used to be called 'German silver'. Making them is said to be an industry of many years' standing throughout the Carolines. Raw coconut eaten in this way is one of the main articles of diet Another is the spongy

body that fills the center of a sprouting nut. These are eaten without cooking or other preparation."

116, 272 Ifalik

"The process of making toddy is simple. A flower stalk is cut off squarely just short of the bud. It is then bound around with sinnet cord, taking turns about a half-inch apart. From this cord is slung a coconut shell, with a hole in the top, to catch the liquid that drips from the cut edge. This edge must be continually cut back, a narrow slice at a time, to keep the wound fresh. The toddy-maker must climb the tree, change shells, and freshen the cut, twice a day. The juice is strained through a funnel made of the fabric from around the base of the leaves. Toddy is carried and kept, nowadays, in glass bottles.

Some trees will not yield toddy at all. The people have no way of telling this in advance. An average tree, they say, yields about a quart a day; an especially good one, two or three quarts. One flower stalk will drip continuously for about two months. After that it is allowed to heal and the tree given a rest. The trees are not injured if treated in this way, the natives say.

Fresh toddy is considered especially good for children and old people, but all ages enjoy it. It is milky white in color, and has a sweet taste. Used with taro, in addition to coconut cream, it makes some of the few delicacies of Ifalik cooking."

1: Burrows--30 (1947-48) Woleaians
116, 302 Ifalik

"Ripe coconuts have one more use. It is customary to oil the skin with coconut after the bath. This especially on dress occasions, when the oil may be mixed with perfume, of which the people are extravagantly fond, or with flame-colored turmeric paint, imported from Yap or Truk. Oil is extracted by trying out grated coconut over a slow fire. The oil gradually rises to the top. For everyday use, though, few go to so much trouble. Half of a ripe coconut, with its meat grated with the ever-present little hand grater and rubbed over the body, supplies oil enough.

Coconut ointment has a high sentimental value. The commonest conventional ending for a lament is the word Gapītei-my coconut ointment. It is a term of endearment, -- as if nothing could be more precious."

1/ Burrows--30 (1947-48) Woleaians
116, 273 Ifalik

"The people know how to ferment the juice and make an alcoholic drink of it. All that is necessary is to abstain from washing the shells in which it is collected, and from straining it; and then to let it stand for four days. The chiefs forbid the practise. Their prohibition works about as well as that tried for some years by the United States. That is to say, those who enjoy drinking fermented toddy (called tubwa as in Yap) make it quietly and drink it without interference. Some of the men drink glass after glass in the course of an evening. A slightly bleary look about the eyes, and a tendency to be jovial or sentimentally friendly, were the only effects we noticed. Drunkenness to the point of a staggering gait or quarrelsome talk, let alone violence, was completely absent. Toddy is not the problem in Ifalik that it is said to be in some more populous islands."

1: Burrows--30 (1947-48) Woleaians
116, 352 Ifalik

"Whole ripe nuts in their husks are lying on the ground everywhere about the houses. Here they may be used as furniture. The people hardly ever sit on the ground. If there is reason to sit outdoors longer than it is comfortable to squat, they will tuck a coconut under them for a stool. In the canoe-houses, where the men spend a great part of their days, working at light jobs, talking, smoking, or simply sitting, coconuts in the husk are always at hand, and are used as pillows, knee-rests or elbow-rests."

1: Burrows--31 (1947-48) Woleaians
116, 283 Ifalik

"Coconuts are husked in the way usual in tropical Pacific islands. A stake of hard wood, some 2 1/2 feet long, is pointed at both ends. One end is driven into the ground. The coconut, held with one hand at each end, is jammed against the other end of the stake where the point protrudes, and the husk pried off in strips.

This supplies another useful product. A piece of coconut husk makes a scrubbing brush for a bath. It serves as a napkin to wipe off the fingers after a meal. Dry coconut husks are important as fuel. One of them will hold fire until time for the next smoke, or while carrying borrowed fire from one house to another. Thin slices of coconut husk, with its rather spongy texture, are laid between the planks of a canoe before they are gummed and lashed together. They expand when wet, and keep the seams tight.

Charcoal from burnt coconut husks is mixed with coral lime to make the putty or mortar used to seal the holes in a canoe hull where the lashing runs through.

Short lengths of a crude kind of rope are twisted out of raw coconut husk fiber. They make wicks (atoliēf) to preserve fire. Such a wick is commonly kept alight during a sea voyage."

1: Burrows--31
116, 415

(1947-48)

Woleaians
Ifalik

"The shell of the nut, with a round hole cut in the bud end, is used as a bottle (peraliēt) to collect toddy. The disc cut out may be used as a lid. Such a covered container, with a bit of sennit cord for a bail, is called louyā. A half shell makes a cup, dipper, or small bowl. Strung on a cord with the hollow side down, a coconut half shell will keep rats from getting at food suspended below it."

1: Burrows--31 (1947-48) Woleaians
116, 777 Ifalik

"A ripe coconut in its husk may serve as a charm (mwiri). In one of the songs, a woman asks such a charm--simply a coconut in the husk, placed beside the house--to ensure the safe return of her lover who is at sea. With a strip of young leaf tied about it, knotted in three places, the coconut becomes a rol gapesh, and takes on special power. In the ritual performed just before a canoe sets out on an interisland voyage, one of these is tapped against the seams of the hull. It is credited with power to prevent leaks."

1: Burrows--31-32 (1947-48) Woleaians
116, 283, 462 Ifalik 13

"The principal use of coconut husks is to supply fiber--sennit--for cordage. Preparation of sennit (gos) is women's work. The husks are first soaked in fresh water to soften them, and dissolve some of the matter that holds the fibers together. If there are no natural pools about, as there are on the borders of the taro swamp on Falālap, artificial water-holes, called libwaligos, are dug and walled with blocks of coral. Men may do the work, but the finished pools are tabu to men. If a man goes into one, he will catch no fish for 20 days afterward, and will get sick if he even tries, --so they say.

When the fibers are sufficiently loosened, a woman takes them to the shore and sits in the shallow water with a short log or projecting coral head in front of her. This she uses as an anvil, laying the softened husks on it and beating them with a stick until the fibers separate. During the process she repeatedly dips them in the water and shakes them about to remove all but the fibers. Finally she takes these ashore and spreads them [32] in the sun to dry. They now form a light, fluffy mass.

From this point men take over. Making rope is the light work they carry about with them to sociable gatherings, as a woman may take her knitting in our culture. They make rope by the hour as they sit with their friends in the canoe houses. It does not interfere with talking or smoking.

The fibers are carefully picked over until they all lie parallel. Little tufts of them are pulled out and twisted, with one hand at each end, into single strands [KS: native word omitted] two or three feet long. When enough of these are on hand, they are rolled

together between palm and thigh--most often on the right, but sometimes on the left--into two-strand cord.

This cord can be made as long as desired. Its thickness, too, can be varied. The smallest is called golgaulIk. What seems to be the commonest size, about 1/8" to 3/16" in diameter, is golgol. A larger two-strand cord, about 3/8" in diameter, is geref. A third strand may be added to this by another rolling on the thigh; it is then called garotel. Stouter ropes, in order of increasing size, are taani, taliou rIk, and taliounap. Hawsers (tennap) are made of three strands of rope. In laying these, one man holds the finished end, and three others, each holding one strand, do a sort of maypole dance at the working end. When a piece a few feet long has been laid, it is slung over a beam, and the man holding the finished end leans back, using his weight to tighten it. On the other end the three holding separate strands do the same, ensuring a tightly-laid hawser.

Sennit cordage has an indefinite variety of uses. One of the most important is that of fastening together the timbers of canoes and houses, where it replaces the nails of our culture. Quite literally it accompanies the people of Ifalik from the cradle to the grave, for their cradles are strung with the cord, which forms bedsprings, and hung up by it; while enormous lengths of rope, brought by all the men as a last tribute, form the outer wrapping of a body when it is taken to sea for burial.

Another important use of sennit cordage is for making fishing nets. Light cotton

netting, used for dip-nets and a few light seines, is bought ready-made from abroad; but large seines (ating) 5 or 6 feet wide and up to 200 feet long, are made of golgol.

Leaves of coconut have many uses. With their leaflets plaited together in various ways, they make thatch for the roofs of houses, screens for the walls, and sitting mats for the floors. (These are described in some detail in the section on house-building, p. 46.)"

1: Burrows--32-33 (1947-48) Woleaians
116, 285 Ifalik 1-2

"Baskets (wetau) of coconut leaf are carried about under men's arms, to do the work performed by pockets in our culture. They usually contain such personal gear as a bush knife, a small coconut grater, and smaller baskets of pandanus which hold tobacco and flint and steel. These coconut baskets are of several shapes. The cruder ones are quickly made of green leaf, plaited in check with the leaflet opened out to its full width. These are made by either men or women. The better ones are made of cured leaf, with the leaflets doubled and trimmed. This makes a basket of double thickness and of much finer wefts. This type is made only by women. [33]

One of the simplest of the baskets of open green leaf is called wëtau lugor, or in a large size trugulilugor. To make one of these, a leaf is split. The halves are laid with the trimmed half midribs on each side. The leaflets are plaited together in check, and their tips joined in a braid, which is finished off with a knot. This results in a flat sheet, which is folded over to hold sennit fiber for making rope. As the ends are left open, it is really a folder rather than a basket. A basket of similar construction, but with the plaiting continued around the ends to close or partly close them, is called wetau ruk (Truk basket). A round basket with a long braided handle, called gato, is used to carry food bowls. This type is illustrated in Plate I of Damm's report. The commonest type of finer basket, made of cured and doubled leaf, is called wetau tuk (see Pl. 3, d). Each side is made of two half leaves, with their half-midribs trimmed down to very thin strips. Alternate leaflets of each are first plaited to form a rim.

After one row, the two leaflets are plaited together in twill to form one side of the basket. The plaiting is only a few rows wide at the ends, at least twice that in the middle, giving the rim its characteristic convex shape. The other side is made in the same way. Then the two are joined by a braid that forms the bottom of the basket. Ends of doubled leaflet project from the braid, forming a fringe. A basket of generally similar construction, but more nearly circular, with the curved rim continued around both ends, is called auruēl. It is attributed to Yap. Both of these types may be of recent introduction. At any rate, Damm's illustration shows three variants of another type, similarly plaited in twill with doubled leaflets, but of a different shape. It does not show any with the convex brims now in fashion."

116, 535 Ifalik

"Half a coconut leaf, tied about the waist over the loin-cloth, forms part of a man's costume when he is dressed to take part in a dance. For most of these ornamental kilts, freshly cut green leaf is used. A few prefer brown, withered leaves."

1: Burrows--33 (1947-48) Woleaians
116, 301 Ifalik

"Young coconut leaves, before they open out, are prized for their color, which ranges from ivory to pale greenish yellow. Ornaments for the ankles, wrists, upper arms, neck and head, and bandoliers slung over one shoulder, are made of this nearly white young leaf (ubwut). There are many ways of tying the leaf to make the pointed ends stick out attractively. It may also be cut into zigzag or lacy patterns.

A man will put on a bit of this leaf when he turns out for any communal task, such as repairing a canoe-house. It appears in greatest profusion on men adorned for the dance. Women are not forbidden to wear it, but it is rarely seen on them. On Ifalik it is the males who wear the bright plumage."

1: Burrows--33 (1947-48) Woleaians
116, 784 Ifalik

"Coconut leaves, commonly including some live ones from sprouted nuts, may be tied and twisted together around any area where trespassers are not wanted. These barriers are flimsy. There is no attempt to make effective fences of them. Their use is symbolic; they are recognized as tabu signs. Another symbolic use is waving a coconut leaf over the patient in several of the little healing rituals that accompany administration of medicines."

1: Burrows--33 (1947-48) Woleaians
116, 226, 372 Ifalik

"Dried coconut leaves are used as torches, especially in night fishing. Other uses of the leaves in fishing will be described later."

1: Burrows--34 (1947-48) Woleaians
116, 554, 245 Ifalik

"Bright young coconut leaf is often a symbol of success. A fishing party that has had exceptional luck may celebrate, and announce the good news, by putting on ubwūt as the canoe nears home. A man who has won the right to the title of sea-captain (palū) by successfully completing an inter-island voyage, may wear ubwūt ornaments as insignia of his new distinction."

1: Burrows--34 (1947-48) Woleaians
116, 789, 245 Ifalik

"Finally this young leaf may be an agent of supernatural power. Part of the ritual for a canoe about to set off on a long voyage is to sweep off the hull with ubwūt, wave it over both ends, then fasten pieces of it to the end posts. This is to keep off misfortune. On shore, squares of mat about 18 inches across are plaited of it, taken to the house of the great gods to be blessed or endowed with power, then hung on branches all about the shore. They are supposed to keep evil sea-spirits from landing."

1: Burrows--34 (1947-48) Woleaians
116, 245, 322 Ifalik

"Coconut wood varies in quality from a hard, dense layer on the outside of the trunk to a comparatively pithy center. The wood rots rather quickly when exposed to moisture. For this reason none of it is used in canoes, and coconut trunks are not set in the ground as posts for houses except when nothing better is available. They are then put over a fire and scorched to harden them, but even so are said to last only a year or two.

Under a roof and clear of the ground, coconut wood escapes this disadvantage. It is in general use for the beams that form the superstructure of a house. Where thin, elastic strips are needed, the hard outer layer makes excellent material. So coconut is considered the best of wood for thatch rafters. The same qualities make it the only wood used for fish spears (kowai). On Ifalik these are not light lances but heavy pikes 15 to 20 feet long. They have simple points without barbs. They are used mainly in a bonito drive when the school of fish is not considered large enough to drive ashore."

1: Burrows--34 (1947-48) Woleaians
116, 322, 245 Ifalik

"The stout midribs of coconut leaves are laid crosswise in the path of a canoe being hauled to or from the canoe-house. As this green midrib does not burn readily, it also makes a good rack for smoking fish. Its perfectly straight grain adapts it to still other uses. A strip of it makes a flexible ruler, for measuring and drawing lines on the curved surface of a canoe hull during its construction. Smaller strips peeled off the surface make thongs for tying thatch to a roof. A strip thin as a thread, formed into a loop and held between a woman's fingers, is used to split pandanus leaf into strips of even width to make a mat or fine basket."

1: Burrows--34 (1947-48) Woleaians
116, 372, 245 Ifalik

"Dry brown leaf makes kindling and fuel--for Ifalik, though well wooded, has such a small area that firewood is scarce. A bonfire of dry coconut leaf will illuminate a night gathering. Bundles of it make torches used in several kinds of night fishing."

1: Burrows--34 (1947-48) Woleaians
116, 524, 245 Ifalik

"Children use coconut leaflet midrib for some of their toys. A big bread-fruit leaf, stiffened here and there by weaving strips of leaflet midrib in and out, along and across, makes a perfectly good kite. Other toys are made in the same way. Tiny coconuts, the size of a small child's fist, are fitted with a strip of leaflet midrib for a stem, and spun as tops."

1: Burrows--34 (1947-48) Woleaians
116, 412, 245 Ifalik

"Tied around a wooden handle, strips of leaflet midrib become broomstraws."

1: Burrows--34 (1947-48) Woleaians
116, 227, 245 Ifalik

"The slender leaflet midribs (logto) some 1/8 inch in diameter, where the midrib of the whole leaf is several inches--are useful where lightness and flexibility are necessary. On a frame of stiffer withes, lengths of leaflet midrib are lashed criss-cross to make a fish trap (ul pam) of the smaller size. These are set on the bottom in shallow water, weighted down with sand and baited with crushed crabs, to catch small fish."

1: Burrows--35 (1947-48) Woleaians
116, 262, 245 Ifalik

"Breadfruit is the principal starchy food, when it is bearing. Its wood is also the most in demand for timber. In season, breadfruit makes up more of the bulk of the diet than anything else. Its main season is the rag, the time of prevailing westerly winds, approximately June to November. The crop reaches it height about July, then dwindles until by November there is very little. A second but smaller crop comes in the trade-wind season. During our stay, breadfruit seemed to be coming in again in January. Mai vae made up most or all of it. We were told that it would have come earlier but for two near-hurricanes, one in November and the other late in December, that destroyed much of the young fruit."

1: Burrows--35 (1947-48) Woleaians
116, 245, 415 Ifalik

"Still other parts of the coconut tree are useful. The clothlike fabric (ʻulu or ʻulʻulu) that grows about the base of the leaves makes a strainer for toddy or medicine. Mothers make water-droppers of it for their babies. Folding a piece into the shape of a funnel, they put some fragrant herb into it, then dip it in water, hold it over the baby's mouth, and let the water drop in. Some of the herbs used for this purpose are listed on p. 43 (this ms.).

A dry fruit stalk makes a crude broom, when one of the better brooms of leaflet midrib tied to a handle is not available. Dry flower spathes, while less used for torches than in some Pacific islands, occasionally serve for fire-brands or kindling."

1: Burrows--35 (1947-48) Woleaians
116, 245, 105 Ifalik

"We have seen that the coconut is meat and drink to the people of Ifalik; supplies most of the material for their houses; provides the cordage used to hold all composite wooden articles together; makes baskets, mats, fuel, and has a multitude of other uses, even acting as a symbol and agent of supernatural power. The list above does not pretend to be complete. Whether human life could be sustained on such an atoll without this plant is open to question. If it could, it would have to be a radically different life from that which the people lead there now."

1: Burrows--35-36 (1947-48) Woleaians
116, 251 Ifalik

"Breadfruit is the only food preserved for any great length of time. (Bonito are smoked, but only to keep them until they can be eaten, which takes two weeks or so with a big catch.) At the height of its bearing season there is more breadfruit than the people can eat. Every household preserves some of the surplus.

The fruit is cut up, mashed with coral pounders, and put into a net made for the purpose (trou li mare). When the net is full it is wrapped up, fastened, and carried--making, in most households, a load for three or four men--into the lagoon. There it is weighted down with blocks of coral and left overnight. In the morning it is brought ashore and put into a pit lined with leaves. After one night there the pit is opened and some of the breadfruit eaten at once. (We foreigners found this mashed and salted breadfruit about the most palatable form of all.) Next, the breadfruit is put back into the pits for the long wait. The pits are lined with big [36] glossy leaves of gul (Barringtonia asiatica). The breadfruit is wrapped up in separate lumps, most of them about half the size of a loaf of bread. The pit is filled with these breadfruit-leaf packages. When it is full, it is covered over with coconut leaves, and these are weighted down with coral. Laid down in this way, mare, as it is called, is said to keep for several years. During the time when there is no fresh breadfruit to be had mare is taken out now and then to vary the daily diet of taro. At this stage it has a penetrating and, to Americans, most offensive smell. But the natives seem to like it no less than their other starchy foods."

1: Burrows--36 (1947-48) Woleaians
116, 381, 245 Ifalik

"Breadfruit sap makes a gum (bwIIIs) used to glue the joints between canoe planks. This is collected by slashing the bark of the tree in several places and, after gum has gathered on the wound, scraping it off with a knife. The day after collecting, it is washed in salt water and bits of bark and other foreign matter taken out. Then it is soaked in fresh water for several days and kept in a bottle.

Breadfruit gum is also the source of the soot used in tattooing. It is burned, and the soot collected on a smooth surface held over the fire. The surface used in recent times has been that of 'Yap bottles', --huge glass carboys from Japan. The soot is scraped off the glass on a breadfruit leaf, then put into a coconut half-shell and mixed with a little water until ready for use. (As tattooing was no longer practised on Ifalik at the time of our stay, this is a past rather than present use of breadfruit, --yet so recent that the process was fresh in memory, at least among the older people.)"

1: Burrows--36 (1947-48) Woleaians
116, 322, 396, 245 Ifalik

"The yellow wood of the breadfruit is light, soft, and easily worked, yet does not split easily and is said to be very durable. It constitutes the underbody of nearly all canoe hulls (I saw one small underbody of the tougher ragues (Calophyllum inophyllum), a favorite in high islands.) Breadfruit wood is also used for all canoe planks and outrigger floats. Only smaller parts subject to special strain, like end posts, outrigger booms, and the sticks and braces of the outrigger attachments, are made of harder and heavier wood."

1: Burrows--36 (1947-48) Woleaians
116, 241, 262, 462 Ifalik

"Taro is the staple starchy food of the trade-wind season, as breadfruit is of the season of westerly winds. This is not because more taro is available at one time than another--it can be harvested at any time--but because it is used most when breadfruit is scarce.

The limiting factor to the supply of taro on Ifalik is labor. The big swamp on Falālap has been planted to taro from time immemorial. More grows there now than can be eaten or taken care of, --especially since the laborious work of weeding and fertilizing it is left entirely to women."

1: Burrows--37 (1947-48). Woleaians
116, 167, 262 Ifalik

"During the war many Woleai people came to Ifalik because the Japanese were using Woleai for an airfield, which not only crowded the natives but subjected them to American bombing. Our interpreter put the number who came to Ifalik at 375. Even if we discount liberally--for his figures could never be trusted--it seems likely that the population of Ifalik was at least doubled then, rather suddenly. Tom assured us that there was plenty of taro for all, and plenty left over; and on information of that kind he was generally dependable."

1: Burrows--37 (1947-48). Woleaians
116, 241, 824 Ifalik

"If we may use the word taro for a moment in a broader sense than the botanists would approve, there are three main types on Ifalik. The one that should not be called taro is the giant arum (filē; Alocasia macrorrhiza) sometimes called in English by the Polynesian name kape. A second is the coarse yellow-fleshed pulaka (pulax, Cyrtosperma chamissonis) grown on atolls far and wide over the Pacific, commonly in artificial pits. The third is true taro, of the type favored on high islands (wot, Colocasia esculenta). This is smaller than the other two, and its leaves are rounded where theirs come to three points. Its flesh is finer-grained, gray in color with a purplish cast.

The giant arum of filē is less exacting in the matter of soil than the others. It grows rankly about the edges of water-holes or, apparently, whereever it can get plenty of moisture from below. Though the natives plant it and weed around it, they eat it much less than the others. (Tom said this was a matter of individual taste, and possibly we did not happen to observe households particularly fond of filē.) Two reasons were given for this. One is that not all women know how to prepare filē properly. A good deal of the outside must be taken off, for one thing. If it is not properly prepared the minute spicules in it will bite the tongue and throat. The other reason is that 'If a man eats filē, he won't catch any fish.'

Pulax is the type grown in greatest quantity in the Falālāp taro swamp (nibwél--to

distinguish from niwel, which means forest or 'bush'.) Everybody on either island has a hereditary right to share in at least one patch in this swamp.

Wot is grown in smallest quantity, apparently because it requires most cultivation. Though highly esteemed, it does not seem to be preferred to pulax to any such extent as on high islands, where pulax may be considered fit only for areas where nothing better will grow. Young leaves of wot, tenderer than those of pulax and filē, are chopped up, stripped of their ribs and cooked for greens."

1: Burrows--37-38 (1947-48) Woleaians
116, 241, 462

"The cultivation of taro (geligeli) is exclusively women's work. It is done either singly or in small groups, such as mother and daughter. Clearing ground to prepare a new patch for planting would require more labor. Presumably, men would be called in for this; but as there is more land in taro than can be used, new patches are hardly ever cleared nowadays.

After planting, the main task is to cut and pull the weeds which threaten to choke out the small plants. A creeping grass whose roots run underground (buyol; Lepturus repens) seems to be the most troublesome. This is where wot needs more care; because it is smaller, for one thing. In places pulax grows eight feet high or more, and the plants crowd so thickly together that one walks under them in twilight. There the weeds are effectively shaded out. [38]

The weeds pulled are usually converted at once into green manure or compost by burying them between the rows of taro. Lagajorang, who gave us a demonstration of the wot planting, first dug a pit about 10 feet long, 3 feet wide and two feet deep. This she did in a surprisingly short time, working with her bare hands in the soft muck. Then she pulled grass and weeds along a neighboring row, laid this in the pit, and covered it over. Finally she brought young wot plants, about a foot long (baulax) from a patch nearby, where they had sprung up from suckers around a parent plant. These she stuck into the bed just prepared, pressing the earth well down and leaving a slight depression about each plant, presumably to hold water."

"A working day in the taro patch lasts from soon after daybreak until about noon. If a woman gets thirsty at her work, she may pause to drink a coconut; but must leave the taro patch to do it. If she were to drink on the patch, the plants would not grow.

The women are perfectly aware of the fertilizing effect of burying weeds under the plants. This, with an idealized view of a gardener's enthusiasm for her work, comes out in one of their songs:

Lovemaking would keep me from my garden.
I like to go there every day.
I don't like to waste time sleeping;
I like to see my taro grow tall.
I heap earth around the wot plants,
Bury leaves all about the wot,
To make it grow faster."

1167 252 Ifalik

"Out of just three ingredients--taro, coconut cream, and fresh coconut toddy--the women prepare a considerable variety of dishes. Those that follow were noted down from gifts brought to us, and do not exhaust the resources of native cookery:

arongiumat-mashed taro with raw coconut cream

aronguvis-whole taro cooked in coconut cream

maigogo-mashed taro, cooked in coconut cream long enough to form a brown crust

malegefale-) big pieces, soaked for a long time in toddy before
pulax vauvau-) cooking. (These seem to be two names for the same preparation; at any rate, if there is a difference, it was not noted.)

pelopel-mashed taro, cooked with coconut cream, put in a bowl and moulded in little square mounds, the hollows between these filled by pouring in toddy.

[39]shewoshū-taro mashed, mixed with coconut cream and toddy, cooked long so that a brown crust forms on top.

(name not learned)-taro cut in small pieces and cooked in coconut cream without mashing. Varieties of rather open texture, among them pulax i sali and annIpenni, lend themselves better to this preparation than the gummier kinds favored for the preceding one.

(name not learned)-taro mashed and cooked with cream and grated coconut meat."

"Though bananas (wir) bear well, and the fruit of some of the varieties seemed to us of excellent quality, the people have a rather low opinion of them as food. They are sometimes eaten, either raw or cooked; but do not compare in importance with breadfruit or taro.

The number of other plants used for food is considerable, but none of them, nor even all taken together, make up an important part of the diet. Arrowroot (mogmog; Tacca leontopetaloides) grows wild under the breadfruit trees. The people know how to make starch (mwisi) out of the roots but rarely take the trouble to do so. We never saw the process or any of the product. Sugar-cane (wou; Saccharum officinarum) is planted on or near house platforms. Children, and more rarely adults, enjoy chewing a piece of the stalk. But one or two clumps are enough for a household.

A plant said to become important in case of famine following a hurricane is gop (Portulaca samoensis). The tiny succulent leaves are washed in sea water, then boiled in fresh water, then crushed with the coral pounder and mixed with coconut cream.

Several plants of European introduction are grown to some extent: squash (a summer squash or marrow), papaia, pineapple. The squash and papaya plants are common, but bear very little, and that of miserable quality. Pineapples are very scarce. I can not recall seeing a plant on the island, but we were offered one fruit, quite a good one.

Fruits of several native trees are eaten, but not especially prized. Those named to me were avūs (Crataeva speciosa) and song (Bruguiera conjugata). The nuts of kazās

(Terminalia catappa?) are enjoyed by small boys enough to induce them to crush the thick, fibrous hulls.

Young leaves from the tips of the branches of a full-sized tree, the aroma (Pipturus argenteus) are said to make edible greens if boiled, mashed, and mixed with toddy and coconut cream."

"The first step in weaving is to set up the warp. This is done on a set of seven pegs stuck in holes on a board about 3 feet long. The pegs project from the board about 8 inches. The order in which fibers of different colors are wound on the pegs determines the succession of longitudinal stripes in the cloth, and the number of turns taken of each color determines the width of each stripe. On every other turn a short separate piece of fiber is passed about the warp and then tied in a small loop or leash around one of the pegs. This procedure is shown in Fig. 4.

The warp thus prepared is then transferred to the loom. The construction of this is shown in Fig. 3.

The weaver sits facing the frame, with her feet braced against it. She fastens the belt about her back, and by leaning back on it keeps the warp taut. The weft is wound on a shuttle shaped like the netting-needles used in making seines. Successive weft fibers are pressed together with a sword. Fringes are left at each end of the piece of cloth. The weaving is entirely in simple check, and the only color patterns woven in are longitudinal stripes. Transverse borders are often embroidered with a needle near each end. The patterns on these include checks, triangles, diamonds, zigzag, lines, herringbone stripes, and a variety of other rectilinear figures."

1: Burrows--40 (1947-48) Woleaians
116, 286, 241 Ifalik

"Though the fruit of bananas is not esteemed, the fiber of the trunk is in great demand for weaving native cloth. Women remove the green outer layer, then peel off in thin strips the fiber of which most of the trunk is composed. They hang it in the sun for two or three days, soak it in salt water for four or five days, then hang it out again for a period that varies from five to ten days, depending on the sunshine. Then they split it to the width desired. Most of the cloths ran between 20 and 30 wefts to the inch. The fibers are not spun, but woven flat.

The bast of hau (gilivō; Hibiscus tiliaceus) is also used for weaving, but is considered inferior to banana fiber. Of the many uses to which this species of Hibiscus is put elsewhere in the Pacific, the only ones customary on Ifalik are for weaving and formerly, we were told, for fishing-lines. The plant is not abundant and does not grow to great size, perhaps because the women cut most of the shoots young. To prepare the bast for weaving, they scrape off the outer bark and soak the sticks in salt water, weighted down with coral, for four days. Then they strip off the bast, hang it in the sun to bleach and dry, and split it into wefts, most of them a little coarser than those of banana fiber. They are said to be good for women's skirts, but too stiff for men's loin cloths."

1: Burrows--40 (1947-48) Woleaians
116, 386, 241 Ifalik

"Whichever plant [KS: banana or hibiscus] is used, some of the fibers are soaked in dye before weaving. Nearly all the dye in use in 1947-8 had been bought from the Japanese. Two native dyes are still remembered, though now rarely or never used. One is a black, obtained from a porous, floating mineral that sometimes drifts to Ifalik. It is ground into water by rubbing on a piece of iron. The other native dye is a red, made by mixing coral lime and lel bark in water. Turmeric paint, though not used to dye fibers before weaving, may be rubbed over finished cloth."

116, 285 Ifalik

"Sleeping mats are plaited from the leaves [KS: of the pandanus] of the variety which is called simply by the generic name far. The leaves are first laid out in the sun until thoroughly dry. They may then either be used as they are, or bleached by soaking in salt water, rinsing in fresh water, and sunning again.

The leaves are split to the desired width by pulling between the fibers a small loop of coconut leaf midrib attached to the right index finger. These strips are then plaited in simple check. The technique gives the mat a double thickness. Mats of plain color, the light brown of the unbleached leaf, are called faulap. The wefts used for this are about 3/8" wide. The other kind, the most prized, is called giegie. The name emphasizes their whiteness, as shown by the fact that giegie is also the name for the snowy-white fairytern. Giegie mats are made largely of sun-bleached leaf; but some wefts of unbleached brown leaf are commonly introduced to make simple, rather widely spaced plaid designs. The wefts of giegie are somewhat narrower than those of faulap. Those observed varied from about 1/4" to 1/8", averaging about 3/16". A small strip of matting of this kind is shown in Damm's Plate 2, No. 60.

Bleached pandanus leaf is also used for the smallest and finest baskets, in which men keep their flint-and-steel or tobacco. These average less than six inches in their longest dimension. One collected is 4 1/2" X 1 1/2"X1". They are plaited in check over wooded blocks that serve as forms. They are made in several shapes. One, like a little pouch,

is called geigas; another, a miniature box with fitted cover, sigurăr. Damm (Plates I, II) shows one of these; also several larger pandanus baskets. The plaiting is similar, but in one the rim is bound with a fine cord, presumably of sinnet, while two have long braided handles. Such large pandanus baskets are not common now on Ifalik. The only one I remember seeing was given to Spiro as a farewell present."

1: Burrows--41 (1947-48) Woleaians
116, 262 Ifalik

"Pandanus fruit is not eaten on Ifalik."

1: Burrows--41 (1947-48) Woleaians
116, 292 Ifalik

"Either far or far en Nuta may be used for hats of flaring conical shape, which are sometimes used by men while fishing. These are called trelivar. Another name, parong, is used only among men. It refers to the under side of the penis, where the edge of the glans has an outline resembling the shape of these hats. A light hoop of gabwi wood forms the rim. To this are attached strips of coconut leaflet midrib which form ribs. They are gathered together in a point at the top. Pandanus leaves, whole except for trimmed edges, are laid vertically over this frame, overlapping and sewed on with horizontal seams of fine sennit cord. A band of the leaf, finely plaited like one of the small baskets, holds the leaves together at the top."

1::Burrows--41 (1947-48) Woleaians
116, 285, 396 Ifalik

"Leaves of the variety of pandanus called far en Nuta, cured but not bleached, are used for sails. Matting for sails is plaited in strips about a foot wide. These are sewed together with sinnet cord, using stitches several inches long. Seams are run both vertically and horizontally. The advantage of making the sail in strips is that it usually limits tearing to one strip. Thus a torn place can be repaired by replacing a single strip of matting."

1: Burrows--41-42 (1947-48) Woleaians
116, 313 Ifalik

"The huge glossy leaves of the variety of pandanus called pogū are said to be worthless for plaiting. They are used only to tie about the trunks of [42] coconut trees, making a band whose slippery surface is said to keep rats from climbing the trees and eating the young nuts. This device is little used on Ifalik. No bands of pogū were seen there, though the practise is referred to in a song. But a walk about Satawan during our few hours ashore there revealed many trees with these pandanus bands about them."

" Native Timber Trees

Names of other trees used for timber, with more specific notes on the uses, follow:

aro-Straight shoots used for palings on house walls, or slats on canoe platforms; saplings used for canoe poles; large trunks for house posts.

gaingei-Proverbially strong. Used for some of the small pieces of canoe outrigger attachment. A favorite for levers, poles, walking sticks.

kelau, kalua-First choice for house posts. Said to be very durable in the ground.

kili-A small tree. The tough wood is used for canoe paddles and smaller house timbers.

lel-House timber.

mog-House timber.

rages-(Also called sevang and vitou) canoe end-posts and outrigger booms.

sol-House timber.

treli-a hard wood with various uses; its forks favored for the forked sticks attaching outrigger floats to booms.

wutu-House timber.

tria-Hard, straight-grained wood used to make men's combs."

1: Burrows--42 (1947-48) Woleaians
116, 322 Ifalik

"Pandanus trunks, like those of coconut, have an outer shell of very hard wood and a comparatively pithy interior. This tubular structure may make them strong for their weight; at any rate, they are favored for certain house timbers where both strength and lightness are wanted, such as king-posts and supports for the overhanging rounded end of roofs. Strips cut from the hard shell alone are put to a few uses for which thickness is not required, --for example, slats to form the floor of canoe platforms. To judge by this use, pandanus wood will stand salt water better than that of coconut."

1: Burrows--42 (1947-48) Woleaians
116, 301 Ifalik

"The fragrant petals of the pandanus flower, fastened together so that their pointed ends project like a crown, form a particularly effective garland for the head."

1; Burrows--43 (1947-48) Woleaians
116, 276 Ifalik

"Two kinds of pepper plant (gabwi) grow on the island. One of them is said to be the right kind (piper betle) to chew with betel nut. There are a very few, perhaps a half dozen, small betel palms (Areca catechu) on the island. But chewing betel is not a local custom. The other kind of pepper is not used as a drug, so far as is known.

The natives are fond, perhaps overfond, of tobacco. A few plants are coaxed up through the coral gravel on house platforms, but nearly all the tobacco is imported. Even neighboring atolls, as Faraulep and Ngulu, export 'Caroline smoke' to Ifalik."

1: Burrows--43 (1947-48) Woleaians
116, 278, 824 Ifalik
1-2

"The following list of plants used for medicine was obtained during the general survey of plants and their uses. Many remedies are hereditary secrets, so the list is certainly not complete. As will appear in the list of rituals seen (p. 184-6), the main emphasis is not on herbal remedies, but on getting supernatural help.

angorIk-aromatic herb, put in medicine ritually prepared, blessed by the gods, and drunk as a preventive. Also considered healthful in drinking water for babies.

aro-a green leafy branch is waved over the medicine as part of the ritual, dipped in the bowl, and used to sprinkle these who are taking part.

bwogorewau-an aromatic sedge that grows in the taro swamp. Said to be very good for the stomach, if taken in coconut juice. Used in babies' drinking water.

korax-Herb. Used medicinally; no details obtained.

livalus-Tree. Bark scraped, put in coconut fabric, strained into water for babies to drink.

olu-Leaves wrapped in coconut fabric and soaked in water, which is then drunk to help stomach trouble and loss of appetite.

sol-Some men know (informant did not) how to make a medicine from this tree to cure a red eruption on the skin.

song-Bark scraped, put in coconut fabric and strained into water for babies to drink.

ualomax-A vine. Infusion of leaves drunk for stomach."

"Both men and women, but especially men, are fond of wearing flowers on the head, about the neck, or in the hole in the lobe of the ear. A few kinds such as the red hibiscus, are worn for color only; but fragrance seems to be even more prized.

angorlk-(turmeric) The crushed leaves are rubbed on the skin, hung in the ear-hole, or worn wherever they will hang. Espècially fragrant when [44] partly dried. One of the plants beloved of the gods, which grows in the sky as well as on earth.

aro-This tree, whose leafy branches are used in ritual, has also a fragrant flower.

atogobwei-A vine. Lovers are said to rub the leaves on their necks to sweeten their embraces.

Flèrōs-(Red hibiscus). For color only.

giǒp-(Spider lily). For form, color, and fragrance.

guruguru-Herb with aromatic root.

Kerriō-Bush with clusters of small flowers used in garlands.

raguēs-(also called geval and sevang) fragrant flower.

remag-(also called natu) Flowers worn in hair, or used for garlands.

seuru-(Plumeria) For color as well as fragrance.

waryng-An herb with aromatic leaves, grown on house platforms. The gods grow this in the sky.

wutu-The long-tubed white flowers of this tree are prized for their fragrance. This, too, grows in the sky."

"Miscellaneous Uses of Plants

Leaves of two ferns are used for the scanty covering which young girls tuck under their belts before and behind. One of these, riri, is especially common about the base of coconut trees, and among the moss that covers some of their aerial roots. It is worn green. The other, ènènux, a bird's-nest fern, is cured in the sun before wearing.

Root fibers of two plants are used for fish lures. The root of the guan, after the outer layer is removed, is soaked in salt water, bleached in the sun, then split into narrow strips, which are tied to the shank of a fish hook. This lure, called ueluelīōp, gleams in the water and is said to be very effective. The white fiber of a bunch grass or sedge called bogo li le pā is used in the same way.

The inner bark of the aroma tree is said to be so tough that fish can not bite through it. After being dried in the sun, it is sometimes attached to a hook as a leader.

The aerial roots of the gïliao, a banyan, are sometimes used for preliminary lashing on a canoe, before the permanent lashing of sennit cord is put on.

A dried moss is sometimes laid between the planks of a canoe. It is said to [45] decrease leaking. This was not done, however, in any of several canoes built during our stay on the island."

1: Burrows--45 (1947-48) Woleaians
H6, 824 Ifalik

"The following plants were dismissed as weeds ('blong nothing'):
atilt, a small herb.

buyol-The creeping grass which is the great pest of the taro swamp.

kamarag-Staghorn fern, apt to overrun the ground under the breadfruit trees.

Keisis-also kevakual. Small herbs.

talingilipat-mushroom or fungus--'Many kinds, one name'."

1: Burrows--46 (1947-48) Woleaians
116, 342 Ifalik

"Dwellings are built on Ifalik almost exclusively for shelter. They are hardly valued at all as works of art or means of displaying the prosperity of their owners. Consequently the only requirements for an ordinary house are a roof and walls that will keep out sun and rain, and a frame that will withstand a strong wind.

As befits the strictly utilitarian character of the craft, the position of house-carpenter is not especially honored. There is no formal, restricted lore of house-building, as there is of canoe-building, navigation, and tattooing. No myth was collected attributing the origin of this craft to the gods, though there are such myths for all three other crafts. Three songs were collected in praise of shipwrights; none in praise of house carpenters."

1: Burrows--46 (1947-48) Woleaians
116, 335, 342 Ifalik

"The term for master-craftsman, sennap, may be applied to builders of dwellings (sennap a l'im) and experts in repairing public buildings (sennap a li gasu van or sennap a li gatchu li fal). But there seems to be some doubt about who deserves these titles. Tom once said there were recognized master-builders; but later, when asked to name them, contradicted his previous statement. 'Everybody savvy', he explained. When the same question was put to the chief, Maroligar, he gave three names; then added 'I think, Totogoeiti (Tom's native name); and finally, when pressed--for he supervised repairs on public buildings in Rauau--admitted he was one himself. After further consideration, he said that three-Toroman, Maroligar and Totogoeiti--were big experts. Three others--Wolpetau, GauaisIg, Arovalimen--were less advanced. If Tom contradicted himself, Maroligar at least wavered."

"Fig. 4. -Construction of Ifalik dwelling (im) or canoe-house (fan ni wā); end elevation.

"In practise, building an ordinary dwelling is a household undertaking, which any adult man may supervise. Building a canoe-house or men's house must be quite a rare event. None was put up during our stay, nor, so far as I learned, in the memory of anyone living. Several times particular timbers, which broke or were thought to be in danger of breaking, were replaced. In that way a building can be made to last indefinitely.

The indifference to house-building, as compared with other crafts, seems to reflect degeneration. Sarfert noticed in 1909 that painted decorations were to be found on only a few old house timbers, and inferred that houses had once been more elaborately decorated than they were at the time of his visit. The process has gone further since then. The rectilinear designs he found on a few timbers are not to be seen anywhere in Ifalik now, though something of the kind was noticed on the front of a shrine or god-house on Lamotrek.

More striking is the almost complete disappearance of what Damm, from Sarfert's notes, describes as the old type of house. It has squared timbers, which fit into each other and form a frame for panelled walls. To be sure, the account is somewhat confused; for instance, no names are given to correspond to some of the house parts numbered in a sketch, apparently redrawn from one by Sarfert. Yet some names of parts are given that differ from any I collected. Any gaps in detail do not obscure the general plan of the house, which seems to have been drawn from something Sarfert saw, not merely from something he was told of. The only building at all like it in 1947-48 was one

[47] of two occupied by Tom. Most of its timbers were of foreign sawed lumber. Walls of several buildings, including the men's house, were of lattice work, others of upright palings fitted into heavier beams. But the beams were unsquared logs, and the holes bored with foreign augers. In a few houses, however, the stringers are squared, as in Damm's 'old type'.

It seems probable that houses of hewn and fitted timbers were once more common than they are now. Yet timber can never have been abundant enough to make many of them. Most of the houses must always have been of a simpler type, presumably like the one that prevails now. This type is shown in Pl. 2a. Its structure is diagrammed in Fig. 11."

I: Burrows--47 (1947-48) Woleaians
116, 343, 285, 335 Ifalik

"Cook-sheds and canoe houses have no walls, but dwellings are almost completely walled in by panels of coconut leaf, plaited in twill. These can be unfastened and slid aside, making a door wherever one is wanted. They are called gili. The same name is used for the smaller of two sizes of sitting mat made to spread on the coral gravel of the floors. These gili are plaited from two halves of a leaf in the same way as thatch sheets. But the leaf is cured, the leaflets doubled before plaiting, and the plaiting carried nearly to their tips, then finished off in a braid. A wider floor-mat, called topoxau, is made more like a ridge sheet; but the two split halves are laid with their bits of midrib in the middle, and the two sides are finished with braids.

The most ingenious feature of construction, particularly in canoe-houses, is the rounded gable. A ridged roof, thatched only on two sides, is not enough to provide shelter in a wet country. Something must be done to keep rain from entering at the ends, when the wind blows in. The solution traditional in Ifalik is, first, to extend the ridge-pole at both ends, and slant the end rafters out to the ends of the ridge-pole, so that the peak of the roof overhangs; second, to build rounded extensions under the peak at both ends. These, covered with thatch, give the ends of the building as good protection from rain as the long sides. (Pl. 2a; Fig. 5)"

1: Burrows--47 (1947-48) Woleaians
116, 342, 285, 335 Ifalik

"As already noted in enumerating the uses of coconut, the roofs of all buildings are covered with coconut-leaf thatch. This is not so durable as thatch of the leaves of pandanus, sugar-cane, or sago, all of which are used on native houses in some Pacific islands. But there is no sago on Ifalik, and not enough pandanus or sugar-cane to go around. When thatch of coconut-leaf begins to leak it can be replaced fairly easily.

To make thatch (aso) each leaf is split down the middle. Each half of the midrib is trimmed to lighten it. The two halves are laid together, with the half-midribs on the same side, and the leaflets plaited in simple check for about half their length. The thatch sheets so made are laid out in the sun for three or four days to begin drying, before they are put on. Some are more thoroughly sun-cured and are then called aso gili. In thatching a roof, the sheets are tied to the rafters, beginning at the eaves and working upwards. The lower side of each sheet hangs free, overlapping the sheet below. Special sheets are made for the ridge by using one leaf unsplit, and plaiting the halves of a split leaf on each side of it, with their half-midribs outward. This makes a ridge-sheet with a whole midrib along the middle, and a half-midrib along each edge."

1: Burrows--47-48 (1947-48) Woleaians
116, 342, 335 Ifalik

"In a cook-shed or dwelling, the rounded end is supported by one or two small posts; commonly one in a cook-shed, two in a dwelling. In the most [48] carefully built dwellings, in which the stringers are hewn square (and in that case called goragu), the purlins under the rounded ends are also squared, and fitted to the stringers with overlapping joints."

1: Burrows--48 (1947-48) Woleaians
116, 343, 335, 401, 284 Ifalik

"In a canoe-house, however, the ends can not be obstructed with posts, for that would prevent carrying canoes in and out. The manner in thich [sic] the rounded gable is suspended, without supporting posts, is shown in Figure 5. In the first place, the whole structure is lightly built. The eave purlins are not squared beams, but light, flexible withes. Purlins and rafters of the rounded end are lashed to purlins and rafters of the long sides, which take up some of the weight. The rest is supported on two beams (numbered 6 in the figure). Their projecting ends converge under one of the purlins of the rounded extension. Their inner portions rest on tie beams, and the inner ends are fastened by a lashing of stout rope to the stringers below them. This lashing is not very massive, and apparently carries no great weight. It will be seen that both the extension of the peak of the roof, and the suspension of the gable on overhanging beams, involve application, though not in a very bold form, of the principle of the cantilever."

1: Burrows--48 (1947-48) Woleaians
116, 335, 345, 532 Ifalik

"The construction of the men's house (fan nap) is shown in Figure 6. It has several distinctive features. The ridge-pole is supported, not by a king post resting on a tie-beam, but by a row of middle posts. The two posts under the ends of the ridge-pole are squared, and the one under the front end is decorated with paintings and a phallic carving (Pl. 4, a). The corner posts are slabs of beach sandstone. The gable ends are filled by vertical walls extending from the peak to the height of the eaves. These walls are covered with coconut leaf, applied in a different way from the thatch of a roof. The lower ends of the leaves are bound in with wooden battens, producing a flat, smooth surface, instead of the shaggy one of a thatched roof, in which the lower ends of the leaves hang free."

"Dann, in his account based on Sarfert's notes, attributes the introduction of men's houses on Ifalik to Fagil, a man from Yap. Fagil is said to have been shipwrecked on Ifalik during the regime of Dibodan or Dibodău (recorded by me as Tipateu). On the list of chiefs he is only four earlier than Daoreligar, who was in power when Sarfert visited Ifalik in 1909. This would make men's houses a fairly recent innovation.

No story of Fagil was told to us in 1947-48. But recent introduction of men's houses is contradicted by several points in the legends we collected. The house Ilamai or Iramai which Damm gives as the dwelling built by Modj (recorded by me as Maur), was described to us as the men's house on Falālap in Maur's time. Though there is no longer a men's house on that island, the site of Iramai is still pointed out. Maur is also said to have made use of the men's house Katelū on Falārik. The site of the ancient Katelū was just inland from the present men's house, also called by that name. A general point that seems to corroborate the ascription of antiquity to men's houses is the fact that they are characteristic of the culture of the western Carolines as a whole. Their absence on Ifalik would be anomalous.

If only the type of construction peculiar to men's houses, with middle posts and stone corner posts, were attributed to Fagil, the discrepancy would disappear. [49]

Damm's story adds that the men's houses built by Fagil were on stone piers projecting into the lagoon. Such stone piers still exist on Ifalik. The men's house is not built on

one of them, nor was it in Sarfert's day. He was told that a house on one of the piers had been destroyed in the typhoon of 1907. Rather flimsy houses stood on piers on Falārik and Falālap when we arrived. One was destroyed and the other partly so in the hardest blow during our stay. The two piers in Rauau district had no houses in 1947-48, but were said to have had them at some previous time."

"Although no large buildings were constructed during our stay, techniques of lifting massive timbers into position were exemplified by replacement of beams in two canoe-houses. In October a huge breadfruit log, more than two feet in diameter and sawed through at one end, drifted ashore from parts unknown. Such figts of the sea are the main source of supply for corner-posts of the canoe-houses. It was decided to use this one to replace a rotting post in the canoe-house called Fale Pënga.

First the log was rolled ashore. Poles or light logs were thrust under it on the landward side to serve as skids. Similar posts were used on the seaward side as levers.

The hole in which the old post stood was now widened by digging on the outer side. Temporary supports for the roof at this corner were lashed together and put in position. The type of support used is shown in Fig. 7, a. At first the upper ends of the two pairs of uprights slanted toward each other at a considerable angle, greater than that shown in the sketch.

A double lever (Fig. 7, b) was now made of coconut logs to hoist the roof. There was room enough for more than a dozen men to work on it at a time. Their efforts were coordinated by a responsive song or chantey. As the sketch shows, the lift was transmitted to the stringer of the house through a crosspiece and upright post.

The height gained by each lift of the lever was secured by moving the lower ends of the supports toward each other, making the uprights more nearly vertical. The crosspieces at the base, to prevent them from slipping out again, were then repegged in the

new position. With the supports in position to take the weight of the roof, the lever was released and made ready for another lift by moving the fulcrum a little nearer the raising end. When the roof was high enough to give the necessary clearance to the corner posts, the supports were pegged in a final, nearly vertical position. They were then supplemented by a log cut to just the right length and set upright under the stringer a little in from the supports.

With the roof securely out of the way, the post to be replaced was removed. A heavy line, made up of six strands of the large size of sennit rope used for morring[sic]canoes, was fastened around its upper end. A fairly light pull on this was enough to topple the upper end of the post out from under the roof, so that its outer side rested against the side of the hole. It was then taken out of the hole by hauling on the line. This was the stage of the job requiring the greatest application of power. The haul on the line was supplemented by prying on levers thrust under the inside of the post (Fig. 4, c). At one time 39 men were hauling on the line. At the crucial moment some of [50] the women, who had been looking on and encouraging the workers, took a hand themselves. To prevent the post from slipping back while the workers paused for breath, the line was snubbed around two trees, passing from left to right around one of them, from right to left around the other (Fig. 7, d).

The new post, it now appeared, was a little longer than the old one. The hole for it was dug deeper, an easier task than cutting through the massive post again with axes

and hand saws. As the hole was deepened, it began to fill with water. The prospect of the water rotting the post at the bottom did not disturb anyone. When the hole had reached the necessary depth, one end of the new post was hauled into position over the hole. The other end was raised by the same techniques of prying on levers and hauling on a line that had served to remove the old one. The bottom of the post slid into the hole. It was then carefully lowered into the same position the old one had occupied. By holding the roof with the big lever while the bases of the supports were spread apart, a little at a time, the roof was gradually lowered back into position. The hole about the post was filled in and tamped. The temporary supports were removed, and the task was finished.

The whole process made nearly a full day's work for all the available men of Rauau district. It was done in the afternoon of one day and the morning of the next. Men were coming and going every now and then, so no one figure would give the number of workers accurately. The largest number actually busy at any one moment would be the 39 counted hauling on the line, plus three or four more with levers."

"Another repair job, requiring somewhat different techniques, became necessary in December, when the stringer that held up one side of the canoe-house Sabwōlap broke in two. Coconut logs, the only timber available for these long stringers, are not well adapted to the purpose. As their centers are rather pithy, the lateral stress imposed by the weight of the roof must be taken mostly by the thin shell of hard wood on the outside. Squared beams of a solider wood form the stringers of the men's house; but there are not enough logs of the necessary length to supply these for the canoe-houses.

In order to take out the broken stringer and replace it with another coconut log, it was necessary to raise one whole side of the roof. Accordingly, a row of temporary supports was required, instead of the pair that had sufficed for the corner-post replacement. But they were of lighter construction: pairs of light logs, crossed like an X, and held together with lashings at the top middle, and bottom (Fig. 8, a). Light logs, lashed under the rafters to take the weight of the roof while the stringer was being replaced, rested in the upper lashing of the X supports. The lower lashings helped to prevent spreading and settling. They were reinforced by pegs driven in at the base.

The roof was lifted, bit by bit, by means of a lever of coconut log. Since only part of the roof was raised at a time, a single log served for a lever, instead of the pair used on the corner-post job. The vertical post that transmitted the thrust of the lever to the roof rested at the bottom in a notch cut in this log. At the top it was lashed under one of the logs that temporarily supported the roof. The height gained by each lift was taken

up by narrowing each of the X supports tightening their lashings, and shifting the pegs (Fig. 8, b). Elderly men and boys worked on the supports, while young men at the height of [51] their strength worked on the lever. Getting the roof tilted to the necessary height, by many repetitions of this process, took about half a day.

The new stringer was now lifted into position. First each end of it was lifted upon a post, which leaned against a pile of crossed logs about waist high (Fig. 8, c). Then the ends were lashed to these posts at the point which would bring the new stringer into position on top of the corner-posts when the supporting posts were vertical. Long, stout lines were attached at each end. The log was now raised into position, with all available men hauling on the lines. At first a few lifted by hand on the ends of the log. At the hardest part of the pull, women, too, took a hand on the lines.

By releasing the lashings gradually, the new stringer was settled into position on the corner posts. Then the roof was let down on it gradually by reversing the process used to lift it; that is, it was held with the lever while the X supports were widened, then let down into the new position.

The stress of tilting and lowering the roof was too much for a tie-beam that supported one of the king-posts. It broke just as the roof was being settled into place. Apparently this piece of hard luck was not altogether unexpected; at least the men took it with good-natured resignation. Another lifting and lowering job was now required in order to replace the tie-beam.

1: Burrows--50-51 (1947-48) Woleaians-3
116, 358, 401, 483, 335 Ifalik

A log of pandanus, cut to reach exactly from the ground to the ridge-pole, was set up as a temporary substitute for the king-post. (This temporary structure was of the same type as that used permanently to support the ridge-pole of the men's house.) It was set up on a slant at first, then gradually raised into vertical position as the roof was lifted. This was done with levers and X supports, as before, except that a new type of lever was brought into use. A scaffold was built, consisting of four uprights, with crosspieces lashed to them at various heights. These cross-pieces served as fulcrums for the lever, higher ones being used as the roof gained height. Small supplementary levers were used part of the time. When the roof was raised clear, the new tie-beam was lifted into place by the same technique as that used for the stringer. The king post, a comparatively light piece, was passed up by hand to men standing on the tie-beam. Supplementary uprights were set up under the new tie-beam. These, and the temporary post holding up the ridge-pole, were left in place for several days, in case the new tie-beam was too weak for its load. When it proved to be adequate, the temporary supports were removed."

"Fig. 8. -Techniques used in replacing stringer of a canoe-house.

a, X-support, of light logs, sennit lashing, and pegs.
b, X-support narrowed to gain height as roof is lifted.
c, method of lifting stringer into position on top of corner post."

116, 396, 554 Ifalik

"A canoe, of all material possessions, brings most glory to its owner. And the building of canoes is beyond comparison the most highly developed craft in Ifalik. Anyone can build a little one; but the construction of that master-piece of Micronesian workmanship, a sea-going sailing canoe, requires the permission of the chiefs, and is entrusted only to recognized experts (sennap), who have learned their art by something like apprenticeship from another expert. During our stay, seven men were recognized as master-shipwrights. The honor accorded this title is exceeded by only two others: that of hereditary chief, and that of navigator (palū), who can pilot one of these canoes to other islands."

1: Burrows--52 (1947-48) Woleaians
116, 552, 501, 782 Ifalik

"Sailing canoes and large paddling canoes are given the names of tracts of land. Sarfert recorded an additional point, that these are the tracts on which grew the breadfruit tree that furnished the timber for the boat. Though I was not told this in detail, it fits what was told. The name of the sailing canoe built for Tom during our stay is Melegubwol, after a breadfruit grove just inland from the canoe-house where the vessel was built. Asked whether these names are supposed to have power to bring a canoe safe home from overseas, Tom said they are. Although he was sometimes over-eager to give an affirmative answer, this one is supported by a similar idea in a prayer, intoned to the god Soupalele when a canoe is casting off for an overseas voyage:

Lay the anchor in the woods!
Lay the anchor in the woods,
O Soupalele!
Put my anchor in a huge tree in the interior!
Right in the middle,
The very middle of the land.
When my canoe goes,
Let me return to this land!"

1: Burrows--52 (1947-48) Woleaians
116, 501 Ifalik

"Ifalik is said to be better supplied with canoes than any of the neighboring islands. The total number on the island in January, 1948, (not counting hulks considered no longer seaworthy), was 91, or one for every 2.7 persons in the population; surely a remarkable showing for a place that has so little large timber. Three sizes are recognized: large sailing canoes with platforms (wā verugIt, 'big canoe'); canoes of medium size with several thwarts for paddlers (wa fatòle, 'paddle canoe'), and canoes with only a single seat on the outrigger booms (rosemāni). Of the total of 91, 23 were sailing canoes, 21 medium-size paddling canoes, and 47 small rosemāni. * Sarfert recorded a different classification: wa li wuei, a large sailing canoe; manuwili, smaller sailing canoe for fishing; kafadule, paddling canoe for 4-5 men; djasemali (equivalent to rosemāni in his orthography), paddling canoe for 1 or 2; and fofat raft, a term I also collected."

"* The spelling of this word follows the attempt at phonemic orthography discussed in Appendix I. The commonest pronunciation is trojemān."

1: Burrows--52-53 (1947-48) Woleaians
116, 396, 501 Ifalik 1-2

"In construction of hull and attachment of outrigger, canoes of all sizes are essentially alike. The small rosemāni have no thwarts except for the inboard portions of the two booms, while larger canoes have additional thwarts nearer each end. All canoes carry paddles (fatole) and wooden scoop-shaped bailers (mat). Paddling canoes are poled in shallow water. When not in use, the poles are laid over the booms just [53] outside the hull, and kept in place by sennit loops (taninga ni meinin) near each end. Wooden trays (tarong) rest on the booms just outside the hull, and are attached by lashing. They are used to carry small articles, which are more likely to stay dry there than inside the hull. In sailing canoes, these are replaced by large platforms (Fig. 7, d, e), not only on the outrigger side but on the lee side as well.

Large canoes conform in every respect but one--symmetry of the hull on Ifalik--to the 'flying proa' type described by Haddon and Hornell in 'Canoes of Oceania'* as characteristic of the western Carolines. Characteristics of that type which are present in Ifalik canoes are:

triangular outrigger platform

"* Throughout the following account, the terminology in English follows that of Haddon and Hornell."

lee platform on the side opposite the outrigger
forked heads at the top of both end-posts
two outrigger booms, curving downward
outrigger float attached to booms by crutch-shaped Y connectives and cord brace made up of multiple lashing. (A difference here is that in Ifalik the connectives are not pointed and driven into the float, but flat-ended, and carefully fitted to press against it. These connectives take only stresses that push the float toward the booms. Stresses that pull float and booms apart are taken by the cord brace.)

The characteristic of the 'flying proa' elsewhere which is not shared by Ifalik canoes is asymmetry of the hull. In the classic 'flying proa' type, Haddon and Hornell say, 'one side, the weather or outrigger side, is more rounding or fuller than the lee side.' As will appear in the account of drawing lines to guide the shaping of the hull, Ifalik hulls are carefully made symmetrical, longitudinally and transversely."

1: Burrows--55-A (1947-48) Woleaians
116, 396, 501 Ifalik

"Fig. 9. -Two types of forked head (metaliwā) for the ends of a canoe.

a, the type called kawalu, used on Ifalik.
b, the type called pōpō, attributed to Seimeligarāra."

(1947-48)

"Fig. 10. -First measurements on the bottom of a canoe.

ABDF is the top of the log, which will be the bottom of the hull. It is called arol. BC and DE are the dividing lines between the end sections, called pōpō, and the middle section, called gawal. The gawal is one half the total length; each of the pōpō one quarter. The dividing points B and D are called annetok."

1: Burrows--53-56 (1947-48) Woleaians
116, 396, 341, 773 Ifalik 1-7

"Details of construction were recorded by Sarfert and Damm and, following them, by Haddon and Hornell. What additions can be made here will be given mostly in the accompanying figures. The following account will emphasize the process of building a canoe and its supernatural sanctions. The membership of the working parties, and the obligations which bring them to the job and keep them on it, will be discussed in the chapter on economics.

The fine point in construction of the hull is the drawing of lines to ensure its being hewn to a symmetrical shape. Tom said: 'Suppose some man savvy chop, no savvy line; he no savvy carpenter.' The origin of the lore of drawing lines is explained in the following myth. [KS: See category 539] This is one of several versions of one of the most popular tales about the sky-dwellers. In this one the building of a new type of canoe is emphasized. What is the climax in two other versions (one collected by Spiro, the other embodied in a song) is omitted here--details of how Galēt, by reawaking his wife's passion for him, induced her to follow him back home. All the characters are supernatural beings, though they behave much like human islanders.

HOW SEIMELIGARĀRA TAUGHT CANOE-BUILDING TO SEILANGI

Galēt was very sad because he could not see his wife. He was living in the Men's House, while she, Ganauliwlr, was in her mother's house. He did no work, staying

inside his mosquito net. Food was brought to him there. GanauliwIr, too, stayed inside the mosquito net in her mother's house. [54]

Then Virar came, and took GanauliwIr away with him to Ulimatau.

Galet had two brothers, Wëtreilók and Uterang. Wëtreilók was the husband of Seramaliwok, sister of GanauliwIr.

Wëtreilók said to his wife 'I am going to talk to Galēt. Then we will go bathing together. While we are in the water, you come past, dressed in your best clothes.'

Seramaliwok made ready, putting on a new skirt, flowers in her hair, and red turmeric paint on her face and body.

Wëtreilók went to the Men's House and called to Galēt, who was asleep in his mosquito net.

'Wake up, Galēt! Your wife is gone! Virar took her away!'

He persuaded Galēt that the first thing to do was to go bathing.

While they were in the water, Seramaliwok came by in all her finery.

'Oh, look!' Galēt cried. 'There is the wife for me!'

'Never mind that one', Wëtreilók replied. 'She is my wife. But she is nothing compared to her sister. I mean GanauliwIr, the wife that Virar took away from you.'

'Is GanauliwIr as beautiful as all that?'

'Indeed she is.'

The thought of losing such a beautiful woman made Galēt furious. He blew his whistle,

until people said 'What's the matter with Galēt?' He took a stick and began to wreck the Men's House.

His father, the chief, tried to console him by summoning all the women, so that Galēt might look them over and choose the one he liked best to be his new wife. When they came, there was one that Galēt thought he liked very much.

But Wētreilok told him 'Oh, she is nothing like so beautiful as the one you had before.'

Galēt broke out again in fury. He blew his whistle, took his stick, and began to wreck his father's house.

Then he decided to have a canoe made, so that he could go to Ulimatau and try to get his wife back. The work was in charge of Seimeligarāra, who had studied the art of canoe-building with Seilangi and Wolfat. He made a canoe in the most approved style of the time. But Galēt did not like it.

'What kind of canoe would you like?'

'Oh, I want something different.'

Seimeligarāra went to Seilangi and asked 'What kinds of canoes can you make?' [55]

Seilangi said 'Only the one kind, like all those we have here.'

'Well just you wait. I'm going to make something different.'

So Seimeligarāra went to work and made a canoe with a special kind of forked end (metaliwā). The fork had a wide, round opening instead of a pointed one. Moreover, he painted the inner curve of the fork white; the outer half, black, instead of making it

black all over. When it was launched it looked very fine, and proved to be a fast sailer. Galēt was greatly pleased with it,

Galēt said 'Now I am going to Ulimatau to get my wife. Who is going with me?'

His two brothers, Wëtreilok and Uterang, went with him; also Wëtreilok's wife, Seramailowok.

Galēt took the sheet. Uterang went aft and took the wheel. Wëtreilok went below and manned the pump.*

Seramaliwok lay on the platform over the outrigger, under the pandanus shelter (gaimwemwe). Galēt had had this rigged so that it opened toward the hull of the canoe instead of away from it, as is usual. This was so that he could look at Seramaliwok.

During the voyage Galēt flirted with Seramaliwok, and at last put his finger in her genitals.

Wëtreilok, down in the hull, smelled the discharge, but went on working the pump.**

"* Tom said 'wheel' and 'pump', although in an Ifalik canoe, to this day, steering is done by a steering paddle, and bailing by a wooden bailer.

** This bit of obscenity, which has nothing to do with the rest of the story, unless to emphasize Galēt's passionate nature, seems to be introduced for humorous effect. I took it down solemnly, but found out later that a more acceptable response would have been uproarious laughter."

They reached Ulimatau and took down sail and mast.

Seramaliwok went ashore and found her sister, GanauliwIr, in the house of Virar.

'Where is your husband?'

'He is out in the bush, putting pandanus leaves around the trunks of the coconut trees so that the rats can't climb them and eat the young coconuts.'

'I have come to take you with me.'

'Where?'

'To see your old husband, and decide whether you like him best.'

'All right. But the husband I have now is a wonderful man. There is no-one like him.'

'Still, you'd better come and see the old one again.'

When GanauliwIr saw Galēt, the husband she had deserted, she decided at once that she loved him best, and got in the canoe with him and went back to Ururial.

(At this point in other versions comes an account of a dance in which Galēt wins [56] back his wife's love; and on the return journey, instead of going in a canoe, she follows him as he walks on the waves.)

After the canoe he built had made such a successful voyage, Seimeligarāra went to Seilangi and offered to teach him canoe-building. He said he was willing to do this because he, Seimeligarāra, did not have enough people to work for him, while Seilangi had plenty.

So Seimeligarāra taught Seilangi the art of the measuring-line. If you use it rightly,

the canoe will be fast in the water. If you don't use it, but rely on your eye and the adz, the canoe will be very slow. Seimeligarāra taught Seilangi all the proper measurements.

Seilangi went to work on a canoe. Whenever he had any doubts or difficulties, he took them to Seimeligarāra. Seimeligarāra taught him how to shape the bottom of the canoe, how to shape and measure the sail, and how to make holes in the outrigger float to tie it to the booms.

Seilangi taught the art of the line to SemerIk. From these three it spread among the gods. People down on earth asked the three gods to descend and teach them the art. The gods came down, so now people know how to shape a canoe.

In this story the special shape of forked end made by Seimeligarāra evidently symbolizes the whole art of shaping a hull by means of lines. The forked end is called metali wā, face or eye of the canoe. The particular shape introduced by Seimeligarāra is called pōpō, the name used by Haddon and Hornell (from what source is not stated) for the type of 'flying proa' used throughout the region. On Ifalik pōpō is also the name of the two end sections of the underbody. The Hamburg expedition obtained a model canoe on Ifalik with this kind of forked end. Its name, they were told, was gauat, and there had been one on Ifalik until the typhoon of 1907. Tom said that in Ifalik a carpenter might

still build a canoe of pōpō type if he wanted to, and that there were many in some other islands. In a version of the Galēt story collected by Spiro, without native text, the peculiarity of the canoe built by Seimeligarāra for Galēt is that the hull 'turns at an angle.' Conceivably this could be a way of describing an asymmetric hull. However that may be, at present the story serves on Ifalik as a mythological charter for the practice of drawing lines on a canoe hull so that it can be hewn into a symmetrical shape."

1: Burrows--56 (1947-48) Woleaians
116, 396, 173 Ifalik

"Damm's account, based on Sarfert's visit, mentions a myth which attributes the first canoe to Seilangi. The only further detail is that he brought the art down to mankind on the island 'Modj', four days' journey south of Truk. Damm identifies this island with Modj (on our charts More) in the atoll Satawan in the Nomoi or Mortlock group. No point of origin was known to my informants."

1: Burrows--56-57 (1947-48) Woleaians
116, 396 Ifalik

"The first day in canoe building which is regarded as of vital importance is that on which the bottom is first measured off. The tree has already been selected and felled, the log for the underbody roughed out and hauled to the canoe-house where the work is to be done. On the morning of the day when the first lines are to be drawn, the workers may not touch food, except for a drink of fresh coconut toddy. [57]

Before beginning the work, the carpenter takes a coconut and offers it to the gods Seimeligarāra, Seilangi, and SemerIk, with the following prayer. (The English words for the first line seem to be a paraphrase rather than a translation.)

Eia ngalir tautou,	Gods of the carpenter
Tautou bwo li valval,	Carpenter of the measuring-line,
E bwe gatre tipal.	He will be happy.

Tom said this was the whole text of the prayer, but explained that the carpenter was going to be happy because his canoe would be light and fast, and would not sink.

The instruments used for measuring are a sennit line (tal ni valval), a flexible ruler (tageluvā) made of a strip of coconut leaf midrib, a bit of leaflet midrib for measuring short spaces, a pot of red paint and a wooden pen or marker."

1: Burrows--57 (1947-48) Woleaians
116, 396 Ifalik

"First the length of the bottom is measured off with the line. Then its middle point is found by doubling the line. The line is redoubled, giving a length one quarter of the total. This quarter distance is measured off from each end and marked. This divides the bottom into three parts. The two at the ends, called pōpō, are a quarter of the total length; the one in the middle, called gawal, half of the total. The bottom is to be curved along the pōpō, straight (or nearly so) along the gawal. This ensures that the two curving ends shall be of the same length.

Next a double line is stretched along the median line of the bottom (ABDF in the figure). With ruler and paint, lines are drawn on each side of it. Lines are then drawn with the ruler on each side of the median line. (ACEF in the figure represents one of them). The distances BC and DE and the corresponding ones on the other side, are carefully measured with a strip of leaflet midrib to make sure that they are all equal. This ensures symmetry of the underbody (pongo) at this stage, both longitudinally and transversely.

The master carpenter then gives permission for the workers to break their fast. They may now drink young coconut, and eat its soft flesh."

1: Burrows--57 (1947-48) Woleaians
116, 396 Ifalik

"Next the bottom is hewn to shape. As the lines are chipped off with the adzes, new ones are drawn on. At a later stage it is customary to have five lines on each side. The principle is the same as with the first two; to keep them equidistant throughout their length, so that the hull will be symmetrical in both dimensions. This is said to ensure its sailing straight and fast.

When the underbody is finished except for final touches, it is turned right side up. Occasionally the builder of a small canoe will be able to get a log big enough to make the hull, except for the end-posts, all in one piece. Such a canoe is called wā velanū. All the larger canoes, though, and most of the small ones, have their sides built up with planks (pape).

The underbody is hollowed out for the sake of lightness, except that several triangular spreaders (vailō) are left intact to keep the flaring sides from collapsing. A joint is cut in each end, at a somewhat acute angle, to take the lower end of an end-post."

"When each joint [KS: of a canoe] is made satisfactorily tight, holes are bored at corresponding points in the two surfaces. Then the two are sewed together, with sennit cord. The leading end of the cord is stiffened, for pushing through the hole, by tying it to a makeshift bodkin or eyeless needle, which consists of a slender strip or splinter cut off a coconut leaf midrib. The cord is passed round and round through each hole; but the technique is strictly sewing rather than lashing, as it is sometimes called, because the cord passes through the planks rather than around them. The first attachment is only temporary.

With the end-pieces in place, breadfruit planks are hewn out of the biggest pieces available, and fitted and sewed together by the processes just described. Wood is so scarce that even wormeaten pieces are used, and patched if necessary. The joints between planks take whatever shape--usually a very irregular one--will waste the least wood. In this way the hull is built up to the size desired, or that dictated by the available timber."

1: Burrows--58 (1947-48) Woleaians
116, 396 Ifalik

"Next the end-pieces (par) are hewn out. Though much smaller than the underbody, they must take the brunt of any end-on collision. So they are made of hard, tough wood, usually rages. They are the only pieces in the hull to be made of other wood than breadfruit, though hardwoods are also used for the masthead and several parts of the outrigger and platforms.

Each end-piece is trimmed to form a cutwater (vetang) as sharp as it can be without weakening it too much. Even in the largest canoes, the cutwater is usually less than an inch wide. The inboard side is hollowed out, leaving two or three triangular spreaders, as in the underbody. The one that will come at the height of the gunwales has a special name, ta li vetvet. A shallow round pit or socket is cut in its upper surface. This holds the apex of the sail, when that end is the bow; and supports the butt of a fishing-pole when the end is the stern and the canoe is being used for trolling. The forked head, the shape of which has already been discussed, is hewn out of the solid top of each end-piece; or, if wood is lacking for part of the fork on one side or both, separate pieces are shaped and fastened on. Finally, the bottom of each end-piece is cut to fit the joint cut in one end of the underbody. The post must set at such an angle as to give the overhang characteristic of all Ifalik canoes."

1: Burrows-58 (1947-48) Woleaians
116, 396 Ifalik

"The technique of fitting two pieces together, which begins with joining the parts of the forked head or, if that is all in one piece, with joining the end-post to the underbody, is always the same. It is a very slow one, requiring repeated trial fittings. The two parts to be fitted together are first shaped by eye; and the eye is such a practised one, in the case of experienced canoe-carpenters, that an approximate fit is achieved at once. But hardly ever can it be good enough to make a watertight joint. So the joining surface of one of the pieces--always the lower one, on the piece first put in place as the canoe is built up--is daubed with red paint. The other piece is then lifted into place, with its joining surface against the fresh paint. Any protrusions, which widen the joint, take the paint, and show the carpenters where more wood has to be taken off. After the reddened bits of surface have been removed, and any other changes indicated by the fitting completed, the upper piece is tried on again. The process is repeated until the joint is satisfactorily tight at every point. This task, which is repeated for every piece in the hull where two surfaces are to be in contact, goes very slowly, with many pauses for consultation and rest. Only a few men--two to four seems a usual number--stay on the job through this stage."

1: Burrows--59 (1947-48) Woleaians
116, 396 Ifalik

"No ribs or inner framework stiffen the hull as a whole. Such a vessel, made of planks simply sewn together edge to edge, seems very flimsy. And, indeed, there is always danger, in a heavy sea, that the hull may be crushed or broken apart. Yet several devices help to strengthen it. The little triangular spreaders left in place in hewing out the underbody and end-posts have that effect, as far as they go. Broad gunwales (mesāp), laid flat, surmount both sides, stiffening them as well as turning aside some of the water that would otherwise splash in. The two outrigger booms, running athwart the hull amidships, are perhaps the strongest braces of all. The little rosemani, which keep to the lagoon except in calm weather, have no other thwarts than these. Larger canoes have several, the number varying with their size. Those nearest the bow and stern of sailing canoes have a special name (metangār) and an additional function. They project beyond the hull, and end in knobs. When the mast is up, the halyards are made fast to these projections, and the knobs keep them from slipping off.

These stiffening devices are most effective against inward stresses that threaten to crush the hull. Against outward stresses, so communicated from one member to another that they threaten to spread the hull apart, there is less protection. As a last resort a rope may be slung about a canoe at sea, to hold the hull together. Not everyone knows how to do this; in fact, the purpose of a song in which I first heard it mentioned was to shame a crew of young men who had let their canoe break apart on a sand-spit because they did not know how to rope it together."

1: Burrows--59 (1947-48) Woleaians
116, 396 Ifalik

"When all the pieces of the hull have been hewn to shape and fitted together, there is another burst of work, requiring a considerable number of men. The hull is taken apart, a few chips hewn off here and there to make the joints fit better, then it is all put together again, this time permanently. The joints are tightened with thin strips that act like caulking, though they are laid in place, not driven in. The seams are glued; and the lashing is replaced more carefully than before. At this point in the building of Tom's canoe, 31 men were counted in the canoe-house, though there were rarely more than 10 working at any one time.

The strips that correspond to caulking are made of the husk of mature coconuts, skillfully cut in very thin slices (päle). Sometimes, it is said, dried moss may be used instead; but coconut husk is preferred for the best canoes.

Over the caulking is spread a glue of breadfruit gum (bwIIIs). The gum collects on slashes made in the bark and outer wood of the trunk. It is kept, nowadays, in glass bottles. To remove it for use, a stick is thrust into the bottle. When withdrawn, it pulls out after it a white rope of gum. This is wound on the stick in a ball. Before applying, it is heated with a torch (kal) of coconut spathes. Thus softened, it comes off on the caulking in a thin, even sheet."

1: Burrows--59-60 (1947-48) Woleaians
116, 396 Ifalik

"Taking the hull apart, caulking it, and re-assembling it, constitute a full day's work, though taken at a much faster pace than the leisurely one used in fitting planks together. About midday the owner of the canoe feasts the workmen on breadfruit or taro in coconut cream, which is usually all he has to offer.

Although this is a day of great activity it is not taken as solemnly as the days of more delicate, risky tasks. The workmen are not subjected to any tapus [sic], and the only ritual performed is a short prayer and offering a bit of food just before the men begin to eat. This is customary at any distribution of food to a group larger than a household. [60]

The fitting of gunwales and preparation of the parts of the outrigger make up another slow, careful stage, with only a few men working at a time. The outrigger booms are centered in the hull by measuring its overall length with a sennit line, then doubling the line. At points equidistant from the halfway mark so determined, and about a yard apart, the outrigger booms are fitted into the gunwales. The same measure--half the overall length of the hull--is used for the distance from the middle of the hull to the point on each boom directly over the middle of the outrigger float."

1: Burrows--60 (1947-48) Woleaians
116, 396 Ifalik 1-2

"The next crucial point is the attachment of the outrigger float (tam). This is considered a particularly delicate and difficult task. On the day when it is done, the workmen again eat nothing in the morning, --this time not even toddy. Four forked sticks (iam) form the Y or crutch connectives. The insides of the forks are carefully fitted to the booms to make as tight a joint as possible. Their lower ends are also fitted with great care to the upper surface of the float. On each boom, one fork presses against the inboard angle of this surface, the other against the outboard angle. They are not fastened at this end in any way.

A number of other pieces are added to strengthen the outrigger attachment. A yoke (wā lieng) connects the two booms between the inner and outer pairs of crutches. Just inboard from the inner pair of crutches, another spar (sosoā) connects the two booms. Riri fern leaves are tied on with the lashing that attaches this brace. These leaves are thought to ensure the presence of fish whenever the canoe goes out after them. If the leaves were omitted, there would be fish sometimes, but not always. The fact that fish are not always found even when this requirement has been met does not seem to disturb anyone's faith. The structure is further braced by means of light struts which run diagonally from the outer side of each boom to the outer sides of each pair of crutches. Another light stick connects the lower side of the booms at the upper ends of these struts; still another connects the two outboard crutches at the lower end of the struts. These pieces are very small, usually less than 1/2 inch in diameter; but they are made

of the strongest kinds of wood, commonly gaingei. Thus the outrigger attachment is braced and reinforced against stress in almost any direction, while the lashing, and at some points the elasticity of the wood, allow the structure to give a little without breaking. The crutches and their bracing serve to keep booms and float at the proper distance from each other. The float is fastened to the rest of the structure solely by stout rope lashing (Fig. 1, 2). It can be quickly and easily detached by simply undoing these ropes; and this is often done, to save space and strain, when a canoe is stowed in the canoe-house.

The light platform on the outrigger booms is built next. As this involves no new techniques, the details shown in Fig. 12 seem sufficient. The same is true of the lee platform shown in Fig. 13.

When all but the rigging [KS: of a canoe] is in place, the final lashing is put in, more tightly and carefully than the others. Wherever any appreciable length of lashing is exposed, it is protected by seizing. The holes in the hull, through which the lashings run, are filled with a putty or mortar made of coral lime mixed with charcoal from burned coconut husks. The charcoal is said to give the mixture strength."

"Fig. 11. -Outrigger attachment." See next page.

"Fig. 11. -Outrigger attachment.

For the sake of clearness, this diagram omits many details, such as the lashings that bind crutch connectives, yoke, and brace to the boom.

a, from outboard side. (Only the outboard pair of crutch connectives is shown.)

1, yoke (walieng); 2, lashing attaching yoke and booms to float;
3, booms (gio); 4, crutch connectives (amw); 5, float (tam);
6, holes in float through which lashings pass.

b, end view. (Only one boom, with the inboard and outboard connectives and strut attached to it, are shown.)

Numbers designate the same parts as in (a), with the following additions:
7, brace; 8, strut (rege); 9, light brace between booms;
10, light brace between inboard connectives; 11, light brace between outboard connectives."

"Fig. 12. -Outrigger platform." See adjoining page.

"Fig. 12. -Outrigger platform.

1, booms; 2, diagonal spars (metare vang) between booms and gunwales;
3, withe platform (vang), spaced to show lower layer of transverse withes.
(Actually they are laid so close together that the lower layer does not show);
4, gunwales; 5, plank platform (peraf);
6, shaped upright planks (mwale maor) at forward and after ends of plank platform."

"Fig. 13. -Lee platform (pep)." See next page.

"Fig. 13. -Lee platform (pep).

1, hull; 2, boom; 3, supporting spar. There is one supporting spar at each end of the platform; only the nearer one is shown. Midway between them is a squared beam, not shown, which forms an additional support to the platform but does not extend across the hull. It is called outeni i pep.
4, longitudinal spar (walieng); 5, end frame piece (pal i pep; only the farther one is shown);
6, withes forming floor of outer part of platform (fang i li pep); 7, slats forming floor of inner part of platform (ujili i li pep); 8, pandanus-leaf roof or shelter over platform (gaimwemwe; this consists of whole pandanus leaves, overlapping, laid over a light frame of withes lashed together. A top layer of sennit netting prevents the leaves from being torn off by the wind); 9, transverse board (folak; there is one at each end of the platform; only the farther one is shown); 10, inboard frame place (weliwā)."

"The shaping of the mast (gaus) is once more a task for one or two men. The mast is made in two pieces, a main spar of soft wood and an extension or masthead (mer e li gaus or just mer) of hard wood. Logs that drift ashore from the east, and are said to come from America, furnish the favorite material for the main spar. The masthead is [61] attached to the main spar by lashing over a long diagonal joint. At the top it is finished off in diamond shape, like a blunt spearhead. This part is broader and flatter than the rest. Through its center is cut a hole, which serves instead of block or pully to take the halyard that hoists and lowers the sail. As the sail is suspended from this halyard, the pull of the wind comes against one side of the hole in the masthead. The stress would be too great for a soft or easily-split wood. That is why the masthead is a separate piece, of the toughest wood available. The favorite wood is ragēs.

Long, light spars (irañū) are prepared for two of the three sides of the sail. In most cases they are pieced together with the same kind of long, diagonal lashed joint as that used to join the two pieces of the mast. Most of the spars have a slight double curve, like an extremely flat 's'. Hence the sail, instead of being a rectilinear triangle, flares out a little, from the apex toward the after side, where there is no spar. This shape of spar seems to be deliberately preferred; whether simply as a matter of traditional taste, or because of some real or supposed advantage in the flare that it gives to the sail, is not clear."

1: Burrows--61 (1947-48) Woleaians
116, 396 Ifalik

"The finished strips are brought to the men. They lay out the gaff and boom on a level piece of ground, usually in front of the canoe-house, at what is judged to be the angle they will take when the sail is finished. The strips of matting are laid in place, according to length, parallel to the gaff and with an inch or two of overlap. Then they are sewed together with light sennit lines. Not only are seams sewed where the strips join, but the whole is strengthened by other lines of stitching run across at right angles. Foreign sailmakers' needles of copper or brass are used for this work. Most of the stitches are several inches long.

It would be perfectly feasible to plait a sail in one piece. But a sail made of strips has several advantages. It is stronger, because of the double width along the seams. When a tear does start, it is apt to be confined to one strip. And such a tear, or worn place, can be easily repaired by replacing one strip, or part of one.

As soon as the rigging is ready, the canoe is carried into the water and launched. It is taken for a trial run (gaterax), to see how it performs under sail. First it is paddled out to where it can catch the wind, then the mast is stepped and the sail hoisted for the first time."

1: Burrows--61 (1947-48) Woleaians
116, 396 Ifalik

"Meanwhile women have been making one of their two contributions to the construction of the canoe--plaiting strips of mat for the sail. (The other is the indirect one of supplying food to the workers.) The strips are about a foot wide, of unbleached pandanus leaf, plaited in simple check with wefts about one quarter inch wide. In length the strips vary from one nearly the full length of the forward spar or gaff, to one only a little longer than it is wide. All will be attached at one end to the lower spar or boom. The other end will form a selvage along the open or after side of the sail. The longest strip will be attached along one side to the upper spar or yard. Each successive strip, counting from this side, is shorter until the last one, at the corner where boom and open side meet, shows as a triangle. Except for overlap, it is only about as long as it is wide on the forward side, and comes down to a point on the after corner.

The length of the largest strip is determined, then, by the length of the yard; the number of strips by the length of the boom. The length of each succeeding strip, as they taper off, is worked out by trial and discussion among all concerned. There is no formal position of master sailmaker among the women, but the ranking member of each working party, according to seniority and experience, is accorded some deference."

1: Burrows--62 (1947-48) Woleaians
116, 396 Ifalik 1.2

"The heel of the mast is set into a socket cut in a block on the outrigger platform, just amidships and directly over the gunwale on the outrigger or weather side. (This side is called palietam; the lee side, igetā.) The sail is hoisted by hauling on the peak halyard that runs through the masthead and is fastened to the yard on the upper long side of the sail. The mast is tilted forward until the apex of the sail settles into a socket cut for it in the wedge-shaped brace (ta li vetvet) on the inboard side of the end-post, at the height of the gunwales. This corner of the sail is made fast by means of a short line or tack. From this point the lower spar or boom rises at an angle, so that the short side of the sail, the one without a spar, is highest and farthest aft.

The mast [KS: of a canoe] is supported to windward by a shroud running from the mast-head to a hole in the middle of the yoke which connects the two outrigger booms directly over the float. For and aft it is supported by a running stay attached in the middle to the masthead and at the ends to the projecting endmost thwarts. The sail is let in and out by a sheet attached to the boom, much as in sails of European type. To shorten sail in case a squall threatens to capsize the canoe, the boom can be raised by means of

spilling lines reeved through the masthead. *

In order to change to the other tack in beating to windward, or to make any sharp turn of more than a right angle, the canoe does not go about like European sailing craft, but changes ends. This is quickly done, while the canoe swings toward the new direction, by the following procedure: raising the boom to shorten sail, unfastening the apex of the sail, swinging the sail around the mast to leeward, and stepping the apex in the other end. This converts what was the stern into the bow. The steersman takes his post in what was the bow, which now becomes the stern. The boom is lowered, the sheet let out. The sail catches the wind, and the canoe moves off in the new direction. Obviously, the reason for this procedure is to keep the outrigger on the windward side, and so balance the vessel against the sidewise pressure of wind on the sail."

"* This rig is shown, more clearly than words can do it, in some of the illustrations in Haddon and Hornell; particularly Vol. 1, Figs. 269 and 270. Fig. 268 shows more clearly the shroud from masthead to yoke, but the sail is either in the wrong position or is of a different type from that used in Ifalik. Abb. 150 on p. 53 of Damm's book shows how some of the lines are attached to the mast. But the artist who redrew Sarfert's sketch made the mast too long and the apex of the sail too high, like a European lateen, rather than an Oceanic one."

"For maneuvering in shallow water, sailing canoes use the same equipment as small paddling canoes; paddles and even poles, though poles are rather for staving off coral heads than for propulsion, as the large canoes avoid water shallow enough for poling. The paddles have round, straight shafts, without knobs or other elaborations at the top, and lanceolate blades. These taper symmetrically from a low ridge along the middle to thin edges. At the tip, in most paddles, the middle ridge is extended and slightly expanded (Fig. 14, c.) The protruding knob or spike helps to prevent the blade from splitting when the paddle is used for poling or staving off an obstacle; though such use is avoided, if there is time to seize a pole.

In open sea, canoes are kept on their course by a quarter rudder (Fig. 14, b.) It is shipped near the stern on the leeward side. The line through the hole in its upper part is made fast to the projection of the stern thwart on the opposite side. The direction of the blade is regulated by the handle. To hold the lower part of the blade against the side of the canoe, the steersman has to sit on the gunwale with one leg over the side. For this reason, steering at sea is an awkward and strenuous task. [63]

The quarter rudder not only steers the canoe, but cuts down drift like the sideboards sometimes fitted to small canoes in the United States when they are sailed."

"The hulls have a total height of four or five feet, and when loaded draw from two to, at most, three feet of water. Lacking a keel, or even the flattened leeward side of some other Micronesian canoes, they can sail close to the wind, and drift rather badly. This seems to be the main weakness of the canoes, otherwise admirably fast under sail, and seaworthy for their size. One of the chief worries of a native navigator is that he may drift off his course unless he has a following wind, and miss entirely the small, low island which is the only destination he can have within three or four hundred miles of Ifalik.

Unless the trial run indicates the need of some further work or readjustments on the canoe--none were necessary on Tom's masterpiece--the permanent lashing (or sewing) is at last put in, and the hull painted. This is the final step in making a canoe. It is always done in red, black, and white, according to the traditional design shown in Fig. 15. This design was part of the traditional lore of canoe-making brought down to men by the gods Seilangi and Semerik. If ever an Ifalik man seriously considers painting a canoe in any other way, the mentality of the island will be very different from what it was in 1948. No tabu against painting a canoe in some other design, nor penalty for doing so, was ever mentioned. It did not have to be. No such idea ever comes up. There is only one right way to paint a canoe, so, of course, they are all painted that way. There is scope for individual fancy at only one point: the middle of the upper red band, between

the outrigger booms, where little decorations or attempts at writing may be painted. Tom's choice for this part of his canoe was an American flag.

The pigments used nowadays [KS: for painting canoes] are bought from foreign ships; but the red, which is the first put on and apparently the most prized, is still mixed with breadfruit gum. If my informants can be trusted as to the pigment formerly used, it was bark of the rel tree soaked in water and mixed with coral lime. When this red paint is being applied, one of the huge leaves of the giant arum (filē) is suspended over the hull. This can hardly be anything but a bit of magic or ritual or[sic] ensure success of the job, or of the canoe after it is finished. But Tom could not explain its symbolism. He fell back on his usual statement about traditional practises whose meaning had been forgotten--'blong before.'

No part of the outrigger is ever painted. Pestered again with the inevitable 'Why?', Tom at first parried with 'blong before.' After thinking it over, he suggested that the paint might be too heavy. We were talking especially about the float, and this suggestion at least reflects native insistence that the float must be light; so light that the wood of only two of the nine varieties of breadfruit is considered suitable for it."

1: Burrows--63-A
116, 396, 501

(1947-48)

Woleaians
Ifalik

"Fig. 14. - a, steering paddle;
b, quarter rudder;
c, paddle."

"Fig. 15. -Traditional design for painting a canoe.

The colors are red, black, and white. Portions painted in red are shown by shading. The little panels of white, outlined with black, are called rajūm; the red portion (perhaps only the wide parts of it near bow and stern?), mētegal; the black line through the middle of the red, fare; the narrow lower strip of red, lanīlap; the boundary between red and lower black, meteitralo; and the black under portion, amīs."

1: Burrows--64 (1947-48) Woleaians
116, 487, 502 Ifalik

"The ancient art of navigation in native sailing canoes is still in use on the seas about Ifalik. Most of the voyages are short, between neighboring islands. Probably more than half of the traffic in and out of Ifalik is with Woleai, only 30 miles away. Yet trips to any of the islands within 100 miles are not unusual. And though longer distances, as to Yap, Truk and Guam, are now ordinarily left to foreign steamers or airplanes, sailing directions for them, too, are still remembered. Tom, whose claim to be the foremost 'captain' of Ifalik seemed to be generally acknowledged, said that he could still reach any of those islands by the old methods. However, he owns two compasses, and knows how to use them from his long service on foreign ships. He would supplement native lore by taking one along."

1: Burrows--64-65 (1947-48) Woleaians
116, 505, 132 Ifalik 1.2

"A glimpse of the extent of interisland voyaging is afforded by the list of sailings to and from Ifalik during our six months there:

Aug. 18. --A visiting canoe from Faraulep, which had been at Ifalik since our arrival (July 28), awaiting a wind from the south, set out for home, accompanied by an Ifalik canoe.
Sept. 2. --Ifalik canoe returned from Faraulep.
Sept. 11. --An Ifalik canoe set out for Woleai.
Sept. 17. --Ifalik canoe returned from Woleai, accompanied by a Woleai canoe.
Sept. 19. --Woleai canoe returned.
Oct. 3. --Another canoe arrived from Woleai.
Oct. 11. --Visiting canoe went back to Woleai.
Dec. 6. --Ifalik canoe went fishing to the reef Faiaulap.
Jan. 14. --Woleai canoe that had visited Ifalik in October came again.

The long interval from Oct. 11 to January 14, with no sailings except one overnight fishing trip, was partly accidental, but largely due to the prevailing winds. During October and November they varied in both direction and force. They were mainly from the west. A west wind is good for reaching Elato, Lamotrek or Satawal from Ifalik.

But Tom was the only one who wanted to go that way (to visit a son on Lamotrek). And he was kept at home by two considerations: first, he had the visiting anthropologists to look after; second, his new canoe was not finished. [65]

Another deterrent at that time of year is that the westerly wind may blow up, with little warning, into a typhoon. Ifalik was not struck by a typhoon at that time; but twice --once in November, once in December-- was in the edges of one whose full force was felt on Yap. On those days the wind blew hard enough to uproot trees. That is far too strong for a canoe to venture out in, though one caught in such a blow may menage to ride it out.

From late November on, the trade wind blew from the east nearly every day. During the early part of its season this wind, too, is often too strong for safe sailing. Later on it dies down, and is more often a mild sailing breeze. Moreover, beginning about May, there would be occasional days of west wind; so that a canoe that went to Woleai before the trade might expect a good wind for the return trip without too long a wait. (A similar situation accounts for the frequent sailings to and from Woleai during September and October.) More frequent sailings might be expected during our spring and early summer months; but as we left Ifalik before then, no record can be given."

1: Burrows--65 (1947-48) Woleaians
116, 505, 554 Ifalik

"An accredited navigator is called palū. They are rather vaguely divided into two classes, palu e lap, great captains, and palū gitigit, lesser captains. There is no formal procedure for conferring such a title, but a man is generally recognized as a palū when he has successfully taken a canoe on a round trip to another island. He will not try this until he has studied the lore of navigation with an accredited navigator, and taken several trips as a member of the crew.

There were six recognized palū on Ifalik during our stay: Totogoeiti (Tom); Magaleisei, Tom's brother; Iregemar; GauaisIg, an old man; and the chief Paliuilimar, who died during our stay, was said by Tom to rank lower than the others. He was definitely a palū gitigit. But of them all Tom was apparently the only one likely to be called palū e lap. In addition to these, several others had made some progress in the art, without yet being recognized as palū.

The position of palū is the most honored one a man can attain by his own merit and effort. The palū is higher in general esteem than the sennap or canoe carpenter; higher also than the tau bwongbwong or oracle of the gods. He is outranked only by the chiefs; and chieftainship, being hereditary, is an ascribed status, while recognition as navigator is achieved. But the title of palū does not confer any tangible advantages, or any precedence except aboard a sailing canoe or in conversations about seafaring."

1: Burrows--65-66 (1947-48) Woleaians
116, 502, 773 Ifalik

"The lore of navigation, like the similarly specialized and restricted knowledge of canoe-building, gains dignity and authority from myth, wherein its origin is attributed to gods. Befitting its position as the most esteemed of these specialties, navigation has not one myth [66] but several. Tattooing might make the same claim, since that art is ascribed to the god Wolfat, who is also the hero of several other tales. But tattooing is mentioned in only one of the Wolfat tales, and that apparently a minor or restricted one; for the chiefs, in giving Wolfat tales to Spiro, did not include the one about tattooing. The myths about navigation, however, all focus on that special lore. Navigation has, too, a greater number of gods than any other specialty. And these gods are owners or rulers of particular islands. One of the islands is supposedly on earth, near Puluwat; but the largest and most fertile part of it is underground. Another one or more are in the sky."

"In beginning one of his greatest favors to me, that of imparting the lore of navigation or 'talk for cap'n', Tom gave a sketchy genealogy of the gods of navigation. Aluluei is the oldest and the only one with any distinctive physical attributes. He has four eyes, two in his face like those of mortals, and two in the back of his head. With the eyes in the back of his head he can see any dangers that threaten the navigators under his care.

Aluluei has three brothers: Metseleilag
Teraolemetau
Farewai

He has also four sons: Paluelap
Farewai
Valur, later known as Sagol
Wëriëng

When asked about the name Farewai, which occurs both as that of a brother of Aluluei and as that of a son, Tom said that the son was a different Farewai. That may be the traditional version. Yet he did not seem to have this genealogy very clearly in mind, and may have made a mistake. If so, I probably made another in questioning him immediately. It may have put him on the defensive, in which case, he might try to justify what he had said rather than correct it. (In one of the myths, Farewai teaches weather lore to Longolap and LangorIk, whom Tom there called his 'nephews').

Paluelap, elder son of Aluluei, went to Ponape and took a wife there. Her name is no

longer remembered. They had two sons: Longolap
LongorIk
and a daughter, whose name also is no longer remembered. In fact one of the characteristics of this lore about a man's occupation is that none of the women mentioned in it have names."

1: Burrows--66-67 (1947-48) Woleaians
116, 502, 539 Ifalik

"The myths in Tom's 'talk for cap'n' follow, in the order in which he gave them. In one or two places, as noted in parenthetical comment, some other order would seem more logical. Indeed, the whole episode of magical canoe-building by Seilangi, god of shipwrights, seems to belong with the lore of canoe carpentry rather than that of navigation. If Tom [67] had been asked, it may be that he would have accepted such changes. But it seemed that a more accurate picture of native thinking would be given by not questioning his original version, thus giving native tradition precedence over a foreigner's notion of logic."

"1. How the Lore of Seamanship Came to Ifalik

The god Aluluei came to Bwennap, an island of sand with one wutu tree growing on it. Bwennap can be seen from Puluwat. He took a wife there, and they had two sons and a daughter. The older boy was called Longolap, the younger LongorIk.

Underneath Bwennap is a large, populous place, of which Aluluei is chief. A sister of his also lives there.

Aluluei, who was the greatest of navigators, began to teach his lore to his sons. One day Longolap came to his father and said he wanted to take a wife. Aluluei objected, because if Longolap were to marry, he would spend too much time with his wife, when he should be listening to the lore of seamanship. But Longolap was set on marrying, and finally had his way. After that, he spend [sic] a great deal of time with his wife, and did not come back and listen to his father for many days. At last he came again, but only learned a little bit.

LongorIk, the younger son, did not want to marry. He stayed with his father, and learned all about seamanship.

One day LongorIk told his father he wanted to cut a breadfruit tree and make himself a canoe. He took his adz and went out in the land below Bwennap, where there were plenty of trees of all kinds.

On the way to the breadfruit grove LongorIk met Longolap.

'Where are you going?'

'I am going to the grove to cut a breadfruit tree, to make myself a canoe.'

'I'll go along and help you.'

So they went together to the grove, selected a tree, felled it, and worked all day hewing it into shape. By evening they had the job well along. Then LongorIk went home to his father, and Longolap back to his wife.

In the morning they returned, only to find the tree standing, with all the chips back in place, and nothing to show that any work had been done on it. They felled it again, and worked all day hewing it into shape. By evening they had the job well along. Then LongorIk went home to his father, and Longolap back to his wife.

Aluluei asked LongorIk 'Is your canoe nearly finished?'

'Yes.'

On the third morning LongorIk set out again, but this time Longolap did not go with him. Coming to the tree, he found it once more standing, with nothing to show for all their work. [68]

This time LongorIk did not set about felling the tree again, but went back to his father. He said to Aluluei:

'Isn't there something about the lore of seamanship that you haven't told me?'

'What makes you think that?'

'Why, every day we fell a tree and work away hewing it to shape. When we go back

in the morning, there it is standing, with nothing to show that it ever felt the edge of an adz.'

'Oh! So that's it! Tell me, did you see a bird while you were working?'

'Yes.'

'Well, you go back and get to work again, and when you see the bird, talk to it.' And Aluluei told his son how to greet the bird.

LongorIk went back to the grove, felled the tree again, cut off a length of four fathoms, and was hard at work hewing it to shape when the bird flew toward him, uttering the high trilling spund that gods make.

LongorIk greeted the bird with the prolonged cry his father had taught him: 'Va irōu!'

At this the bird changed to the form of a man. It was Seilangi, god of canoe carpenters.

'Oho! That's better!', the god said. 'I think you didn't know me before. Who told you who I am?'

'It was my father, Aluluei.'

'Very well. Go back and tell your family that the canoe is all finished.'

So LongorIk went and told his family.

'Finished so soon?' Aluluei asked him.

'Yes.'

So Aluluei told the women to plait a pandanus mat sail for the canoe. Meanwhile

Seilangi summoned his people, the ants. They finished the canoe in one day, mast and all, except for the sail, and carried it into the water.

When LongorIk came and saw his fine new canoe, Seilangi asked him:

'Is the sail finished?' [69]

'All finished.'

'Bring it along.'

So LongorIk brought the sail, and it was quickly bent on.

Then LongorIk told his family to make him plenty of food. He said to his father:

'I want to go to your land, Pie li Eluluei (Sands of Aluluei.)

'Very well. But take care! You will come to a place where they eat people. Follow my instructions exactly. When you come close to shore, and a man asks you 'Shall I anchor your canoe for you?', don't let him do it! Anchor it yourself. Then when they show you fresh water to bathe in, you will see two pools. One has fine, clear water, the other has dirty water. Be sure to bathe in the dirty water.

'Another thing: before you go to sleep, cut pieces of white coconut meat and tuck them under your eyebrows. Then when someone comes and looks at you he will see a gleam like the whites of your eyes, and will think you are wide awake. And finally, while you are there you must ask the people for a big stone that belongs to me.'

But before LongorIk was quite ready to go, his brother Longolap came to him and said:

'Don't you go this time! Let me go first. You can come later.'

So LongorIk let his elder brother take the canoe and go first.

Longolap set out. He only knew a little bit. But he got to the Sands of Aluluei, and there found his father Aluluei, who had come by magic, sitting under the lone wutu tree that grows there. Seilangi had come along, too, in the form of a sandpiper.

Longolap chanted the chant he had learned, to bring his canoe safe home, and set out on the return voyage. He came to another island. As he drew near shore, a man called out to him:

'What are you doing here?'

'I am going to the land of Aluluei.'

'Whose son are you?'

'Aluluei's son.'

'Very well. Let me take your anchor rope, and I will anchor your canoe.'

Longolap, who had not heard his father's instructions, let the stranger take the rope. The man tied it about a big mweial shell under the water. [70]

Longolap went ashore to the Men's House. A man asked him if he wanted to bathe, and offered to show him fresh water. He and his sailors went with the man, who showed them two pools, one of fine, clear water, and the other of dirty water. Since he only knew a little bit, and had not heard his father's instructions, he bathed in the fine, clear water.

Then Longolap came back to the men's house. Tired after their voyage, he and his men were soon asleep. While they were sleeping, the men of that land came upon them, seized them, and put them into the rounded end of the house, where the roof overhangs. They had this walled off like a separate room. They did not kill Longolap and his men. But the one who had anchored the canoe went and unfastened it, took it out to sea, set it adrift, and then returned.

Back home in Bwennap, LongorIk worried about his brother and wanted to go and find him. For that he needed another canoe. He went into the woods, thinking over his problem, and there met Seilangi.

'Do you want another canoe?'

'Indeed I do.'

'Well, just go back and tell your people to make the sail.'

LongorIk told his people, while Seilangi and his ants finished the canoe in one day, as before, and put it into the water. When the sail was bent on, LongorIk came and told his people to prepare plenty of food for the journey.

He sailed to the Sands of Aluluei, and there was his father waiting for him.

LongorIk and his sailors came ashore, tired and hungry. LongorIk said to his father: 'We want something to eat.'

Aluluei said: 'Look about this land. There are no coconut trees here, no taro. How can you eat?'

LongorIk answered: 'You find something.'

So Aluluei talked to his people underground, as if on the telephone. The women down there got together wot and pulax. The men climbed trees and got coconuts. They brought a great feast for LongorIk, then went back under the sands.

LongorIk said to his father: 'I want to go and find my brother Longolap.'

'Very well. Go. But do not forget any of the things I told you!'

'I won't forget.' [71]

LongorIk sailed on and came to land. He went through the pass into the lagoon and was nearing shore when the man who had deceived his brother called out:

'Give me a rope so I can anchor your canoe!'

'No, you go back ashore', LongorIk replied. 'I'll take care of the anchor.'

And he tied his canoe to a coconut tree.

He went into the Men's House, and the men of that place asked him 'What did you come here for?'

'I came for the big stone that belongs to my father, the stone of Aluluei. Is it here?'

'Yes. It is here.'

'I'd like to go and bathe.'

'You'd better let some of us show you where.'

Some of the men guided him and his crew to the water. They urged them to bathe in the fine, clear water, but LongorIk refused, and he and his men bathed in the dirty water.

Then they went back to the Men's House.

LongorIk told his sailors not to go to sleep yet. He had them prepare coconut meat and put it under their eyebrows, so that when they had to go to sleep that night, the people would think they were awake. The men of the place came during the night, but thinking they were awake, did not attack them.

In the morning LongorIk told the people he wanted to go back home.

'Can you bring me my father's stone?'

'Yes, but it will take all of us, men, women, and children, to haul it. It is very heavy.'

'Well, if you'll bring it to the shore today, I'll go tomorrow.'

So the people went into the interior and tugged and heaved at the stone. They could barely move it; but they kept at it, inching it along toward the shore.

When they were all at work, LongorIk went back to the Men's House. He hewed through the wall that closed off the rounded end, and found his brother and the crew that had come with him.

Longolap muttered drowsily 'What are you doing? I want to sleep.'

'Are you sleeping or are you dead?' [72]

'Just sleeping.'

'Well, you'll be dead if you stay in here much longer!'

He took them all to his canoe, untied the mooring line, and put out to sea, leaving the

people of that land tugging and heaving at the big stone.

When they came to the Sands of Aluluei, LongorIk went ashore and talked to his father.

'Did you bring your brother back?'

'Yes.'

'You see, it's just as I told you. Longolap doesn't know the lore of seamanship. He only knows a little bit.'

'Let's go back home now.'

So LongorIk went back to Bwennap, taking his brother with him in the canoe, while Aluluei went back by magic, and was waiting for them when they arrived.

They came ashore, and Longolap went to his wife. LongorIk, who had no wife, went home to his father.

(The episode that follows seems quite distinct from the story of Longolap and LongorIk. Logically, it might well precede that story. But Tom gave it as the conclusion to what has gone before.)

One day, early in the morning, a canoe came to Bwennap. It was a big canoe, but had no sail. It was propelled by paddles. In it were three gods: Valur, god of fish; Wëriëng, god of birds; and Segur, god of navigators.

Aluluei's daughter, who was bathing, saw the canoe coming and ran to her father, asking that food be prepared for the travelers. But the canoemen kept on paddling. The

canoe seemed about to pass the island without stopping.

The girl picked up a tiny coconut, no bigger than her fist, held it up, and called out to them to come.

'What for?'

'I want to go with you. I'll bring a coconut for you to drink.'

'All right. Bring it along.'

She waded out to the canoe with her coconut. When they saw the tiny thing, they said 'That is not enough.'

'Drink it anyway', the girl answered. [73]

One of the men in the canoe took the little nut and began to drink. He drank and drank until he had had all he could hold, but there was plenty of water left in it. He passed it to the next man, and so it went around, until all had drunk their fill. And still there was plenty of water left in the nut.

The three gods laughed with pleasure to find that the little coconut would hold so much water.

'Climb into the canoe', they told the girl. She got aboard.

They spread a chart before her.

'You see that? We are very grateful to you for bringing us that coconut, so we will let you have our chart. Look here. See all the islands? See all the birds? See all the fish? Take this, and give it to your father.'

The girl went back to Aluluei with the chart, and the canoe paddled on out of sight.

'What is this?' the girl asked her father when he had spread it out before him. 'I don't understand it.'

Aluluei understood it well, and was overjoyed to see it. Though he was a great navigator, there was much information here that he did not know. It had all the lore of seamanship: the positions of all the islands, and all the birds and fish that a navigator would see in voyaging from one to another.

Aluluei summoned the famous navigator Paluelap.

'Come look at this chart!'

Paluelap took it. He too could understand all that it revealed.

'Tell the people all that is on there. Teach them the lore of seamanship.'

So Paluelap began to teach the people. Many did not understand, but there were some who did. Thus the lore of seamanship became known in Bwennap. From there it spread to Puluwat and Souk. There it was learned by men from Satawan. From Satawan it came to Lamotrek, and so to Ifalik and Woleai and Faraulep.

That is how the lore of seamanship first came to Ifalik."

"2. Why Valur Changed His Name to Sagol

Wërië̈ng went from Bwennap, where there was hardly any food except coconuts, to Truk, to get food for his wife. His brother Valur went with him. Now Valur had been carrying on a stealthy love affair with Wërië̈ng's [74] wife. So when they were out of sight of land, Wërië̈ng threw Valur overboard and sailed on, thinking he had got rid of him.

But Valur found a piece of floating bamboo, crawled inside it, and used it as a canoe to get back to Bwennap. He hid in his house, letting the people think he was in Truk.

Wërië̈ng got a supply of breadfruit, taro, and red turmeric paint, and came back to Bwennap. He told the people Valur had taken sick and died on the way to Truk, and that he had buried him at sea.

Wërië̈ng stayed four days in Bwennap. While there he prepared an offering of food for Iolau, a god of navigators. Iolau makes people sick if they eat wot taro without mashing it, or eat any of his seven kinds of fish: trep, tak, igolau, atek, lipërë, gus, and apap. But Wërië̈ng knew a song to sing over the food, which would cause the god to take the curse off it, so that it could be eaten safely.

During the preparations for the feast, Valur got into a big food bowl, a fathom or more in length. Some women who were in the secret piled mashed taro over him, and brought the bowl to Wërië̈ng's house.

Wërië̈ng dipped his finger into the bowl, and Valur bit him.

'I'm not dead!' he shouted. 'Here I am!'

With that he stood up. Thus all the people knew that Wërië̈ng had lied when he said that Valur was dead. Wërië̈ng was shamed before the people.

Valur, in his anger, left Bwennap and came to Satawan, Lamotrek, Faraulep, Aurupik, Woleai and Ifalik.

He changed his name to Sagol, the name of the kind of bamboo he had used for a canoe when Wërië̈ng threw him overboard at sea."

"3. The Overconfidence of Longolap

Farewai understands the east and the west. By looking either at the morning sky in the west, he can forecast the weather--clouds, winds, rain, or fair weather. He taught this knowledge to his nephews, Longolap and LongorIk. Longolap only learned a little bit, but LongorIk learned everything.

LongorIk looked in the east and saw bad weather coming. Longolap looked in the west, and thought he saw fine weather. So in spite of his brother's warning, he put out to sea. A typhoon came, with torrents of rain, and broke in the hull of his canoe. Longolap was not drowned, but swam beside the wreck.

LongorIk looked at the sky and saw fine weather coming. So he made a big canoe. Then he took 2,000 coconuts, loaded the canoe with them, and went to look for his brother. His father, Paluelap, went with him. [75]

After a while they caught sight of Longolap, swimming beside the wreck of his canoe. They tied the 2,000 coconuts together, making a floating drydock of them. On this they placed the wreck of Longolap's canoe, and thus repaired it well enough so that he could make his way home in it.

LongorIk said to his brother 'See? What did I tell you?'

Longolap followed his brother's canoe back to their home. When they got there, Paluelap and LongorIk told Longolap he had better stay ashore thereafter. But he said

'No. I want to find the place where Aluluei lives.'

So he set forth again. He found the Sands of Aluluei. But there are two islands by that name. One is where Aluluei lives. The other is inhabited solely by sandpipers, who spend their time singing for the god. It was the island inhabited by sandpipers that Longolap found. When he saw that his grandfather Aluluei was not there, he went on.

There is an enormous taro growing in the ocean that belongs to Aluluei. A number of little taros grow close around it. Longolap came to this, and tried to get one of the little taros to eat. But in order to do this, it is necessary to sing a certain song, and Longolap did not know the song. So the ants of Aluluei bit him when he tried to pull the taro. He tried again and again, but at last had to give up.

Then for a long time Longolap saw no land, and had no food to eat. At last he came to a lone coconut tree, growing in the midst of the ocean. This, too, belongs to Aluluei. But in order to climb it a man must sing a certain song; and Longolap had not learned the song. So he could not climb the tree. Some of his sailors starved to death.

Again LongorIk came to the rescue and found him.

'What are you doing out here? You've been away from home a long time.'

At last Longolap had to admit that he did not know all he needed to know to succeed at seafaring.

'Come with me', said LongorIk. They came to the taro growing in the sea. LongorIk sang the proper song, pulled some of the little taros, and they had food to eat.

They went on and came to the lone coconut tree. Again LongorIk sang the proper song, climbed the coconut tree, and they had ripe nuts to eat and young ones to drink.

LongorIk said 'Follow me. I'll show you the way home.'

But Longolap, now that he was well fed, had regained his confidence in himself. He said 'No. You go where you please. I know the way.' [76]

LongorIk sailed directly home. Longolap cruised about on the sea for four months, and could not find the way. He and his sailors were so famished they could not walk.

Once more LongorIk came and found him. 'I will show you the way. If you do not follow me you will die.' And Longolap, once more driven to admit his ignorance, agreed and followed his brother.

When they reached home, LongorIk waded ashore. But Longolap and his men had to be carried."

"This is not the place for a systematic analysis of these myths as examples of folklore. But a few striking characteristics are worth noting, if only to suggest some of the possibilities of such an analysis.

For one, the tales are developed to a considerable extent by repetition of incidents, one of the commonest devices in folk-tales. Examples of repeated incidents are: the tree twice restored after being felled and hewn; the two canoes built for LongorIk by Seilangi and his ants; the several voyages of LongorIk in search of Longolap; the anchoring of the canoe, choice of pools for bathing, and use of coconut meat to simulate whites of the eyes, on the cannibal island; the two visits to the huge taro and lone coconut that grow by themselves in the sea; and even such little phrases as the one about LongorIk knowing everything about navigation, while Longolap only knew a little bit.

One of the incidents in the first myth is widely distributed in Oceania, --the repeated restoration of the hewn tree by a god until he is properly placated, whereupon he builds a canoe out of the tree with miraculous speed. Frequently, as here, the god appears first as a bird. Beckwith, in 'Hawaiian Mythology' (pp. 272-3) notes the occurrence of this incident nearly everywhere in Polynesia; in one island generally classed as Melanesian (Mota of the Banks group); and in one Indonesian tribe (The Dyaks of Borneo). Probably several other incidents, such as the inexhaustible drinking nut, are also widespread.

In the story of Longolap and LongorIk, it is the younger child who is successful. This motif, 'youngest child successful', is world-wide. One variant of it is the incident of Cinderella and the glass slipper. Is this a piece of wish-fulfilment fantasy, a solace for younger children who are relegated to an inferior role? Such questions are easy to ask, but hard to answer with anything more trustworthy than a guess. A method of reaching rigorous scientific answers to such questions has yet to be developed.

Another outstanding characteristic of the two tales (or two variants of one tale?) about Longolap and LongorIk is that they serve to point a moral. This puts them in the category of fables, like those of Aesop. The moral here, of course, is: Don't let a woman distract you from your study of navigation.

Finally, all these myths have an inconsistency and shiftiness that give them a dream-like character. This shows up especially in comparison of [77] the myths with the 'genealogy', if it deserves the name, of the gods of navigation. In the genealogy Longolap and LongorIk are grandsons of Aluluei. In the myth they are his sons. In the genealogy Wĕriĕng and Valur are sons of Aluluei. In one of the myths they are strange gods from afar, who bring Aluluei the chart containing all the fine points about navigation. The other strange god does not appear in the genealogy at all.

The peculiar characteristics of the island Bwennap reappear in the other island called 'Sands of Aluluei'. Both are sandy islands, with only one wutu tree growing on them. But underground, in both of them, is a large and populous realm, abounding with all

useful plants. Bwénnap is given a location in the Pacific. The Sands of Aluluei and the unnamed cannibal island are not located; but from Tom's statement that the gods of navigation live in a special part of the sky, I suppose that these islands may be thought of as in the sky. Yet canoes can reach them from Bwénnap.

Such inconsistencies and vaguenesses are of course not uncommon in folklore. The 'genealogy' looks a little like an attempt to pull the myths together and give them consistency; but if so, it is a very sloppy job. Evidently the custodians of these myths--that is, the navigators of Ifalik and the islands about--never got together and worked out an official, consistent version of them, as the priests of various other lands have done with their traditions.

After all, the myths serve what seems to be their main purpose without being precise and consistent. That purpose is to give the lore of navigation the dignity of divine origin. This wins respect for the lore of navigation and gives confidence in the navigators. Presumably the special connection of the navigators with the gods helps to preserve discipline aboard ship."

"Songs for Divine Guidance

Seven songs were dictated by Tom as part of the navigator's lore. They seem to be both prayers and incantations, if we define prayer as an appeal for help to a divine being, and incantation as a song thought to have magical power in itself. Each song is accompanied by a bit of ritual, which reinforces its meaning as gesture reinforces the meaning of ordinary speech. But these are not mere optional gestures. They are essential to the proper utterance of the song. This seems to give them the character of magic, credited with power in itself, rather than of religion, appealing to an outside power. Yet the ritual can well be thought of as obeisance appropriate to an appeal, like a bow or salute to a human superior. It is my impression that the natives do not make the distinction between the two, but regard this behavior both as what we call magic and as what we call religion.

The texts of the songs will be given in the study of native art. One of them is an appeal to Sautā, a god not mentioned in the myths, for wisdom. [78] He is asked to illuminate the navigator's mind by lighting a fire within him. As he sings this, the navigator rubs over his chest sand, mixed with sea water taken from the point where land and water meet. A similar song, using the same figure of lighting a fire but not naming any particular deity, is uttered while cutting off the bud end of a coconut and mixing the juice with leaves of aro.

A third song, which Tom said was particularly advanced and hard to get, is intended to lighten the canoe so it will stay afloat. It invokes Loulemwau, whom Tom called 'god of the canoe.' It is sung while the navigator, holding a ripe coconut in its husk, bound about with a strip of coconut leaf, wades around his canoe, tapping the hull at the water-line with the coconut.

An appeal for fair weather is sung to the god Wĕriĕng. To sing this, the captain goes aboard with a piece of white young coconut leaf. This he taps against the sail as he sings, then ties bits of it to all the lines of the rigging.

Before the mast is set up, it is swept with a strip of white leaf, while the navigator sings a song to Ilekerĕp, god of the sea-lanes, asking him to bring the canoe safe to its port. A similar appeal for the return voyage is sung as the mooring line is untied from a tree, and rubbed back and forth against the landward side of the tree. In this song Soupalele, god of the navigator, is asked to anchor the canoe in the woods, in the center of the home island.

Far the longest and most comprehensive of the songs was described by Tom as his own special prayer for success at sea. It had been given by one of the gods of navigation--he did not know which one--to a navigator of ancient times, and handed down to his pupils from generation to generation ever since.

This song invokes not one god but a multitude of them, running up the number in a

final stanza from one hundred to ten thousand. It appeals for most of the gifts asked separately in the other songs: wisdom in seamanship, divine guidance of the canoe, strength and health for the navigator, fair weather, and shortening the distance between Ifalik and Woleai. As he begins singing it the navigator ties about his wrist a strip of white coconut leaf. He drinks a coconut for the gods, and offers a piece of taro and an umule fish."

1: Burrows--78-79 (1947-48) Woleaians
116, 789, 532 Ifalik

"An illustration in Damm's report shows two images, presumably collected by Sarfert, which are said to be used for weather magic. The heads, bodies and arms are carved of wood in stylized human form. One of them is double, with heads and bodies facing both ways. The single one has a disproportionately large penis. Instead of legs and feet they have bases, apparently of some plastic material, in which are embedded long, slender prongs--the text calls them Rochenstacheln, spines or thorns--on which the images apparently stand; three of them for the single image, four for the double one. Strips of coconut leaf are tied about the arms, and about the body of the single [79] image. They are said to be vangvang (? Dann uses bangwang for 'prayer', but it ordinarily means any gift) of the god Aluluei. The double figure taken with the statement that Aluluei has four eyes, suggests that this may be an image of him. It was apparently to some such objects that Tom was referring when he said that a navigator may have an object or image which has power like that of the songs to help him on his voyages. He had none himself, and said there was none on Ifalik when we were there."

1: Burrows--79 (1947-48) Woleaians
116, 502, 821 Ifalik

"For some reason, Sarfert was told that the old lore of navigation had been mostly forgotten. But the two best navigators of Ifalik were away at the time. He did collect names and positions of 28 stars, which correspond fairly well to the 32 given me; and some other details. However that may be, Tom had a remarkable amount of 'talk for cap'n' in his memory. The supernatural part of it has been given. What we would consider the practical part follows. Even this has many details that seem to us fantastic and impossible; notably the bits about sighting particular birds and fish at particular places. Some of the guiding stars named for certain islands, even, are not accurate, according to our charts. Yet conceivably they may serve the purpose, for some reason of wind or current. It is noticeable that the directions have not the vagueness and inconsistency of the myths. At any rate, canoes are able to reach neighboring islands most of the time, though being lost at sea is unquestionably one of the people's haunting fears. Directions for more distant points are little used and may be more dubious.

Fig. 16 shows the positions of the stars used for navigation in Ifalik; of the nearer islands and reefs; and a few of the more important ones at greater distances. Tom gave them to me from memory, but with a compass before us; and I wrote them down on sheets of paper with circles drawn on them like those on Figure 16, marked to show the points of the compass. This kind of notation was suggested to me by Tom's occasional use of English terms for points of the compass. He approved it, and at times supervised my notations closely, so far as directions are concerned."

(1947-48)

Woleaians
Ifalik 1-2

"Fig. 16. -Star chart."

See next page.

1: Burrows--79-A (1947-48) Woleaians-2
116, 502 Ifalik

"Fig. 16. -Star chart. Names outside the circle are those of stars used in navigation. Taga means 'rises'; tubwu, 'sets'; li being the definite article. Horizontal lines indicate the paths of the stars across the sky. Inside the circle, the two words in parentheses indicate the most clearly conceived cardinal directions: (Ievang) north, (Iauru) south. Names inside the circle and not in parentheses are those of islands or reefs said to be reached by steering for the rising or setting points on the same radial line."

"Damm, from a sketch by Sarfert, shows positions of some stars on a rectangular figure. Undoubtedly Tom's approval of my use of circles came from his familiarity with the European compass. It is questionable whether natives unfamiliar with the compass would conceive the universe with either square or circular boundaries. What they would have in mind, pretty surely, is something corresponding to the horizontal lines of Figure 16, which represent the courses or paths of the stars from rising to setting. When I asked Tom what a navigator would do when his guiding star was not in sight, he said 'He must know the road for that star.' Damm, too, speaks of the road of a star (die Bahn dieses Sternbildes) and may be quoting, via Sarfert, a native expression.

To save space, the corresponding charts for other islands are summarized in Appendix I. This does not exhaust the lore in Tom's memory. After giving me the lists from several islands, he asked me whether I wanted them all. As the process was taking a good deal of precious time, I decided that lists from the nearest islands and from the three most important farther ones--Guam, Yap, and Truk--would do to illustrate the nature [80] of native lore and suggest the extent of it. How many more he could have given I am not sure. Perhaps not many; but I recall his speaking as if he knew a similar list from Puluwat, which seems to have been a center of particularly high development of native navigation. And probably he could have given several others.

It is noticeable that the lists from the farthest islands are the least complete and

exact. That for Guam, which because of the east-west direction of prevailing winds is the most inaccessible by sail from Ifalik, is the worst of all. Putting Europe north by west from Guam is the nadir. But in that Tom was, of course, departing from anything in native tradition. I suspect that the mistakes in locating Saipan and 'Nuta' (Rota?) from Guam are not errors in his knowledge but in his use of English. He was subject to lapses in which he would say 'south' for 'north', and vice versa. One such would account for these errors. In spite of this, the Guam list is not impressive. Yet the total amount of his memorized information, and the accuracy of a good deal of it, do speak well for native mental capacity."

"Stars as Weather Signs

Stars are used not only to give directions, but to indicate weather. Only a few of these signs were given. They may have some validity for seasonal changes. When the star Maileu (not used as a guiding star, hence not shown in the star chart) is high in the sky before dawn, winds will be light and good for sailing. But when Maileu hangs low over the sea at dawn, and the star Sota comes up before sunrise, winds will be dangerously strong. The star Rangalieli in the east presages good weather. When the star Ul rises before dawn (this would be Tagal'ūlu of Fig. 16), it is a good time for a voyage toward the west."

1: Burrows--80-81 (1947-48) Woleaians 1-3
116, 815 Ifalik

"The following attempt to identify the guiding stars with names used in our astronomy is due to the kindness of Dr. Maud W. Makemson of Vassar College. She computed the azimuths of the stars as located by Tom according to points of the compass, and identified them as nearly as possible from such rough data. In the third column are given identifications of some of them as given by Sarfert. Several agree with those worked out by Dr. Makemson from Tom's location. Others differ slightly; for example, one of the possibilities for Pauievang is Alpha Aquilis, in Dr. Makemson's list, while Sarfert gives 'Adler' (Aquila) for the next star to the south, Mailap. Still others, such as Sarfert's !Orion' for UgilIk as compared to Dr. Makemson's Nu Ursae Majoris, are completely incompatible. But in that case Sarfert's own identifications are inconsistent; for if UgilIk is Orion, then Elieli, half a sky away, can not be the drei Könige im Orion or Orion's belt.

Possible Identifications of Stars

Native Name	Scientific Name	German Name
Wolwol li ievang	Polaris	Polarstern (fr. report on Faraulep) [81]
Mailap e li vang	Beta Ursae Minoris	- - - - - - - - -

Native Name	Scientific Name	German Name
Wileugo	Alpha Ursa Majoris (Zeta Cassiopeiae)	- - - - - - - -
Ugillk	Nu Ursae Majoris	Orion
Mēl	Vega--Alphae Lyrae	Leier (Lyra)
Megarigari	The Pleiades (Pollux Beta Geminorum)	Plejaden
Ulu	Aldebaran-Alpha Tauri (Arcturus-Alpha Bootis)	Aldebaran
Pauievang	Betelgeuse-Alpha Orionis (Altair-Alpha Aquilae)	- - - - - - - - -
Mailap	Belt of Orion (3 stars)	Adler (Aquila)
Pauiaūru	Spica-Alpha Virginis	- - - - - - - -
Elieli	Alpha Capricorni or Epsilon Leporis	Drei Könige im Orion (Orion's Belt)
Sarabwol	(Beta Fornacis) Fomalhaut- Alpha Piscis Australis	Rabe (Corvus)

Native Name	Scientific Name	German Name
Tumūra	Theta Scorpii or Lambda Velorum or Alpha Phoenicis	Jungfrau (Virgo)
Metārua	Canopus-Alpha Carinae	- - - - - - - -
Ipu	Alpha Cantauri Beta Cantauri	- - - - - - - -
Metremeital or Metremeiat	Magellanic Clouds	- - - - - - - -

"Fig. 17. -Diagram map of the atolls about Ifalik, with native names of the interisland seas."

"Fig. 18. -Weather vane, lowered into the water to show the direction of the current."

1: Burrows--81-82 (1947-48) Woleaians
116, 502, 823 Ifalik

"Lore of Currents

On any voyage, as soon as the canoe is out of the pass and far enough from the island it is leaving to be clear of currents affected by that body of land, the direction of the current in the open sea is tested. First the sheet is let go and the sail left flapping until the canoe loses headway. Then several light lines, weighted with sinkers, are lowered over [82] the sides. Each has attached to it a strip of coconut leaf, as shown in Figure 18, to act as a weather vane. The lines are lowered until these strips are far enough below the surface not to be knocked about by waves, but are still in plain sight. The current will then swing them around until the longer end points in the direction in which it is flowing. The several lines provide a check on each other, and prevent the navigator from being misled by some accident, such as a swirl of water around bow or stern, that might affect one of the vanes.

The captain then picks his course to allow for the current. If, for example, the current is flowing from north to south, he will choose a guiding star farther north than the true direction of the island he is heading for. Thus he guards against one of his great perils, --drifting off his course (mennāxo)."

(1947-48)

"Detailed Sailing Directions

The following directions include, besides guiding stars, some further directions: a rear sight on Ifalik while it remains above the horizon; choice of guiding stars according to the current; and directions for recovering a destination which has been misled. In naming the stars in these more detailed directions, Tom omitted the prefixes tagali-or tubwuli-for rising or setting, and his example has been followed.

Ifalik to Woleai and Return

Guiding Stars-Ulu, a little north of west. If current is flowing north, Mailap, due west; if it is flowing south, between Ulu and Mwarigari.

Rear Sight- Keep Matolo, the channel between Falārik and Falālap, 'open'; that is, visible throughout its length. Keep the islet Ellā in such a position that 'two fathoms' of Falālap are visible to the south of it.

Birds- If the navigator drifts off his course and 'goes to Mailap' instead of to Ulu, passing south of Woleai, he will see two small black and red birds (gerap). He must 'leave them to the south'; that is, turn north from where he sees them.

If the canoe drifts north, and goes to Mwarigari instead of Ulu, two white sea birds (paiennai, bigger than a fairy tern) will be seen. They must be 'left on the south.' Woleai will not be far, but it will be necessary to have a lookout climb the mast in order to see it.

If the canoe continues on a course too far to the north, after leaving the paiennai birds, a shark will be seen of the kind called malrang, of the bright red color of turmeric face-paint. Then it will be necessary to take a course a little east of south ('east half south', Tom called it). [83]

Stars for Return Trip-The star indicating the true direction is Elieli. If the current flows north, take a course between Elieli and Mailap; if it flows south, between Elieli and Sarabwol."

116, 136, 227 Ifalik

"Wild animals, particularly sea creatures, are used in more varied and ingenious ways. The skin of the fish called rel, which has a silvery gleam in some lights, is wrapped around the shanks of fish hooks to serve as a lure, usually in connection with a tuft of feathers."

1: Burrows--83A (1947-48) Woleaians
116, 231, 152 Ifalik

"Dogs serve mainly as pets and playthings. The play often takes the form of cruel teasing. This may serve as an outlet for pent-up aggression, a matter that belongs in Spiro's analysis of personality."

1: Burrows--83A (1947-48) Woleaians
116, 231, 492, 281 Ifalik

"In the use made of animals, as in so many other respects, the culture of Ifalik is simple and rather narrowly specialized. Animals are used mainly for food. None of the domesticated species is adapted to use as a draught animal or in transportation. The tanning of hides is unknown, and would be of little service anyway, for leather does not keep well in that moist, warm climate."

1: Burrows--83A (1947-48) Woleaians
116, 321, 301 Ifalik

"Shell, both of turtles and molluscs, is cut into various ornaments: bracelets, ear-rings, pendants, necklaces, and little chains hung from holes in the ear-lobes. The Hamburg expedition collected a considerable variety of these, some of them no longer common. Disc-shaped beads in contrasting colors--white from trumpet shell, dark brown from tortoise shell--form necklaces and women's belts. A simple bow drill, nowadays tipped with steel, is used to perforate the shell. The discs are cut out by twirling between the hands a long-handled steel gouge. The belts are made of four to six strands of beads, the white shell forming a variety of rectilinear patterns against the background of dark turtle-shell. Most of the belts worn on Ifalik come from Eaurupik, which makes a specialty of this craft."

1: Burrows--83A (1947-48) Woleaians
116, 224 Ifalik

"Dogs are not used in hunting. There is hardly anything to hunt except rats. The dogs hunt these on their own, but not very effectively. Apparently the cats do better at it. Rats are also caught in simple box traps with trap doors tripped by a tug on the bait. These are not much used. Spring traps bought in trade are preferred."

1: Burrows--83A (1947-48) Woleaians
116, 231, 301, 227 Ifalik

"A necklace made of dogs' teeth is shown in one of Damm's illustrations. These are not now common; I saw none. About the only part of a domestic animal that is in common use, except for food, is feathers. A rooster's long tail feathers effectively top off a male dancer's head-dress. Tufts of smaller feathers are lashed to fish hooks for a lure. None of these uses of domestic animals involves any noteworthy development of technology."

"Pearl shell and turtle shell are combined in the bonito hook (pā). This is of a type widespread in Oceania. It is composed of two pieces, a pearl-shell shank and a turtle-shell point. In the thick end of the shank a hole is bored to attach the line. (As this end is nearer the fisherman when in use, it is convenient and customary to call it the proximal end.) Little grooves are cut in the sides of the distal end to hold the lashings which attach the turtle-shell point. There are two of these lashings. In a specimen collected on Ifalik, which is now in Bishop Museum, Honolulu, both lashings pass through holes in a proximal projection of the point. Damm illustrates both this type and another, which has only one hole, for the distal lashing. In this type the proximal lashing passes entirely around the projection of the point, which flares out at the [83B] end to keep the lashing from slipping off.

Local variations in attachment of point to shank on bonito-hooks have been studied by Te Rangi Hiroa (Dr. Peter H. Buck). Following his lead, the writer compared types in different parts of Polynesia (Burrows 1938), and came to the conclusion that the type with two holes in a proximal projection of the point was invented in western Polynesia. Its occurrence as far west as Ifalik throws doubt on that conclusion. Fuller data from Micronesia will probably make possible a clearer reconstruction of the invention and diffusion of bonito hooks in Oceania.

The shank is shaped like the body of a small fish. This, and its pearly gleam, quite

like that of a fish's skin and scales, make it a most effective lure. As Buck has pointed out, shanks can be made of different colors by grinding off more or less of the outer layers of the shell. This is done deliberately, and the fisherman chooses which hook to use according to the light at the moment, or the kind of small fry on which the bonito are feeding, or by trial and error. Three names for hooks of different colors were told to me on Ifalik: renifār, with yellowish lustre; alo, bluish; and reneverale, reddish or coppery. Damm lists four names collected by Sarfert, none of which corresponds to these. Probably both lists are correct as far as they go, but incomplete.

As an additional lure, many bonito hooks have, lashed to the distal end, a tuft of feathers or of white fibers from the roots of the plants called guan and bogo li le pā."

1: Burrows--83B (1947-48) Woleaians
116/321, 202 Ifalik

"Conch shells are used as trumpets (taui). In Ifalik the hole used for a mouthpiece is made, not by cutting off the pointed end, but by drilling in one side. The long-drawn monotone of such a trumpet summons the people to public meetings, and warns off evil in several rituals. One trumpet hangs from a branch of a small dead tree stuck in the ground beside the channel between the two inhabited islands. An obvious use there would be to summon a canoe from the other side for a ferry. But I never happened to see it so used. One night when a school of bonito had been surrounded by seines, natives in canoes kept several conch shell trumpets (as well as one or two navy boatswain's whistles) sounding over the lagoon all night."

1: Burrows--83B (1947-48) Woleaians
116, 412, 284, 321, 177 Ifalik

"As recently as 1909, the time of Sarfert's visit, all the adz heads were of Tridacna shell, lashed with sennit to wooden handles cut from a forked branch. In 1948 no shell adz heads were to be found. Similar handles and sennit lashing are used to attach steel plane blades."

"Methods of capturing animals for food are varied, though mostly simple. The extreme of crudity is catching a chicken. There are no coops, and while the birds stay near the houses, they roost in trees or on rooftops, and can fly for considerable distances when alarmed. When one is doomed to be eaten, young men and children, some of them armed with sticks or stones, try to surround it or run it down. No particular skill is shown, and the process often involves a lively hue and cry. This, like a good many native activities, rates very low on any scale of efficiency, but has a high yield of fun.

More ingenious, and demanding respectable acrobatic skill, is [83C] the method of catching noddy terns. They sometimes visit the island in great numbers. At such times the men hunt them by climbing at night the coconut trees in which the terns roost, and catching them in large, light nets with short handles and round wooden rims. During our stay on the island, the terns were not considered abundant enough to repay the effort of catching them. But during our last weeks there, when we were known to be short of meat, our faithful Tom--rather along in years to be scrambling in the treetops --twice caught a brace of terms, which his wife cooked for our breakfast. Unplucked and bedraggled, they were not appetizing to look at. But they proved to be surprisingly tender and well-flavored."

1: Burrows--83C (1947-48) Woleaians
116, 225, 262, 565 Ifalik

"The most prized of all meat is that of the sea turtle. The people say they are commoner on some of the other islands, notably Lamotrek and Elato, then they are on Ifalik. On some uninhabited islands they are said to abound. During the six months we were there, four of them were taken, to our knowledge; three of these within two or three days, so that they were all cut up and cooked at the same time. Turtle meat is reserved for the clan Kovalũ, in which the highest chiefly title is hereditary. Others get it only when this chief deigns to distribute it to them. Except for members of this clan, and the other chiefs, a meal of turtle meat is a rare delight."

1: Burrows--83C (1947-48) Woleaians
116, 225 Ifalik

"The easiest and most favored way of catching turtle is on land at night, when they come ashore to lay their eggs. They leave easily recognizable tracks on the beach. When found on shore, they are turned over on their backs. Then they are helpless and can be dragged at the end of a line or, with manpower enough, carried. Three of the four caught during our stay were taken in this way. The fourth was speared, we were told, by the chief WolpaitIk. How he managed to drive a spear through the shell, or whether he speared the head or a flipper, I was unable to make out. After WolpaitIk had speared it, I was told, another man dived and speared it from beneath. It is said that turtles are sometimes caught by running a noose of rope about the head and one of the fore-flippers. Tom--apparently as much for fun as anything else--once attempted to catch a turtle in the lagoon by riding it ashore. He could not guide it, and as it took him toward deep water, he gave up the attempt."

1: Burrows--83C (1947-48) Woleaians
116, 462, 226 Ifalik

"Catching crabs is women's work. The largest and most prized variety is the coconut crab, that lives in holes about the bases of trees. It my [sic] be smoked out of the hole, or dug out with a pointed digging-stick. The people know that these crabs come out at night, and can be hunted with torches; but this way of catching them is seldom practised. Other land crabs are occasionally gathered, and several kinds of sea crabs are caught by hand on the reef at low tide."

"Butchering a turtle is a job performed only by the highest chief. The proper place for it is between the canoe-house called Fan ni Wong (House of the Turtle), and the neighboring homestead, Uelepi, associated with the senior lineage of the Kovalū clan. Asked, in the presence of the chiefs, whether this association of turtles with the highest chief had any religious significance, Tom rather contemptuously denied it. Yet the pattern of associating turtles with high rank, which is widespread in the Pacific, is in some places explicitly religious. As a matter of fact, Tom begrudged the Kovalū clan's [83D] monopoly on turtle, and would be inclined to belittle the privilege in any way he could. He once spoke longingly of a visit to the uninhabited islands, where a man could eat all the turtle he could catch. Yet if the reservation of turtle for Kovalū clan, and the butchering by the highest chief, was thought of as explicitly religious, he would hardly have denied it.

The high chief, Wolpetau, made one job of butchering the three turtles that were caught within a few days. Before he cut them up, the first to be caught was left on its back, alive, for three days; the second for two days; the third,for approximately one. Two of the turtles had bodies more than three feet long. The total length of each, with head and tail extended, would have been more than four feet. The third was smaller, with a body--the part within the shell--about 30 inches long. To estimate the total weight of the meat is beyond my capacity; but it must have been fully 100 pounds, perhaps

two or even three times that.

The three turtles lay on their backs in the little grove between Fan ni Wong and Uelepi. The chief Wolpetau, with the aid of his adopted son Uveli, laid them side by side in shallow pits. The two built over them a hot, quick fire of light fuel, mostly dry coconut leaves; to kill them, I was told. After that, Wolpetau did all the work alone. He had for spectators, beside Uveli, two women of the household, his sister and niece; two young men, the niece's husband and another, not of the household, whose relationship is unknown to me; and a small boy of the household, the heir apparent to his title.

When the fire had burned down, Wolpetau hauled the first turtle out of the pit and carefully scraped off remaining bits of ash. Then, with a bush knife I had given him, he cut around the edge of the under shell, following a suture most of the way. At the tail he did not cut as close to the shell as possible, but straight across the base of the tail and the rectum. With this incision completed, he pried off the under shell.

Four iron pots were laid nearby when the work began. Two or three more were brought later. Pieces of each kind of meat were put into each pot, to be distributed as gifts. Three baskets, newly plaited of green coconut leaf, were ready, one for the intestines of each turtle. Several newly cut green leaves served as platters for the larger pieces of meat.

First to be removed were the slabs of muscle (witigo terag) overlying the fore flippers. Then the layer of green fat (ui) over the belly. The intestines (tal) were then hauled out

into the basket ready for them. The fore flippers (iengal) were then neatly cut through at the joint, twisted off, and tossed on one of the open leaves. Lean meat on the lower belly (fitiu) was partly distributed among the pots, the rest thrown on the leaves. Yellow fat (sha), found here and there among the other tissues, was distributed among the pots. A big triangular piece (peral) about the base of the tail was cut in two and put on the leaves. The eggs were left in the shell. The opening of the reproductive organs was thrown away. To prevent the women from hearing, Wolpetau whispered the name of this to me so softly that I could not hear it, either. The women, the least bit ostentatiously, paid no attention.

The other turtles were now cut up in the same way. Butchering all [83E] three made a fairly strenuous afternoon's work for an elderly man. The meat in the pots was cut up and cooked by the women. The largest pieces, those laid on the open leaves, were cooked in an earth oven (um). There was enough meat this time for quite a generous distribution. Not only was one of the pots brought to us, but a small basketful was given to Tom, who ate it all himself."

1: Burrows--83E (1947-48) Woleaians
116, 226 Ifalik

"Men's kinds of fishing are so numerous that probably this account does not include all that are known and occasionally practised. The list of fishing methods noted by Sarfert during his short stay on Ifalik includes several I did not hear of, --as my list includes several not in his. Having learned elsewhere about fishing with a baited hook attached to a kite flown over the water, he asked the people of Ifalik about it, and was told it was known and practised there. But we saw none of it. He was also told of catching shark with a noose, which is spread out, while a separate line run across it holds a smaller fish used for bait. No shark were caught during our stay, except for small sand-shark occasionally rounded up in seines or caught on a hook. He also lists fishing with poison as a technique learned from Yap. My question about this was answered in the negative. Ifalik has a few Barringtonia trees, whose crushed fruit is used elsewhere for fish poison. The people told me they knew of this method being practised elsewhere, but did not use it themselves. And indeed, in the absence of fresh-water streams, which make narrow channels in the fringing reef, I know of no suitable enclosed spaces in the water where the poison could be effectively concentrated."

1: Burrows--83E (1947-48) Woleaians
116, 226, 462 Ifalik

"Fishing, which involves a greater variety of techniques and apparatus than all the rest of the food quest, is men's work; almost exclusively, but not quite. Women rummage on the reef for crabs, shellfish and any fish which may have been left in shallow pools by the outgoing tide. Another kind of fishing they do is an extension of that process. It consists of surrounding with a mat or screen of coconut leaf a slab of coral that stands in shallow water. When it is all fenced in, they move the slab. There is an incantation to lighten this work:

Gērige vaul!	Come now, stone!
Trō le gurok bweje wāje!	Like a gurok leaf, be light!
Io! Gaje vā! Eu i langēia!	Oho! Be light! Rise up!

When the fish dart out from under the slab, they are stopped by the coconut leaf barrier, and caught in dip-nets.

It is said that women also make temporary fish weirs of plaited coconut leaf, which they set out along the reef, weighting the leaves down with blocks of coral. This is apparently not a common practise, at least during the part of the year when we were there. I never saw it done. The secondary part that women play in a bonito drive will be described later."

1: Burrows--83F (1947-48) Woleaians
116, 226, 177 Ifalik 1-2

"Another method [KS: of fishing] described by Sarfert--and attested by specimens of tackle used--consists of fishing for flying-fish with double-pointed gorges. These were attached by short lines to empty coconut shells, plugged so they would stay afloat. A number of them were tossed into the water. The bobbing of the shell showed when a fish was caught on one of the gorges. Bits of young coconut leaf serve as lures, a detail not noted by Sarfert. The following incantation accompanies this fishing technique, which is called măt:

Saū a li go!	Come, flying-fish!
Saū e li var!	Come bite my hooks!
Go tami le i meraku!	Do not delay!
Gou wa li gēru a!	Come at once!
Mwa ramu gatāgei alo!	Hurry, before the sun comes up,
Tā perē la getrioú.	And the red getriou buds open.
Ngē nutu ngē nut',	Up and down swim the hooked fish,
Nutu fē li pāle	They rise to the hook,
Nutu rangē rang'.	They fly out of the water.
Trū eru ge le mwanne!	Come through the water!
Saū e li var!	Come bite my hooks!

Go tai ninge mware ru e pa.	It is not good, two pieces of white leaf.
Go ninge mware rueik.	It is in good with twenty.

Nowadays steel hooks are used instead of wooden gorges. Foreign hooks have also--so far as my observation goes--replaced two other types collected by Sarfert: simple recurved hooks of tortoise shell, and large wooden ones for shark."

1: Burrows--83F-83G (1947-48) Woleaians
116, 226 Ifalik 1-3

"The native composite trolling hook is still in use. Wooden boxes with fitted lids (sawe le pā) with one or more hooks in them, were hanging up in all the canoe-houses.

Trolling for bonito has the greatest emotional appeal of any kind of fishing, to judge by the fact that 5 out of 16 fishing songs collected celebrated feats of bonito trolling. No other kind of fishing had more than two songs. Yet this kind of fishing was not once undertaken during our stay. Weather may account for this. Trolling has to be done in small canoes outside the lagoon, and is only feasible during fairly calm weather; and a good deal of the dalmest weather comes during the part of the year when we were absent. Yet the people did not say that this was a seasonal kind of fishing; only that wind and sea had to be just right. Having worked in two Polynesian islands where this strenuous kind of fishing had gone out of use, I wonder whether it is on the decline in Ifalik.

Enough was learned about it to indicate that it follows the same general pattern as in Polynesia. The poles are of bamboo, most of which has to be imported. The lines, said to have been made of hibiscus bast before foreign lines were available, are about the same length as the pole. The presence of a school of bonito is often indicated by a flock of sea birds--in Ifalik the white fairy tern and the black noddy--hovering over to catch the small fry as they leap out of water to escape the bonito. The canoe paddles over the [83G] school, and the fisherman--one in the stern of each canoe--lets out his line astern, resting the pole in the forked head of the canoe or sometimes against his body. The pole is tilted at such an angle that the hook skitters along the surface of the water.

As he lets out the hook, the fisherman holds the pole with one hand, while with the other he splashes water over the lure. This throws a screen of water between the hook and the boat, so that the bonito which sees the hook will not see the boat just beyond it and be scared away. The fisherman keeps up this splashing while he is in the school, when not too busy hauling in fish.

When a fish strikes the hook, it is hauled in with one motion. The tip of the pole is raised, lifting the fish out of water, then swung around slowly, in order not to frighten away the other fish--until the fisherman is facing the bow, when he lets the fish strike against his chest, which knocks it off the barbless hook into the bottom of the boat. Failing this, the sailor sitting nearest him may remove the fish from the hook. It must be done quickly, for the canoe is only in the middle of the school for a short time, and the fisherman must make the most of that time.

Several bits of religious or magical procedure accompany this kind of fishing. Before they set out, the fishermen must bathe carefully, to remove any odor of the body or perfume of their wives or sweethearts. Once a fisherman takes a pearl-shell out of its box, he must have no contact with a woman until he has returned from fishing. As he sets out, he waves a branch of aro, and sings a prayer to a god, to vouchsafe him a good catch. No one god has power over bonito-trolling, but each fisherman sings to a god whom he considers favorable to him. Leaves of aro may be rubbed over the body and on the

lure. The fisherman[sic] may adorn themselves--as men do on any social occasion--with strips of white young coconut leaf. This leaf is also displayed on the return trip as a sign of success. As will be seen later, some of these precautions and bits of ritual also accompany other kinds of fishing.

A similar kind of trolling is practised from large sailing canoes over reefs within sailing distance of Ifalik. The most frequented, called Vasulos, lies about an overnight sail from Ifalik, a little west of north. This reef is also called Faiaulap or Great Faiau. One trip there was made during our stay on the island. The catch consisted of one yellow-fin tuna, weighing perhaps 100 lbs. This was the only tuna caught during our stay, and its flesh is highly prized; yet one fish was considered hardly worth the effort of the long trip. It was also reported that the seas were breaking over the reef, so the expedition was not repeated during our stay. The time was December 6, early in the trade-wind season. Calmer seas are to be expected near the end of that season, and such expeditions may be more frequent at that time. Species commonly caught by this kind of fishing, besides yellow-fin tuna are albacore, pompano (Hawaiian ulua), and wahoo (Hawaiian ono)."

1: Burrows--83G (1947-48) Woleaians
116, 226 Ifalik

"Hook and line are also used for angling about coral heads in the lagoon, a method practised mostly by solitary fishermen who expect no greater catch than will make a family meal. Casting along the shore, with small hooks, is another minor kind of fishing. Occasionally, at low tide, men will cast into the surf at the outer edge of the fringing reef on the eastern side of the atoll. However, as they have no reels, and use lines not much longer than the poles, the casts are short."

1: Burrows--83H (1947-48) Woleaians
116, 226 Ifalik

"Fish traps, (ul), are made of wattle. The frames are of light withes. Coconut leaflet midrib, commonly doubled, is used to fill in the walls. The pieces are lashed together with light sennit cord. There are two distinct sizes, differing in name and use.

The smaller traps, ul pam, average 2 or 3 feet long and 1 or 2 feet high. The general shape is diagrammed in Fig. 16a and b. These are set on the bottom in the shallow water near shore on the lagoon side. They are weighted down by pouring sand over them. Most of it sifts through, but some stays on the bottom of the trap and some on the top. It also gives the trap a natural appearance, like that of the surrounding bottom. These traps are baited with crushed crab of the small kind called ragūm. The fish most commonly caught in them is the oerIk, a fish averaging four to six inches long, schools of which appear suddenly in the lagoon, stay for a time, and then as suddenly vanish. The fish are cooked whole on green leaves laid over the usual light fire of rubbish. Before eating, they are cleaned by removing the heads, tails, skins, and the spine with entrails. Thus it takes several fish to make a mouthful. In spite of their small size they make very good eating. For over a month, beginning in mid-November and continuing through December into January, they constituted the main supply of fish. Occasionally other fish are caught in these traps. The best catch seen numbered a dozen or more fish of fairly good size, up to about a foot long. They were reef fish of various kinds, mostly parrot-fish and goat-fish.

The larger traps, ul merouā or merouel, run about six feet long, three feet wide,

1: Burrows--83H-A (1947-48) Woleaians
116, 227 Ifalik 1-2

"Fig. 19. -Fish traps. a, small trap, plan; b, small trap, side elevation. c, large trap, plan; d, large trap, elevation. 1, narrow entrance; 2, door for removing fish."

and two feet high (Fig. 19, c and d). They are carried out to sea in sailing canoes to search for drifting logs, which attract certain kinds of fish. When a log is sighted, the men dive overboard and fasten the trap to it. It is said that huge catches are sometimes made in this way, but during our stay the canoes went out day after day without so much as finding a log; and only twice did they have fair success. The largest catch reported was '200'. The largest seen numbered about 100, rather small fish, mostly of the kind called rel, with a few larger fōfō. Fish caught in this way are laid directly on the coals and broiled whole. We were warned not to put them in our frying-pan, for if we did there would be no more driftwood.

These large traps are also sometimes set on the seaward side of the reef. Tom described a bit of ritual accompanying their use. When driftwood is sighted, a half coconut shell is attached to a stick called merouel, and an incantation sung over it. Then stick and shell are put inside the trap. Nothing was said about bait being put in the shell."

116, 227 Ifalik

"Fig. 20. -Fish weir (gamei) of piled coral blocks.

The dotted line indicates high water mark on the beach. The weir points into the lagoon. Its arms are perhaps 50 feet long."

1: Burrows--83H-83I (1947-48) Woleaians
116, 227 Ifalik 1-2

"The only kind of fishing device that is constantly in use is a permanent weir (gamei) built of blocks of coral. These are set up along the beach on the lagoon side of Falārīk, --evidently the shore of Falālap is not considered suitable for them, perhaps because most of it, instead of sandy beach, is irregular, shelving more steeply, and of coarse gravel. The shape of a gamei as indicated in Fig. 20, is something like a broad arrowhead. They are made with their points away from shore. The single wall that would correspond to the shaft of the arrow extends out from approximately high water mark. The double walls, corresponding to barbs of an arrowhead, average 30 to 35 feet long. At high tide they are covered with a foot or two of water; at low tide they [83I] rise out of water from a few inches to about a foot. Fish that come close to shore at high tide, mostly by night, are expected to follow the single wall to seaward as the tide goes out, and so to be led into the V-shaped space between the double walls. When the water is below the top of the walls, they can not escape.

During our stay on Ifalik (late July to early February), there was only one catch of consequence in such a weir, and that in only one out of four of them. On the morning of December 15 we were given five fish out of a catch estimated by Maroligar at 100. The largest, somewhat less than a foot long but not improbably the best of the lot, was one of the several kinds that in Hawaii would be called papio or--in a restaurant--'baby ulua.' The others seemed to me to be horse mackeral--in Hawaii akule; but Maroligar insisted they were not the same as the picture of akule in Hosaka's book.

Someone took a glance at each of the gamei every morning; but no one was disappointed to find them empty. It is only on rare occasions, when a run of small fish enters the lagoon, that the weirs are sometimes so full that the fish can be scooped out by the netful. However, the labor of building them has to be expended only once, after which a little repair work now and then will keep them in working condition indefinitely. Good catches, even though they come months apart, are worth that much trouble."

1: Burrows--83I (1947-48) Woleaians
116, 227, 286, 171 Ifalik

"The kinds of fishing that require the largest number of men, and yield most of the large catches of fish, are done with nets. In one of the commonest and most productive methods, dip-nets are used for the final catch, but the fish are first herded together by what amounts to a movable weir. It is made of a long line of sennit rope and a number of green coconut leaves, which are split, and the halves tied along the line. Men wade out with it into shallow water, usually in the lagoon. They extend it to its full length, then sweep as large an area as it will cover by bringing the ends together. One end may be anchored, and the other brought around to meet it; but more often, within my observation, both ends were moved. The projecting coconut leaflets scare the fish, and drive them ahead of the line as it is pulled in and the circle narrowed. When the fish are enclosed in quite a small space, they are scooped up with dip-nets.

This technique, carried out on a small scale, is called sengango; on a larger scale, rop. Although it sometimes fails, it is the most reliable resource yet mentioned. When a good supply of fish is wanted for some special occasion, such as a feast on the completion of some public task, the kind of fishing tried is as often rop as any other.

Whether the word rop is a loan from English, or whether the resemblance to our 'rope' is a coincidence, I could not make out. The latter seems more likely. It is used only for the method of fishing, not for sennit rope in any other connection. This fishing technique is widespread--essentially the same as Hawaiian hukilau, for instance-- so it

1: Burrows--83I-83J (1947-48) Woleaians
116, 226 Ifalik 1-2

"The most important fishing done with dip-nets, and the technique [83J] attended with more formality and ceremony than any other, is catching flying-fish by torchlight. This kind of fishing, with all its institutional elaboration, is called turu.

When the trade-wind season, called vang or seu e vang, has about three months to go, the chiefs may order the observance of turu. This is not done every year. The only consideration mentioned as determining whether it should be done or not was that turu is observed 'when there is plenty of food.' Since there is always plenty of taro and coconuts--except after a typhoon--and since breadfruit is out of season at this time, I could not make out the meaning of this statement. It might refer to an observed abundance of flying-fish. But the same factor--abundance of food --is also said to determine the time when men's dances are performed. It seems to be a conventional explanation for a decision made 'on impulse'--that is, based on an indefinite variety of factors.

During the observance of turu [KS: turu-catching flying fish by torchlight], all the men sleep in the canoe-houses or, formerly, the men's house. They are forbidden to enter the dwellings in which women sleep, or to have sexual intercourse. They may not eat preserved breadfruit (mar). It is permissible to eat fresh breadfruit, if there is any; but there would never be much at this time of year. Their principal food is taro--both pulax and the scarcer wot--and coconuts. The food is cooked by the women, who bring it to the canoe-houses, but leave it outside, being forbidden to enter. The observance lasts for three moons.

1: Burrows--83I-83J (1947-48) Woleaians-2
116, 226 Ifalik

The technique of fishing principally associated with turu involves preparation of many torches of dried coconut leaves, which are rolled into bundles and fastened by wrapping and tucking in the leaflets. Canoes, each supplied with plenty of these torches, go out of the lagoon on calm nights, fishing in the open sea, mostly not far from the seaward side of the reef. They light the torches, which have given their name, turu, to the whole observance. The light attracts the flying-fish. While some of the men handle the torches, and others manage the canoes, the most skillful wielders of dip-nets catch the fish as they swim about the boat. An occasional one may be caught in mid-air, as it flies over the boat or strikes against a sail; but the main supply is dipped out of the water."

"Serving as a charter for this institutional kind of fishing [KS: turu-catching flying fish by torchlight] is a myth which attributes its origin to Maur, leader and orator of ancient times, and ancestral holder of the second chiefly title, which decends [sic] in the SauvelārIk clan. The myth as told to me follows:

Maur went to Woleai, took a wife there, and had a son, who lived on the islet Falāris, while Maur and his wife lived on one of the other islands. One day Maur went over to Falāris to see his son, taking with him his sleeping mat and wooden pillow (ulul), which he prized highly.

When he returned, at nightfall, and opened out the sleeping-mat, he was much disturbed to find that the wooden pillow was not in it. It could not be found in the house, or anywhere about, so he decided that it must have been lost overboard on the journey from Falāris. Taking a supply of torches, he shoved off again in his canoe to search for the pillow.

Attracted by the light of the torch, flying-fish gathered about the boat, thick as mosquitoes. Some of them flew against the sail and fell [83K] into the canoe. Maur attached a dip-net to a long pole and scooped out many of the fish that were swarming in the water about the canoe. When he came back, his pillow had been found; and he brought in a notable catch of fish.

'How did you get them? ' he was asked.

'Let all the people assemble', he replied, 'and I will teach them'.

When the people gathered around, he showed them how to make the dip-nets and attach a long handle to them, and how to prepare coconut-leaf torches. And they went out and caught many flying-fish.

When Maur came back to his home on Ifalik he brought with him the knowledge of this new kind of fishing. From Ifalik and Woleai it spread to other islands; to Faraulep, and Aurupik (Eaurupik), and Sorol, and Yap. The lore even reached distant Nauru. But to this day many islands have not mastered it. Nearby Lanotrek is one of them. Satawan, Puluwat, and many others, still do not know how to catch flying-fish by torchlight.

Sarfert collected a version of this myth, somewhat less detailed and with minor variations, but in essentials the same as the one just given."

1: Burrows--83K (1947-48) Woleaians
116, 226, 177 Ifalik

"Casting-nets are known in Ifalik, but little used. As it happens, I just once saw a man walking along the beach with a casting-net over his shoulder; and did not see him throw it. His net, and the others seen in the canoe-houses, were of imported cotton netting. This, and the fact that Damm does not mention casting-nets, suggest that they may be a recent introduction."

1: Burrows--83K (1947-48) Woleaians
116, 226 Ifalik

"Coconut-leaf torches are also used for fishing in shallow water without canoes; either wading in the lagoon near the beach, or walking at low tide on the exposed reef, where fish may be impounded in shallow pools. Usually three to six people accompany each light. Only men and boys were seen when the fishing was in the lagoon. For scouring the reef, some of the groups were also made up entirely of men, but others were household parties including women. The torch is usually carried in the left hand of the most expert fisherman. In his right hand he carries a dip-net. One of the others carries a basket to hold the fish; another a bundle of spare torches. Some kinds of fish, especially limen, may be struck with bush knives. Spears are not used in this kind of fishing. One of the fish most commonly taken with the dip-net in the lagoon is the needle-fish, which swims near the surface. Scouring the reef yields a greater variety. Crabs and molluscs may also be picked up there."

1: Burrows--83K (1947-48) Woleaians
116, 226, 262 Ifalik

"Not only are flying-fish prized as food; they are also used as bait to catch larger species. Large hooks are attached to stout lines, baited with flying-fish, weighted with coral sinkers, and lowered to considerable depths in the open sea near the seaward side of the reef. The species caught are tangéri, yellow-fin tuna; ngal, wahoo or (Hawaiian) ono; and aule, 'a big, fat one', probably albacore. This kind of fishing supplements the netting of flying-fish by torchlight, and so forms part of the institutional turu."

"Fig. 21. -Shuttle used in making fish nets. Made of split bamboo.
(Shuttles of the same type, but usually of hard wood instead of bamboo, are used in weaving.)"

1: Burrows--83L (1947-48) Woleaians
116, 226 Ifalik

"The length of a seine can be extended indefinitely. Two sizes are recognized. The longer ones, called ausepā, measured by pacing off a number of them spread on the ground to dry, average a little less than 200 feet. The shorter ones, called ăting e sau, run less than half that long, with considerable variation among them. The people make the distinction that an ăting e sau can be cast several times in a day, while one cast of an ausepā is a day's work. For the largest operations, such as rounding up a school of bonito, a number of seines are stretched end to end, and further extended by lines of rope at both ends and across any gaps between seines in the middle. The length of such a barrier is limited rather by available manpower than by material. We never saw all the seines of Ifalik in use at one time. Judging by the two bonito drives seen, a total length of half a mile for seines and rope is not uncommon.

For shorter casts, single seines may be used in the same way as the leaf-fringed lines in rop fishing. Or two seines, usually of the shorter size, may be used to extend the sides of a short section of net which is doubled and then sewed along the lower edge to form a pocket. When stretched straight, these form a V-shaped barrier with the pocket-shaped piece at the apex. An enclosure is formed by bringing together the outer ends of the seines which form the arms of the V. This is then narrowed by hauling in the seines in the usual way. When all the fish are driven into a small space near the apex, they are taken out, first by dip-nets, and finally lifting the pocket-shaped net out of water and dumping the fish into a canoe."

1: Burrows--83L-83M (1947-48) Woleaians
116, 226 Ifalik 1-2

"The climax of seine fishing comes when a school of bonito enters the lagoon. Indeed, though less celebrated in songs than trolling (which better displays individual prowess), and less attended with myth and ritual than torchlight expeditions for flying-fish, such an occasion involves more people (virtually all able-bodied individuals), and when successful yields a greater quantity of food than any other fishing. We saw two such drives. The first ended in failure, but the second was a success, capturing the whole school. That worked up a higher pitch of public excitement than any other event of our six months' stay on the island. [83M]

Except for the outcome, the course of events was much the same during the two drives, one August 1, the other August 9. The following account is pieced together from notes taken on the two days. The actual catch and succeeding activities were witnessed, of course, only once.

Both times the fish were sighted early in the morning. It takes a skilled eye to distinguish the little ripple or swirl made by a school of bonito from all the other surface movements of the water; but the difference is so important that the male population has life-long practise at it. Months later, a false alarm had the men out on the beach or in canoes for a while, until the disturbance was found to be made by small fry. The first time, the announcement was made by boys, who sped by in three canoes, shouting the glad tidings. Tom said afterward that the cry is Garangap ē! (Bonito ho!) The second time, it was Maroligar, No. 2 chief, always an early riser, who first saw the school of

fish. It is one of his functions to take charge of a bonito drive. He hurried to the nearest canoe-house and bellowed at the top of his voice to call out the men. To us, in our tent close beside the same canoe-house, it seemed that they took their time about getting there. Certainly they showed no such amazing speed as did the immediate neighbors on the one occasion when I saw a thatched roof catch fire. Still, they probably turned out as fast as they well could for what was apt to be a long day's work.

The first task was strenuous: hauling canoes from the canoe-houses into the water; unrolling seines, which are stowed on the tie-beams in balls some three feet in diameter; dragging them to the water--with men strung a few yards apart along them--and piling them into the boats; then heading for the rendezvous where they hoped to surround the school.

Meanwhile the women began their contribution. Gathered in several groups near shore, they sang and danced their serenade, the bwarux, with beckoning motions of the hands and erotic swinging of the hips. Primarily this dance is performed by one woman for one man, her sweetheart, in the utmost privacy. The very name bwarux is not uttered by people of either sex in the presence of the other. It is only on this occasion, so far as we saw, that it is performed in chorus and in public. (One other time at a men's dance, several women sang a bwarux, by way of applause and encouragement, but did not dance it.)

1: Burrows--83M-83O (1947-48) Woleaians
116, 226 Ifalik 1-4

"There are four places about the edge of the lagoon where the impounding of a school of bonito is said to be feasible. One is a little bay off the beach of Falārlk district. The second is the bay called Lé, opposite the men's house in Rauau district. The third is the shallow water next to the beach on Falālap, just north of the largest canoe-house on that island called Gavilea. The fourth is a bay near the northernmost point of the uninhabited islet Ellā. The one used on both occasions during our stay was that off the shore of Falālap. It is nearer the pass [83N] than the sites off Falārlk; the line of seines when fully extended there nearly shuts off the pass. It is nearer the canoe-houses than the site of Ellā. Whether these were the reasons for using it I could not make sure. It seems not to be a matter of where the school is first sighted, for the fish swim fast, and on both occasions made the circuit of the lagoon more than once.

The men stretched a line of seines, with intervals of rope, from one canoe to another, forming a barrier that extended from the shore nearly due west to the pass. At this stage on the first day there were 22 canoes in the line, ranging in size from the smallest to big sailing canoes. The number increased later to 33, then 37, but some of these were in other parts of the lagoon, trying to round up the school of fish, which escaped at least twice. The largest number of canoes counted in action at one time was 46; 26 of them in the line of seines and rope, the others driving the fish toward the barrier.

The next step, that of bringing the ends of the line of nets around the school of fish, is slow and hazardous. Towing or hauling the nets is hard work and can not be hurried.

At this stage the women take a more active part, wading out to help pull the nets. This interferes with the dance, but they go on singing. Partly towed by canoes, partly hauled by lines of men and women, the nets were swung around and their ends hauled in until they formed a crescent with its points toward shore. By the time this was accomplished on the first day, it was too late to complete the catch before dark. So the ends of the net were pulled together, leaving the fish impounded. All night canoes moved about the circle of nets. Conch trumpets and boatswain's whistles were blown, apparently to keep them from escaping. But they did escape, not only from the nets but from the lagoon, into the open sea.

On the afternoon of the second day, after several escapes, the school was herded into the space between the crescent of nets and the beach, and kept there while the two ends of the crescent were hauled ashore. The hauling continued, bringing the fish into shallower water, closer and closer to shore. Soon they could be plainly seen whirling about within the narrowing barrier. The top of the net was sometimes lifted where they came near, or they were frightened back by shouts and splashing.

The excitement mounted. All the men were shouting orders at each other. Many of the men had managed to deck themselves with young white coconut leaf during the slow hours earlier in the day. The women who were not hauling on the line came dancing down to the beach, swinging their hips in wider circles than ever. The ranking chief and

Later inquiry about the purpose of this performance brought only the usual answer that it was an ancient custom. My guess is that the song and dance were addressed to the men, to cheer them on, rather than with any magic purpose in mind. The words may be those of any well-known love song. Once when I passed close to a group as they sang, their giggles and sidelong glances suggested that they were improvising words about me."

was said that one fish was allotted to each person. As the pile for each district was finished, young men came up, bowing low in deference to the authority represented by the occasion (though only the lowest-ranking chief was taking part), and carried the fish away.

There were plenty of fish left, so the distribution continued. First five small piles were counted out, one for each of the chiefs. Then three larger piles, one for each of the most populous and highest-ranking clans: Kovalū, SauvelārIk, Mangaulevār. The other five clans were ignored in this allottment, though the lowest chiefly title belongs in one of them. However, that clan, Rapevelū, has less than half as many members as any of the ranking three.

Still a few fish were left. I did not make out on what basis they were allotted, but they were divided into little piles, and taken away by young men, like the others."

1: Burrows--83O-83P (1947-48) Woleaians
116, 251 Ifalik 1-3

"The people scattered to their homes [KS: after the bonito catch], but not to sleep. Those who had not taken part in the distribution had been busy preparing earth-ovens (um), not in the cook-sheds behind the dwellings, but on the foreshore near the beach. Shallow pits were hollowed in the sand. Piles of dry firewood were brought from the cook-sheds, and supplemented by dry coconut husks; and fires were laid and kindled in the pits. When the fires were going well, basketfuls of coral gravel were thrown over them to be heated. Meanwhile the bonito had been cleaned, cut into large pieces and made into bundles with wrappers of banana and breadfruit leaf. When fires were well burned down, the bundles were laid over the hot coral and the whole covered over with coconut leaf and earth. There they stayed for what was left of the night. (This traditional kind of cooking is no longer used to prepare ordinary meals in the cook-sheds, but only for special tasks like cooking large fish and turtles.)

Early next morning the pits were still covered, but the people were busy making racks (fang) to smoke the bonito. Four upright posts were set in the ground forming a rectangle. On top of them, at a height of about four feet, a horizontal frame was made of poles, either laid in forks on top of the posts or lashed in place with sinnet [sic] Pieces laid crisscross over this formed the rack. Most of them were of green coconut leaf midrib, which does not burn easily. The wrappers of cooked fish were laid on the rock, the top roofed over with plaited green coco- [83P] nut leaf, and the sides walled in with the same material, except for a low opening left on one side for feeding a smudgy fire,

mostly of coconut husks. This fire was kept going as long as the supply of fish held out. Some of it, cooked over an open fire, had been eaten the night before. (I did not see any eaten raw, but some may have been, as bonito commonly is in Japan, Hawaii, and other parts of the Pacific). From then on, smoked bonito was the daily fare for about two weeks. Gifts made to us would spoil overnight, until we asked our neighbor Maroligar to put them on his rack. Toward the end the fish was very hard and smoky, but as long as it was kept on the racks, no more tainted than smoked and salted fish eaten in the United States.

For three days after such a catch, work is forbidden, except for that necessary in the preparation of the fish and in daily housekeeping. The tabu extends to sexual intercourse. The traditional penalty for violation applies explicitly only to men, and only when the next bonito catch involves use of the spear. The violator of the tabu will be unable, next time, to spear the fish. This is expressed in something like a proverb, a rarity in Ifalik. Ig e valī la ig owai, the fish refuses the spear. It was compared to a woman refusing sexual intercourse."

the foreign observer, as they stood on the beach, were ardently wooed behind their backs.

Some of the big blue fish began to flop ashore. Men and women ran down, seized them by the tail with one hand and ran a finger of the other under a gill-cover, then tossed them up on the bank. Others were seized and thrown from the water. Sometimes the chiefs order the use of spears at this stage; but this time they decided that the catch could be managed better without them.

The whole catch was carried, some in canoes and some by hand to the space in front of the men's house, and laid in a great heap. People took [830] time out to breathe and bathe, and eat a hasty snack.

After dark, by the light of a fire of dry coconut leaves, the catch was counted and distributed. The total number was 311 (at least one had previously been given away, to the anthropologists). Garegeligar, priest and healer, seemed to be in charge of the distribution, though he is not a chief. (He never missed a chance of being the center of attention.) The counting and tossing the fish into piles was begun by the lowest ranking chief, Toroman. He handled the fish one at a time, calling out the count. When he tired, his place was taken by one of the strongest men, who handled the fish in pairs, one in each hand. The count was called out in the same way, except for the tens; that is, after nine came twenty, after the second nine, forty, and so on.

The first distribution was made by districts: Falālap, then Rauau, then Falārlk. Within each district there seemed to be a count of heads, by households; at any rate, it

1: Burrows--83P (1947-48) Woleaians
116, 226 Ifalik

"Some indication of the relative importance of different kinds of communal fishing is given by journal entries of expeditions noted during our stay. It applies mainly to Rauau district, partly to Rauau and FalārIk together. (Falālap had a different schedule, though on the same general pattern.) The long gaps during the early months may mean that fishing was less noticed at first. Yet it is also possible that during that time most of the fishing was done individually or in small groups. That was a daily undertaking. The journal entries take no account of it, except for the use of small traps, which was a general response to the appearance of the little OerIk in the lagoon."

1: Burrows--83P-83S (1947-48) Wŏleaians
116, 226 Ifalik

"Fluctuations that appear in the list are not necessarily seasonal, as some kinds of fish come and go at irregular intervals. Indeed, the kind of fishing that is most strictly seasonal, torchlight expeditions for flying-fish, is not noted at all, as it was never witnessed. It comes at the end of the trade-wind season, when we were not there.

The entries follow:

Aug. 1. -Bonito in lagoon. Left in the circle of nets overnight.

Aug. 2. -The school of bonito got away during the night.

Aug. 9. -Bonito in lagoon again. All caught late in the day.

September 6. -One turtle caught.

September 20. -Men of all districts fished night and morning for feast in connection with religious ceremony. (The kind of fishing was not noted because of concentration on the ceremony.)

Oct. 6 -Big rop fishing, 8 to 10 canoes. Small catch. [83Q]

Oct. 11. -Rop fishing by men of Rauau. Good catch, estimated at 200. Reef fish, many of them parrot-fish.

Oct. 13. -Three sailing canoes put out with traps, looking for driftwood. Found none.

Oct. 14. -One canoe put out with trap; driven back by strong wind.

Oct. 15. -Canoes continue to go out at dawn every day. No luck so far.

Oct. 19. -Daily sorties with traps abandoned. Twelve canoes from Rauau, 8 from Falārik, went out today for rop fishing. Came back early in the afternoon

with a good catch, estimated at 200. Reef fish of many kinds, parrot fish predominating. Large black ulua presented to us.

Oct. 22. -Canoes from Falālap out rop fishing. Good catch; provided a feast for the men who had recently replaced a corner-post on one of the canoe-houses.

Oct. 28. -Rop fishing by Rauau men. Fair catch; '20-odd big ones and a few shovelfuls of little ones.'

Oct. 30. -For several days men in all the canoe-houses have been making big seines for Falālap.

Nov. 6. -Rather large party from Rauau and Falārlk; 22 canoes counted. (Fishing probably rop.) Poor luck; reported at 50-60 fish. In the afternoon, Rauau men swept the reef near the men's house with seines. Good catch, reported at 300.

Nov. 14. -The little Oerlk (Anchoviella?) has appeared in large numbers in the lagoon. People are setting out small traps for them. First catch noted this day. (For some time after this, use of small traps for oerlk was a general daily practise. It seemed to go by bursts and only conspicuous activity is noted.)

Nov. 16. -One canoe from Rauau, one from Falārlk, went out with large traps looking for driftwood. No luck.

Nov. 18. -Everybody setting out small traps, catching oerlk.

Nov. 19. -At last a good catch with a big trap, around driftwood at sea. Number reported at 200, which seems a standard figure for a good haul.

Nov. 20-22. -Canoes out daily after driftwood. The usual poor luck. Fish are scarce.

Nov. 24. -An unusual catch in one of the small traps, of fish bigger than oerIk, about a dozen, mostly parrot -fish and goat-fish.

Nov. 26. -A turtle came ashore at night and was caught.

Nov. 27. -Another turtle speared in the lagoon.

Nov. 28. -A third turtle caught; this one came ashore.

Nov. 29. -Wolpetau, No. 1 chief, butchered the three turtles. [83R]

Dec. 4. -Scarcity of fish continues.
Canoes have been going out pretty regularly, looking for driftwood. One of them made another good catch in the big trap; about 100.

Dec. 6. -A canoe went trolling over the district reef Vasulos. Caught one yellow-fin tuna perhaps 4 feet long; but this was not considered enough for the long, hard trip. High seas reported over the reef.

Dec. 12. -The boys went out still-fishing over the fringing roof on the eastern side of Falālap, to get fish for a feast celebrating completion of canoe-house repairs in Rauau. Used small canoes, as in solitary fishing; but went out in a body, and to an unusual place. Catch rather small, mostly the red toothy lipwaix.

Supplemented at feast by a clam-like bivalve.

Dec. 13. -At least two sailing canoes out this morning after driftwood. Caught nothing. Maroligar ordered a scouring of the reef by torchlight at low tide, which came in the middle of the night. Five lights counted on the western barrier reef. Others fished the fringing reef on the eastern side. Catch reported small.

Dec. 15. -First and only considerable catch in a coral weir. Number estimated at 100. Commonest species looked to me like horse macherel, [sic] but identification is not certain.

Dec. 16. -19. Shortage of fish continues. Canoes go out nearly every day with big traps, but find no drifting logs, though many are coming ashore on the eastern beach. Small traps are not set out along the lagoon beach for oerIk; some are caught, but not many.

Dec. 20-26. -Small traps set out daily for oerIk. No communal fishing. High seas, --a near-hurricane on the 21st. Men busy in the canoe-houses making small traps.

Jan. 2. -Young men of Rauau out rop fishing. Moderate catch. Estimated at 100. This was for a feast following a ceremony on behalf of a sick woman.

Jan. 15-19. -Seas calmer, some angling even on eastern fringing reef; but the

daily trapping of oerIk seems still to furnish the main supply.

Jan. 24. -No more catches of oerIk. They seem to have left the lagoon. Men of Rauau and FalārIk spent all day making several casts of small seine along lagoon shore Catch small while I was watching, but later we were brought two fish big enough to make a good dinner for the two of us.

Jan. 26. -Men of Rauau and FalārIk spent all day on one cast with the big seine on the lagoon shore One end anchored to a stone pier. Catch moderate, but again we were brought two fish, one of which was enough for us. [83S]

Jan. 29. -Disappearance of oerIk seems confirmed. None have been caught for some days now, and the people have given up setting out traps for them.

Feb. 2. -Men and boys of Rauau went torchlight fishing on the eastward fringing reef. Catch reported small.

Feb. 3. -Another torchlight expedition on the eastward reef."

"While this list has some value for illustration, it is obviously too slight a foundation for any general statement as to which kinds of fishing are most in favor or most successful. With this limitation in mind, its showing can be roughly summarized in tabular form. Only communal methods are included, which leaves out the use of small traps for oerIk, casting, and most of the angling.

Fishing Technique	Number of Mentions	Large Catches	Small Catches	Failures
large traps	9	2	0	7
rop	5	2	3	0
seines	4	1	2	1
torchlight (on the reef)	3	0	3	0
trolling	1	0	1	0
angling (communal)	1	0	1	0

This review of fishing methods makes it clear that the people of Ifalik are not well supplied with fish. The lagoon, not quite a square mile in extent, is not big enough to

furnish an adequate supply. The reef, too, is limited in extent. Moreover, it is inaccessible because of high surf except in calm weather. The open sea has few fish. Shallow reefs in the vicinity of Ifalik are the best fishing grounds; but they are accessible, in native canoes, only when the wind is in the right direction, and not too strong."

1: Burrows--84 (1947-48) Woleaians
116, 621 Ifalik

"Discussion of the pattern of relationships among the people of Ifalik may well begin with a list of the bonds that unite the whole population. This unit has all the characteristics ordinarily cited to define a society, community or tribe. In fact, few of the aggregations called by those names are held together by as many bonds as the people of Ifalik. They share, to begin with, a common habitat and a common culture. Being so few, and confined within so little space, they are all personally acquainted by the time they grow up; though of course the degree of acquaintanceship varies widely. The chapter on government will show that they form a political unit; that on religion, that thay [sic] make up a single church or congregation.

As a matter of fact, it seems probable that all are biologically akin, But that is according to our way of thinking, not their own. As long as they do not recognize kinship, it does not exist as an additional bond except within the smaller groups to be discussed later."

1: Burrows--84 (1947-48) Woleaians
116, 648 Ifalik

"Toward the enormous populations that inhabit vast lands far away-- or some of them--the people of Ifalik show a certain deference. They are used to being ruled by outsiders-Spanish, then Germans, then Japanese, and now Americans. But this does not put too great a strain on their self-esteem. They like to think that the world power with which they are affiliated is the largest and mightiest of all. Nowadays they are glad to accord that supremacy to the United States, as formerly they probably accorded it to their previous rulers. But world powers are so vast that Ifalik people can form only a dim conception of them; and so far away that most of the talk about them is of the kind we dismiss as 'academic.' "

1: Burrows--84 (1947-48) Woleaians
116, 186 Ifalik

"The people are keenly aware of their unity, and proud of it. True, they have also some fellow-feeling for the inhabitants of neighboring atolls; 'all same one people', as Tom said more than once in concluding the legends about repopulation of the neighboring islands from Ifalik. But, as the legends also show, they like to think of themselves, and to have others think of them, as a little superior to the others. They even manage to look down, in at least two respects, on the people of Yap, who admittedly outrank them. 'To talk like a Yap man' is one way of saying 'to lie.' And the suspicion and dissension said to prevail among different districts in Yap are contrasted with Ifalik's solidarity."

1: Burrows--84-85 (1947-48) Woleaians
116, 621, 476 Ifalik

"The unity of the whole population is not exclusively a matter of relationships with foreigners. All the people assemble as a unit for religious and governmental meetings. All act as a unit to capture a school of bonito when one is found in the lagoon. Occasionally they undertake other common tasks. Most conspicuous of these, during our stay, was that of cleansing up the island. It was suggested, indeed, by an outsider, the American doctor, who advocated sanitation in order to reduce disease. Presumably he had in mind separate jobs of house-cleaning about the dwellings. But the chiefs took the matter further. They ordained that all the more frequented parts of the island, including the coconut and breadfruit groves, should be, as our army calls it, policed up. The whole population went over the ground as caretakers go over a park or golf course. And the motive was the very local pride we have been discussing. They wanted to get a higher rating for cleanliness than the other islands. It was a matter of rejoicing all around when we were able to tell them, just before our departure, 'the doctor says this is the cleanest island he has seen.' [85]

In carrying out this task, and in most others, the actual working units were smaller groups. These are united, and delimited, by a variety of bonds-sex, age, occupation, common residence, kinship; in many cases by more than one of these at a time."

1: Burrows--85 (1947-48) Woleaians
116, 463 Ifalik

"Occupation also governs the formation of temporary groups only. Some of these, as already noted, have other bonds as well--sex, age, common residence. There are no formal permanent organizations of fishermen, canoe-builders, or specialists of any kind. Navigators from different islands, on the rather rare occasions when they meet, may gravitate together. They have a good deal in common; not only a common part-time occupation, but a common status, next to that of the chiefs, and common possession of the restricted lore of seamanship. But since they meet only at long intervals, and then mostly in twos or threes, they hardly constitute a distinct group."

1: Burrows--85 (1947-48) Woleaians
116, 462 Ifalik

"Groups whose membership is delimited by sex have only a temporary or intermittent existence. Usually, even then, they are united by some other bond in addition to that of common sex. Often the other bond is occupation. Groups of men or of women gather to perform some task allotted by custom to one sex alone, as fishing for men, cooking for women. Such groups disband on the completion of each task, unless they are also united by membership in the same household. Virtually all of them have the additional bond of residence in the same neighborhood. Hardly ever do all the men of the atoll, or all the women, act together without the participation of the other sex. War would bring about such a group of the men, but warfare in Ifalik is a thing of the rather remote past."

1: Burrows--85 (1947-48) Woleaians
116, 463, 643 Ifalik

"The chiefs do indeed constitute a group, continuous though not always in session. The bonds that unite it are common rank, a common part-time occupation, and, as a rule though not necessarily, male sex and rather advanced age. Their rank seems to be the most prominent characteristic in native thought. Their common occupation, that of governing, involves a relationship to all the rest of the people. Further discussion of this activity makes up the chapter on government."

1: Burrows--85 (1947-48) Woleaians
116, 561, 882 Ifalik

"Some groups formed on the basis of age-those of children and (approximately) adolescents-have a more continuous existence. They are united also by common residence, for it is only the children, or the youths, of one particular neighborhood who play together regularly. Quite young children play in groups that include both sexes. (By 'quite young' is meant here old enough to talk and be fairly sure-footed, but too young to wear clothes, which are put on at about the age when our children begin school.) But when they reach adolescence their only distinct groups are limited by sex as well. It is only the young men who form groups of any permanence. Adolescent girls, more restricted by custom to their own households, may go out together to gather pandanus leaves for a mat, or carry on some similar task; but these gatherings, like other work gangs, disband when the job is finished. Formerly, when the unmarried men slept in a men's house, of which there were several at one time, or in one of the canoe-houses, they were almost continuously together. But of late they separate every night to sleep in the households of their relatives. Pre-marital sexual relationships, permitted by custom on Ifalik as in many Pacific islands, are not carried on by groups, as in parts of Polynesia and Melanesia, but by isolated couples, who meet secretly to avoid gossip."

1: Burrows--85-86 (1947-48) Woleaians
116, 575 Ifalik

"Ifalik has nothing corresponding closely to the secret societies, guilds, or other formal associations that abound in some primitive cultures. To use the [86] convenient term recently suggested by Lowie, Ifalik lacks sodalities."

1: Burrows--86 (1947-48) Woleaians
116, 162 Ifalik

"Much of the daily activity of the atoll is carried on by, or on behalf of, permanent groups organized on the basis of common residence, or kinship, or both. In the discussion of these that follows, the source of the specific figures given here and there is a census by households, taken during our first days on the island. A rather thorough collection of genealogies, made later on by Spiro, revealed some inaccuracies in the census. So most of the figures represent the consus [sic] as corrected by the genealogies."

1: Burrows--86 (1947-48) Woleaians
116, 621 Ifalik

"The largest territorial subdivisions of the population are determined by residence on one or the other of the two inhabited islands, Falārik and Falālap. Although some individuals have ties on both islands, and shift their residence rather freely from one to the other, nearly everyone is clearly identified, for participation in communal activities, with one or the other. The most conspicuous case of shifting residence, within our observation, was the chief Maroligar, who had close relatives on both islands. But his title involved authority over part of Falārik island, which identified him for most practical purposes, with that territorial group.

Each of the islands is further divided into two districts (gapilām). On Falārik island these are Falārik district, to the north (households 8-8 inclusive), and Ranau (households 9-19). On Falālap they are Ievang, to the north (the name means 'north'-households 20-24) and Iauru ('south' households 25-29).

In 1909 Sarfert recorded three sub-divisions in what is now called Falārik district: Sago, Gadjudolling, and Ledjourou. There are no longer any dwellings in the area corresponding to his 'Sago,' though the site of a former men's house is still pointed out there. 'Gadjudolling' (my 'Gajuteling') is the name of a canoe-house; and 'Ledjourou' may well have been the name of another, for which I was given only Fan ni Wā, the generic term for 'canoe house.' In Rauau, too, he collected two names for territorial subdivisions: 'Lawuau,' obviously the same as my 'Rauau,' and Sawolōb, as clearly the canoe-house name I recorded as Sabwōlap."

"Now the word gapilām, which I translate 'district', is used in two senses: (1) for the more formal territorial units of which there are now two on each inhabited island; and (2) for the smaller, informal neighborhoods made up of the households about each canoe-house. The canoe-houses, through their use by men and boys as club-houses, constitute neighborhood centers for the males. The obvious interpretation of the difference between Sarfert's list and mine is that he, or his interpreter, did not distinguish between these two uses of the native word. That would not be surprising, in view of his short stay on the atoll.

However, the very ambiguity of the word suggests another possibility: that what are now mere neighborhoods may have been more distinct units, perhaps even political subdivisions, 38 years earlier. The situation on Falālap reinforces this suggestion. There the two districts, Iauru and Ievang, are the same as in Sarfert's time. Some of the song-texts collected suggest a distinct consciousness of difference between them. (The age of a song, except for some quite recent ones, is impossible to determine.) But in 1947-8 they were distinct in little more than name. They were sometimes treated separately in distribution of food. But they had only one canoe house, Gavilea in Iauru, large enough to accommodate sea-going canoes; so in communal fishing they acted as a unit, and seemed to do so in [87] most other public activities. For most purposes the island during our stay had only three districts: Falālap as a whole and, on Falārik island,

Rauau and Falārik districts. Iauru and Ievang were well along toward merging. Further evidence of a tendency to merge former subdivisions will be given in the chapter on government (pp. 139-141)."

1: Burrows--87 (1947-48) Woleaians
116, 592 Ifalik

"The smallest unit based on common residence is the household, except insofar as the family maintains separate residence within the household. Both these units are determined also by kinship so they will be discussed later."

1: Burrows--87 (1947-48) Woleaians
116, 588 Ifalik

"Kailang exogamy is the only formal verbalized incest ban. Marriage between a girl and her father, though he is of a different kailang, seems not to occur to them as a possibility. This ban does without saying, as it does among us. nformal exogamy will be discussed further by Spiro."

1: Burrows--87 (1947-48) Woleaians
116, 614 Ifalik

"One kind of kinship tie--common descent in the maternal line--places each individual in one of eight groups called kailang. These groups have names: Kovalū, Sauvelārik, Mangaulevār, Rapevelu, Sauwel, Kailangailuk, Bwel, and Kailangalualea. They are exogamous, and this rule is strictly observed. There was no case on Ifalik during our stay of a wife and husband both of the same kailang. Children adopted into a kailang other than their ancestral one may not marry members of either kailang."

1: Burrows--87 (1947-48) Woleaians
116, 194 Ifalik

"Three details of pronunciation of the word kailang may be useful for comparison with related areas. First, the initial k is not only unaspirated, but pronounced so lightly that at first I did not hear it, and recorded the word as ailang. (This is the name reported for similar groups in some other islands.) Later test and inquiry showed that in Ifalik the k is always present, or at least is thought to be. Second, in the language of Ifalik, as commonly in neighboring islands, l and n are equivalent sounds, variants of one phoneme. So this word can be pronounced kainang as well as kailang. Third, a final vowel, though not sounded unless the next word begins with a consonant, is conceptually present. When it is sounded, it seems to be the 'neutral' (central, mid, unrounded) vowel. So one of the ways of pronouncing the word is very nearly the same as kainanga, the name for the largest descent group in some Polynesian islands. The Polynesian groups, however, are patrilineal."

1: Burrows--87 (1947-48) Woleaians
116, 618 Ifalik

"The name in commonest use for unilineal, exogamous descent groups like the kailang of Ifalik is 'clan.' Clan will be used here as the translation of kailang. Since the line of descent that determines membership here is matrilineal, this group would still be called a clan in the terminology formerly common among American anthropologists, whereby a patrilineal group was called a 'gens.'"

1: Burrows--87-88 (1947-48) Woleaians
116, 173, 618 Ifalik

"The clans are not localized, --that is, most of them are represented in the population of all inhabited parts of the atoll. In fact, the same clans, or most of them, are found also on neighboring atolls. Woleai is said to have the same clans as Ifalik. I could not check this statement there, as we stopped at Woleai only on our way to Ifalik, before we knew the clan names. But a visiting chief from Woleai, hearing that the chiefs of Ifalik had given me their [88]legend about the settlement of both islands, asked that my account be read and translated to him. This legend (p. 151) gives names of traditional founders of all the clans. Thw Woleai chief was already familiar with most of them, and accepted without question the one or two which, he said, had been forgotten on Woleai. At Lamotrek, where we stopped on the return trip from Ifalik, I was given names of three clans; Sauvelārik, Mangaulevār, and Sauwēl. The names are the same as far as they go, and it is quite likely that the list is incomplete. On Elato, within sight of Lamotrek, the list given me was Kovalū, Savelārik, Mangaulevār, Kailangalualea, Sauwēl. Faraulep is also said to have the same clans, but the statement was not checked by inquiry there. The list obtained on Satawal was lost overboard, I recall one name in it which is evidently the same as an Ifalik name, though pronounced somewhat differently: Sauvelāchik. If memory can be trusted, there were one or two others; but certainly there were also some which had no apparent resemblance to Ifalik clan names. Satawal, then, seems to be on the border of distribution of these clans."

1: Burrows--88-89 (1947-48) Woleaians
116, 618, 162 Ifalik 1-2

"Because they are not localized, the descent groups on Ifalik would be called sibs in the terminology recently proposed by Murdock. However, localization is not an all-or-nothing characteristic. It may change in degree, and even appear or disappear in the same locality in the course of time. The degree of localization on Ifalik in 1947-48 is shown in the following table, made up from the census by households. Falālap island was treated as a unit, but Falārik island divided into the two districts of Rauau and Falārik, the commonest form of local subdivision in native practise. Children recorded as adopted in this census (corrected later from Spiro's genealogies), and natives of other islands married to Ifalik women, were not included. This because, although adoption is commonly within the clan, it is not always so, and there was doubt about the clan mambership [sic] of some of the adopted children. As for natives of other islands, whatever their clan, their place of residence on Ifalik may not exemplify local practise. In another table prepared as a test, children listed as adopted were included, assigning them to the clan of the adopting mother unless membership in some other clan was known. This table, though discarded as less accurate, brought out the same pattern of minimal localization as the one that follows.

Clan Membership by Locality

	Falārik	Raŋau	Falālap	Total
Kovalū..	2	25	17	45
Sauvelārik..	8	15	21	44
Mangaulevār..	20	11	23	54
Rapevelū..	0	12	6	18
Sauwēl..	7	12	4	23
Kailangailūk..	9	12	2	23
Bwēl..	0	0	11	11
Kailangalualea..	0	0	2	2

The general rule is clear, --that clans are not localized. All the members of two clans, however, live on Falālap. In the case of Kailangalualea this has no significance, as the clan is reduced to two (or three) members; a woman, her [89] daughter, and the latter's adopted daughter, whose clan membership is uncertain. Naturally, all three live in the same household."

1: Burrows--89 (1947-48) Woleaians
116, 618 Ifalik

"No other clan is associated with a particular plant or occupation. But the name of one of them suggests former localization: SauvelārIk. Two of the clan names, and a third on Sarfert's list, begin with 'sau'. This recalls a prefix which occurs in the names of certain descent groups in western Polynesia: Samoan Sā, Futunan Sa'a, Tongan and Uvean Ha'a. In the clan name Saupolowat, collected by Sarfert, the clan is said to have come from Puluwat. Accordingly, I asked whether SauvelārIk meant 'clan (or people) of Falārik'. Tom and another member of the clan--as I recall it, the chief Maroligar--said that it did. That this was not merely a matter of falling in with any such suggestion is shown by the fact that a similar question--whether Bwēl and Sauwēl were offshoots of one original clan--was answered in the negative. Of course, the answer of natives to any such question may be wrong. Yet the probability that the name indicated former localization of this clan seemed strong enough to be worth mentioning."

1: Burrows--89 (1947-48) Woleaians
116, 618 Ifalik

"The localization of the clan Bwēl, however, seems more than accidental. The name bwēl, as a common noun, means taro swamp. The clan Bwēl is especially associated with the cultivation of taro. Traditionally no others can equal them at horticulture. Since all but a few small patches of taro swamp are on Falālap, the localization of this clan there seems related to this traditional function. However, this showing is weakened by the fact that Bwēl, too, is a small clan, and all but one of its members belonged to a single household."

1: Burrows--89-90 (1947-48) Woleaians
116, 618, 565 Ifalik 1-3

"Names of some of the other clans connote rank rather than locality. There is a recognized order of rank for those clans within which chiefly titles are hereditary, corresponding to the order of the chiefs who hold these titles. Clans that have no title rank below those that have, but apparently in no particular order.

Below are listed the clans, in order of rank as far as possible, with what was learned about the meaning of their names, and any special attributes:

1. Kovalū: Ko is said to mean something like 'chief' or ruler, though the ordinary word for chief is tamōl. Valū means 'land' or 'island'. The word is said to be not only the name of the clan, but also the title of the highest ranking chief, who is of this clan. However, the chief is rarely, if ever, addressed or referred to as Kovalū. This clan has first claim on all turtles.
2. SauvelarIk. People of FalārIk. This is the only clan that has two chiefly titles. They rank No. 2 and No. 4. It has first claim on all yellow-fin tuna. Tom, a member of this clan and inclined to make the most of its importance, said that SauvelārIk, through the higher of its two chiefs, has charge of the lagoon and of fishing. The response of the chiefs when asked about this claim is discussed on pp. 140 and 141.
3. Mangaulevār: Translated by Tom as 'more high' (in rank). Title of the No. 3. chief.
4. Rapevelū: Title of the No. 5 chief. Rape translated by Tom as 'all same tamōl';

like ko, but less exalted. Velū is 'land' or 'island', the same as valū in kovalū.

5-8. (As noted, the following clans, which have no chiefly titles, seem to have no particular order of rank except that all are subordinate to the preceding four.)

Sauwēl. The name was not translated. Sarfert's statement that this clan [90] came from Woleai suggests that the name might mean 'people of Woleai'; but this is inconsistent with the Ifalik legend of repopulation of Woleai, and was denied. Another suggestion, that the name might mean 'people of the taro swamp', and so be a variant of Bwēl, was also rejected. 'Just name', Tom said. The traditional function of this clan is to run errands and carry out orders for the chiefs. Tom said 'all same policeman.' The only reflection of this noted in practise was that an old man of this clan living in Falārik district was said to be a sort of petty chief, the only instance of such a position. He did not meet with the chiefs, nor sit with them at public assemblies. No case was observed in which he exercised his authority. But then, he was very old, and correspondingly inactive.

Bwēl: Taro swamp. Traditionally the expert gardeners. No more active in routine gardening, however, than members of other clans.

Kailangailuk: The name was not translated, nor any special characteristics attributed to this clan.

Kailangalualea: No translation obtained, nor any special attributes. This clan seems on the point of extinction in Ifalik. The members were a woman and her widowed daughter, perhaps also the latter's adopted daughter. If this girl has children, and they are ascribed to Kailangalualea, the clan will continue; otherwise it will die out with this generation. On Elato the highest ranking chief, in February, 1948, was of this clan.

The difference in rank among clans is a source of pride to those whose clan membership gives them some claim to superiority. This confers no practical privileges, however, except for Kovalū's right to turtles and SauvelārIk's to yellow-fin tuna."

1: Burrows--90-91 (1947-48) Woleaians
116, 618, 565 Ifalik 1-2

"In one important respect the relative rank of clans seems to be reflected in behavior. This is in choice of a mate.

The following list shows intermarriages between clans, as represented by the married couples living on Ifalik during our stay, except for four cases in doubt because of adoption. Kailangalualea does not appear in the table because the two certain members of this clan were widows. No attempt was made to learn the clan membership of the former spouses of widows and widowers.

Clan	Kovalū	SauvelārIk	Mangaulevār	Rapevelū	Sauwel	Kailang-ailuk	Bwel
Kovalu	x	10	6	1	1	4	1
SauvelārIk	10	x	7	3	3	0	0
Mangaulevār	6	7	x	1	7	6	1
Rapevelū	1	3	1	x	0	0	0
Sauwel	1	3	7	0	x	4	1
Kailangailuk	4	0	6	0	4	x	0
Bwel	1	0	1	0	1	0	x

Marriages between members of two title-holding clans (upper left quadrant of the table) total 28; between a member of a title-holding and a member of a titleless clan (lower left or upper right quadrant), 23; between two members of titleless clans, 5. It is true

that the number of marriages is correlated with [91] relative numerical strength of the clans as well as with relative rank. Membership of the four title-holding clans, excluding cases in doubt because of adoption, totalled 161; membership of the four titleless clans, 69. But this correlation between rank and numbers is itself another suggestion that clan rank may be a factor in selection of a mate. It is clear, though, that the apparent tendency to marry into a title-holding clan if possible does not amount to segregation or class endogamy. For instance, the highest-ranking clan of all, Kovalu, is allied by marriage with all the other clans."

1: Burrows--91 (1947-48) Woleaians
116, 618, 773 Ifalik

"No trace of totemism appears. The only connections between particular clans and creatures other than human are those mentioned: the right of Kovalū to turtles, or SauvelārIk to yellow-fin tuna, and the association of Bwel with taro. The first two are nearly the opposite of the food tabus commonly associated with totem creatures. They are special privileges of these highest ranking clans with regard to particularly prized kinds of food. The association of Bwel with taro is different. It has more the look of a sentence to hard labor for this low-ranking clan, sweetened by flattery. Neither turtle nor tuna nor taro were used as symbols of the clans associated with them. Nor were any myths found about descent from non-human creatures, supernatural help from them, or any other traditional relationship."

1: Burrows--91-92 (1947-48) Woleaians
116, 618, 175 Ifalik 1-2

"Damm gives, from Sarfert's notes, a list of 10 clans from Ifalik, only four of which correspond to the eight which are there now. My work with census and legends, and Spiro's with genealogies, provide so many cross-checks, including clan membership of every individual, that there is no possibility of error in our list of the eight clans. It seems that there must have been some misunderstanding between Sarfert and his informants or his interpreter. Below is the list collected by Sarfert, with his notation about place of origin. To the right are the comments of Wolpaitik, the only chief who happened to be in the canoe-house when I took Sarfert's list there, and of Tom. The order is changed so that the four names which refer to clans now functioning on Ifalik come first.

Clan name	Sarfert's Comment	Comment of Wolpaitik & Tom
Sauwalei	Called on Ifalik Saufalasik.	Apparently Sauvelārlk. Other name unknown on Ifalik.
Monaulifer	From Yap.	Mangaulevār. Origin accords with legends collected in 1947.
Bwol	From Pulap.	Bwēl. Origin mistaken. My informants thought that Pulap must have been written by mistake for pulax, the commonest kind of taro, because of the association of this clan with taro cultivation.

Clan name	Sarfert's Comment	Comment of Wolpaitik & Tom
Sauwol	From Woleai.	Sauwēl.. Origin incorrect. ' 'E talk lie', said Tom; Sauwēl like all the other clans, went to Woleai from Ifalik, not the other way. (See legends and discussion, pp. 139 ff.).
Saupolowat	From Puluwat.	Once represented on Ifalik. Died out long ago.
Wisusu	From Puluwat.	A clan of Puluwat and Truk. Never represented on Ifalik. [92]
Fanimei) Gadaman) Wolei)	From Yap.	Never represented on Ifalik.
Wuido	Called Djak.	Never represented on Ifalik."

1: Burrows--92 (1947-48) Woleaians
116, 618 Ifalik

"Conceptually and verbally, the clans are important units on Ifalik. The feeling of clan membership and solidarity is strong. People generally know the clan membership of everyone on the island, or nearly everyone. One of the commandments or exhortations that form a conventional part of the chief's speeches at public assemblies, is 'Do not speak evil of people of another clan.' Some of the chiefs in such exhortations address particularly the people of their own clan. Travelers from Ifalik are said to feel perfectly free to claim hospitality from their clansfolk in neighboring islands, and to reciprocate without question when clansfolk of other islands come to Ifalik, whether the claim is reinforced by previous acquaintance or not.

Yet clans never meet or act as units. Their only important effects on conduct seem to be the limitation they impose on marriage, and--a much weaker one--the effect of their rank on choice of a mate. House sites and chiefly titles are said to belong to clans, but actually are held and transmitted in the smaller groups to be discussed later (pp. 96-98)."

"Fig. 22. -Sketch map of Ifalik...."

116, 592 Ifalik 1-2

"The buildings in which the people of Ifalik live are not isolated and self-sufficient, nor are they apartments in larger buildings. They are single-room structures, always grouped in clusters. Most often the clusters include several dwellings (im) and one cook-shed (malūm); but some have only one dwelling, while others have more than one cook-shed. What gives them their unity is location on distinct, named sites or homesteads. During our stay on Ifalik 29 homesteads were inhabited, as shown on the map, Fig. 22. The number of inhabitants to a homestead ranged from 3 to 19. Of the 29 homesteads, 12 were occupied by 6 to 9 persons.

Membership in a household--defined for this culture as the group inhabiting a homestead--is determined not only by common residence but also by kinship. The kinds of kinship ties that typically unite the members of a household in Ifalik appear in the following list, which sorts out into broad classes the 29 households that existed there in 1947-8.

(a) Three households consisted of simple families--father, mother, and children.

(b) Seventeen households were made up of joint families of the type usual when residence after marriage is matrilocal, that is to say, groups to which the married men belonged by virtue of marriage, the others by virtue of common descent. More explicitly, seven of these households comprised a married couple (or one surviving member), their unmarried children, their married daughters, the husbands of these daughters, and the children of these couples. Two of the largest households--one with 14 members, the

1

other with 19--included two such groups. Seven more were similarly made up of kinsfolk related by common descent in the maternal line, plus the husbands of the married women. The exact membership of these varied with varying incidence of births, deaths, and marriages. But all conformed to the same type.

(c) Seven households included, in addition to an extended family, one or [93] more individuals, or families, more distantly related, or not recognized as kinsfolk at all.

(d) One household (Falūm) was made up of a family and a bachelor, the latter related only very distantly.

(e) One household (Uarigīn) was an extended family of the type brought about by patrilocal residence."

1: Burrows--93 (1947-48) Woleaians
116, 591 Ifalik

"All of the households which are not strictly matrilocal extended families include some deviation from matrilocal residence. To find out the extent to which this rule is observed, the type of residence exemplified by all the 60 married couples living on Ifalik in 1947-8 was reviewed. One case was not clear. Of the 59 others, 41, just under 70%, were matrilocal. Six were patrilocal, living on the husband's ancestral homestead. Twelve couples were heterolocal, living in various other places. Breach of the rule of matrilocal residence came to the rather high total of 18 couples, 30.5% of the total."

1: Burrows--93 (1947-48) Woleaians
116, 596 Ifalik

"The typical household, then, is a matrilocal extended family. Its composition is determined by common residence, matrilineal inheritance of the homestead, and matrilocal residence after marriage. Most of the households that do not conform strictly to this type have an extended family as a nucleus, with some additions on the basis of other claims or of simple congeniality. Given the predominance of the extended family as the basis of membership in a household, the few households that consist of simple families can be regarded as vestigial or incipient extended families. Only two households, (d) and (e), vary fundamentally from the type.

The extended family is not as clearly envisaged in native thought as the clan. There are several terms for groups of relatives smaller than the clan, but none of them is strictly synonymous with 'extended family'. One, tral li votai (with a possessive suffix, in this case first person singular), means approximately 'all my relatives'--all who are recognized and treated as such. Another, welimwales, is also used in reference to some individual. Tom translated it as 'man, and women and boy blong that man.' Pressed to be more specific, he included the man's wife and sisters, and the children of both. These would not all be members of the same household or extended family. In the absence of a generic term for 'household,' particular households are designated by the names of the homesteads they occupy."

"In order to bring out any common factor underlying cases of departure from matrilocal residence, the membership of households that include such cases is listed below. They are divided into three categories: (1) those which constitute extended families of the matrilocal type, but are not matrilocal in residence; (2) those which include a matrilocal extended family, but have some additional members who are not living matrilocally; and (3) those which include no examples of matrilocal residence. Most of the data were supplied by Spiro from his genealogies. Each case begins with the name of the homestead on which the group is living. Then follows, in parentheses, the name of the clan to which the site is said to belong; then the personnel of the household.

1. Households consisting of extended family of matrilocal type, but not exemplifying matrilocal residence:

Atielu (Sauwēl). A man, his wife, and her sister. The property belonged to his clan, but was not his childhood home, so residence is heterolocal rather than patrilocal. If these people had not gone there to live, the homestead would have been unoccupied.

Uluās (Sauwēl). A family: man, wife, and one child. The property belonged to his clan, but was not his childhood home. If he had not set up a new household by moving there, the homestead would have been unoccupied. [94]

Metalegop (Bwēl). A family: man, wife and one child. The property belonged

to his clan: it is not clear whether he was brought up on it. If the family had not gone there to live, the homestead would have been unoccupied.

2. Households consisting of a matrilocal extended family, with additional members not matrilocal in residence:

Nimau (SauvelārIk). In addition to three women of the Sauvelārik clan, who apparently had been brought up here, the occupants included two families without hereditary claim to this homestead. The wives in these families are sisters, of the Mangaulevār clan. Why the families came to live here was not specifically stated. But if the household had not had some such addition, there would have been no men in it to perform the men's work necessary for subsistence.

Faleolarik (Kailangailuk). In addition to a typical extended family, the occupants included the chief Maroligar (SauvelārIk), his wife (Mangaulevār), and their adopted daughter. Their claim to the site--one rather remote from the native rule of inheritance--was that the homestead had been that of Maroligar's father. Apparently living here rather than on his wife's ancestral homestead was a matter of convenience.

Alingeliu (Sauwel). In addition to a rather complex extended family, including four adopted children, this homestead was occupied by a woman of Kovalu clan, with her daughter and the daughter's husband. They

moved there after the death of a son of the older woman. No reason was given except her wish; but she made herself most useful by taking care of the numerous small children of the household.

Apilimat (SauvelārIk). In addition to two unmarried or widowed women who were brought up here, there were the following occupants:
(a) a woman from Faleolārik (Kailangailuk), with her husband and children. She may have been adopted into this household.
(b) A woman from Nimau (SauvelārIk), distantly related to this household. (c) A family-husband, wife, and two daughters-- none of whom had any hereditary claim to this homestead. Their reason for living here is not known.

Weluāra (Mangaulevār). In addition to a rather large extended family, the occupants of this homestead included a family of outsiders. The wife (hence the children) was of Rapevelū clan. The husband was of Mangaulevār, but from another homestead, Arotrang. No particular reason for their presence here was learned.

Falitrel (SauvelārIk). In addition to an extended family, this household included an unmarried woman, whose connection was uncertain, and a married couple, whose only claim to the homestead was a distant relationship

to the woman. She was of SauvelārIk clan, but had come from another homestead.

Fanneserax (Kailangailuk). In addition to a rudimentary extended family-two sisters who grew up here and the husband of one of them--the occupants were as follows:

(a) A widow from Nimau (SauvelārIk). Her husband had been of this clan. She had come here to live with him--a case of patrilocal residence--and had stayed on, with her three children, after his death. [95]

(b) One of (a's) sons and his wife, who came from Woleai. This was one of two reported cases of patrilocal residence after an interisland marriage. *

(c) A woman of Sauwēl clan, with her husband and their adopted son. She belonged to Alingeliu homestead next door and had moved

---

"* The other was that of a woman from Bwagolei, a SauvelārIk homestead no longer inhabited in 1947-8. She had married a man from Elato and gone there to live with his people. Cases of interisland matrilocal residence were not collected, but were more numerous."

here, it was reported, just because she chose to, regardless of custom.

3. Households which include no examples of matrilocal residence.

Foraik (Sauwel). The line that traditionally occupied this homestead died out. The site was occupied by two women of Kovalū clan with their families. They moved in from Welipeien, next door.

Uarigīn (Rapevelū). The only member of this household who was brought up here is the chief Toromann. He brought his wife to live on his homestead, a case of patrilocal residence. They have a son and a daughter. The daughter is unmarried. The son also brought his wife (Kovalū) to this homestead. By means of these two cases of patrilocal residence, the homestead has remained occupied and suitably manned.

Falūn (Sauwēl). The line that traditionally occupied this homestead died out. The occupants were a bachelor and a family. The bachelor's claim to the site was that his paternal grandfather lived there. The woman of the family had some similar, rather remote connection with the site. The reason given for this choice of residence was that the occupants wished to resettle this homestead, which had been deserted.

This list of deviations from matrilocal residence indicates that the main reason behind it is depopulation. The occupants of a homestead, according to the pattern of matrilineal descent and matrilocal residence, die off. The homestead is kept occupied, or re-occupied, either by switching to patrilocal residence, or by acting on some more remote, sometimes quite far-fetched claim; or even without any hereditary claim to the site at all. In the case of men who keep their ancestral homestead occupied by bringing their wives there to live, a sentiment favoring continued occupation of the old homestead may be one of the motives. Another, which may be involved in all cases, and seems the most likely one when no hereditary claim in involved, is simply a wish to take advantage of the availability of a desirable site. Whether matrilocal residence would be more consistently observed if the population were constant or increasing, is a pertinent question. But no answer can be given from the data on Ifalik, where the population is diminishing. While depopulation seems to be the main reason for residence other than matrilocal, it is not the only one. Although matrilocal residence is customary, it is not insisted upon. Residence elsewhere is not condemned or punished. In Sumner's terminology, matrilocal residence is one of the folkways, but--unlike clan exogamy--not one of the mores."

1: Burrows--95-96 (1947-48) Woleaians
116, 591 Ifalik

"Married men, as a rule, have two households. One is the household of the mother, sisters, and maternal ancestors, ordinarily the one in which a man was brought up. By analogy with a term in common use for family, this may be called the household of orientation. (In exceptional cases, as has been seen, the household of orientation may be other than that of the mother and her lineage.) The second is the household of a man's wife and her lineage, ordinarily that in which he lives with his family after marriage. This, according to the same [96] terminology, is his household of procreation. Even if he does not live there, he is closely linked to this household through his wife and children.

Women have, typically, only one household. They live on the same homestead all their lives, so for them the household of orientation and that of procreation are the same. In the comparatively few cases in which residence after marriage is patrilocal, it is the woman who has two households, the man who has only one. In other exceptional situations, where residence is heterolocal, both husband and wife may be said to have two households.

In any of these cases, an individual has close ties with more than one household. A man's welimwales--the women and children for whom he feels responsible--includes his mother and sisters, and his sisters' children, as well as his wife and own children."

1: Burrows--96 (1947-48) Woleaians
116, 591, 881, 841 Ifalik

"Children who belong to the majority so far as their pattern of residence is concerned, --that is, who live in their mother's household and have not had their relationships complicated by adoption--feel a strong secondary relationship with their father's household of orientation. This is expressed in at least one formal pattern of behavior. The rite of passage called taurang, on the occasion of a girl's first menstruation, is celebrated at the homestead where she lives, ordinarily her mother's. But the women who bedizen her with turmeric paint, skirts, and necklaces, come both from that household and from her father's household of orientation. At the close of the ceremony, the girl, with all these women and any other women and children who may care to attend (men are not forbidden, but take no formal notice of these affairs), parades from her homestead to the ancestral homestead of her father. The four days of isolation which custom requires during menstruation are then spent in the menstrual hut on her father's homestead. After that, she may spend these periods either on her father's homestead or on her own. This particular custom is apparently recent, as formerly there was only one, or at most only a few places of seclusion for menstruating women on the whole atoll. But the parade, which also apparently symbolizes her relationship to both households, is ancient, as far as we know."

1: Burrows--96-97 (1947-48) Woleaians
116, 613, 592 Ifalik 1-2

"The people who inherit a homestead from generation to generation--as distinguished from husbands who come in by matrilocal residence--are all related by common descent in the maternal line. They are members, not only of the same clan, but of a subdivision of the clan, descended from a common ancestress less remote than the clan's traditional founder.

Although in Ifalik descent is not memorized by means of genealogies, the heirs to most of the homesteads are so closely related that a common ancestress is either alive or at least remembered by living descendants. In the three households which consist of simple families, the common ancestress--since husbands are excluded by definition --is of course the mother. These households conform to type only if they are living on her ancestral homestead. Otherwise they will found a new line if the women stay on the same homestead, whatever its previous history, for more than a generation. In nearly all of the 17 households which consist of extended families, the common ancestress is either the oldest living woman or--when there is more than one in the oldest generation, or its only representative is a man--the mother of the oldest members. In only a few cases is the common ancestress more than one generation earlier than the oldest living resident. Similarly, in most of the households which have an extended family as a nucleus, the members of this nucleus have a common ancestress within two or three generations. It is only in the few atypical households, in which residence [97] other than matrilocal predominates, that a common ancestress is either lacking or too

remote to be remembered.

Unless the homestead has been settled or reoccupied within a few generations, the remembered common ancestress was not the founder of the line. In homesteads long occupied, the line extends back farther than the people can trace it. Attached to each homestead are one or more ghosts, ancestral members of the line, thought to be still active for good or evil. Some of these, too, were in the flesh within memory of the living. But others seem to be more ancient, so that the connection can no longer be traced.

For lack of a better name, such a line of heirs to a homestead will be called a lineage. That term has been variously defined, and the Ifalik line of descent does not fit all the definitions. But it conforms to the broader ones. *"

"* Lowie has recently proposed the term 'kin' for groups of this character when the members can not trace relationship to a common ancestor. The groups he has in mind are commonly clusters of lineages, not only larger but more complex than those united by inheritance of an Ifalik homestead. It seems clearer here to retain the term 'lineage', which is in use for similar groups elsewhere in the Carolines. The Ifalik group could be made to conform to Lowie's definition of a lineage by excluding from membership ancestors whose genealogical position has been forgotten. But in Ifalik ghosts of some such ancestors are believed to be still active members of the group."

1: Burrows--97 (1947-48) Woleaians
116, 613, 423 Ifalik 1-2

"On Ifalik the lineage is not clearly conceived as a descent group. The clan, which includes a number of lineages, is the only such group which is distinct in native thought. Lineages have no names. They are designated by the names of the homesteads they occupy. Thus they are not distinguished from extended families, although they differ from these in two respects: first, by including the dead; and second, by excluding husbands related only by marriage.

Nor was any name found for 'lineage' in general, to correspond to kailang for clan. The nearest I came to such a term was in a phrase expressing the preferred type of adoption, which is within the lineage: vam a li nibwogot. Vam means adoption or, with a possessive form, adopted child. A li are, as nearly as our grammatical terms can describe them, a preposition and definite article, which can be translated here as 'according-to-the-'. Ni is another preposition, 'in' or 'within'. Bwogot, usually followed by a possessive suffix, is the name for most of the real property inherited within a lineage. It includes the homestead, one or more separate tracts of coconut land (Tom usually translated it 'coconut land'); also, if I understand it rightly, any breadfruit groves not on the homestead; but not the tracts of hereditary taro swamp (bwēl), although these are inherited in the same way. The English word which comes nearest to translating bwogot (though too broad) is 'estate.' So the phrase vam a li nibwogot can be clumsily translated 'adoption according to the within-the-estate (plan).' This labored

attempt at translation seems worth while in order to show that native thought is focussed on the property, and uses it, perhaps unawares, as a symbol for the lineage within which the property is inherited."

I: Burrows--97-98 (1947-48) Woleaians
116, 613, 423 Ifalik

"Although 'lineage' is an abstraction made by the ethnographer and not, at least explicitly, by the people themselves, adoption is only one of several ways in which it affects individual lives. The most important, because it governs the main source of subsistence, is inheritance of homesteads and food-producing land. In the realm of government, although chiefly titles are talked of as attributes of the clan, they are actually held within the lineage. Only the members of the clan's senior lineage are eligible to the succession. And in the realm of religion, ghosts of ancestors associated with homesteads--that is, in effect, with lineages--are among the supernatural beings most likely to affect [98] the lives of the living."

1: Burrows--98 (1947-48) Woleaians
116, 588, 601, 611 Ifalik

"Extension of exogamy to some relatives on the father's side has already been noted. Marriage is forbidden, not only with the father himself, but with his children and his sister's children. This extension of the incest ban to some relatives on the father's side is suggested by the kinship terms, which are extended bilaterally. The term for mother is applied to father's sisters as well as mother's sisters; and the sibling terms are extended to all cousins recognized as such, on the father's as well as the mother's side."

1: Burrows--98 (1947-48) Woleaians
116, 643, 611 Ifalik

"The statement of succession to chieftainship given me by the chiefs included a son as possible successor, though after brothers and sisters' sons. I found no case of such patrilineal succession. But then, the people keep so little of the past in memory that very few cases of succession were available. The very fact that the chiefs agreed on it as a possibility shows something of the importance attached to the father's line."

1: Burrows--98 (1947-48) Woleaians
116, 173, 611 Ifalik

"Finally, there is a curious recognition of descent through males in the mythology. The two bits of divine genealogy collected--that of the high gods, and that of the gods of navigation--are both patrilineal."

1: Burrows--98 (1947-48) Woleaians
116, 613, 592 Ifalik

"Although descent, inheritance, and succession are mainly matrilineal, the father's homestead and lineage are by no means ignored. The father's share in procreation is recognized. The father, by matrilocal residence, lives on the same homestead, usually in the same one-room dwelling, as the rest of the family. And he is not merely tolerated there, like an interloper. He is as much at home as those who inherited the site, and has as much authority in ordinary household affairs as men of about his age in the mother's lineage.

Yet he has not lost either rights or obligations toward his own maternal lineage and homestead. And some of this is passed on to his children. Thus everyone inherits, through his father, a kind of secondary membership in the father's household. The parade of a girl to her father's homestead at the conclusion of her first menstruation ceremony has already been mentioned as a token of this relationship. Both boys and girls feel some obligation to contribute their services, and some claim to share in the products, of their fathers' households. The father's death weakens this relationship but does not end it. For the next generation, though, it dies out almost entirely. Only in exceptional circumstances would either obligations or privileges toward the people and property of one's paternal grandfather by strong enough to lead to action."

1: Burrows--98 (1947-48) Woleaians
116, 428, 868, 463 Ifalik

"The most prized special skills and lores--those of navigation and canoe-building--are ordinarily taught by a father to his son or sons. A man may choose other apprentices; but a son is a particularly likely choice. Tom, as first navigator of Ifalik, taught seamanship to his eldest son; but also to his brother and wife's brother.

Coconut trees planted on someone else's land, as already noted, are inherited from father to son."

1: Burrows--98A (1947-48) Woleaians 1-2
116; 612 Ifalik

"As suggested by the bilateral extension of kinship terms, a bilateral group of relatives or kindred also exists in each individual's mind. Its existence is proved by the fact that there is a name for it, --airō. The name was used by Tom in telling me where visitors on islands other than their own look for hospitality. He said they stay with their airō.

'What does that mean--airo? ', I asked him.

'All same clan. '

Taking a wrong turn on Tom's translation, I wrote this down as a term for fellow-clansmen. Spiro, in his more intensive and more internalized study of kinship, found that the term expresses the concept of a kindred. By 'all same clan, ' Tom meant that the airō is a group much like a clan. Spiro's inquiries also showed that Tom's use of the word to me in connection with hospitality was typical; in other words, that hospitality is the main overt expression of the feeling of unity within the airō. One treats his relatives on the father's side with the same open-handedness as those on the mother's side. Another, negative expression of this feeling is the extension of exogamy to patrilineal relatives.

An airō meets as a unit. The nearest to such a meeting is the taurang ceremony, when the girl whose first menstruation is being celebrated is adorned by the women of her father's as well as her mother's household, and marches with them afterward from her mother's to her father's homestead. Indeed, it is only for a rite of passage or similar

occasion, centered about one individual or at most one set of siblings, that such a group could very well assemble. For, by definition, its membership must vary for each set of siblings. Such groups are bound to exist mainly in the mind. No doubt that is why, as Murdock points out in 'Social Structure,' the existence of kindreds is frequently overlooked by ethnographers."

1: Burrows--98A-99 (1947-48) . Woleaians
116, 601 Ifalik 1-4

"The terms used on Ifalik to designate relationships by descent and marriage are shown in the following table. These are exclusively terms of reference, not used in address. Whatever the relationship, people are addressed by their names, often shortened in familiar speech. The only term used in address that implies a relationship, so far as I learned, is autegi. This is not a kinship term but an endearment, sometimes used by a man to his wife when they are by themselves.

Kinship terms take possessive suffixes: tamai, my father; tamom, your father; taman or tamal, his father; tamare, our father; tamami, your (pl.) father; tamer, their father, [sic] The form used in the table is the first person singular. The third person singular appears also in composite terms. [99]

KINSHIP TERMS

Generation	Lineal	Collateral	Affinal
+2	Paternal grandfather, tematemai. Descriptive composite terms for other grandparents: paternal grandmother, sin ni tamai, (mother of my father); maternal	Lineal terms extended to others of the same generation.	Descriptive composites, as tamatamān ni vetiai, paternal grandfather of my wife.

Generation	Lineal	Collateral	Affinal
	grandfather, tamān ni silei; maternal grandmother, sin ni silei.		
+1	father, tamai mother silei	mother's brother, manenepai (sometimes manenepei; extended within lineage; sometimes further within clan. Mother's sister, silei, extended; father's brother, tamai; father's sister, silei; both extended.	Descriptive composites, as tamān ni vetiai, father in law (father of my wife).

1: Burrows--98A-99 (1947-48) Woleaians-3
116, 601 Ifalik

Generation	Lineal	Collateral	Affinal
0	sibling of same sex (brother of man, sister of woman) bwisi. sibling of opposite sex (sister of man, brother of woman], moengai.	bwisi and moengai extended.	spouse, vetiai. Other terms composite, as bwisin ni vetiai, sister-in-law (sister of wife) or brother-in-law (brother of husband); moengān ni vetiai, brother of wife, sister of husband.
-1	child, lai. (Son, lai mwal; daughter, lai rowot).	sister's child of man, vatuwei; extended within lineage. Lai extended to other nieces & nephews.	Descriptive composites, as laun ni bwisin ni vetiai, child of the sister of my wife, or child of the brother of my husband.
-2	grandchild, launei	launei extended.	Descriptive composites.

The system of classifying relatives exemplified by these terms is widespread in

Oceania, and has been called by a variety of names. The most generally used of late seems to be 'Polynesian system'."

1: Burrows--100-101 (1947-48) Woleaians
116, 601 Ifalik 1-5

"Another [KS: system of classifying relatives] proposed by Dr. Fred Eggan of the University of Chicago, is 'generation system.' This specifies the distinguishing characteristic of the type: that the strongest category in classifying relatives is that of generation or genealogical level. No term is applied to relatives in more than one generation. The category of descent is weaker in that terms for relatives in the direct line are extended to apply also to relatives in collateral lines.

In so far as the category of generation is stronger than that of descent, the terminology used on Ifalik differs from the actual alignment of relatives in groups. In two of the groups, clan and lineage, the category of descent predominates. In the joint family, three categories are involved--descent, common residence, and marriage. There are no groups based on generation level, and groups based on common age, as already noted, are relatively weak.

Yet kinship terms are not so completely at variance with usage as might appear at first glance. Although people are not formally grouped by generation level, the informal grouping of males in canoe-houses follows a line of cleavage which approximates that of generation. Boys and young men (even after marriage) cluster by themselves. Much of the time they are separate from the older men, though a common task, or even common interest in the subject of a conversation, may bring the two groups together. The most distinct young men's groups were in the two northernmost canoe-houses, in the part of Falārik where there are no longer any dwellings. Older men generally

congregated in the canoe-house nearest the homestead where they lived, so much of the time the youngsters had these canoe-houses to themselves.

Relative age is more generally important in that a senior outranks a junior. The clearest formal expression of this is in succession to chieftainship. It appears also in the form of a general attitude of respect and deference for elders. This is not elaborated by formal etiquette but is constantly perceptible.

At one crucial point the kinship terms make a distinction between lines of descent. This is in the use of separate terms for what we can only translate as 'father' (tamai) and what we can only translate as 'mother's brother' (manenepai). The same distinction appears in the reciprocals of these terms; that for 'child' or 'offspring' (lai--here there is no distinction of sex) and that for 'sister's child' (vatuwei).

Tamai is applied primarily to the father and to the men of his generation--mostly his brothers--who live, or lived before their marriage, on his ancestral homestead. If there is frequent association--which would ordinarily come about through neighboring residence--with more distant relatives on his side, the term would be applied also to them. Application of it to persons outside his clan (his father's father's brother's sons, for instance) is also usual, when association with such kinsfolk keeps the relationship in mind. In any case, this term, though rather widely extended to men of the older generation, ordinarily expresses a relationship through the father. Its most immediate use

is to express the relationship to the father himself; next, that to his brothers; next, to other men, if any, of his generation and lineage. Similarly, manenepai applies primarily to mother's eldest brother; then to her other brothers; then to other men of her generation and lineage. When extended further, as all Ifalik terms can be when occasion demands, it would still express a relationship to a man of the parental generation through the mother. The distinction between tamai and manenepai, as most often used, is essentially one between father's lineage and mother's lineage.

The reciprocal terms manenepai and vatuwei express a special relationship of the kind that Radcliffe Brown calls dyadic (SS: 'all social relations of person to person'); and the kind that our students of personality usually mean when they speak of 'interpersonal relations.' The language of Ifalik, too, has a term for such relationships. Maru e malu means a pair of closely related individuals; it may be husband and wife, parent and child, siblings, or mother's brother and sister's son. [101]

The latter relationship, commonly called the avunculate, is important in Ifalik, as might be expected in a matrilineal, matrilocal society. But it is not extremely developed. It is not emphasized by ritual, nor by any formal privilege, nor reinforced by cross-cousin marriage. Cross-cousin marriage is permitted, but not required, nor even especially preferred.

The mother's brother can not be said to supplant the father, though his role includes some functions performed by the father in societies of a more patriarchal cast. Because

of matrilocal residence, a young person's father usually lives in the same homestead with him, while a mother's brother, once he is married, does not. Yet the mother's brother is the most closely related older male in anyone's own lineage. He personifies the main source of livelihood, insofar as a man is a more appropriate representative or symbol of that than a woman is. The relationship is most conspicuous in economic reciprocity between males. The vatuwei, or sister's son (sometimes in a classificatory sense) is the heir presumptive of the manenepai, (or one of them,) and may be regarded as dependent on him for a livelihood. This imposes on the vatuwei an obligation which he discharges by services, particularly work performed for the manenepai. Specific examples of this will be given in the discussion of economic co-operation. When the manenepai is a chief, the vatuwei may succeed to the title, though younger brothers of the chief have first claim.

There is no corresponding special term for father's sister. She is one of the 'classificatory mothers', the term silei being extended to her. In this extension of the term, the category of common descent is disregarded; a father's sister can not be of the same clan as the mother, because of clan exogamy. No special powers are attributed to the father's sister, as in some Pacific islands; and no special obligations imposed on her reciprocal, the brother's child. Since father's sisters are the most closely related older women in the father's household, the relationship is kept in mind by the generally frequent

association with that household. So the relationship is a rather close, kindly one; but there is no formal empnasis upon it."

1: Burrows--101-102 (1947-48) Woleaians
116, 601, 593 Ifalik 1-3

"One of the characteristics of the type of kinship terminology to which that of Ifalik belongs is the way in which sex is specified in the terms for siblings. There is no term for 'brother' or male sibling, and none for 'sister' or female sibling. What the terms specify is whether the speaker and the sibling referred to are of the same sex or not. Bwisi means 'my sibling of the same sex' (brother, man speaking; sister, woman speaking). Moengai means 'my sibling of opposite sex' (sister, man speaking; brother, woman speaking).

This emphasis on unisexual or bisexual pairs, rather than on the sex of the individual referred to, suggests association with the incest ban. Polynesia shares this feature of kinship terminology; and in western Polynesia there is a formal pattern of avoidance between brothers and sisters. In Ifalik there is only a slight trace of such avoidance. Formerly, when unmarried youths slept in the men's house, brother and sister did not sleep under the same roof; but now that the men's houses are no longer used as bachelors' dormitories, and the young men sleep in their own homesteads, an unmarried man and his sister often sleep in the same dwelling. The only restriction on conversation between them is that sexual topics are forbidden; and that holds between men and women generally, except for married couples and lovers. The one trace of avoidance appeared when Tom, in Spiro's presence, refused to light a cigarette for a woman of his household. He gave as the reason that they were brother and sister. He said brother

and sister may not eat food cooked over the same fire. [102] (He was using the term moengāl in an extended sense. The two were parallel cousins, their mothers having been sisters.) I have no data on how rigorously this prohibition is observed; but apparently, as often in Oceania, a food tabu has been extended to smoking.

On the positive side, the relationship between brother and sister is very close, and involves an obligation of mutual help. A man's welimwales, the women and children for whom he feels responsible, include his sisters and their children, as well as his wife and own children. Sisters, as well as mother and wife, lead in the wailing over a dead man's body before burial. When the chiefs, following the advice of the American physician, were haranguing the people about sanitation, urging them not to defecate on shore but use overwater toilets or go into the sea, one of them said, 'If a man is sick and can not go into the sea, let his wife or sister collect the feces and take them into the sea.'

Between siblings of the same sex there is also a close relationship of mutual helpfulness. They often work together, sisters in the taro patch or about the house, brothers fishing or making toddy. The only distinctive pattern I found was in a song which tells of two brothers going into the bush with the same sweetheart. When this song was dictated to me by the chiefs, they evidently knew it was something I was not used to. They laughed about it, loudly, and, I thought, a little uneasily. Tom said afterward that the practise is not rare. When asked if it applied to wives as well as sweethearts, he

denied that emphatically. 'Very bad that--all same America.' He said that if a man went to another island, his brother might bring food to the wife and her children; but this was a matter of choice, depending on the state of feeling among the individuals concerned. When a man dies, his brother may marry the widow. But this practise (the levirate), is not required or regarded as particularly praiseworthy. My data do not show how prevalent it may be. Given the excess of women over men and the fact that polygyny, though said to be permissible, is not practised, many widows do not remarry.

The one little tabu between brother and sister, slight as it is, is the only pattern of avoidance between relatives to be found. Mothers-in-law are treated with respect and deference, but not avoided. The sight of a man eating a household meal with his wife, the children, and his mother-in-law is not uncommon. Conversely, there is no formally patterned intimacy of the kind usually called a joking relationship.

The bilateral extension of sibling terms, so that there is no distinction between parallel cousins and cross cousins, is reflected in the existence, at least conceptually, of a bilateral group of relatives or kindred (airō), discussed on p. 98."

1: Burrows--102-103 (1947-48) Woleaians
116, 597, 162 Ifalik 1-3

"One of the striking characteristics of the social organization of Ifalik is the prevalence of adoption. Spiro worked out an estimate of the number of people in the population less than 20 years old. (As they do not keep track of chronological ages, this had to be based on relative ages.) The total came to 81. Of these, 32, or 39.5% had been adopted. A corresponding percentage for the older people was not worked out. (This would have been more difficult as adoption among them is less widely remembered.) However, as we see no reason to suspect a change in the prevalence of adoption, the estimate for the younger people probably indicates fairly well the proportion of adoptions in the population as a whole.

A request for a child is usually made before its birth. A childless mother (or even one who has children, but wants another) will ask a pregnant woman for her baby. Such a request may be refused, but custom exerts pressure in favor of granting it. Negotiations for adoption may also begin after the birth of a child, when someone takes a fancy to it. Although the negotiations seem to be conducted by the women, their husbands share in a decision about [103] giving or taking a child. In talking about adoption with men, adopted children were commonly referred to as the vam (adopted child) of the adopting father.

The adopting parents prepare to feed the mother after the birth of the child, in order that she may have plenty of milk. The adopting mother makes a special planting in her taro patch. When the expectant mother goes to the birth house to be delivered of the

child, the adopted father goes fishing to provide food for her. Traditionally, he is expected to 'keep the fire going in the earth oven for 10 days', in order to feed the mother. Actually, the earth oven, the ancient way of cooking, is only used nowadays for cooking in greater quantities than usual, as when a turtle or large fish is caught. If a child is requested after his birth, the adopting parents are still under an obligation to give food, which then takes the form of a present to the biological parents.

Acquiring a new set of relatives by adoption does not mean renouncing the old ones. When adoption is within the lineage, it is only the parents who are changed, joint family and clan remaining the same. This is said to be the preferred kind of adoption. But the rule is not always observed. Adoption even from another clan is not uncommon. Six cases were noted in my preliminary census. Spiro's genealogical study later revealed many cases of adoption of which I was not told when taking the census, so adoptions without the clan are undoubtedly much more numerous than that.

When adopted into another household, a child's home is primarily with its adopting parents. But it knows perfectly well who its original parents were, visits freely with them, and may spend the night at their house whenever it cares to. When adopted into another clan, it acquires something like a double clan membership. It may not marry either in the clan into which it was born or in that into which it was adopted.

One of the functions of adoption is to express and reinforce good-will between two

families. Another one, obviously, is to continue a lineage which otherwise would become extinct."

1: Burrows--104 (1947-48) Woleaians
116, 471 Ifalik

"The manual operations by which the people of Ifalik get a living from the soil and sea around them have been discussed under the heading 'Technology' [KS: pp. 27-44]. This chapter is concerned with the standards and practices that organize this activity; in other words, with the patterns that govern the control of material goods and the work of producing and distributing them."

1: Burrows--104-105 (1947-48) Woleaians
116, 421 Ifalik

"The concept of ownership of material wealth that prevails in Ifalik differs from our own. Ownership there is not absolute to the verge of irresponsibility, as in our economic system. A doctrine generally accepted among us--'It's nobody's business what I do with my own property'--would hardly be understood in Ifalik; or, if understood, would be indignantly condemned. Individual possession of material goods is, to be sure, a familiar idea with them. It is explicitly expressed in their language by possessive suffixes and adjectives. But in effect the individual 'owners', to whom these forms of speech refer, are no more than members of groups which share in the right to use the property; or else, in the case of those who have authority over its use by others, managers on behalf of the group. The whole group is the real owner, in our sense of the term. The nominal owner is either a co-owner or a trustee.

This contrast must not be taken as diametrical opposition. With us[105] too, there is of course a sense of public responsibility in ownership of some kinds of nominally private property; particularly property which the public uses and depends on, --public utilities, common carriers, and the like. This sense of public responsibility seems to have been growing stronger among us during the 20th century. But there is still a decided difference in degree between our concept of ownership and the one which prevails in Ifalik."

1: Burrows--105 (1947-48) Woleaians
116, 423, 471 Ifalik 1-2

"Most of what we would call public property is called in Ifalik the property of the chiefs. One example is the main roads or paths of the two islands; one running along the lagoon side of Falārik between the houses and the shore; the other a 'belt line' around Falārik close to the taro swamp. Another example is the big seines kept in the canoe-houses. The men's house and the plot of land around it, including the overgrown site of the former men's house--all regarded as a unit and called by the one name Katēlū--is also considered property of the chiefs. In this case the ascription to them has additional force, for one of the functions of Katēlū is to symbolize chiefly dignity and authority.

This concept, ownership by the chiefs of property not used by them more than by everybody else, suggests at first glance the feudalism of medieval Europe. But the resemblance is superficial. While ostensibly the chiefs can do as they please with this property, actually what they please to do is limited by tradition. It never has occurred to them to allot exclusive use of the road or seines to favored retainers, in return for services like the military services of feudal Europe. The former use of the men's house as a dormitory for unmarried youths, and the fairly definite tasks assigned to them, look more like services owed the chiefs in return for use of the chiefs' property. But the natives apparently did not think of the young men's work as room rent; at least the youths still perform definite tasks--so far as we know, the same as before--now

that they no longer sleep in the men's house. Nor have the chiefs ever thought of selling or trading these properties of theirs, or reserving them for their own exclusive use. Such uses of the properties seem inconceivable to them; hence, for all practical purposes, might as well be forbidden.

There is no telling what may happen in the future, as the influence of a foreign concept of property grows stronger. However, one other likely result of increasing foreign influence would be waning power of the chiefs. That would tend to counteract any inclination toward tyrannical disposal of property. But the outcome of such a pull between opposed tendencies, as complicated by an indefinite number of other pulls, is impossible to predict.

Meanwhile, what the chiefs do with such property is virtually the same as what our government officials do with property entrusted to their charge. Both issue orders controlling the use and upkeep of the property for the common benefit. For instance, fishing with the big seines, and repairing or replacing them, are done only on order of the chiefs. But fish caught with the seines are distributed among all the households whose men have done the fishing. If there are enough fish to go further, some will be sent to other districts. And when all districts take part in the fishing, the catch is distributed among the whole population."

1: Burrows--105-106
116, 427, 643

(1947-48)

Woleaians
Ifalik

"In distributing a large catch, the chiefs are allotted some fish in their capacity as chiefs, in addition to what they may receive as senior members of households. But this seems to be tribute--a prerogative of rank, or token of respect for rank. To regard it as rental for use of the seines would be incongruous with the general pattern governing disposal of property. On this point, I have no statement from a native, one way or the other. Such a statement, if obtainable, would have little value. It is doubtful whether any of them could be made to understand the concept of rent, without going abroad and having experience of its operation. Tom, in his six years of residence in [106] Manila, has undoubtedly done that. But he has thereby become less trustworthy as an informant on how the natives think of their disposal of property, --except where a statement of his fits native behavior but would be incompatible with our own. The best procedure seemed to be to observe native behavior closely; to ask few questions, and these preferably of the chiefs or others less familiar with foreign ways than Tom; to try to make these inevitable questions as simple and comprehensible as possible; and to interpret these data according to the simplest and most consistent scheme that would account for what the people do. Such a scheme unquestionably requires some notion of reciprocity; but our notion of rent would not fit without broadening its meaning almost beyond recognition."

1: Burrows--106 (1947-48) Woleaians 1-2
116, 423, 343 Ifalik

"Canoe-houses are in effect public property, or at least property of the men of the neighborhood, most of the time. Yet nominally each one belongs to one or two individuals, and occasionally one is used as private property. They shelter all the sailing canoes and larger paddling canoes whose owners live nearby, and some of the little single-seat rosemāni. (The rest of the rosemāni are either left on the beach or kept in little sheds, erected usually on the shoreward end of the owner's homestead land.) Canoe-houses are also used as club-houses by the men and boys (especially taremwanni, older boys) of the neighborhood, who spend there most of their daytime leisure--and they have plenty of it. They are used, too, for the men's lighter work, not only rope-making, but the making of nets and traps; and as carpenter shops for building canoes. Finally, they are guest-houses for visitors from other islands, who sleep there and are fed by presents from chiefs or relatives.

The canoe-houses from north to south, with their owners as given by Tom, are as follows:

1. Pa'ugop -Totogoeiti (Tom) and Arovalimen
2. Gajuteling -Ilegemwār
3. Fan ni wā -Totogoeiti
4. Sabwōlap -Gabwileisei
5. Fale Pëngā -Fagaulīr
6. Katēlū -north side, Maroligar and Totogoeiti

south side, Toromānn

7. Fan ni Wong -WolpaitIk
8. Pa'auēl -Wolpetau
9. Gavilea -WolpaitIk and Wolpetau

In this list Tom allotted to himself, under his native name Totogoeiti, ownership of two and a quarter canoe-houses, while his nearest rivals, the chiefs Wolpetau and WolpaitIk, have only one and one-half each. This may reflect his insatiable thirst for glory. Particularly suspect is his claim to a share with Maroligar in the north side of the canoe house at Katēlū. This is next to the men's house, shares the same name and, in lesser degree, the same chiefly eminence. It was used by the chiefs during our stay for meeting among themselves, though not for public assemblies. Tom is of the same lineage as Maroligar, and claims to be heir-apparent to his chieftainship; a rather tenuous claim, as he is older than Maroligar, though his junior genealogically. By an unfortunate oversight, I failed to check this list by getting one from somebody else. However, there is no reason to question the pattern of nominal ownership by one or two men."

"Through most of our stay, Tom was using one of the canoe-houses he called his own, Fan ni wā, as a workshop for building his sailing canoe. For a time his son used the other, Pa'ugop, for building a small canoe. Other canoes were sheltered in both houses at the same time, but only on the busiest working days did the work interfere with the usual neighborhood meetings. [107]

We saw only one other instance of private use of a canoe-house. For a time the seaward side of one of them, Fale Pëngā, was temporarily walled in, and the family of the owner slept there. This was not during the last part of the west-wind season, a time of heavy rain, occasional strong wind, and constant danger of hurricane, when a man might well want the more substantial shelter of the canoe-house. It was during the trade-wind season, when there was no need for better than ordinary shelter. If the trouble had been a leaky roof, it could have been rethatched in half a day. That was not done during the brief residence of the owner in the canoe-house. To the question 'Why?', the answer was simply that he and his family thought they would like to sleep there for a while. After a week or so they moved out again. This instance shows that the claim to ownership is more than nominal. But it is rarely exercised. Ordinarily the only requirements for constant use of a canoe-house are residence in the neighborhood, and masculinity. Women hardly ever enter a canoe-house: rarely even pass in front of one. (We were told one story--submitted as true, but remembered because it was considered funny--of illegal sexual relationships between an Ifalik man and a Mogmog woman, on a platform

over the tie-beams of a canoe-house in Mogmog. But this account of behavior abroad--behavior as improper as it would be with us--is hardly an exception to the rule that Ifalik women keep out of canoe-houses.)"

1: Burrows-107 (1947-48) Woleaians
116, 343, 423, 643 Ifalik 1-2

"The two southernmost canoe-houses on Falārik island, Fan ni Wong and Pa'ugop, were not in daily use for light work and loafing, like all the others. Pa'ugop, on the channel between the two islands, was indeed busy and populous on special occasions, as when the population of Falārik island was crossing to Falālap for a religious ceremony. At least twice during our stay feasts were held beside this house; once to celebrate the conclusion of a thatching job, once--as I recall it--to partake of an especially good haul of fish which Rauau and Falālap men both had a hand in catching. But on ordinary days it was deserted, or nearly so. More frequently occupied was a small building beside it which served as a workshop, especially for the women of the nearest household, that of chief Toromānn. The next canoe-house to the north, Fan ni Wong, was still less used. Most of the time there was no-one in it, and I never saw more than one or two there except when the men of the adjacent household, Uelepī, gathered there for some common task.

These two canoe-houses adjoined, on opposite sides, the homestead Uelepī, which as the traditional homestead of the senior lineage of the clan Kovalū was the highest-ranking dwelling site on the atoll, and was tabu to outsiders. The butchering of turtle, reserved to Kovalū, was done in a little grove between Uelepī and Fan ni Wong, but nearer to the canoe-house than the dwellings. The question arises whether the aura of rank and sanctity from Uelepī extended to the two canoe-houses, and made men feel less free to use them. This is possible; but in telling us of the tabu on Uelepī, Tom

said nothing of its extending to the canoe-houses. The nominal 'owner' of Fan ni Wong was WolpaitIk, a chief but not of Kovalū clan. (He lived at Uelepī by virtue of marriage to a Kovalū woman.) The owner of Pa'ugop was Wolpetau, highest ranking chief, of Kovalū clan and Uelepī lineage. But this site, though not the canoe-house itself, was most frequented by the household of the lesser chief Toromānn, of Rapevelū clan. On the whole, it seems most likely that the reason for these canoe-houses being less frequented than the others was simply that there were few dwellings nearby. In addition, Fan ni Wong was off the main road; and, because currents had been building a sandy point to seaward of it, was farther from water than any other canoe-house."

1: Burrows--107-108 (1947-48) Woleaians
116, 423, 501, 643 Ifalik 1-3

"Canoes have individual owners. The degree of exclusiveness in their use varies inversely with the size of the canoe. That is, the little rosemani are commonly used rather like private property by the owner and his family for [108] transportation and small-scale fishing. Members of other households do not take out these small canoes without permission. But a larger paddling canoe, still more a sailing canoe, is used most often for fishing by larger parties, usually a district undertaking. Since the owners are usually men of some age, while the fishing is done most often by the youths, the owner of a canoe often does not go out with it on a fishing trip. He has no special claim to the catches made in his canoe. If the chiefs ask his permission to have it taken out, this is more an assignment than a request. He would have difficulty in justifying a refusal, unless the canoe was unseaworthy. In that case it would be his duty to see that it was repaired.

Canoes for sea-burial are similarly assigned. Tom seemed proud to have his new canoe used for the burial of the chief Paliuilimar, who died soon after it was completed. It was kept in the canoe-house nearest the chief's residence; but was not the only sailing canoe there. The reason Tom gave for using it was 'because it is the biggest.' Both the dead chief and the owner of the canoe were honored. An owner would not undertake an interisland voyage in his canoe without permission of the chiefs, and would take passengers without expecting payment. In sum, the owner of a large canoe, as of a

canoe-house and most other property, is in effect more a custodian than an owner as we think of ownership. Large canoes, like canoe-houses, come very near being public property."

1: Burrows--108 (1947-48) Woleaians
116, 423, 643, 618 Ifalik 1-2

"Asked whether there is such a thing as clan property, Tom said there is. The reef and the lagoon, he declared, belong to his clan, SauvelārIk. Members of other clans fish there only on sufferance. Now Tom was always inclined to make the most of any claim to distinction in which he could share, whether the distinction was his own exclusively, or that of his clan, or that of Ifalik as against other islands. I asked him whether other clans had similar claims. He was not sure, and, as usual, referred the question to the chiefs. The first to hand were Maroligar and Toroman. They talked it over, but did not give me an answer. 'Some other chief', Tom explained, 'might say 'This chief, 'e lie'.'

All five chiefs then held a meeting and discussed the question long and vehemently. Then they issued, through Tom, an official answer. No clan, neither SauvelārIk or any other, they declared, has exclusive claim to the use of reef and lagoon. They belong to all the chiefs. Ordinarily it is all right for anyone to use them; but if there is a shortage, as during the time after a hurricane, the chiefs may say 'Only eat a little'; in other words, may ration what food there is.*

"* As this decision was an act of the government, it will be discussed again from that point of view."

This pronouncement did not dispose of the question of clan property other than the reef and lagoon. It was not until later that I learned of the exclusive right of Kovalū clan to turtle, and of SauvelārIk to yellow-fin tuna. These were the only cases found of exclusive claims to property on the part of clans. Actually, these are not instances of ownership in the ordinary sense, but prerogatives of rank; for these two clans hold the highest chiefly titles."

"Homesteads are spoken of as belonging to particular clans. Again the association with rank in the case of Kovalū and SauvelārIk provides the clearest cases. The homestead Uelepī, as just noted, is said to be tabu to all but members of the clan and the husbands of the women--women of the senior lineage of Kovalū--who live there. SauvelārIk has a similar homestead, Tom hastened to assure me--Bwagolei, inland from the men's house, a site no longer inhabited.

In the beginning of our census by households, Tom said that the homestead Ilux, where the highest chief, Wolpetau, lived, 'blong Wolpetau.' [109] He added that it was a homestead of the clan Bwēl. But Wolpetau's clan is Kovalū. In living at Ilux, his wife's ancestral homestead, he follows the custom of matrilocal residence. The homestead 'belongs to him' in the sense that he lives there and, being the senior male, may have the final word, if he cares to, about household activities other than routine.

When we came to the homestead Val i Trel, Tom said 'Blong WolpaitIk', though WolpaitIk lives at Uelepī. This is ownership in another sense. Val i Trel is WolpaitIk's ancestral homestead, but, following the custom of matrilocal residence, he has not lived there since he married. How much interest he takes in the affairs of the household is a matter of choice with him. Any wish of his would be respected, and might well be carried out. But ordinary affairs of this household would only concern him by way of his responsibility for his sister, who lives at Val i Trel. If the sister had sons,

WolpaitIk would have an additional interest on their behalf; but as it happens she is childless.

These cases illustrate a point already made in the discussion of homestead, household, and lineage. Homesteads are occupied and used by households, which are typically extended families; and they are inherited within maternal lineages. For practical purposes that statement covers the question of actual ownership, as distinguished from the imputed ownership by clans or individuals. In other words, title to the homestead is inherited within a group whose existence the natives never explicitly acknowledge--the lineage. Usufruct of it belongs to the household."

1: Burrows--109 (1947-48) Woleaians
116, 423, 613, 241 Ifalik

"A man will say bwogotai--'my coconut land', as Tom translated it-- either of tracts in which he has inherited a share through his mother, or tracts inherited in his wife's lineage, in which he shares the usufruct by virtue of living on her homestead and gathering coconuts and breadfruit for the household. When Tom said of a bit of coconut land through which we were passing, 'This my land', I asked him if it belonged to him and nobody else. He answered, 'Me and my sister and my sister's boy,' the lineage again. I happen not to have a specific statement referring to land of the wife's lineage, but general discussions of the matter suggest that he might say first 'This my land'; then, if pressed, 'blong my wife and my boy.'

Ownership and inheritance of tracts in the taro swamp conform to the same rule. But in this case they are verbalized differently. Taro patches are spoken of as the property of any of the women who work them, or of their clan. Thus when Tom and his wife Lagajarong took us through the taro swamp so that she might give us a demonstration of weeding and planting, he said of the particular tracts we visited, not 'my land' but 'blong my wife.' He added proudly that she had inherited seven such patches. To my usual follow-up question, he said they were patches belonging to her clan, Mangaulevar. When he pointed out a particularly large stretch as belonging to Wolpetau, I unfortunately failed to follow up the statement; but suspect that this land, or at least some of it, was inherited by Wolpetau's wife as a member of a lineage of Bwël clan.

116, 423 Ifalik 1-2

"All the land on the atoll, except for the road, the sites of the men's house and canoe houses, and the beach between high and low water mark, is divided into tracts, which have names like those of the homesteads. The boundaries of these tracts are supposed to be a matter of common knowledge; at least, those directly concerned seem to have no doubt where they are. Any natural object--most often, apparently, a coconut tree no different from any other--serves as a boundary mark."

Members of that clan, traditionally associated with taro culture and now reduced to 11 members, probably have more taro land than they can care for. In this case, probable reasons for naming the chief rather than his wife as owner are his rank and the fact that as a public figure he was well known to me, while his wife was not."

1: Burrows--110 (1947-48) Woleaians
116, 231, 423 Ifalik

"Domestic animals are, in effect, household property, except that ownership of dogs --or some of them--seems to be more individual. There are perceptible attachments between some dogs and some individual masters. The masters, at least when they are grown men, may feel free to dispose of these dogs without consulting the rest of the household. Tom got his dog in that way, as a gift from a friend on Faraulep. I heard of no gifts of pigs--their scarcity makes that less likely--nor even of chickens, though a cooked chicken may be offered as a gift of food. Ordinarily pigs and chickens are regarded as part of the household supply of food."

"To anyone accustomed to the rigor with which titles are searched and boundaries surveyed in our culture, the Ifalik system of land tenure must seem loose and vague. Yet it works satisfactorily. As long as there are enough coconuts, taro, and-in season-breadfruit to go around, their way of locating boundaries, which they consider exact but which might be open to question if tested closely, causes no difficulties. Presumably it would be quite a different matter if these crops were scarcer, or if foreign influence increased to a point where land was more intensively cultivated (if that is feasible), and productive of more than subsistence. Difficulties would almost certainly arise if the land became desirable to foreigners, and so began to be sold. In such a case the surveys, hearings and disputes that have tormented administrators of many other Pacific islands might be expected. But so long as the poor soil of Ifalik is of no interest to foreigners the native system of land tenure will suffice. We heard of no disputes over ownership of land."

1: Burrows--110 (1947-48) Woleaians
116, 241, 423, 613 Ifalik

"Certain coconut trees are owned and inherited in a special way. Although the run of the trees in the coconut groves 'go with the land' according to the scheme just described, custom allows any man to ask permission to plant coconuts on another's land. As far as learned, refusal of such a request is unheard-of. But such a planting would never be on a large scale. Only a small, even number of trees--usually two or four--will be planted. Half of them will belong to the owner of the land; more precisely, to his household and eventually his lineage. The other half will belong to the man who planted the nuts. And these will not be inherited according to the usual pattern, within his maternal lineage. They will pass to his son, and so on, patrilineally.

The advantage of this special kind of ownership is convenience. When a man gets thirsty, no matter where he is, he will probably own a coconut tree not far away where he can get a young nut to drink. Coconut trees and the fruit on them are very definitely not public property. Asked whether a man might take a nut from a tree that did not belong to him, Tom said 'very bad that.' Having a tree of your own nearby reduces temptation to steal."

1: Burrows--110-111 (1947-48) Woleaians
116, 423, 643, 576 Ifalik

"Tom added that it would be all right for us, since we were foreigners and had no trees of our own, to take nuts from other people's trees. But in practise the chiefs, as our hosts, kept us in drinking nuts, getting them from their own trees. Usually that meant from trees on land belonging to their lineage; but some nuts were given us from trees on Katēlū, nominally chiefs' property. And at least once we were regaled from a tree owned in the other way. After a stint of census-taking, I asked for a nut to drink. Wolpetau, who was with us during the first part of the census, assumed the obligation to provide drinking nuts for the two of us, because of his rank. (If he had not been present, the head of the household would have had them brought to us.) Wolpetau directed a boy to a particular tree near by, which belonged to him. [111]

In discussing this, Tom said there were other men who owned more trees than Wolpetau. Could Wolpetau, as highest-ranking chief, commandeer nuts or trees belong to another? Yes, Tom answered; if Wolpetau wanted some, 'no can keep 'im.' When the same question came up in another connection, though, Tom denied any such right. Pretty surely the question is 'academic'. Though such a right would often be accorded a chief in discussing the extent of his authority, a chief would never think of exercising it, unless perhaps, in an emergency, for public use."

1: Burrows--111 (1947-48) Woleaians
116, 422, 227 Ifalik

"The smaller fish-traps made by individual men are used, primarily by the maker, in small-scale fishing for his household. Any male member of the household--male, because women do not take part in this kind of fishing--would feel free to use such a trap, but would pretty surely ask the maker first, if there was any chance of his wanting to use it himself."

1: Burrows--111 (1947-48) Woleaians
116, 422, 431, 462 Ifalik

"Another approach to private property is handiwork, or some of it. Coarser baskets are made by either sex, and readily given or thrown away. If one is used more than once, it belongs to the person using it. If someone else wants one not in use, there is no hesitation about asking for it, or giving it. Finer baskets are made by women only, commonly for some man or boy of their household, or as a present to a lover. Once given, they become individual property, and are not readily given away."

(1947-48)

"The only property which may pass patrilineally, beside coconut trees planted on another's land, is an intangible: the lore of a navigator or master-builder. The apprentice of such a specialist is typically his son. But this property is not rigidly entailed. Tom was teaching his navigator's lore to his eldest son while we were there; but he was also teaching it to his brother-in-law, and had already finished teaching it to his brother, Magaleisei, who had won recognition as palū. As part of this property, Tom had taught these pupils or apprentices his songs for divine guidance in navigation, including the long one which was not common knowledge among navigators, but which he regarded as his own special prayer. It had come to him patrilineally, from his father, who got it in turn from his father. I failed to check on whether, in either case, he used the English word 'father' in a classificatory sense. If so, it would not change the patrilineal pattern of inheritance--if that term may be applied to what is not simply given, but taught. But the most remote transfer of this prayer which he remembered was not patrilineal. The grandfather had received it from his father-in-law. The exclusiveness or secrecy with which this lore is kept, and the fact that the owner may bequeath it at will, make it more strictly private property than any other discussed so far. Yet the voyages achieved by the skill of the navigator, and the canoes built by that of the shipwright, are used for the benefit of others as well as himself. So ownership of this lore is a trusteeship, like ownership of all kinds of property on Ifalik."

"Flower garlands, for the brief duration of their beauty or fragrance, follow a somewhat special pattern. A large part of the total is made for offering to the gods. Others are made for wearing by the maker. Still others are made by women for men, whether sons, husbands, or lovers. An offering of a garland to another is a common friendly gesture. As guests of the island, we received them almost daily. But there are limits to the giving even of a garland. In one of the love songs collected, a woman complains bitterly that her lover has given the flowers she made for him to another woman."

"Larger fish-traps are made in the canoe-houses by groups of men, usually [112] of the same neighborhood but not necessarily of the same household. They are kept in the canoe-house, and taken out in large sailing canoes, on the order of a chief. As these are usually district expeditions, the traps are virtually district property."

1: Burrows--112 (1947-48) Woleaians
116, 286, 422, 462 Ifalik

"Cloths are often woven by the women for immediate wear, whether by the maker or some other member of the household. Clothing once worn is rather definitely individual property, as it is almost everywhere. How much sharing of it there is among women, or men, of the same household, or among close friends, like the proverbial college room-mates in our culture, I could not make sure. Such sharing is not conspicuous, and my impression is that it is not very common. A man often keeps a loin-cloth in the neighborhood canoe-house, for a change. I never heard of anyone else touching such a cloth.

An industrious weaver will accumulate a surplus. They are her property in the sense that she has 'first say' as to their disposal. She may wear any of them herself, or give one to whomever she chooses. She may offer one to a god, to be hung up in the men's house. If anyone in her household asks for one, or perceptibly needs one, she will feel an obligation to give it; though she still has some choice about which one to give. If a relative or neighbor dies, she will be obliged to give one or more cloths or sleeping mats as an expression of grief and an honor to the dead, to be wrapped about the body."

1: Burrows--112 (1947-48) Woleaians
116, 283, 422, 462 Ifalik

"Rope made by the men follows exactly the same pattern. It is often made for immediate consumption, and readily given. If we were wrapping up a package for shipment, we had only to ask whoever was in the near-by canoe-house, saying what size we wanted and how long, and he would immediately make it for us, no matter how many coils might be hanging in the canoe-house ready for use. These were the property of their makers, to be used as they saw fit, and were never taken by others. But if rope were needed for any more or less communal use--lashing for a large canoe, or for the timbers of the canoe-house, or line for a seine, --every man of the community concerned would feel an obligation to contribute. I did not hear of shirking such an obligation, but have no doubt that if such a case came to the attention of a chief, he would order the man to give rope or make it. And every male relative or neighbor contributed rope after a death, to be wrapped about the body."

"Labor

The emphasis in the following discussion, as distinguished from what has been said about work in the section on technology, is on the allotment of tasks among the population and the direction and organization of those in which more than one person takes part.

The fundamental line of cleavage in division of labor, that by sex, has been sketched here and there under 'Technology.' The following table affords a synopsis and adds some details, without pretending to be exhaustive. The tasks biologically allotted to women, bearing and suckling children, are not included. Nor is their time-consuming sequel, child care. One reason for this is that the care of children devolves to some extent on whoever is available for it. The main burden falls on the women. But older children keep an eye on younger ones to a greater extent than with us. And men love to play with children. Not only does a man frequently hold a small child on his lap or keep it near him when he is at home; he will often take one to the canoe-house, where other men may [113] help to keep it amused. But the main reason for dismissing this subject in a few words is that it is vital to Spiro's problem of personality formation, and will be fully discussed by him.

Woleaians
Ifalik

"Men are not scorned, however, if they trespass into basket-making. The chief Maroligar had learned on another island--Faraulep, I think--how to plait a large, round basket of doubled coconut leaf that the women found convenient for storing fiber for weaving. Maroligar made several of these baskets for female relatives. This seems to be one of the matters in which room is left for individual taste and aptitude. Maroligar was much more industrious than most of the men; deft with his hands, and something of a putterer. Some of the things he enjoyed doing reminded me of a weather-skipper I once knew, who took to knitting as a pastime at sea."

1: Burrows--115 (1947-48) Woleaians
116, 462, 562 Ifalik

"Although the number of tasks allotted to men and to women in the table is about the same, most of the time-consuming drudgery falls to the women. Whenever we suggested this to any of the men, they admitted that it was so. Their stock defense against the implication that they were not doing their full share was: 'But we do the dangerous kinds of work. We are the ones who risk our lives at sea, and climb trees to gather coconuts and toddy.' Men also do the kinds of work that require extreme muscular effort, as lifting heavy timbers into place in the superstructure of a house, and extreme endurance, as a long sea-voyage (women take such voyages, but less often). Women certainly have their time more fully taken up with work than men do. And their work, if less risky, is more monotonous. On the whole, they have far the harder time of it.

Nevertheless, the women can hardly be called downtrodden. Though ostensibly subordinate in most matters, their work is not supervised by men. In accordance with the high value placed on kindly speech, they are not ordered about. Within the limits set by tradition, they manage to do as they please a good deal of the time. They make use of their sexual attractiveness to win at least occasional deference. Several times the chief Maroligar came to us, rather sheepishly, to request a can of meat or fish for his ailing wife. Our impression was, not that he was using her as a pretext, but that he was somewhat henpecked."

1: Burrows--115
116, 461

(1947-48)

Woleaians
Ifalik

"Division of labor by age is less systematic and extensive than that by sex. Most of it can be brought under two heads: one, reserving difficult and responsible tasks to those old enough to be trusted with them; the other, relieving those past their physical prime from the more strenuous and dangerous jobs. An example of the first is that only grown women use up much of the scarce banana fiber in weaving; of the second, that elderly men are not expected to climb coconut trees, whether for young drinking nuts or for toddy."

1: Burrows--115 (1947-48) Woleaians
116, 283, 565, 461 Ifalik

"Rope-making is work for mature man; just why is not certain. There may be more than one factor involved. For one, the preparation of fiber, which is women's work, is laborious. This limits the supply, and the seniority of the older men may give them first claim to what there is. Another possibility is that this slow, steady work may appeal more to middle-aged men than to the more vigorous, comparatively restless youngsters. Still a third factor may be the ascription of a certain dignity to rope twisting, which makes it a more appropriate occupation for grave and reverend seniors than for upstart youths. Such an association between the manufacture of sennit cordage and high status has been established in Samoa. Tø Rangi Hiroa (Samoan Material Culture, p. 248) calls it 'a chiefly custom' there and adds: 'The status of the occupation was recognized by terming the braiding materials a chief's staff.' (The fact that the technique there is braiding rather than twisting seems irrelevant.) In Ifalik the connection is at most less explicit. If rank is indeed attributed to the occupation, it is the rank of all mature males, whether chiefs or commoners."

1: Burrows--115-116 (1947-48) Woleaians
116, 461, 565 Ifalik

"Division of labor by rank is minimal. If a chief chose to refrain from manual labor, it is my impression that he would be considered within his rights. But the only chiefs who did so in 1947-8--Wolpetau and Paliuilimar--would have been justified by age even if they had been commoners. Maroligar, not very old but afflicated with some pelvic trouble that made his gait a hobble, and gave him painful days after physical exertion, also refrained from heavy work to some extent. But at light tasks he was the most industrious man of our neighborhood, if not of the whole atoll. He took charge of Katēlū, site of the men's house, the former men's house, a canoe-house and two stone piers; and worked daily at removing brush and rubbish, planting little tufts of sod, and similar park-keeping; even, at the risk of pain, piled coral blocks to repair the [116] seaward end of one of the piers, which had been battered by a typhoon. WolpaitIk, youngest of the chiefs and burly--even fat, a rarity on Ifalik--threw his bulk into whatever hard work was going on. Toromann, though slight and getting along in years, was a skilful adzeman, and almost as industrious as Maroligar. He was one of the steadiest workers on Tom's canoe. He also suggested and carried out, partly with his own hands, several improvements in our camping setup."

"A minimum of individual specialization is one of the most nearly consistent marks of communities we call primitive--that word of so many meanings that they threaten to cancel each other out. In that respect Ifalik is truly primitive. Most of the work can be done by any able-bodied individual of the right sex and age. Only the following activities are reserved to specialists:

1. government, to the chiefs
2. butchering of turtle, to the highest chief of Kovalū clan
3. navigation, to accredited palū
4. carpentry on canoes and public buildings, to accredited sennap
5. tattooing (a complete job only), to taupotu
6. some healing procedures, to tautavē
7. intercession with the gods, to taubwongbwong

Even this brief list has to be further qualified. In government, navigation, and carpentry, it is only the planning and direction that are reserved to specialists; others do most of the labor involved. Tattooing is an individual skill; but it is only the application of the complete traditional pattern that is reserved to taupotu. Anyone can put on other scattered motifs, as leaping porpoise along the outside of the legs. Moreover, in Ifalik this was an obsolete specialty during 1947-8. The only living taupotu had long ceased to practice his craft. Men who wanted a complete tattooing--if any still do--would have to seek a taupotu on some other island. This had not been uncommon in

the past; Tom, for example, had been tattooed on Woleai. The degree of specialization of healing and religious activity will be discussed in the chapter on religion."

"Some other skills, particularly fine woodwork in small articles like statues and men's combs, are specialties without title or formal training. Tom summed up the situation: 'Some men savvy; all men no savvy.' One such, who made more statues than anyone else, was WètrIliwok, emaciated by some ailment that prevented his doing heavy work, but deft with his hands. When he wanted specimens of the finer men's combs, skilfully pegged together from little splints of straight-grained ria wood, Tom found a man to make them. He also undertook to have a wooden bowl hewn out for each of us; but, whether because of scarcity of raguēs wood, or decadence of the art in these days of metal pots and pans, or some other reason, the bowls were never forthcoming."

1: Burrows--116 (1947-48) Woleaians
116, 463, 565 Ifalik

"Every man, when he is not loafing, is a laboring man as well as a jack of nearly all trades. Chiefs are not exempt from manual labor. For that matter, the one-man specialty of the top-ranking chief, butchering and cooking turtle, is hard, messy work. This chief also brought a stick of wood to several of the meetings which were held daily for a time in order to supply me with song texts; and, during the talk and singing, finished a particularly well made shuttle for a woman's loom. The women are equally versatile. Skill in weaving and plaiting, as well as cooking, is expected of every one of them."

1: Burrows--116-117 (1947-48) Woleaians
116, 618, 463 Ifaiik

"Traditionally, two clans, as noted under 'Social Structure', have special occupations; Bwèl, that of horticulture; Sabwēl, that of running errands [117] and carrying out orders for the chiefs. Whatever practical importance these specialties may have had at some former time, in 1947-8 they were purely nominal. Members of these clans put in their time no differently from anybody else."

1: Burrows--117 (1947-48) Woleaians
116, 226, 466 Ifalik

"The slow but exciting task of rounding up a school of bonito was similarly marked by periodic outbursts of shouting along the line of canoes. At the climax of the successful attempt, when the line of seines was herding the big fish to the beach, a high proportion of the men on the job were acting as if they were in charge. Particularly noticeable, to an observer on the shore, was GauaisIg, a respected craftsman but too old for strenuous work. He hobbled back and forth along the beach, gesticulating and shouting at the top of his rather feeble voice. Nobody seemed to pay the slightest attention."

1: Burrows--117 (1947-48) Woleaians
116, 396, 226, 466 Ifalik

"As to direction of labor, final authority over every job of concern to more than one household rests with the chiefs. All such jobs, like district fishing parties, repairing a canoe-house, or a general clean-up, are undertaken at their order. But it was only during the bonito drives that chiefs were seen to assume active command.

The building of a large sailing canoe requires permission of the chiefs, presumably because it makes such inroads on the available manpower. The course of the work itself is under the direction of an expert shipwright, who may or may not also be a chief. Tom, as a sennap, was nominally in charge of the building of his canoe. But since his time had been allotted by the chiefs to Spiro and me, he delegated supervision of the work on the canoe to his brother, Magaleisei, also a sennap.

An observer who had not been told in advance who was in charge of a job would ordinarily have difficulty in picking him out. The only tasks in which a boss was clearly in evidence, within my observation, were the drawing of lines on what was to be the bottom of a canoe, and the hurried launching that followed the sighting of a school of bonito in the lagoon. The drawing of lines has to be constantly, narrowly supervised. The sighting of a school of bonito is a crucial moment and calls for utmost haste. On the two occasions when we witnessed it, the usually mild Maroligar came hobbling to the canoe-house at the best speed he could make, bawling orders at the top of his voice, his eyes blazing."

1: Burrows--117 (1947-48) Woleaians
116, 358, 466 Ifalik

"Maroligar as superintendent of repairs on a canoe-house, was quite a different person. He sat in the shade, rarely speaking, and only by careful watching could it be seen that he kept a closer eye on the proceedings than any of those who were resting between spells of work.

At crucial moments he did indeed give orders; but so did nearly everybody else. When a big timber was being lifted into place, or when some post or lashing seemed about to give way, the almost continual quiet chatter among the men rose to a hubbub. Everybody yelled what might be called either orders or vehement suggestions; few gave heed. Under those conditions, it was a surprise to us foreign observers that the work went along as well as it did. One probable reason for the fairly steady progress, in spite of these recurring crises, was that the procedure was governed, in main outline, by tradition. Except for a beginner or two, everybody had done essentially the same job time and time again. Even the beginners had watched just such jobs from early childhood."

1: Burrows--117-118 (1947-48) Woleaians
116, 396, 466 Ifalik

"In building a canoe, the sharing of authority was even more evident. [118] It often happened, in the job we had a chance to follow from day to day, that more than one recognized expert was working at a time. One of them, Toromann, was also a chief; but another, Magaleisei, was nominally in charge. Neither distinction could have been guessed from their behavior. There was no jockeying for precedence, as might be expected in our culture unless a rigid order of precedence was observed. Everybody felt free to sight along a line and give his opinion about it. There were frequent pauses for consultation. Nobody seemed to be criticizing anybody else, or defending himself against criticism.

That sort of divided command is obviously inefficient. Yet it has an advantage rarely attained in modern American culture. Every worker gets far more fun out of his work than he could by taking orders from a foreman, who in turn follows a blueprint. In the Ifalik way of working, everybody shares in the joys of feeling himself an executive, whether anybody follows his instructions or not. The morale of the workers is enviably high. Add the custom of dressing up in a strip or two of white young coconut leaf at the beginning of a communal job, and celebrating the end of it with a feast, and it will be plain that Ifalik combines work and play more successfully than has been done in our culture since the days of barn-raisings and husking-bees. Ifalik still extends democracy to economic production, a sphere in which we have sacrificed it to speed, quantity and precision."

1: Burrows--118 (1947-48) Woleaians
116, 461, 476 Ifalik

"The incentives that put men to work and keep them at it in Ifalik are quite different from the wages and profits on which we rely. A man goes to work there because of some felt obligation. In the long run, he will be repaid by the results of work others do for him. But the connection between his effort and its eventual reward may be remote. In the case of work done for his household it is clear enough. His housemates share the results of his efforts, and he shares the results of theirs. There is nearly as direct a connection when he works with others on some public project, whose benefits all will enjoy. When he helps build a canoe for another man, the kind of reward he may expect is more complicated. He will be partly fed while on the job. That is only part payment. The rest of it is roundabout, and indefinitely postponed. Sooner or later, he will want help, whether for a canoe of his own or to meet some other need. When that time comes, help, including the services of the man for whom he built the canoe or his family, will be forthcoming on the same terms as the labor he provided. In the long run, everybody comes out even. The people of Ifalik seem to understand quite well how the system works. A few examples will help make it clear to one accustomed to our economic system."

116, 396, 461, 602, 476 Ifalik 1-3

"In the making of Tom's canoe, the obligations that brought men to the work were of three kinds: (1) kinship; (2) neighborliness; (3) friendship. On the big days, when many hands were needed, all the neighbors rallied round. Most of the workmen seemed to be from Falārĭk, where Tom lived and where the work was going on; but there were some from Fauau, and Tom said proudly that some men, not relatives of his, came all the way from Falālap just out of friendship.

Sociability might be added as an additional motive with all hands. On those particular days, that job and the assemblage it brought together probably afforded the best entertainment to be found on the island. And on some of these days there was still another inducement, sometimes held out in our culture in the one word 'refreshments' on notices or invitations. Women of Tom's two households cooked and brought food for the workers.

For the long pull--the many days when only a few workers stayed on the job--the obligation that brought most of them was kinship. The steadiest workers were: (1) Magaleisei, Tom's brother, to whom he had delegated supervision of the work while he was on duty with the visiting anthropologists; (2) the chief Toromann, whose wife is Tom's sister (my records do not make clear whether she is [119] what we would call a sister, or whether Tom used the word in an extended sense, in which case she is what we would call a cousin); (3) Aueligar, Toromann's son, whom Tom would call vatuwei (my sister's son); (4) Siuman, another sister's son; (5) Auilimar, husband of one of

Tom's sisters; (6) Tom's two grown sons, one his own, the other adopted. The elder, his own son, was rather sulky and uncooperative toward him. (Analysis of this strained father-son relationship falls in Spiro's field.)

Three of these man [sic]--Magaleisei, Toromann, Auilimar--were considered master-shipwrights. Aueligar, an intelligent and energetic young man, is probably on hiw way to that distinction. In that case, beside meeting his obligation toward his mother's brother, the job would count toward finishing his apprenticeship.

The motivation in this case was not always strong enough to keep a crew of men on the job; perhaps because of the unusual circumstance that Tom himself was absent so much of the time, working for us, and hence could not inspire the other workers with his own enthusiasm. On October 2, he asked the chiefs to issue an order for more men to work on his canoe. The word spread rapidly, and within about an hour a number of men appeared, and got on with the job of fitting and fastening the planks of the hull. But on October 5 there was a public task--replacing the corner post in a canoe house--that took all available manpower. On the day after that, only Toromann and two other elderly men were at work on the canoe.

October 15 Tom announced angrily to the chiefs that he was not going to work for us on the following day. He was going to work on his canoe. Nobody had been at work on it for several days, he said; and if he spent all his time working for us, it never would be finished. This episode will be considered in detail in the chapter on government.

Here it is enough to say that thereafter work on the canoe went more steadily."

"Some test of how typical the building of Tom's canoe may be is afforded by a lesser job of the same kind that was carried out in January, 1948--the re-lashing of a canoe belonging to Gabwileisei of Rauau district. Gabwileisei, not a sennap himself, called on GauaisIg of Falālap to supervise the job. The two are kinsmen, Tom said. I do not know what the relationship is, beyond the fact that they are not of the same clan, Gabwileisei's clan being Sauwèl, GauaisIg's Kovalū.

On the first day a considerable number of men assembled. GauauisIg brought some with him from Falālap. Most of the men of the neighborhood also appeared. Their obligation, Tom explained, was that whenever that canoe brought in a good catch of fish, they would receive a share of it. Altogether, on that day, there were more men than there was room for about the canoe, so they spelled each other. Husked young drinking nuts were distributed.

Though the job took only about a week, the attendance quickly fell off. Again the faithful few were kinsmen: (1) Arigomar, a sister's son of Gabwileisei; (2) Saralimwan, another sister's son; (3) Magaleisei, whose wife is the daughter of a sister, so that he lives on Gabwileisei's ancestral homestead; and (4) Metagesou, another affinal relative --his wife is related to Gabwileisei, [120] Tom was not sure just how. Old GauaisIg, having got the job organized and under way, did not bother to attend every day.

The pattern seems to be about the same as Tom's canoe. Again neighborliness exerted a perceptible pull, but only kinship kept on pulling men to the job for its whole

duration. Among kinsfolk, sister's son ('true' or classificatory) were again prominent, showing that the avunculate gives a man a stronger claim on the services of his sisters' sons than on other relatives."

1: Burrows--120 (1947-48) Woleaians
116, 396, 476, 621 Ifalik

"Rethatching or repairing a canoe-house is a district job. All the men of the district, whether the particular canoe-house is their neighborhood club or not, are expected to take part. The women help, too; plaiting some of the thatch-sheets for a thatching job, and cooking food for the modest feast which is the proper conclusion for any public task. Sometimes this feast is served several days after the work itself, in which case another job for the men of the district--a district fishing expedition--may help provide food for it. In these district undertakings the claim of kinship is still perceptible, but is now subordinate to that of locality. Some men who were brought up in the district concerned, but have moved away by marriage to another district, will come back on these occasions to the old neighborhood to help with the work and share in the festivities. Men's dances (ur) are also district undertakings. Particular dances are the specialty of particular districts. For these, too, men who have married out of a district will commonly return, and rehearse and perform for the district in which they grew up."

1; Burrows--120 (1947-48) Woleaians
116, 226, 476, 286 Ifalik

"A few public works concern the whole atoll. In these, kinship ties become irrelevant. Most conspicuous are the drives to round up a school of bonito in the lagoon. Everybody turns out, and everybody shares in the catch when there is one.

Another, but related, task of this kind was undertaken in October, 1947. One or more of the big seines kept in the canoe-house on Falālap had rotted beyond repair. This was a matter for the attention of the chiefs, as the nominal owners of these seines. They ordered the manufacture of a new seine for Falālap.

For some days thereafter men could be seen busy on sections of seine, not only in the canoe-house on Falālap but in the others, all the way to northernmost Falārik. Now this seine was to be kept in Falālap, and used more often than not for district expeditions from which only the people of Falālap would benefit. Why should the men of other districts be called upon to help make it? In answer to this question, Tom replied that, in case of a bonito drive, the whole island takes part, and shares the benefit. So the making of these seines, which calls for a large expenditure of material and labor, is considered the task of the whole atoll. Like all such tasks, it involved reciprocal obligations. When it is Falārik's turn to get a new seine, Falālap men will help. Incidentally, this undertaking required individual contributions, not only of labor, but of material, sennit cord, much of which had been made individually before this particular use of it was foreseen. Such cordage, we have noted, is regarded as individual property, though with the element of trusteeship involved in all individual ownership on Ifalik."

(1947-48)

Woleaians
Ifalik

"The role of women in this task [KS: manufacture of a new seine] followed the usual pattern. In the first place, women had prepared the fiber of which the cord was made. This was individual work. Toward the end of the job women took part in groups. While men [121] from all the districts took their sections of net, mostly unfinished, to the Falālap canoe-house and went on with the work there, the women of Falālap prepared food for the assemblage. On the first day of this, I counted 24 bowls and baskets, and believe there were some others that escaped my count. On what was officially the final day (actually some finishing touches took several days after that), a still larger gathering required a still larger feast, this time contributed from all parts of the atoll. My count that time was 52 baskets and pots; and later a canoe came from Falārīk, loaded high with more, which I did not manage to count."

1: Burrows--121 (1947-48) Woleaians
116, 226, 476, 621 Ifalik

"Different kinds of fishing are carried on by groups of all sizes, and afford a review of all the forms of cooperation exemplified by other tasks. To begin with the smallest, a man may go fishing alone to feed his household or meet some special obligation, such as that involved in adopting a child. All the men of a household may unite for similar purposes. These small fishing parties are united both by kinship and coresidence.

Larger parties, overstepping kinship lines but still united, as a rule, by residence in the same neighborhood or district, are required to man some kinds of fishing apparatus --rop drag, seine, large trap (which is taken out to sea in a sailing canoe, and so calls for a full crew). Fishing with tackle of these kinds is most often a district enterprise. In the case of rop drag or seine, all the men of the district, except for the infirm or a few who may have other urgent tasks, are expected to turn out. It does not take so many to man a canoe, and expeditions with the big traps, while usually district undertakings too, are generally manned by crews who are age-mates as well as neighbors--the groups of young men who gather in the different canoe-houses. Finally must be mentioned once more the bonito drive, which calls out the largest possible group, the entire able-bodied population."

"Some idea of the nature and frequency of public works--tasks involving groups larger than a household--is given by the following list of journal entries, which is approximately complete only for the district of Rauau. One job, the building of Tom's canoe in Falārĭk district, was going on nearly every day from the beginning until well on in January, though only the crucial days of work are noted.

Aug. 1.-Bonito in lagoon. Entire population busy all day. (The fish escaped from the seines during the night.)

Aug. 9.-Bonito in lagoon again. Entire population busy all day. School captured toward sundown.

Aug. 10-12.-All work tabu except smoking of bonito.

Sept. 5-12 (approximately).-Clean-up of island, ordered by chiefs at general meeting Sept. 4, after visit of American ship.

Sept. 20.-Fishing for feast held at conclusion of religious ceremony.

Sept. 27.-Planks of Tom's canoe glued and permanently lashed.

Sept. 28.-New thatch plaited for canoe-house Fan ni wā, in Falārĭk district.

Sept. 30.-New thatch put on roof of Fan ni wā. [122]

Oct. 3.-Chiefs order men out to work on Tom's canoe.

Oct. 5.-Corner post replaced in canoe-house Fale Pëngā, Rauau district.

Oct. 6.-District fishing (For feast at conclusion of canoe-house job? Not noted.)

Oct. 11.-District fishing.

Oct. 13-18. -Young men go out in canoes every morning with large traps.
Oct. 19. -Fishing by united forces of Rauau and Falārĭk.
Oct. 21. -Post replaced on canoe-house Pa'urĕl. Done by some men, but not all from both Rauau and Falālap.
Oct. 22. -Falālap district fishing for feast to celebrate conclusion of canoe-house job. Feast held late in the day.
Oct. 24. -(and thereafter nearly every night until Nov. 15 at three canoe-houses; one in Falārĭk, one in Rauau, and one in Falālap). Men rehearse at night for performance of ur dance, ordered by chiefs at request of anthropologist.
Oct. 25 (approximately, and daily thereafter). -Men at work in all canoe-houses making new seine for Falālap.
Oct. 31. -Feast at Falālap for conclusion of seine-making; which, however, continued thereafter for several days.
Nov. 5. -New thatch sheets plaited for canoe-house Sabwōlap, Rauau district.
Nov. 6. -Rauau district fishing.
Nov. 7. -Thatch put on roof of canoe-house Sabwōlap.
Nov. 10. -Thatch put on roof of canoe-house Pa'ugop in Falārĭk.
Nov. 14. -No work except preparing feast to conclude final performance of ur dance.

Nov. 15. -Men of all districts take part in final performance of ur.
Nov. 16 (and on into December). -Young men out in canoes nearly every morning with big fish-traps.
Nov. 25. -Thatch sheets plaited for men's house. (Thatch put on several days later-exact date not noted.)
Dec. 3. -Over-water 'head' or latrine built for anthropologists.
Dec. 6. -Young men of Rauau went trolling over distant reef Vasulos.
Dec. 9-11. -Stringer replaced on canoe-house Sabwōlap, Rauau district. [123]
Dec. 12. -Boys of Rauau fishing for feast on completion of canoe-house job. Feast held late that day.
Dec. 13. -Canoes out with traps in the morning, several parties with torches scoured reef at night.
Dec. 24. -Extra-tie beam and king-post installed in canoe-house Sabwōlap, recently repaired.
Dec. 28. -Outrigger fitted on Tom's canoe.
Dec. 31. -Canoe sail repaired by small group in front of one of the Rauau canoe-houses.
Jan. 2. -District fishing by young men (Rauau) for feast to conclude four days of prayer for a sick woman.
Jan. 6. -Trial run of Tom's new canoe, completed except for finishing touches

and painting.

Jan. 7-14 (approximately). -Re-lashing of Gabwileisei's canoe.

Jan. 24. -District fishing, Rauau.

Jan. 26. -District fishing, Rauau.

Feb. 2-3. -Torchlight fishing on reef by young men.

To sum up: work is undertaken and working groups formed, to meet some felt obligation. The smaller groups unite to meet the needs of kinsfolk and neighbors, with kinship the strongest bond. Larger groups are formed mainly on the basis of common residence. The district or, in the case of Falālap, the island, are the units of most frequent cooperation on this larger scale. A few tasks call for cooperation of the whole population. Women cooperate according to the same pattern as men. In the larger groups, they usually play a supporting role."

1: Burrows--123 (1947-48) Woleaians
116, 461, 476 Ifalik

"The immediate rewards of group labor are ordinarily confined to sharing in the sociability of the gathering and in food distributed during the course of the work or at its close; sometimes, also, in the products of the work-- a catch of fish or a canoe-house which all the men may use. Other payment comes in roundabout ways and may be indefinitely delayed. That is, a stint of work does not entitle the worker to a specified return from a specified employer, as with us; but does give him a claim to equivalent services, whenever he needs them, from whoever is available to help. There seems to be no thought of one individual profiting more than another, or at another's expense."

1: Burrows--123-124 (1947-48) Woleaians
116, 476, 105 Ifalik 1-3

"The framework within which goods and services are distributed has been partly stated, partly implied, in the foregoing discussion. A summary of the main points follows:

Each individual shares in the use of the homestead and arable land of [124] his maternal lineage. This involves a claim, not only to shelter, but also to food from cultivated plants and domestic animals.

Claims of this kind are lifelong and inalienable. What we call real property changes hands only as individual claims are initiated by birth or adoption, or extinguished by death.

A man acquires an additional claim by marriage, when he joins the household of his wife. Thereafter he lives mainly on the produce of her land, but without losing his right to draw on his own heritage. In cases of residence other than matrilocal, all who take up residence on some homestead other than their maternal one assume similar claims to the new homestead and whatever property goes with it.

Collected food--fish (except yellow-fin tuna), other sea-food (except turtle), land crabs, terns--is shared among the households of those who get it, or distributed farther if there is a surplus. For example, fish caught by a district expedition are distributed among all households of the district. If any are left over, they go to other districts. The exceptions, delicacies reserved for the clans of highest rank, are also distributed beyond these clans as far as the supply will go.

Each individual is obliged to contribute services, according to sex, age, and physical condition, by taking part in the work of his household and in communal tasks carried out by his neighborhood, district, island, or by the whole population of the atoll.

Specialization, beyond the general division of labor by sex and age, is confined to a few occupations: government, navigation, supervision of carpentry on canoes and public buildings, tattooing, some forms of healing, and some religious activities.

This economic system provides, indeed imposes, approximate equality of wealth. Some lineages, to be sure, have more arable land than others. But none is landless. And none can benefit from more land than its members can cultivate, nor as a rule--since there is no market for staple products-- dispose of more than they can consume. Further distribution on special occasions which constitute exceptions to this rule, will be discussed later.

This situation offers very little opportunity or incentive for a prestige economy. Not only can no individual or group acquire much more property than others; there would be no advantage in doing so. Honor and status are not equated with possession or expenditure of material goods, except in a few cases, as canoe ownership and display at funerals.

Control of labor is almost as equalitarian as ownership of property. The chiefs, and, within the household, the senior individuals, can command to some extent the services of others. But tradition channels, and in effect limits, the purposes to which labor is

applied. It is used only for the common welfare, never to enrich one individual or group at the expense of others."

1: Burrows--124-125 (1947-48) Woleaians
116, 476, 592 Ifalik

"This economic system entails a constant interchange of services, but tends to minimize exchange of goods. Production is for subsistence almost [125] exclusively; only rarely for trade. There is, to be sure, some routine exchange within the household, determined by the customary division of labor. Men--young men especially--provide coconuts, toddy, breadfruit, fish, timber, cordage. Women provide taro, cooked food, mats, the better baskets, woven cloth, fiber for cordage. Since the goods involved are owned jointly, it is services that are exchanged in this daily housekeeping.

Exchange beyond the household also involves services more often than material goods, as has been brought out in the discussion of labor. In addition to the obligation of return services imposed by a contribution of labor, the food served to a working party on the completion of a task, and at intervals during the course of longer jobs, is part payment."

1: Burrows--125 (1947-48) Woleaians
116, 463, 173, 304, 152 Ifalik

"Additional payment to the experts in charge of a job consists mostly of the prestige that goes with authority. A rare instance of a more acquisitive attitude, involving insistence upon material payment, is the conclusion of the myth which tells of the divine origin of tattooing. After the god Wolfat had first taught a few men how to apply the designs, many applied to have their skins decorated. 'But Wolfat told them to put the designs only on those who gave them many fine presents,--cloths, rope, coconut trees, and whatever else they might desire.' Since the sole surviving master-tattooer of Ifalik, who told the tale, had long retired from practise, I could not suspect him individually of adding this as a profitable postscript. Presumably the conclusion was as traditional as the rest of the story. But it does seem to require avarice, which is unusual in Ifalik, of the practitioners of this craft."

1: Burrows--125 (1947-48) Woleaians
116, 431, 764 Ifalik

"Most other exchanges of property consist of gifts appropriate to special occasions. Conspicuous among such occasions for giving is a death. Women bring cloths and mats to adorn the body and wrap it up for burial. Men bring coils of rope. These gifts involve association, exceptional in Ifalik, between material goods and honor. Cloths, mats, and rope are offered partly for use, partly as tokens of respect and grief. Consequently, the bulkier the wrappings of the body, the greater the honor accorded the dead.

A feeling for moderation in this respect was shown by the chief Toromānn during the preparations for burial of his colleague Paliuilimar. Toromānn decided at a certain point that enough cloths had been used to wrap the body, and redistributed a few as a surplus. As far as I could make out, these were not--at least, not all--returned to the givers. But they may well have been given to households which had made particularly lavish contributions.

For four days after a death, the closest relatives, in token of mourning, must abstain from all work, even preparation of food. This calls for gifts of another kind. Relatives and neighbors prepare extra food during this period and bring it to the bereaved household. These gifts are not repaid or returned directly. But in the long run all such giving is reciprocal. That is, gifts received by a mourning household amount to reciprocation for gifts it has contributed or will contribute to other households when their time of mourning comes."

1: Burrows--125-126 (1947-48) Woleaians
116, 768, 158 Ifalik

"Destruction of property is a traditional outlet for extreme grief or rage, --witness the wrecking of houses by Galēt in the myth (p. 54), when he was made to feel what a loss he had suffered in the abduction of his wife. Such destruction may appear as an extreme form of mourning. The only instance during our stay was the act of a young man of Falālap after his mother's death. He burned their house. He had been particularly attached to her. In addition, he was deeply and frequently disturbed by more or less violent outbursts on the part [126] of his father, who was the most troublesome of the island's psychotics, and had kept the mother in a state of terror toward the end of her life. It seems safe to say that the relief which this act may have afforded was its only reward. It is economic only as an exceptional form of consumption of property."

"Gifts are expected from the chiefs on certain public occasions. Other men of prominence may also offer them. Commonest of the occasions are religious assemblages, when the gods are invoked in song and dance. Any of the chiefs may walk along in back of the rows of dancers, holding in his right hand, high and away from the body, some small present. A piece of native plug tobacco is the commonest. At this time all the people are seated. Anyone near enough and bold enough may spring up, snatch the gift from the hand of the chief, and return to his seat. Boys are the most eager takers, but older men may spring up too. Women never do. Apparently that much audacity would not be considered becoming to them.

Not all the chiefs take part in this giving. I can recall seeing WolpaitIk only on the receiving end. This is not necessarily a sign of greed. He was the youngest of the chiefs, both in years and in length of service, and may have been more comfortable in the humbler role. Yet the fattest man on the atoll can not be absolved from all suspicion of greed.

Paliuilimar, too, only sat and looked on. Probably that was because of age and weakness, for at other times he was a ready giver. Once when a group of young men were going about the island at night, singing to exorcise an evil spirit, they called on Paliuilimar at his house early in the proceedings. The old chief appeared in the doorway, holding a particularly large piece of the usual plug tobacco. This was a gift to reward the pious endeavors of the young men and their leader Gargeligar, oracle of the high

gods.

Wolpetau, the highest chief, seemed to be the most lavish giver. Once he distributed tobacco among the women at the close of a public meeting held for purposes of government rather than religion. This time he did not hold up the tobacco to be snatched from his hand, but passed among them where they sat and handed it out without requiring them to stand up for it."

1: Burrows--126
116, 585, 431

(1947-48)

Woleaians
Ifalik

"Absence of any exchange or distribution of gifts on the occasion of a marriage is part of one of the most conspicuous gaps in the culture of Ifalik, --the lack of any rite of passage to solemnize this occasion. One way of saying it is that, while there are marriages in Ifalik, there are no weddings."

1: Burrows--126 (1947-48) Woleaians
116, 431, 597 Ifalik

"Adoption, we have seen, does involve gifts of food from the parents who receive the child to those who give it. Tom's way of telling it made it a more individual affair, -- an obligation of the adopting father to the biological mother, just after the birth of a child already bespoken for adoption. Characteristically, this is not thought of as payment for the child, but only as a contribution to the mother, so that she may have plenty of milk to make the child grow and thrive. The gift of a child, like any gift in Ifalik, does confer an obligation; but not one that can be liquidated by payment of a specified price. These obligations are more like the social obligations than the economic ones of our culture. No one transaction can be final. Each is a step in a relationship that is expected to continue, and one of the principal motives involved is the maintenance of good will."

1: Burrows--126-127 (1947-48) Woleaians
116, 565, 431, 152 Ifalik

"....public giving by commoners, while permitted by custom, is infrequent. It is hard to tell whether this is because few of them have tobacco [127] or similar gifts to spare, or because less generosity is expected of them, or because they would feel it presumptuous to act in such a conspicuous and lordly way. All of those motives may be involved. One of the few who attempted it, in our experience, was Tom, always avid for glory. One of my motion pictures shows him unreeling a gauze bandage, which a young fellow eagerly gathered in. They had no thought of sanitation; presumably the lad planned to decorate his head or arms with strips of the white cloth.

On the surface these are one-way transactions. Yet my impression, which I can not substantiate rigorously, is that in the long run they too are reciprocal. The obligation involved seems to be that expressed in the adage: Noblesse oblige. If that is the case, the consideration for the gifts would be the dignity and authority accorded the chiefs. It is characteristic of the free and easy kind of exchange prevalent in Ifalik that the natives seem to make no connection between the two. To them the high position of the chief is part of the natural order of things. Generous giving, to be sure, is chiefly behavior, part of a chief's expected role. But it seems not to be thought of as payment for the privileges of rank; rather as pure kindness on the chief's part, and pure gain to the people. It is only to a foreign observer that the two seem reciprocal."

1: Burrows--127 (1947-48) Woleaians
116, 439 Ifalik

"Trade with Europe did not begin until comparatively recent times. Although Spaniards were established on Guam, only 350 miles away, from 1668, no European ship seems to have visited Ifalik until Wilson called in 1797. Trade with Europeans was negligible throughout the following century. When the German expedition arrived in 1909, the people still had only shell adzes. During the few remaining years of the German regime a beginning was made of buying copra in exchange for foreign trade goods. This was developed by the Japanese. For years now all cutlery has been of steel, and some other foreign wares, such as cloth, dyes, and cotton fishing nets and lines, have become fairly common, though only the dyes have displaced the native product. Up to the early months of 1948, American vessels had not begun calling regularly, and the people had not been able to resume making copra, as they never knew when the arrival of a ship would enable them to sell it. The prospect was that American transportation would eventually become organized so that ships would call more regularly, and trade would again reach the level attained by the Japanese. There was no visible prospect of its developing much beyond that, -the islanders have so little to export."

"Purely native trade with other islands has been going on for an indefinite period, - presumably ever since the islands were first settled. With its nearest neighbor, Woleai, Ifalik has little opportunity for trade, since the resources and products of the two atolls are nearly the same. What trading there is follows the native pattern of gift exchange. We witnessed one example. Woleai was short of breadfruit at the time, because virtually all trees had been destroyed on the largest island of the atoll. This destruction was begun by the Japanese in clearing for a landing strip, and finished by the Americans in bombing it. A canoe that set sail for Woleai during the breadfruit season took all of the fruit it could carry; in fact, several loads taken out in small canoes had to be returned for lack of storage space aboard the sailing canoe. Some of the breadfruit may have been earmarked for relatives or particular friends, but [128] most of it was to be distributed as the Woleai chiefs saw fit. Nothing was said about payment, or any return present. Woleai, in accepting the gift, assumed an obligation and will make a return when possible. But it is hard to see what it will be, unless Ifalik, and not Woleai, should be devastated by a typhoon. What Woleai has that Ifalik has not is mainly fish; and native methods of preservation would not get it to Ifalik in good condition. (The people do not make salt, and their smoking of fish, to be effective, has to be almost continuous.) One meager present of preserved fish was indeed brought in one of the canoes from Woleai. It was apparently a surplus from the supply taken on for the voyage; at least there was only enough for the chiefs. I did not get a close look at

it to see whether it was preserved in any other way than the usual smoking. Tom kept us away; rather officiously, it seemed, yet his explanation was doubtless true. We would not like it, he said, 'because stink'."

1: Burrows--128 (1947-48) Woleaians
116, 321, 439 Ifalik

"A regular article of import from Eaurupik is turtle-shell discs or beads for women's belts. Curiously, the German account of Eaurupik--written like that of Ifalik, by Damm from field notes by Sarfert--speaks of a belt of coconut-shell beads as characteristic of Eaurupik, and traded as far as Puluwat. But my Ifalik informants insisted that all their dark beads were of turtle shell, and that most of them came from Eaurupik. As usual, no mention was made of payment, or of return present. Swamp taro (pulax), of which Ifalik has an abundance, is one possibility; but this grows on Eaurupik too."

116, 276, 439 Ifalik

"Native tobacco is imported from several of the nearest atolls, which seem able to grow more of it than Ifalik, though the soil can not be very hospitable on any of them. Faraulep and (this from memory) Lamotrek were mentioned as sources of tobacco."

1: Burrows--128 (1947-48) Woleaians
116, 302, 386, 439 Ifalik

"One highly prized article--'red' turmeric root, rubbed on the body as adornment or medicine--came from the more distant high islands; either Truk, 400 miles to the east, or Yap, about the same distance to the west. The turmeric plant grows on Ifalik, and is one of the plants most highly prized for its fragrance--the angorIk. But it is the leaves that are used. The locally grown roots are apparently too small to be worth putting through the elaborate process of grating, straining, decanting, and baking by which the orange or flame-colored powder called rang was prepared. At any rate this process is not part of the technology of Ifalik. Tom always translated rang as either 'Yap paint' or 'Truk paint'."

1: Burrows--128-129 (1947-48) Woleaians
116, 502, 439 Ifalik

"It has been noted in the account of native navigation that canoes from Ifalik sometimes went as far as Truk to the eastward, or even farther. Whether these long trips accounted for most of the supply of rang [KS: powdered turmeric root used for body painting] from that direction, or whether most of it came by trading along the chain of low islands in between, is not clear. But certainly some of the supply from Yap was brought directly, in the course of the regular visits to the village of Gatschapar (Ifalik Garpar) in Gagil district, whose chiefs are regarded as overlords of Ifalik. The political aspect of these voyages will be considered in the chapter on government. As to the economic aspect, Fonachar of Yap told me that the people from outer atolls like Ifalik would bring cloths, mat sails and other pandanus mats, sennit rope, and coconut 'candy' (what he meant by 'candy' I could not make out). Yap gave in return, he said, rang, canoes of the larger and better timber available on the high islands, mats of Yap manufacture, betel nuts (but betel chewing is not customary on Ifalik), and foods not obtainable on the atolls, such as Tahitian chestnut. Since foreign vessels from the high islands have been making fairly frequent trips to Ifalik, most of the turmeric has been brought on them, though [129] the trade in it seems still to be in the hands of native sailors or passengers."

(1947-48)

Woleaians
Ifalik

"It is noteworthy that the people of Ifalik do not make or use--and so far as I could learn, never did--any of the kinds of native currency which reached a remarkable development on Yap and Palau. To be sure, the material for the kinds most valued on Yap--huge limestone disks and dugong ivory--would have had to be imported to Ifalik; and the stone is too bulky to transport on canoes without great difficulty, while the dugong ivory is said to be extremely scarce even on Yap. (One necklace of what seemed to be this material was seen on Ifalik--about the neck of the chief WolpaitIk.) But there would be no such obstacle to the acquisition of shell currency, either by trading or by local manufacture. The absence of anything of the kind in the economic system of Ifalik illustrates the limited and selective character of cultural borrowing by Ifalik (and presumably by neighboring atolls of similar culture) from the more populous high islands. In this case the failure to adopt native currency may well have been influenced by the absence of selling and barter--indeed, the weakness of any concept of payment for a gift--in the local economy."

1: Burrows--130

Woleaians
Ifalik

"Government on Ifalik, as described in this chapter, is limited to administration of certain rules regulating conduct. Another activity which might well be allotted to government is public works. But since the services performed are economic, and some of them involve distinctive techniques, it has been convenient to describe this activity under economics and technology, except for the matter of enforcing participation in communal undertakings, which will be discussed in this chapter. Various other activities performed in our culture by governmental agencies are either absent in Ifalik or seem to be outside the sphere of government as here understood.

Not all rules are regarded as governmental. Following Malinowski*, the distinction drawn here is based on the sanctions by which they are enforced. Rules not taken seriously enough to be sanctioned at all, or sanctioned only in informal ways, as by the inertia of custom, the negative sanctions of gossip and ridicule, or the positive sanction of practical efficacy, are not the concern of government. And sanctions that we regard as supernatural, whether thought of as automatic, or as administered by superhuman beings, are allotted to religion."

"* Malinowski's views on government were first formulated in 'Crime and Custom in Savage Society,' redefined later in the preface to Hogbin, 'Law and Order in Polynesia.'"

1: Burrows--130 (1947-48) Woleaians
116, 622 Ifalik

"In Ifalik, matters of public concern, except for most of the religious ones, are administered by five chiefs, who hold office by virtue of hereditary rank."

1: Burrows--130-131 (1947-48) Woleaians/-3
116, 621 Ifalik

"....government in Ifalik might be defined as interaction between chiefs and populace, and between chiefs and foreigners. It is unmistakably institutionalized, in any sense of the protean word 'institution'. If we apply Malinowski's concept of an institution, government in Ifalik can be outlined as follows:

Group: Chiefs as the governors, populace as the governed.

Activity: Regulation of conduct in accordance with traditional rules; formulation of new rules when necessary.

Shared Environment: The atoll of Ifalik, including its reef and lagoon, and extending to the open sea as far as it is frequented by Ifalik canoes on short round-trip expeditions. (Interisland voyages take the canoes out of the jurisdiction of this institution.)

Material Equipment: The kind of property called 'property of the chiefs', and analyzed in the chapter on economics as public property: that is, the men's house, the path along the lagoon shore of Falārĭk and the belt line about the taro swamp on Falālap, especially the northwestern part of it, which constitutes the main thoroughfare among the houses; the big seines kept in the canoe-houses; to a great extent the canoe-houses themselves and the large sailing canoes,

though these are nominally private property; in emergency, any other property.

Charter: (1) The legends insofar as they confer the authority of ancient standing on the principle of rank, including subordination of Ifalik to Gatschapar in Yap, superordination of Ifalik over surrounding atolls; most specifically, the passages which trace the paramount title, and its succession in Kovalū clan, to the [131] prowess of Mailias as a warrior, and the second-ranking title, with its succession in SauvelārIk clan, to the feats of Maur as a leader and orator; less explicitly, the traditional association of these mighty men of old with the abandoned site of the ancient men's house just inland from the present one.

(2) Symbols of rank in material objects and deferential behavior. These cluster around the men's house, as described later.

(3) All traditional rules of conduct insofar as it is regarded as the business of the chiefs to administer them. (It is hard to draw a clear line between these rules and rules of two other kinds: on the one hand, those administered within the household or informally by public opinion; on the other hand, those administered by gods or--in the case of tabus--by impersonal supernatural power. An

attempt to draw this line will be made later. The belief that the spirits of ancient chiefs avenge any violation of the tabu on the site of the ancient men's house is a case in which governmental and religious rules, as those categories are here defined, merge into one.

(4) The traditional, unverbalized 'constitution' - which places every individual in a hierarchy of hereditary rank, and confers authority on the holders of five chiefly titles, each of which descends nominally in a particular clan (actually, so far as observed, in the senior lineage of that clan). This constitution specifies--by precedent, as in the British constitution and the common law--the duties and prerogatives of the chiefs, some division of authority among them, and the obligations of the commoners."

1: Burrows--131-132 (1947-48) Woleaians/-2
116, 622 Ifalik

"The following table shows the order of rank among the chiefs, the clans in which they descend, and the names of the individuals holding these titles during our stay on the atoll in 1947-8. The official titles of the chiefs, except for those in SauvelārIk clan, are the same as the names of their clans. Apparently the names of these particular clans, as discussed on p. 89-90, originated as titles. I never heard titles for the two chieftainships in SauvelārIk clan, and the name of that clan is not, like the others, a title. Indeed, the other titles are now used only as clan names. Although it is said to be proper to address the paramount chief as 'Kovalū', the third as 'Mangaulevār', and the fifth as 'Rapevalū', I never heard this done. There is no way to test the suggestion that this was customary at some former time, unless this custom proved to be general among surrounding islands of related culture, which would of course support the suggestion. Whatever may have been the former custom, nowadays the use of these titles in address is obsolete, so far as our observation goes.

Order of Rank	Clan	Title	Holder in 1947-8
1.	Kovalū	Kovalū	Wolpetau
2.	SauvelārIk	?	Maroligar
3.	Mangaulevar	Mangaulevār	Paliuilimar (died 1948)
4.	SauvelārIk	?	WolpaitIk
5.	Rapevelū	Rapevelū	Toromann

[132] In addition, Fagaurateu of Sauwêl was credited with a unique status as a sort of sub-chief. Tom said this position was called by the same name (tamōl) as that of the five full-fledged chiefs. Yet Fagarateu did not meet with them, nor sit with them on public occasions. His position seems to exemplify the traditional role ascribed to Sauwêl men--to act as errand-runners and subordinate executives for the chiefs. This was the only trace found of this role in current practise; and even this was only nominal, so far as observed. Being old and in poor health, Fagaurateu seemed not to exercise any of the authority accredited to him."

1: Burrows--132 (1947-48) Woleaians
116, 565 Ifalik

"Rank is so highly valued and respected that it stands out as one of the master-values of this culture. A hierarchy of rank runs through the whole society. In it each individual has a place; and standards of good behavior require each to show by his conduct that he 'knows his place'. This involves not only deference toward superiors, but a certain lordliness toward inferiors, --not in informal contacts, but on occasions of state. For example, when the highest-ranking chief of Faraulep was visiting Ifalik, and came to the canoe-house where the local chiefs met, Wolpetau remained lying on his back and paid his visitor only a negligent attention; this although he is personally an affable man, rather diffident in manner. The point was that traditionally he outranks the Faraulep chief, and was in duty bound to mark the distinction by his conduct.

It has already been shown (pp. 90, 131) that the chiefs are aligned in a definite order of rank; that the clans which hold chiefly titles have an order of rank corresponding to that of their chiefs; and that clans which have no chiefs rank below those which have."

1: Burrows--132 (1947-48) Woleaians
116, 613 Ifalik

"Within the clans, lineages rank according to traditional seniority. Even within lineages--or, what comes to nearly the same thing, households--there is a similar order among individuals. Insofar as the division of labor segregates men and women into separate groups, this small-scale hierarchy splits into two, one of men and one of women. It is unobtrusive, and may be weakened, perhaps even reversed occasionally, by individual differences. Yet it operates more continuously than the large-scale, comparatively formal hierarchy of chiefs and clans, because the individuals involved are interacting most of the time."

1: Burrows--132-133
116, 565

(1947-48)

Woleaians/-2
Ifalik

"Rank, then, is a graded continuum. The sharpest line of cleavage is between chiefs and commoners; and this is in effect a part-time distinction, perceptible only on formal occasions. Ordinarily it would be hard to tell, from the behavior of a group of men, which among them were chiefs. All work and talk together like equals. The chiefs are treated courteously, to be sure, but so is everybody else; for courtesy is another of the master-values. The distinction in rank only becomes apparent in moments of formality. For instance, as already noted, communal tasks of any importance are made the occasion for communal meals,--not to use the word 'feast' for anything so unpretentious. Such meals always begin with the offering of a little food to the gods, with a brief spoken prayer, like the "grace before meals' customary--or formerly customary--in our culture. When there is a chief present, as there usually is, he is the one to make this offering; or if there is more than one chief, the senior one. That bit of ritual over, he again becomes indistinguishable from the rest. Although chieftainship is hereditary, the chiefs, elevated only by such part-time distinctions, can not be said to constitute a social class, as that term is ordinarily understood. Still less can they and their kinsfolk, whether households or clans, be said to constitute a [133] nobility. For what distinction there is is nearly all individual. The order of rank among clans is manifested only through their chiefs, except when a title is vacated by death and a successor has to be chosen, or--in the case of the two highest-ranking clans--on one rather infrequent occasion: when a turtle is appropriated by Kovalū, or a yellowfin tuna by Sauvelārlk.

In sum, for all the importance of rank in this society, the society is not stratified into classes.

The importance of courtesy, evident in all social behavior, is conspicuous in the treatment of distinctions in rank. When the occasion requires, the distinctions are made and accepted, but unostentatiously. They are not allowed to become invidious. So, while rank serves to enhance the authority of superiors, it is rather successfully prevented from humiliating inferiors, at least overtly. The emphasis--unless in malicious gossip, which would have to be furtive to be tolerated--is on the positive importance of rank, rather than the negative importance of lack of it. Even in the case of chiefs homage is paid to the office rather than the man."

"This fact is evident in the nature of the symbols of rank. They do not consist of emblems or insignia attached to the person and carried about. The reservation of turtle to Kovalū clan and yellowfin tuna to SauvelārIk, in addition to the practical advantage of use of these delicacies, symbolizes the superior rank of these two clans. This is the symbol that comes nearest to being invidious. Tom, a SauvelārIk man, fretted under the restriction on turtle. The requirement that the paramount chief butcher turtle in person is an individual distinction. Except for that, the symbolism of this custom distinguishes clans rather than individuals.

Only one other individual distinction was noted, --a bit of symbolic behavior. Once every rag, or twice a year, men from FalārIk district make a ceremonial offering of coconut toddy to the No. 2 chief, the senior man of SauvelārIk. We saw it once, on November 10. About mid-morning, a file of men came along the path, each carrying a bottle of fresh toddy. Maroligar awaited them on the homestead Somat, between Katēlū and Bwagolei. He does not live there, but now that Bwagolei is uninhabited Somat is the highest-ranking SauvelārIk homestead, hence the most appropriate site for this little ceremony. There was no elaborate speech-making. The men greeted the chief quietly, put down the bottles of toddy, and squatted on the coral house platform facing him. He saved out some for his relatives, and one bottle for the Americans, but redistributed the rest at once, and he and his callers drank it together."

1: Burrows--133-134 (1947-48) Woleaians
116, 345, 565 Ifalik

"Far the most conspicuous and important symbol of rank on the atoll is the tract of land called Katēlū, in Rauau district. There are two buildings on it, and a coral platform, now overgrown, where another building stood in ancient times. The two now standing are a canoe-house (generic name Fan ni Wā) and what speakers of English call the men's house, because unmarried men formerly slept there. The native generic name for it is Fan Nap or big house. Both canoe-house and men's house are sometimes called Katēlū, the same as the whole site.

The canoe-house seems to be only slightly more respected than other canoe-houses. In its use for storage of canoes it does not differ from them at all. As a men's clubhouse, it is used more by the chiefs than by anyone else, but is not forbidden to commoners. It was the regular meeting-place of chiefs during our [134] stay. Whether they would have used the men's house if our tent had not been pitched close beside it, I could not be sure."

1: Burrows--134
116, 345, 565

(1947-48)

Woleaians
Ifalik

"The men's house is far more significant than the canoe-house as an emblem of rank. It is rarely occupied nowadays except when the chiefs summon all the people to gather in and around it for a public meeting. Occasionally a few men-usually chiefs, or at least with a chief among them--gather there to consult together. At least once during our stay a few people, including both men and women, met there to talk with the chief Maroligar. I think, but am not certain, that he performed for them a kind of divination reserved to him, the apparatus of which is stored in this building (p. 189-190). Once a group of women, in response to the chiefs' request or order that a pandanus mat be plaited for Spiro, met in the men's house for part of the work."

1: Burrows--134 (1947-48) Woleaians
116, 345, 565, 532 Ifalik

"The symbolism of rank which invests this building [KS: the men's house] as a whole is reinforced by several of its details. One is that the four corner-posts, unlike those of any other building on the atoll, are not of wood but of the compact beach sandstone called perou. The significance of this is indicated by the fact that one of the men's religious dances is called sur perou (stone corner-post), as if to say 'This is the firm, durable support on which the whole structure rests.' Another is the foremost or seaward one of the row of posts set in the ground which support the ridge-pole directly, another unique feature of this building (p. 48). This front post is called ŏngarIk. This word, too, is used as the name of one of the men's religious dances.

The ŏngarIk, unlike the rest of the row of posts, is hewn square and covered from top to bottom with decorations. A detailed discussion of these belongs with the study of native arts. Most of them seem to have no specific symbolism, only the general purpose of adorning and so dignifying the post. But the most conspicuous one refers to the legend of the massacre of the ancient population of Woleai and the repopulation of the atoll from Ifalik, most important of several such legends which, as will be pointed out (p. 162-3), express the sentiment of rank by exalting Ifalik above the other atolls round about. This symbol is a large phallus, rather realistically carved but painted white. The penis, about 18 inches long, points toward Woleai. It is said to represent the penis of Maur, which pointed toward Woleai in the legend (p. 154)."

"Two other bits of decoration on this post [KS: front post in men's house], in which the specific symbolism is of foreign origin, require mention because of an incident that illustrates both how the people feel about rank and--a related matter--how they feel about the United States.

At the top of the post, when we arrived, was a Japanese flag, painted in black. From the first we thought we would eventually suggest changing this; but decided to let any suggestion of change wait until the people knew us better, and understood that suggestions of change were not what we were there for. (If any such idea of our mission had become current among them, it might have led them to conceal from us whatever of their culture they valued so highly that they did not want it changed.)

Below the flag were some Japanese characters. An American ship, on its next call, brought Cmdr. Kinney, then head of naval government in Yap district. He noticed both the flag and the characters, and had the latter translated. They represented the name Bwongulimoi, paramount chief some years before. Though Commander Kinney made no further comment, I decided to suggest to the chiefs not only that the painting of a Japanese flag be replaced by an American one, but that [135] the name of the former chief in Japanese characters be replaced by the names of all the chiefs then in office, written in the kind of characters Americans use.

As always, the chiefs accepted our suggestion. (Even if they had been unwilling, they might have been afraid not to accept it. Witness a remark by WolpaitIk, which Tom

translated to this effect: 'We'd better do whatever these Americans want us to. If we don't--no more chiefs!') In due time, Maroligar climbed the post, chipped off the Japanese flag, and--after failing on the first attempt--made quite an exact copy of the American flag given to the island by the navy (pl. 3). I was furnished a board, on which I set about outlining the names of the chiefs.

At this point Tom's thirst for glory made him want his name on the board, too. He argued plausibly that, since he was the interpreter, it would be a convenience for visiting Americans to have that fact posted. In a moment of weakness, I consented to suggest this to the chiefs. They agreed, as they always agreed to our suggestions. So I outlined the names of the chiefs on the board, in capitals; and below them, in smaller capitals and lower-case letters, 'Tom-Interpreter.'

I succeeded only in displeasing all concerned. Tom did not like being distinguished from the chiefs by having his name in smaller letters. The chiefs did not like having the name of a commoner on the OngarIk at all, but did not want to offend their American guest. They decided on a characteristic compromise, --to hang my placard on the OngarIk only when an American ship was anchored at Ifalik."

1: Burrows--135-136 / (1947-48) Woleaians
116, 778, 784 Ifalik /-3

"The most sacred part of all Katēlū is a tract just inland from the men's house. This is said to be the site of the ancient men's house which was in use in Maur's time. It is now covered with a thick growth that includes some tall trees, evidence that it has been long unoccupied. This Katēlū is strictly tabu except, nominally, to chiefs; and we never saw even a chief set foot on the central part of it, where the old building stood. All that remains of that is a few vertical slabs, some of them apparently stone corner-posts like those in the present building, while others may be backrest stones; and a terrace or platform strewn with coral gravel and outlined with coral blocks. This is like any other house platform except for a few other lines of blocks at one side, suggesting a bit of terracing which may have constituted a formal entrance.

Maroligar, who acted as caretaker of all Katēlū, did some weeding and trimming about the edges of this part of it, but we never saw him venture on the old platform. The only violation of its sanctity that we did see was by the psychotic called, for short, Tarof. He was subject to outbursts of obstreperous and sometimes violent conduct. On hearing that he had impiously trespassed on the overgrown, tabu site of the old men's house, a group of agitated men, mostly relatives who felt some responsibility for his conduct, gathered at the edge of the overgrown tract. They called to him to come out, and rebuked him for his presumption, but did not venture in after him. This was not from fear of violence on his part, for some of these same men more than once tied him hand and foot after other outbursts. It was from reverence for the sacred site, respect

for the tabu, and awe of the spirits of ancient chiefs who are supposed to punish trespassers.

Violation of this tabu by Spiro and me was punished by these spirits. Our camp was on Katēlū, just south of the present men's house and west, or shoreward, of the site of the old one. Our only toilet facilities, at first, were the lagoon and what the navy calls an overwater head, which could be entered only by walking along an unsquared coconut log set at rather a steep angle. The lagoon [136] was well enough, part of the time; but since, unlike the natives, we had to change clothes to wade into it, it was often inconvenient. After one attempt to negotiate the log leading to the overwater head, which ended in an ignominious leap into the water, I gave up trying to use that; and for Spiro, if I remember rightly, a look at it was enough. The only concealment near our tent was the foliage on the overgrown part of Katēlū. We took to using the edges of that, part of the time. Maroligar delicately dissuaded us by intertwining the leaves of the young coconuts about the old site, forming a flimsy barrier, which is a traditional tabu sign. The hint was not lost on us, but now and then, under pressure of time and when we thought we were unobserved, we disregarded it.

About that time came a period of rainy, gusty weather. The chiefs decided that it was visited on Ifalik by the spirits of the old chiefs to show their indignation at the violation of their sanctuary. So they had the overwater head moved to a new position, beside a stone pier that projects into the lagoon; and built a short, level approach, so

that there was no longer any difficulty about using it. Then they had Tom explain the whole situation to us, and ask us to use the new facility. This seems worth telling, not as a funny anecdote, still less as a confession of what now seems stupidity on our part; but rather as an illustration, first, of how the sentiment of rank may work out in conduct, and second, of the diplomacy shown by the chiefs in persuading foreigners to respect their rules."

1: Burrows--136 (1947-48) Woleaians
116, 778, 784, 565 Ifalik

"Two other sites share, but in much lesser degree, some of the sanctity attributed to Katēlū. One is the homestead Uelepī, traditional residence of the senior lineage of Kovalū clan, whose members succeed to the highest chiefly title. This site is said to be tabu to all but relatives. Except for men of other clans who live there by virtue of marriage to women of this line, we did not hear of outsiders trespassing on it (except the psychotic Tarof on one of his rampages). A similar site, no longer occupied and of less importance but still respected, as far as we know, was Bwagolei, just inland from Katēlū. This is the traditional homestead of the senior lineage of Sauvelārīk clan, holder of the second chiefly title. Tom took me there by virtue of his membership in that lineage, and did his best to make it out as practically equivalent to Uelepī."

"Commoners are required to acknowledge their subordination to chiefly authority by stooping as they pass in front of the men's house. The main path along the lagoon shore of Falārlk island passes immediately in front of the men's house; but this part of it is not often used. Unless they have business there, commoners detour to shoreward. This roundabout way is noticeably more worn by passing feet than the direct one. Even at this distance, they bend low as they pass, usually with hands clasped behind their backs, like a miner stooping as he walks through a low gallery. This deferential gesture, though rather carefully observed most of the time, is sometimes forgotten or ignored. Children who hold their heads high in passing Katēlū may be rebuked by their elders. One adult who failed to stoop, and was seen by the chief WolpaitIk from the nearby canoe-house, was sharply reprimanded."

1: Burrows--136-137 (1947-48) Woleaians
116, 173, 622 Ifalik

"Several points in this elaboration of rank--particularly the awe of ancestral chiefs shown in the respect for the old site at Katēlū, and the formalities about turtle--suggest the Polynesian complex of chieftainship. There, chiefs commonly traced their ancestry to gods, --indeed, the most influential gods, or some of them, seem to have been deified chiefly ancestors. And living chiefs were thought to embody some of this divinity. As for turtle, in more than one part of Polynesia it was offered to the paramount chief explicitly in his divine capacity.

It seems highly probable that the chieftainship complex of [137] Polynesia and that exemplified by Ifalik are historically related. But it is clear that in Ifalik, though native religion still flourishes, the respect shown to chiefs does not include attribution of divinity to them. The oracles of the gods are typically not chiefs. Chiefs do not trace their descent from the gods--in fact, divine genealogies are patrilineal, human ones matrilineal, and both very brief. Except in association with Katēlū, ghosts of chiefs seem no more important than any other ghosts. In sum, religion on Ifalik does not support government in this particular way. As to what process brought about this difference with Polynesia--whether chieftainship in Ifalik has fallen from a former high estate, or chieftainship in Polynesia has been elevated by local development--that could only be determined, if at all, by careful comparative study."

1: Burrows--137-139 (1947-48) Woleaians
116, 622 Ifalik 1-5

"Succession to chieftainship is determined by primogeniture in the female line. Asked for a more exact statement of the rule of succession, the chiefs conferred and issued, through Tom, a series of choices, given below with the comment that seems necessary to explain them.

(1) When a chief dies, the first choice for a successor is a 'brother'. Tom said 'brother' as the only term in English to translate bwisīl. Actually, as shown in the discussion of kinship terms, this one (given there as bwisī, with 1st person possessive suffix instead of that for 3d person) applies not only to siblings of the same sex, but also to more distant relatives in the female line, --to all recognized relatives of the same lineage, sex, and genealogical generation. So this statement includes a range of choices. First would be a true brother; and among brothers, the oldest surviving one. Next would be mother's sisters' sons, with priority to the eldest son of the eldest sister; and so on, as far as kinship is recognized. As a rule, as has been noted, it is recognized only within the lineage. And as the lineage groups (living members of a lineage) are small, the usual extension of kinship terms does not take in a very wide range of relationships.

(2) If no 'brother' is available, next choice will be a 'sister's son' (vatu wei). This term is also applied to more than sons of sisters. The sons of women whom we would call parallel cousins or orthocousins of the deceased chief, on his mother's side, would also be eligible; for the chief would speak of any of them as 'my sister' (moengai); and

the term for 'son' would be used in a similarly extended sense by all of these 'sisters', So, in effect, any man of the chief's lineage, but one generation younger as generations are reckoned genealogically, would be eligible as a vatu wei. In practise, the term is not commonly extended beyond true sisters' sons and the sons of mother's sisters' daughters.

(3) If no 'sister's son' is available, the choice will pass to a son, (laú). This statement was a surprise, as a man's sons, or the nephews to whom the same term would be applied, are not of his lineage or even of his clan. When asked about this, Tom said that a son was a possible successor because he was of the same 'house' as the chief. The word for 'house' in this connection, he continued, would be im, the ordinary word for dwelling. He knew of no instance in which a chief had been succeeded by a laú. So this statement may have little or no practical significance.

(4) If none of the preceding choices is possible, the chief will be succeeded by 'some other relative.' Again it is questionable whether in practise succession would be, or ever need be, extended to such rather remote relatives. [138]

Because the people of Ifalik do not cherish genealogies, and can not trace relationships farther than their memory of living persons, the only specific cases of succession obtainable were those involving the chiefs in office during our stay. Each knew his own relationship to his immediate predecessor. Some of these statements were confirmed, from memory, by others. In the case of the two highest-ranking chiefs they could cite

names of earlier chiefs in order of succession; but did not know the relationships involved.

Wolpetau, No. 1 chief, was a 'brother', in the extended sense, of his predecessor Mul. Their mothers were true sisters.

Maroligar, No. 2 chief, was a sister's son of his predecessor, Bwongalimoi.

Paliuilimar, No. 3 chief, was a sister's son of his predecessor.

WolpaitIk, no. 4 chief, was a true brother of his predecessor; 'same father, same mother.'

Toromann, No. 5 chief, was a brother of his predecessor.

Succession in three of these cases followed the choice named first in the list announced by the chiefs. In the other two cases it followed the choice named as second. There is little doubt that these two choices provide a successor to a deceased chief in most instances.

Two limitations on succession were exemplified when the third-ranking title was vacated, shortly before we left Ifalik, by the death of the chief Paliuilimar. Though the matter may not have been entirely settled when we left, we were told that no successor to the title would be named for the time being, as no suitable person was available. If all members of Paliuilimar's clan, Mangauvelar, had been considered eligible, a suitable successor would have been available. But Tom explained that

within the clan, some were 'more high', others 'more down,' and that only the 'more high' could succeed to the chieftainship. Apparently this meant that succession is confined to the lineage. This is a typical example of the fact that the people do not clearly conceptualize lineages, even when in actual practise they observe distinctions among lineages. Typically, then, succession is limited to the senior lineage, except in SauvelārIk clan, which has two titles, so that members of two lineages in that clan may become chiefs.

The other limitation followed by not naming a successor to Paliuilimar was one of sex. There was a woman of suitable age in Paliuilimar's lineage. And it is said that women may become chiefs. No specific instance was found, and--unless there was a change after we left--this woman was not considered suitable. Whether female chiefs are entirely a thing of the past, or whether the elevation of a woman to chieftainship is still possible in exceptional cases, only time can tell.

One other qualification, a matter of personal character, was mentioned in general discussions of chieftainship. The quality emphasized is courtesy, already mentioned as one of the master-values. Kindly speech from a chief is so highly valued that it is believed to confer long life on his people, while evil speech from a chief may mean death to them. So if a man otherwise eligible for chieftainship has a reputation for 'bad talk', he may be passed over, and the title conferred on one of his juniors who keeps a civil tongue in his head. In accordance with the general principle that the chiefs

interpret the rules, the [139] actual decision in such a case would be left to the chiefs in council. No actual instance was cited.

It is not practicable to leave the title of highest-ranking chief vacant, because final authority in matters of general importance belongs to this position. So when the senior line of descent in Kovalū clan fails, the senior chief of SauvelārIk clan, who ordinarily ranks No. 2, may take the No. 1 position. This had actually happened within the memory of our informants. Oraitiu, a Kovalū chief, was lost at sea during the typhoon of 1907, when he was returning from a visit to Lamotrek. In default of a suitable successor in the Kovalū line, he was succeeded as No. 1 chief by Daoreligar of SauvelārIk clan. Daoreligar was paramount chief in 1909, when Sarfert visited Ifalik. His successor, too, was a SauvelārIk man, Bwongalimoi (he whose name appeared in Japanese characters on the ŌngarIk). On the death of Bwongalimoi, though, the title reverted to Kovalū in the person of Mulelimar, commonly known as Mul. He was the immediate predecessor of Wolpetau, paramount chief during our stay."

"Matters of concern to the whole atoll are decided by the five chiefs in council. Matters of concern only to one locality are allotted to one or two chiefs, each of whom has some local jurisdiction. Three accounts of this local division of authority agree both as to the general pattern and some of the details, but differ in other details. One version was given by Wolpetau, the paramount chief and presumably best authority; but this was early during our stay on the island, and Tom was not present to interpret, so I may have misunderstood some points. The second was given by Maroligar and one other chief (my notes fail to specify which one, and I can not trust to memory) with Tom interpreting. The third is made up of answers given by Tom at different times, to a variety of specific questions.

All agree that Wolpetau, ranking No. 1, and WolpaitIk, ranking No. 4, have charge of Falālap. Wolpetau said that he had charge of Ievang, WolpaitIk of Iauru. This division was not mentioned by the others, but at least was not denied, so can be taken as correct. Absence of mention of this point by Maroligar or Tom apparently reflects a gap in my questioning. It may also reflect the fact, already brought out, that the division of Falālap into two districts is not very important. The only time we saw this local authority exercised--when a dog bit Spiro, in Ievang (p. 149-50)--the two chiefs acted together.

Authority over Rauau district is divided, and accounts differ as to which chiefs are in charge. Wolpetau said that the rulers of Rauau were Wolpetau, Maroligar, and

Toromann. Maroligar gave the list as Maroligar, Paliuilimar, and Toromann. The difference may be one between theory and practise. Whatever Wolpetau's nominal authority, he did not trouble to exercise it, so far as I could observe. Neither did Paliuilimar. Not only were these two the most aged of the chiefs, but neither lived in Rauau. Wolpetau lived in distant Iauru, Paliuilimar in Falārlk. Both came frequently to Katēlū in Rauau district, to attend chiefs' meetings; but usually left for home as soon as the meetings were over. If they took part in the local affairs of Rauau--which were of a routine sort, while we were there--it must have been only as consultants. The active chiefs in Rauau were the two who lived there, and whose names appear on both lists: Maroligar and Toromann. As between the two, Toromann's role was distinctly subordinate. He was not lacking in ability or initiative. But one of the points that attest his [140] intelligence is his clear understanding of the limits of his authority, as lowest-ranking of the chiefs. He knew his place, and never overstepped its boundaries.

Asked which chief had charge of Falārlk district, Wolpetau only laughed quietly; disparagingly, it seemed to me, as if to imply that Falārlk was beneath the notice of a chief. Maroligar's answer was not incompatible. He named Fagaurateu of Sauwēl clan as ruler of Falārlk district. Fagaurateu was not a chief, but held the unique position of sub-chief. These two answers presumably express the official position. Tom, at a later time, said that Paliuilimar was in charge of Falārlk. This may have been true in practise, for Paliuilimar lived in Falārlk, and was the only chief who did; so presumably

he would be consulted about any local problem. A still later entry in my notes, based on another comment of Tom, says 'It seems that Maroligar has authority over FalārIk, too.' The situation seems to be that Fagaurateu was nominally in charge; but he, besides being inferior in rank to the chiefs, was old, sick, and perhaps senile. Under the circumstances, any chief--but particularly Paliuilimar, who lived in FalārIk district, and Maroligar, highest-ranking and most active resident of FalārIk island--might well intervene whenever it seemed advisable.

Local division of authority among the chiefs seems, on the whole, rather elastic. Yet one statement by WolpaitIk suggests that individual chiefs are held responsible by the other chiefs, for the condition of the districts they control. The statement was in answer to one of a schedule of questions to bring out psychological characteristics. The particular question was aimed at sources of worry or anxiety. WolpaitIk said that one thing he worried about was that the other chiefs might criticise him for the condition of his district. (WolpaitIk was the junior, in age and length of service, of all the chiefs, as well as being next to the bottom in rank; so he might well have been more sensitive on this point than a more experienced man.)"

"Maroligar took charge of the bonito drives in the lagoon, in which the whole population took part. My question about the meaning of this, in terms of division of authority, led to a discussion which is all I have in the way of evidence on the formation of policy. So it will be discussed in the following section.

Formulation of Rules

Concrete evidence as to the initiation of rules of conduct is scanty to very near the vanishing point. The rules are traditional, and their origin is lost in the past. On that point, I can not improve on Tom's answer to all such questions: 'blong before'.

The one possible glimpse of how rules are modified was the answer to my question about Maroligar's authority over the bonito drives. Tom, always the most convenient source of information, was asked first. He said that Sauvelārlk clan has charge of the reef and the lagoon. While ordinarily members of other clans are allowed to fish there, they do so only on sufferance, said he. Supervision of the bonito drive by Maroligar, senior Sauvelārlk chief, was one manifestation of this general prerogative.

Asked if other clans had similar rights, Tom said he did not know, and suggested referring the question to the chiefs. That was obviously the thing to do anyway; for while his statement sounded plausible, it was suspect because of [141] his continual attempts to lay claim to glory, whether by way of his membership in Sauvelārlk clan or by any other means that occurred to him.

At the moment only two chiefs were available; Maroligar and Toromann. The question was referred to them. They talked it over and decided to submit it to all the chiefs. Their reason, Tom explained, was 'Some other chief might say 'This chief 'e lie'.' Plainly this claim of one clan to special authority was a touchy matter.

Next day all five chiefs discussed the question long and seriously. This fact strengthens my suspicion that Tom's statement had some foundation. Otherwise, presumably, they would have dismissed it at once. But their answer gave no suggestion of this. They instructed Tom to tell me that the reef and lagoon belong to all five chiefs together, not to any one clan. Ordinarily it is permissible for anyone to use them. But if the chiefs decide to restrict their use, fishing can be carried on only by their permission. It is the same with the land, they said (disregarding an important difference, that arable land is divided into patches, owned by separate lineages). Ordinarily people may eat the fruits of the land as they please. But in time of shortage--for example, after a hurricane--the chiefs may say 'Only eat a little.' In other words, the chiefs asserted their authority to ration food.

If this answer, as I suspect but can not prove, involved abrogation of a traditional allotment of authority to one clan, it would constitute legislation by the chiefs. Whether this is indeed an instance or not, the obvious way, and the only apparent way in which rules can be modified or new rules initiated under this form of government, is by decree of the chiefs after such discussions. When a situation arises which is not covered by

the rules, or not covered satisfactorily, the chiefs will have to decide it according to their best judgment. Their decision will constitute a precedent, to stand until some new problem requires further modification."

"While the chiefs have final decision, there is nothing to prevent any individual from requesting or suggesting a new ruling, or even setting up by some unconventional act a situation which may require one. Again I have one possible example, but no trustworthy evidence as to how novel this situation may have been, beyond the fact that it was unique in our brief experience. As in a good deal of the available evidence about the process of government, our presence was indirectly involved. We were a considerable irritant to the body politic.

Tom was assigned by the chiefs to devote his full time to working for us as interpreter. The activities to which he would have ordinarily devoted this time--helping to feed his household, working on his new canoe--were to be taken over by others. On October 15, Tom went on strike. He announced that he would not work for us that day or the next, but would work on his canoe. His reason was not any objection to us or our tratment of him, but the fact that nobody had been working on his canoe for days. If he had to spend all his time with us, he said, his canoe never would be finished.

Conceivably this was the first strike on Ifalik, although, as already said, there is no evidence as to this. What is certain is that it was the only example in our experience of open defiance of the orders of the chiefs. Tom went so far as to criticize the chiefs for not issuing orders to men to work on the canoe--or not issuing them often enough to keep the men on the job. He showed [142] not only a short temper, as compared with the mildness usual on Ifalik, but also considerable courage.

The response of the chiefs was not to issue a command or decree. Nor did they punish Tom for his temerity. Following the general rule of courtesy, they were quite conciliatory. They reasoned with Tom, and persuaded him to reduce his abstention from work for us to one day. The two junior chiefs, WolpaitIk and Toromann, themselves helped him work on the canoe that day, and several younger men appeared. The work seemed to go somewhat better from then on. In other words, Tom won his strike. But it cost him a good deal of emotional stress. About noon on his day of strike, Spiro found him much disgruntled. Not only had the chiefs disapproved of his conduct, however gently; his wife had scolded him, apparently more emphatically, for deserting us. 'Too much talk', Tom said.

The chiefs' mild policy worked well. The strike was limited to one day, and--what was of great importance on Ifalik--there were no hard feelings. By implication, the chiefs had promulgated a rule of conduct, whether or not it was a new one. They had acknowledged the 'right to strike'."

116, 646, 537 Ifalik 1-3

"Other evidence on rules of conduct is verbal. Yet much of it is in a native setting, hence probably more representative of native behavior than replies to questions from a foreigner would be. It consists of the harangues delivered by the chiefs to the people at three public meetings held in the men's house. At these meetings the chiefs not only make announcements and issue specific orders, but lecture the people about their conduct in general. These speeches or sermons are a traditional way of 'laying down the law'.

There were three of these meetings during our stay. One object of the first, held on August 14, was to issue as formal chiefly commands the suggestions of the American physician about hygiene, made during the visit of the ship that had brought us to Ifalik two weeks earlier. But the immediate occasion of the meeting was a chance remark of Spiro's that there were Americans on other islands, doing the same kind of work that we were doing on Ifalik.

Unexpectedly, this stirred up considerable excitement. The whole expedition, or set of expeditions, seemed to be taken as a kind of competitive examination, in which the visiting Americans would give the various islands a comparative rating in conduct, particularly in cleanliness. In other words, it touched off the lively sentiment of rank--in this case, comparative rank among islands. The people of Ifalik were eager to get a high rating--to gain in rank, if possible, at the expense of their neighbors, in the eyes of the Americans, whom they acknowledged as their superiors; or at least, not to

sink lower. The occasion of the 2nd meeting, held on September 4, was similar; to carry out the suggestions of the American governor and physician, made when the ship called on September 2. The occasion of the third meeting was, at least in part, my request to the chiefs for a performance of the men's religious dances (ur), which otherwise would not have been seen during our stay.

There was a certain amount of formality about the proceedings [KS: public meeting]. Although informal announcements of them spread by word of mouth a day or two before, the formal call was issued (for two of the three we saw) by the lowest-ranking chief, Toromann. He took a conch-shell trumpet, went out on one of the stone piers [143] projecting into the lagoon from Katēlū, and blew repeated long blasts. The meetings were held at the highest-ranking site on the atoll, Katēlū. The people assembled in and about the men's house or big house (Fan Nap), highest ranking building on the site. When they were gathered, the chiefs took their seats beside the highest-ranking part of the building, the ÒngarIk or front ridge-post, decorated with symbols of rank. After a dignified silence, the chiefs spoke. First to speak was always Toromann, the lowest in rank, as if 'introducing the main speaker'. In part the contents of his speech were the same as those of the others, but always he enjoined the people to heed well the words of their chiefs. The second speaker, at least in the first and last of the three meetings (this point not noted for the second one), was Wolpetau, paramount chief. Other chiefs spoke, as the spirit moved them, in no fixed order. This was partly a matter of individual gifts

and inclinations. Old Paliuilimar, who had a reputation as an orator, always spoke, and was the most vehement and dramatic; indeed, at the close of some of his speeches he looked alarmingly exhausted. Wolpetau always spoke, ex officio; but seemed not to revel in it as Toromann and Paliuilimar did. Ordinarily he was a man of rather few words. Maroligar spoke only once, and then briefly, in a low voice. WolpaitIk never spoke at all. Not only was he the youngest in years and length of service, but he was fat, had a very high voice, and was a bit of a clown and butt of ridicule, though the jokes were always good-natured. Commoners never spoke, except for brief interjections of assent and applause, like 'amen-shouting'. In this the most frequent expression was Rongrongo! (Hear, hear!)"

"At the end, the chiefs distributed tobacco among the people. Jokes, which might come at any moment in their speeches, were frequent in their last words; as if to heal any wounds inflicted by what scolding was involved in the earlier ones. This interpretation accords with repeated statements, some of them in song texts, that an extremely high value is set on kindly words from the chiefs. With 'good talk' from their chiefs, the people will thrive and live to a ripe old age; with 'bad talk', they will die.

I managed to get a translation of only one of these jokes, made by Wolpetau as he walked among the women, passing out tobacco with a bit of jolly swagger, which, I judge, may have come hard to this quiet, dignified man. He and the others had been preaching about hygiene, especially about using the lagoon or the American-plan 'over-water heads' for defecation. Wolpetau said: 'If any woman wants to defecate on shore, let her make a basket, and defecate in that, and then carry it into the sea.' This was greeted with uproarious laughter."

"For a more specific picture of one of these meetings, here is the account of the last one, from my field journal:

Oct. 23.-Third public meeting today. The people had notice of it yesterday. In the morning Toromann blew the conch from the stone pier. He made two trips, seemed like an hour apart. The people were slow to come.

Toromann began with what sounded, in Tom's translation, like the usual formal beginning. Come all ye. Listen to what the chiefs have to say. 'Work good, no work bad. No steal something from 'nother man.' He spoke in five bursts, with meditative pauses between. Burst 3 was apparently a joke, but I didn't get it translated in time.

As usual, WolpaitIk didn't talk. Maroligar, toward the end, did, but in a low conversational tone and at no considerable length. In a pause between Toromann's early efforts, Maroligar suggested something to Paliuilimar, seemed like [144] urging him to speak; but P. said nothing at that time. Toromann's last burst was to the effect that when women were working in the taro swamp, they should not take taro that did not belong to them.

Wolpetau was the second speaker. He talked about menstruating women. Said when the blood first appeared, they should go into their seclusion house and stay there, not go to the taro swamp. When the flow was finished, and not before then, was the time to go back to work.

Between bursts, he worked industriously at rope-making.

Wolpetau's second burst was to the effect that when the chiefs tell men to go out fishing, they are to go. Then, if there is a good catch, the chiefs will see to it that fish are distributed to all the people.

Third burst: if any man doesn't want to go out with the others when the chiefs order a fishing expedition, let him speak up now.*

Then Toromann filled in, beginning with a hear, hear the words of the chief. He pointed out that if men didn't go fishing, and women didn't work in the taro swamp, there would be nothing to eat. Ifalik is too small. (Meaning, apparently, too small to support loafers.) He called on Paliuilimar to speak, but the old man did not respond until the second urging. Then he finally got going, in a low voice at first, but warming up. He told the people to heed what their chiefs said--the regular formula. Said some men didn't seem to like to work when the chiefs told them to. Very bad business that. He also told them to do whatever Mel Spiro and I told them to (but of course we're not giving orders, except to Talimeira and Uveli**of a morning.) He told them to clean up,

---

"* Apparently a challenge to some malingerer. Mainly rhetorical; as might be expected, nobody spoke up.

** Talimeira was assigned by the chiefs to work for us; Uveli volunteered for the same service.

against the coming of the ship.

Finally, when everything seemed about over, Wolpetau said that by and by there would be dancing. This was the promised response to my suggestion that I'd like to see some of the ur I have been getting the words to. I could not make out whether he set a definite time, but they'll come through.

Paliuilimar and Toromann wound up with short speeches. I had asked Tom to tell the chiefs that the important place to clean was around the houses, and to avoid stagnant water because of mosquitoes, rather than to do a wholesale weeding job in the interior, as they did after the last call of the ship. Pointed out that the doctor was the man interested in how clean they were. Paliuilimar said something to that effect in his final speech, but by the time it got back to me in Tom's translation it was somewhat diluted.

The element of formality makes of these meetings a ritual, not unlike the type of church service in our culture that emphasizes the sermon. In this case the meaning is not religious. Like the kava ceremonies of western Polynesia, parts of Fiji, and some eastern Micronesian islands, these meetings serve to manifest and emphasize the sentiments of rank and law and order, as exemplified by obedience to the chiefs."

1: Burrows--144-146 (1947-48) Woleaians
116, 626, 646 Ifalik 1-3

"To show which rules of conduct are particularly emphasized, recurrent [145] commandments in the speeches at the three meetings are listed below, beginning with those that seemed most frequent. The list is minimal, because Tom was not so well trained for running translations as the interpreters who perform the same service at meetings of the United Nations; so his accounts were sketchy. It was only at the last meeting that I could understand any considerable part of what was going on; and even that was only midway in our stay on the island, so the language was still only dawning on me. The commandments recorded were these:

Heed the words of the chiefs
Clean away rubbish
Work hard, so that there will be plenty of food
Do not steal (with emphasis on food)
Share with the poor and sick (emphasis on food)
Build 'overwater heads' or latrines

Another commandment, not recorded at these meetings, but heard several times--one of them, in a hypothetical chief's address to the people dictated by Tom as a text--was 'Do not speak evil of people of another clan.' During one of the meetings, Paliuilimar spoke especially to people of his clan, Mangaulevār, and Maroligar followed with a brief talk which contained repeated mention of his clan, SauvelārIk. I did not manage to get a translation of this passage.

The repeated insistence on respect and obedience to the chiefs illustrates one of the main purposes of these meetings. The repeated emphasis on food suggests that one of the main sentiments clusters about food; at least, that abundance of food is a master value. The repeated strictures against idling and stealing suggest that these may be particularly common forms of misbehavior, though the only specific instance noted was the tongue-lashing about shirking communal fishing, which seemed to be directed at one or more specific malingerers.

Conspicuous by their absence from these harangues are rules about sexual relations and violence. To be sure, the one mention of the traditional behavior required of menstruating women is in the general area of sexuality. But nothing was said about clan exogamy or adultery. Clan exogamy is certainly taken seriously. We have seen that there were no violations of it in 1947-8. Perhaps it is so generally observed there is no need to talk about it.

Adultery is quite another matter. According to common report it was, at least, not uncommon. The fact that the chiefs did not condemn it in their speeches may indicate that this is a rule which the government does not try to enforce.

As to violence, that seems to be, like violation of clan exogamy, so rare that it does not have to be condemned verbally. Certainly the courteous, peaceable behavior of these people is one of their most striking characteristics.

The frequent exhortations against theft in the chiefs speeches at public meetings

suggest that this crime may not be uncommon. There is no question that public opinion strongly condemns it. Tom repeatedly expressed abhorrence of a thief (melmorók). But he as often assured us that the people of Ifalik would not steal anything of ours; that we need have no hesitation about leaving our property unguarded. Judging by the chiefs' exhortations, the kind of property most often stolen is food. At least once, taro was specifically mentioned. In the taro patches the vegetation is so dense, and the place so little frequented, that a worker could often take taro from someone else's patch without being seen. All we can say, in the absence of specific cases, is that theft, whether rare or not, is at least rarely detected."

"On the evidence at hand, the government seems to confine itself to a rather narrow jurisdiction in enforcing rules of conduct. Malicious talk, idling or malingering, theft, and failure to observe the restrictions imposed on menstruating women were the kinds of misconduct rebuked by the chiefs at the public meetings. From other sources, to be discussed shortly, violence and some kinds of sexual misconduct can be added to the list. Other rules--and in some instances, even those just mentioned--seem to be enforced only by public opinion, as expressed particularly in gossip; or by concerted action within a small group of relatives--a household or two or three closely related households; or by fear of supernatural punishment.

Positive sanctions for observance of these rules consist mainly of continued trust, friendliness, and co-operation. Promotion to higher status, another way to reward approved conduct, has little scope in Ifalik, where status is so largely a matter of descent and primogeniture. Yet informal promotion to higher standing in general esteem is constantly operative; and, though the absence of any marked tendency to compete with others or excel them in good works makes the operation of public approval inconspicuous, the general smoothness of human relationships suggests that the desire for approval may be a powerful motive.

Negative sanctions to punish breach of the rules follow a general pattern of retribution in kind, with increasing severity for repeated offences. Sarfert obtained a list of punishments for specific offenses, like a criminal code. Being based only on verbal testimony

--and presumably on only one questioning--it is probably over-simplified. Yet it accords with the general pattern that emerges from my longer, more passive observation. First offenses of a minor kind, such as 'bad talk' or malingering, are punished by reprimand and warning from the chiefs (the paramount chief, Sarfert says; probably so in most cases). Repeated offenses of these kinds will be punished by confiscation of property (Sarfert specifies a canoe)."

1: Burrows--146 (1947-48) Woleaians
116, 685 Ifalik

"Theft calls for restitution to the aggrieved party of goods approximately equivalent to those stolen, --rather like damages for a tort in our law. The thief is also publicly reprimanded; and repeated thefts will bring down heavier confiscation, more like what we call a fine. (Ifalik, however, makes no such distinction as we do between civil and criminal law)."

1: Burrows--146-147 (1947-48) Woleaians
116. 682 Ifalik

"Assault may be punished by anything from a reprimand, in the case of a first and mild offense, to confiscation of all property (Sarfert specifies plots of land, canoes, and clothes) in the case of murder. According to Sarfert's list, a murderer is also bound, brought to the men's house, and severely reprimanded in the presence of the whole populace, but then released. Sarfert also specifies payment for lesser injuries:

For loss of an eye, arm, or leg--a canoe and two cloths.
For loss of both eyes, arms, or legs--two canoes, and all of the cloths owned by the culprit.
For loss of a finger--one cloth.
For loss of two or three fingers--two cloths.
For loss of four fingers--two or three cloths.
For loss of a hand--three or four cloths. [147]

Not having a copy of Damm's monograph on Ifalik, I did not check this list with native informants. I see no reason to question its authenticity. But the people, as we saw them, are so mild and civil in their dealings with each other that all talk of severe deliberate injuries seemed remote and hypothetical. Not only did I hear no accounts of murder or grievous assault, but find no mention of anything more severe than a few blows with a stick in more than 230 song texts that seem to cover the whole range of experience that moves them enough to be commemorated in song."

"Destruction of property is mentioned in one song as a penalty for adultery. The poetess--who was the 'other woman'--sang:

If his wife finds out,
Her people will attack us.
If I steal her husband,
They will wreck our house.

Tom--with confirmation from the chiefs, who were all present when the song was dictated by one of them--said that this is a traditional penalty for adultery. Relatives of the aggrieved spouse destroy crops on the land of the homebreaker, cutting down banana trees and coconuts. (I did not make sure whether this referred only to bunches of nuts, or to the coconut trees.) They also destroy any portable property and objects in the house, but not the house itself. This procedure is said to have the approval of the chiefs. But there had been no actual instance of it for a long time.

The penalty for incest--defined as sexual relations with fellow-clansmen or parent--is death or banishment. This was Tom's reply to a question from Spiro. The fact that the penalty is by far the severest we heard of, shows how seriously clan exogamy is regarded. But I never heard of an actual case of incest, and no couples were 'living in sin' in this sense while we were on Ifalik. So as far as we know this rule is only a threat, though perhaps an effective one.

One other hint of law enforcement in sexual relations occurs in a mother's lament for

a daughter who died young. The burden of the whole song is 'Don't gossip about her now.' There is mention of 'a man from the district' coming to spy upon the girl and her lover, because she was considered too young for love. Asked whether this was customary, Tom said it was. But no such patrolmen were on duty during our stay. Presumably one would be assigned by the chiefs in case of complaint or scandal."

"Specific observations on misconduct and its punishment are almost entiely lacking. The only misdemeanors that became public knowledge during our stay on the atoll were committed by four dogs and one madman. None of these cases represents normal relationships among human beings. Such as it is, though, this evidence is of such a valuable kind that it seems advisable to examine it in detail.

The four dogs bit human beings. The penalty for that is death. In three of the cases it was promptly imposed.

Treatment of dogs in general is capricious. They are sometimes fondled, sometimes ignored, sometimes teased in ways that seemed to us cruel. This teasing may furnish one outlet for the aggression which, under the general rule of courtesy, can hardly be discharged overtly against human beings.

In the first case it seemed to us that the dog had ample provocation to [148] bite. Tom, too--whose views may have been affected by exposure to other customs in his travels--grumbled when dog-bites began to assume the proportions of a crime wave. He held that people (boys, I think he said) ought to be made to leave the dogs alone. Otherwise there would soon be no dogs left. A dog is like a man, Tom went on. If it is mistreated, it wants to fight.

The first instance can perhaps be best described by another quotation from the journal:

August 30. The small boys of this neighborhood killed a dog this morning. He was the biggest dog on the island. . .He used to chase all other male dogs away. The last

few days there had been much copulation between him and a bitch. A very noisy business, with yelping and a kind of bawling that he also uses when attacking another male. The yelping comes from the bitch, perhaps only in the painful process of disengaging. With the cruelty toward dogs which we have noticed among the boys, there had been some stone throwing and other teasing along with all this.

This morning our boys told us this dog had bitten a man, so that it drew blood. (Probably the man had asked for it.) The dog came around and hung about us all through breakfast, in hopes; as he often does at mealtime. He was gentle and friendly, as always with us; unlike his mate of the last few days, who is apt to bark at us whenever we go far from our tent.

The boys seem to have passed a death sentence on the dog. Talimeira said to it, in some of his newly acquired English, 'Bimeby you die.' Mel told the dog to stick around with us, and he seemed to get the idea; he did it for a while. He knew the boys were after him. They all had sticks and stones. He took refuge between two canoes in the canoe-house, but there they could hit him with sticks. He ran away, with them in noisy pursuit, and we heard howls and yelps.

Nest thing we saw was the dog swimming out in the lagoon. Uveli went out in a canoe and herded the dog away from shore. I could see his head, far out. . . . More canoes went out later, and apparently kept him from coming ashore.

Toward noon the boys came by. When we asked what had happened to the dog, they

said he drowned in the lagoon.

The nominal owner of this dog had gone to Faraulep. Perhaps that was why the boys took the law in their own hands. They seemed to have a lot of fun. Nobody objected, except ourselves; and we did not try to insist, because our business there was to observe custom, not reform it.

The next time, a dog bit a small boy, I do not know on what provocation. Its owner and other men of the household took it into the woods, killed it, and, we were told, ate it.

The third time, a bitch with pups, that I had previously noticed as extremely irritable, attacked and bit Spiro. This time there was no more provocation than his unusual appearance, as compared with the natives, when he passed near where the animal lived.

Mayhem committed against the foreigner who was the guest of the [149] chiefs, and in some sense a representative of the high authority of the United States, made this nothing less than an international incident. So this time the chiefs took a hand. Wolpetau and WolpaitIk, the chiefs in charge of Falālap, where the offense was committed, went in person and saw to it that the dog was put to death. Everybody, particularly the chiefs, the people of Falālap, and the Americans, were agitated about this for some time; the chiefs and people of Falālap because it seemed to threaten the good feeling that prevailed between them and the Americans; the Americans because, if the wound had become

infected, with no medical aid available and no way to summon it, the danger would have been serious. (Luckily, the wound healed cleanly.) Some time later, when I passed a house platform on Falālap, a woman called to me reassuringly 'No dogs!' Again, when a dog barked at me there, a man in the canoe-house nearby roused from his revery to call it off.

The fourth offense was committed against Maroligar by the dog of his colleague Toromann. He was playing with it and fondling it when it bit his hand. They were in sight of me, and this time I saw no teasing or cruelty. Maroligar, one of the gentlest and most courteous of this courteous people, insisted that the matter be overlooked."

116, 683, 158 Ifalik 1-3

"The lone human culprit was 'Tarof', the only troublesome one of several psychopaths on the island. As already shown in the account of his violation of the tabu site on Katēlū, he could not stand authority. Most of the time he seemed more dangerous to himself than to anybody else, as he made several ineffectual attempts to commit suicide. Once he struck a young man, who was himself something of a 'mental case' and who, Spiro thought, had probably provoked the attack by teasing. Again, he was reported to have thrown a stone at his mother-in-law. He was moved from Falālap to Rauau at the request of his wife, who had been living in terror of him. In Rauau, too, he frightened the women of the household and neighborhood. At last he was moved into a house that stood off by itself.

Twice, after his escapades, he was tied hand and foot. The decision to do this was reached, so far as I could make out, by his male relatives. One of these was Maroligar, senior chief of Rauau district, where all this went on. Tarof, the patient, particularly resented Maroligar's chiefly estate. The one time that I saw him tied up, it was Maroligar who first took hold of him and laid him on the ground for tying. But this was the only evidence I saw of Maroligar assuming more responsibility than anybody else. He did not take charge and give orders, as he did in the bonito fishing or (less conspicuously) in such Rauau public works as the repair of a canoe-house. He seemed to be acting, not in his capacity as a chief, but simply as one of the relatives. The whole affair was handled as a family matter, rather than a governmental one.

Two or three times, much to the shame of his relatives and the chiefs, Tarof took little articles from our tent: once a calendar hung from a post, once a bush-knife, once an intrenching tool; never food. The calendar was brought back from the house where Tarof by that time was living alone. The knife he brought back himself. He had used it only to cut a piece of wood for some harmless purpose. The intrenching tool he returned, with a lavish gift of angorIk (turmeric). He had used it only to dig this offering for us.

That is the sum of the overt misconduct we observed on Ifalik, except for a few accidental glimpses of furtive love-making. On the whole our observations leave the impression that the people of Ifalik are so law-abiding as to leave the chiefs very little to do in the way of law enforcement. The chiefs occupy themselves more with prevention--in haranguing the people about how they ought to behave--than with punishment. Most of their decisions and orders are concerned with public [150] works: communal fishing expeditions, repair of canoe-houses, making of seines, and so on. The shortage of evidence as to misconduct and punishment, however disappointing to ethnographers in search of specific data, is a striking tribute to the success of the native government in maintaining law and order. For the most part, public opinion seems to keep behavior within the approved channels so well that negative sanctions do not have to be invoked. An apparent exception is adultery. In that respect, the government of Ifalik seems to be in the same position as our own local governments, which do not attempt

to supervise the sexual behavior of the citizens except in the comparatively rare cases when formal complaints are brought in, or scandal becomes so flagrant that it can not be overlooked."

1: Burrows--150 (1947-48) Woleaians
116, 642 Ifalik

"An attempt to compare the government of Ifalik and that of the United States is interesting, though the data do not permit doing it with scientific rigor. In form the government of Ifalik is strictly aristocratic. In practise it is quite democratic, in the sense that every individual gets a chance to express his opinion and can make sure that it will be heard and considered by those in power. Perhaps any form of government would be democratic, in practise, with so small a population, unless there were rigid class distinctions.

The government of the United States, in form, is strictly democratic. In practise, as all citizens seem to agree, it falls far short of that ideal. Again, size and complexity are obviously a main factor.

If democracy in practise is the goal to aim at, there seems to be no reason to change the traditional form of local government. All the more, in view of the remarkable degree to which the people observe their laws. There is, on the other hand, a strong reason against attempting such a change. Any form of government foreign to their traditions would be confusing and disturbing. It would lead to difficulties that would probably extend into matters remote from government, so that some of them could hardly be foreseen. Pretty surely, for a long time at least, it would not work as well as the established system."

1: Burrows--151 (1947-48) Woleaians
116, 173, 609 Ifalik 1-2

"It is already plain that government in Ifalik, during our stay there, was dominated by two factors: one, their own tradition; the other, the new influence of the United States. The latter was exercised through occasional visits of the Naval Government ship, and--mildly, involuntarily, yet steadily--by the two American anthropologists.

The previous chapter has given what was observed in the way of official action in foreign relations. An attempt to understand underlying attitudes, however, calls for examination of whatever other evidence can be found. One source of evidence is the legends collected on Ifalik, --to use 'legend' for the traditions that most resemble history, as distinguished from myths, with their supernatural setting, and tales told for entertainment. It happens that all the legends collected deal with relationships between the people of Ifalik and those of other islands.

This chapter will present these legends and attempt to interpret them. Each will be followed by some discussion of details, based mainly on comparison with versions recorded on Ifalik and neighboring islands by the German expedition. Some of this has little direct bearing on foreign relations, but at least it shows what parts of the legends are relatively constant in different versions: and how far the stories told in Ifalik during our stay agree with those from the other islands concerned. The whole series of legends will be followed by a more general interpretation, intended to bring out what they show about the attitudes of the people of Ifalik toward foreign countries. Finally, this will be supplemented by what can be learned from books and from informants

about recent contact with foreigners."

1: Burrows--151-153 (1947-48) Woleaians
116, 173 Ifalik 1-4

"From time immemorial the people of Ifalik have acknowledged the rule of some outside power. Their traditions name as the earliest of these foreign overlords two lines of chiefs in Gagil district on Yap. One of their legends traces this relationship back to the first settlement of the island. What little ethnological comparison can be made here suggests other possibilities; but no such doubt seems to exist in native minds. The legend follows, as dictated to me by one of the five chiefs, in conference with the others. Tom acted as interpreter. In rewording his account, I have tried to keep as close to it as possible without too much violence to English idiom.

First Settlement of Ifalik

Long, long ago, a chief of Garpar (Gatschapar) village, in Gagil district, Yap, ordered some of his people to go out and colonize the outer islands to the east. He himself remained in Yap.

In charge of the expedition was a man named Tatar, who was accompanied by his sister, Iau. They went first to Mogmog on Ulithi; then to Wetegau (Utagal?) in Woleai, then to Ifalik and the other islands--Faraulep, Elato, Lamotrek, Satawal, and so on to Puluwat and Truk and 'all Caroline place.' The chain of command, ever since, is from Yap to Mogmog, from Mogmog to Wetegau, Wetegau to Ifalik, from Ifalik to the other islands. [152]

On Ifalik Tatar left one man and one woman from each of the eight clans. The two

from each clan were brother and sister. Their names were:

From Kovalū clan: Maraige and his sister Lemaregara.

From SauvelārIk clan: Alovar and his sister Eilapikel.

From Mangaulevār clan: Trigabwa and his sister Ungusaren, sometimes known as Litamata.

From Rapevelū clan: Uelisogo and his sister Iau.

From Sauwēl clan: Temou and his sister Narom.

From Bwēl clan: Miatomwar and his sister Ilametoi.

From Kailangailuk clan: Uetiu and his sister Lemangeverau.

From Kailangaluelea clan: Marogerag and his sister Ilimēng.

The descendants of these women, who married the men from other clans, make up the membership of the clans today.

The first men's house was built at Iramai, in the Ievang district of Falālap. No building stands there now, but the site is still remembered. It was used by Tatar, Alovar, and the other early settlers. Another early chief of Kovalū clan was Filitamol. Another early chief of SauvelārIk clan was Maur. In dictating this story, it was said that Maur used the men's house at Iramai. But in the story of the war with Woleai, Maur is associated with the men's house Katēlū on FalārIk.

This was the story of first settlement as dictated by the chiefs. Bits of information from various other sources support it in some details, differ in others. Tom himself

made one change in the course of passing the story on to me; a very slight one, yet not insignificant. In his first version he named Ifalik before Woleai. This was later changed to conform to the order given as the chain of command. This seems to reflect an unresolved inconsistency about the relative rank of the two atolls. In the foregoing story, Woleai outranks Ifalik. In the account of the war with Woleai, to be given shortly, Ifalik outranks Woleai. Questioned about this, Tom said that the account of the war, giving Ifalik precedence over Woleai, is true; but that Wetegau in Woleai precedes Ifalik in the matter of relaying messages from the high chiefs in Yap. This could reconcile the two stories; yet it was my impression that in Tom's mind they remained unreconciled.

In one detail the story may seem self-contradictory. Iau is named both as sister of Tatar and as sister of Uelisogo. Asked about this, Tom said there were two women named Iau. Another possibility is that Tatar and Uelisogo were brothers. The name Ilimang or Ilimëng also occurs twice; once as the founder of the clan Kailangaluelea, once as the wife Maur took on Woleai.

Among the details in which other accounts vary are the names of the first settlers. In a brief account received from Fonachar in Yap, before we went to Ifalik, the name of the leader of the colonizing party was [153] recorded as Liomerer. The only name at all like this in the story collected on Ifalik is Lemaregara (final 'a' silent), the woman of Kovalū clan. Sarfert names as the first settler Modj (recorded by me as Maur) said

to have come on a raft with his wife Filitamol. My informants insisted that Maur was a later chief of SauvelărIk clan, and Filitamol a later chief of Kovalū clan. Sarfert has llamai as the name of the house where Modj and Filitamol first lived, while my informants used it as the name of the site of the first men's house."

1: Burrows--153 (1947-48) Woleaians
116, 173, 618 Ifalik

"The clans represented by the colonizers, as told to me, are the same as those found on Ifalik during our stay. They differ widely from Sarfert's list of clans. I would be inclined to reject Sarfert's list, whereever it differs from mine, except for one thing; that my informants admitted the former existence on Ifalik of one of the clans he named--Saupuluwat. The name suggests that this clan came from Puluwat rather than Yap. Sarfert also mentions later arrivals from Woleai and Faraulep; such a voyage from Puluwat might account for the presence of this clan. However, as already said in the discussion of social structure, several other clan names listed by Sarfert were, according to my informants, never represented on Ifalik.

Another kind of early arrival mentioned by Sarfert was 'very large devils in human form, so thorny that big fish were speared on their bodies. They swam to the island, but when they did not find any food, they went peacefully away again.' Though no such episode was told to me, I see no reason to question the existence of such a tradition, at least at the time of Sarfert's visit."

"Lieut. Carrol identified the Kovalũ clan of Ifalik with one of two branches of the Yap clan called Fanif. According to a legend he collected on Yap, the two branches of this clan are descended from two sisters. One of them went overland from some unnamed starting point to Tomil district. The other was blown out to sea in a canoe. She came ashore at Onean in Gagil district, where her descendants constitute the Niarou branch of the clan, the one that is related to Ifalik's Kovalũ. Similarly, Lieut. Carrol equated the SauvelărIk clan of Ifalik with the Ueloy clan of Yap. As for the six lower ranking clans of Ifalik, he had heard nothing about them on Yap, and inferred that, even if they originated on Yap, they must have reached Ifalik indirectly, after a sojourn somewhere else.

The traditional subordination to this line of chiefs in Yap has been maintained by fairly regular voyages both ways. Whether such voyages were made every year I could not make sure. Fonachar of Yap said that when the people of Ifalik came to Gatschapar, they would bring as tribute cloths, mat sails, mats, sennit rope, and coconut 'candy'. I could not make out what was meant by coconut candy. Hearing the story before we went to Ifalik, I supposed I would find out there. But nothing on Ifalik nowadays could very well be called coconut candy.

Fonachar said that the people of Yap would contribute to their visitors from the atolls turmeric, canoes made of the better wood available on high islands, mats, betel nuts, and food. Though thought of as a matter of tribute one way and largesse the other, these

mutual gifts amounted to an economic exchange. The atoll men would sometimes remain on Yap for considerable periods, and work for their overlord. One indication that the people of Ifalik did not always rejoice in this subordination is a bit of [154] sarcasm in an Ifalik song about a typhoon:

> The people of Yap will be sorry to hear of this;
> There will be nothing left for them to take."

1: Burrows--154
116, 648, 175

(1947-48)

Woleaians 1-8
Ifalik

"Foreign vessels, as they came to replace native canoes for such long voyages as that between Ifalik and Yap, continued to foster the old relationship by carrying passengers both ways. Maintenance of the traditional chain of command has been a policy of the U.S. Naval government, though some officers disapprove of it. In 1947-48 the American ships, on their tours of these 'outer islands', took along the Yap chiefs who were regarded as overlords of the atolls. The highest-ranking of them, Fithingmau, who was old and partly paralyzed, was represented by his heir-apparent. He claims no special jurisdiction over Ifalik. Foneg of Gatschapar village (Gagil district, Yap) was considered the overlord of Ifalik. On these trips he would always meet with the chiefs, receive gifts, particularly of cloths, and pray. Lieut. Carroll said that the prayers were for good crops, an abundance of fish, and fair weather. Lieut. Carroll considered the ascendancy of the Yap chiefs mainly a religious matter. Some other Naval government officials, who disapproved of encouraging this old relationship, said that the Yap chiefs maintained their ascendancy mainly by threats of inflicting disaster through their supernatural power. During our stay, the Yap people brought to those of the atolls many baskets of food, particularly boi nuts (Tahitian chestnut), bananas, watermelons and pineapples.

Return gifts were meager: hospitality-but nothing lavish-while the visiting chiefs were ashore; a cloth or two on each trip; perhaps other bits of handicraft; young coconuts to drink. Some other atolls contributed a canoe or two. The people of Ifalik seemed to

accept their subordination. I heard no grumbling about it. No more did I see any signs of enthusiasm."

"Conquest of Nearby Islands

In contrast to the acknowledged subordination to Yap is a series of legends that tell of conquest of the atolls nearest to Ifalik, extermination of the early inhabitants, and repopulation by colonists from Ifalik. These make Ifalik the mother country of all these atolls, as far as their present population is concerned. These legends follow, as told by the five chiefs, with Tom for interpreter.

Woleai

Maur, an ancient chief of SauvelārIk clan on Ifalik, went to Woleai, took there a wife named Ilimëng, and had by her a son, Legagilewau'. Some of the men of Woleai, jealous because of his winning the woman, attacked him, beat him about the head and body, and left him for dead.

In the night the woman Ilimëng went out of the house to urinate. She did not see the fallen body of Maur, and urinated on him. The urine so stung his wounds that he returned to consciousness.

Maur tied up his wounded head with a bit of rope. At daybreak he swam out on a piece of driftwood, spent the day at sea, and came in again at night. He slept in his house, and left again early in the morning. [155] He took a piece of coconut leaf and tied it about the wrist of his son, Legagilewau'.

Finally Maur went out through the pass on his bit of driftwood. One man saw him and

cried out 'Maur is still alive!' But the Woleai people laughed. 'No, Maur is dead!' There was much talk about sending a canoe out to see, but they did not find him.

Maur swam on his driftwood all the way to Ifalik, and landed on the little uninhabited island of Ellā. A canoe went by and he hailed it. He told the boatman that he was Maur, and that the people of Woleai had tried to kill him.

The man went to the men's house, Katēlū, and spread the news. Another canoe was sent to Ellā to bring Maur to Katēlū. He summoned all the people.

When all the men of Ifalik were gathered together before him, he told them how the Woleai people had fallen upon him and left him for dead. 'I will not waste words', he said. 'I will take off my loin cloth, and if my penis points to Woleai, that will be a sign to you to go there and kill all the people.'

He took off his loin cloth, and his penis pointed to Woleai. 'Go kill all the people', he shouted, 'men, women, and children. Only spare the woman Ilimëng, and the boy who has a strip of coconut leaf tied around his wrist.'

The men of Ifalik went to work and made spears (kowai), many spears for each man. They went to Woleai in many canoes--two hundred, three hundred. In Woleai they went first to Falālap, then to Mariong, then to Traulap, then to Paleau, then to Raur. Everywhere they attacked the Woleai people and speared them--women, children, and all. But they spared the woman Ilimëng and the boy Legagilewau, who had the strip of coconut leaf tied about his wrist.

Next the Ifalik warriors went to Wetegau. All the people fled and swam over to Falālus. Twice the Ifalik men tried to make a landing there, but twice they were turned back by the defenders.

Then the Ifalik people took a log, set up a coconut leaf on it like a sail, and shoved it out to sea from Wetegau. The Woleai people thought it was an Ifalik canoe setting out for home, and decided that all the Ifalik people had gone back.

Two Woleai canoes came back to Wetegau. The Ifalik men had hidden their canoes in the bush and covered them with leaves.

A Woleai man climbed a breadfruit tree, plucked a fruit, and said, 'The Ifalik men are very strong, but now they are gone. We won't be bothered with them any more.'

At this the Ifalik men came out of hiding, with a 'What's that you say? We'll see about that!' The Woleai men fled into the water, but were speared there. [156]

The Ifalik men caught the Woleai men during a bonito drive, attacked and killed them. Then they went on to Falālus and killed the women and children, too.

The canoes returned to Ifalik, leaving only Ilimëng and her boy alive on Woleai. They had a great feast at home, and then assembled again at Katēlū.

Maur told them it would be too bad to have no people on Woleai. Then he sent people from Ifalik to settle in Woleai:

One man and his sister from the clan Kovalū
One man and his sister from the clan SauvelārIk

One man and his sister from the clan Mangaulevār
One man and his sister from the clan Rapevelū
One man and his sister from the clan Sauwēl
One man and his sister from the clan Bwēl
One man and his sister from the clan Kailangailuk
One man and his sister from the clan Kailangaluelea

Each of the men became a chief in Woleai. Little boys went too, with the women, their mothers. These people, with Maur's wife and son, repopulated Woleai.

So now when Ifalik men go to Woleai, there is no more fighting. It is as if the two islands were all one place. People from either island visit the other, do not have to ask for food, but live as if they were at home.

This version itself includes two accounts of how the Woleai men were killed, told one after the other with no attempt to reconcile them; one about an ambush on land, the other about a surprise attack during a bonito drive. The two could be reconciled, of course, by attributing one of them to one islet on Woleai, the other to another. But the incident of a surprise attack while the men were fishing appears also in two versions of the legend about Faraulep. One of them, told to me on Ifalik, will be given shortly (p. 160-1). The other was told on Faraulep to Hambruch, during the German expedition. The suggestion is that this incident may have been transferred from the legend about

Faraulep to that about Woleai.

A version of this legend recorded by Sarfert differs in several details from the one just given. The beginning is similar, except that the incident of the woman urinating on his unconscious body is not included. Nor are the names of the woman and the son she bore to Maur, there written as 'Modj'.

After the attack on him, Maur is said to have returned to Ifalik in his canoe instead of by swimming with a piece of driftwood. But in another of Sarfert's stories, which attributes to 'Modj' the first settlement of Ifalik, he is said to have come there with his wife on a raft.

The incident of Maur's penis pointing toward Woleai does not occur in Sarfert's version.

The order of islets on Woleai visited by the Ifalik expedition is the same in Sarfert's version and in mine, except that his list omits [157] two of those mentioned in the one told to me:

German Version, 1909	CIMA Version, 1947	Name on H.O. Chart
'Hauptinsel'	Falalap	Woleai (?)
----------	Mariong	Mariaon
----------	Traulap	Tagaulap
Bäliau	Paleau	Paliau

German Version, 1909	CIMA Version, 1947	Name on H.O. Chart
Raur	Raūr	Raur

Sarfert's version adds one detail not told to me: that the people of Ifalik, in moving from islet to islet on Woleai, first ate their unwilling hosts out of house and home, and did not close in for the kill until they had them weakened by starvation.

A final detail omitted in Sarfert's version is the list of clans (all of those now on Ifalik) represented in the later expedition that repopulated Woleai.

A third version was collected by Hambruch on Faraulep. It differs particularly in the beginning. The king of Ifalik, Mois, visits Woleai and there repeatedly rapes a woman while her husband is out fishing. This makes him the first agressor, and justifies the attack on him. He is beaten and left for dead. Toward morning he is revived, by rain. He takes a piece of timber from the bush and with it swims to Ifalik. The summons to war, with the incident of the penis pointing toward Woleai, agree with the version told to me. The ending follows, in my translation:

'Then the people made many spears, sailed to Woleai in countless canoes, and slew everyone, even the young girls.'

No mention is made of a son born to the Woleai woman. The list of islands, that of clans, and various other details, are omitted."

"Lamotrek

A similar legend about Lamotrek was dictated by the chiefs and translated by Tom. Here I have retained a few bits of his peculiar English.

Long, long ago, the people of Lamotrek used to kill the Ifalik people whenever a canoe from Ifalik put in there. One Ifalik canoe that went there had aboard, besides the crew of Ifalik men, one Tungā, a being in the form of a man but not human. The Lamotrek people killed all the Ifalik men but did not fight with Tungā.

In Ifalik, when the canoe did not return from Lamotrek, the people wondered what had become of it. Maur, their chief, summoned all the people to the men's house, Katēlū. He ordered a canoe to be fitted out to go look for the lost vessel.

'Who among us shall go?' asked the Ifalik men. [158]

Maur said: 'Suppose one man 'e savvy captain, all right, go'.

So a man named Wĕtiei, a very savvy captain, built him a canoe, got together a crew, and sailed to Lamotrek.

'Where is that canoe from Ifalik that sailed here?'

The Lamotrek people said 'Canoe from Ifalik no stop here. He go to Truk.' That was a lie.

Wĕtiei went on to Truk to look for the Ifalik canoe. The Lamotrek people, in an attempt to cover up their lie, sent Tungā on to Truk in a Lamotrek canoe. When the Ifalik canoe got to Truk, the Lamotrek canoe was lying offshore but had left some of its

men on Truk.

The Ifalik canoe beached at Truk, and the men came ashore and asked 'What about that Ifalik canoe that came here?' The Lamotrek men said 'We don't know anything about it.' That was a lie.

One of the Ifalik men saw a Lamotrek man take some food and put out to sea with it. The Lamotrek men had left Tungā as a captive aboard their canoe. So the Ifalik man said he was going to bathe in the sea. Once in, he swam out to the Lamotrek canoe and called out 'Any Ifalik men aboard?'

Tungā called back 'Yes! Me!'

So the Ifalik man swam up close, and said 'Don't say anything to the others. Tomorrow night our Ifalik canoe will come over close to this one. You dive overboard and swim over to us.'

This was done next night as planned, so Tungā was once more aboard an Ifalik canoe.

They asked him what had become of the men from the canoe that took him from Ifalik to Lamotrek. He told them the truth, that the Lamotrek people had killed them all.

So Wëtiei's canoe went back to Ifalik. There Tungā told Maur his story. So Maur knew that the Lamotrek people had killed his men in the first canoe.

Maur called all the people together at the men's house, Katēlū. He told them to make ready, for they were going to make war on Lamotrek. So the Ifalik men went to work and fashioned spears--one man 20, another man 30, another man 40--and put them in

canoes. Then they set sail for Lamotrek.

They came first to Elato, but the Elato people, when they saw the Ifalik canoe coming, were afraid, got into their canoes, and fled to Lamotrek. So when the Ifalik canoe came ashore, there was nobody there. They stopped in Elato three days. ('Want to chow.') Then on to Lamotrek.

At Lamotrek one big island is inhabited, two small ones uninhabited. The Ifalik invaders landed on the two small islands. One day they attempted a landing on the main island, but were repulsed. Twice they tried, and twice they failed. The Lamotrek people were too strong.

A great warrior of Ifalik, named Mailias, had been visiting on Woleai at the time the Ifalik fleet set out for Lamotrek. He came back to find all the Ifalik canoes gone. [159]

'Where are all the men?' he asked.

He was told they had gone to avenge the death of the Ifalik canoemen at Lamotrek. So he got in his canoe and followed them. Arrived at Lamotrek, he asked for a report on the situation. He was told how things stood--that two landings had been attempted, but both had failed.

'Leave it to me', said Mailias. He told the men to gather bundles of dried banana leaf and put them in the canoes. They filled their canoes with leaves, then, in mid-afternoon, shoved off once more to assault the main island. It was mid-afternoon, and the wind was at their backs, from the west.

The Ifalik forces divided into two parties. One of them made the same kind of frontal attack as before. But when they came near shore, they set fire to their bundles of leaves. A great cloud of smoke arose. The wind carried it ashore, and blinded the Lamotrek warriors.

Under cover of this attack, the other party from Ifalik went around to the other side of the island, and landed there.

The Lamotrek men fought bravely against the party that had landed behind a smoke screen. But they were at such a disadvantage, with the smoke in their eyes, that they were driven back, and at last fled into the bush. Here the other Ifalik party was lying in wait. They fell upon the demoralized defenders and killed every last one of them; then went on into the houses, killing, killing, until not a man, woman or child was left alive in Lamotrek.

So the fleet returned to Ifalik, and repeated to Maur that Lamotrek had been depopulated, and the slaughter of the Ifalik canoemen avenged.

First the returning warriors were welcomed with a big feast. Then Maur assembled them at the men's house, Katēlū. He told them it would not be good for Lamotrek to remain without people. He ordered each clan to send one man and his sister. All these could take their families along if they cared to.

So Lamotrek was laid waste and then repopulated from Ifalik. Ever since, it has been as if Lamotrek and Ifalik were all one place. In Ifalik, Lamotrek people are just the

same as Ifalik people. In Lamotrek, Ifalik people are given food without having to ask for it. They all belong to the same clans.

So that is the story of how 'Ifalik man, he kill Lamotrek man. Ifalik more high.'

A short song or remnant of a song commemorates this battle. For all its brevity, it is noteworthy as the only one among the 228 song texts collected which deals with legendary (as distinguished from mythical) material; and the only one which deals with war. Although this may be accidental, it seems to suggest the importance of this particular legend. The chiefs dictated the text, and Tom translated it. This translation, edited into smoother English, follows: [160]

Coming up from behind on the fugitives
As they fled from the lagoon shore,
We will close in from both sides
At the Pu-el-Ifalū.

Pu-el-Ifalū is said to be the name of a place in the interior of Lamotrek, where the two parties of Ifalik men closed in on the defenders of Lamotrek and finished them off. (It did not occur to me at the time to ask whether Pu-el-Ifalū would be in ordinary language Bwèl Ifalòk, Ifalik taro swamp.)

The German monograph on Lamotrek contains no legend like this--indeed, no legends at all, though it has several myths.

During my few hours on shore at Lamotrek I asked about this story, expecting a

denial or variant version. But they confirmed it. Although, lacking an interpreter, I did not manage to check all details, they agreed that Mailias was leader of the invading party, and added that he was of Kovalū clan."

1: Burrows--160 (1947-48) Woleaians
116, 171 Ifalik

"Satawal

As a sequel to the Lamotrek legend, Tom said 'Satawal all same.' In those early days, he explained, that island was uninhabited. Some of the Ifalik people who had settled on Lamotrek went on to Satawal and began the population of that atoll.

As already noted in the discussion of clans, the virtual identity in culture among the other islands named in these legends begins to diminish at Satawal. This was perceptible even in my few hours ashore there. The sound pronounced on Ifalik as a lingual trill, sometimes attacked by way of a stop like our 't', is replaced on Satawal by a sound identical, or nearly so, with our 'ch'. Thus 'Lamotrek' becomes 'Lamochek'; SauvelārIk, 'SauvelāckIk. Moreover, some of the clan names did not resemble those of Ifalik clans. The notes I took there were lost in reboarding the Navy government ship, and I cannot recall whether I asked the Satawal people about this story of first settlement. Probably not, as the difference in dialect made it more difficult to talk with them."

"Faraulep

Faraulep, too, was repopulated from Ifalik. In this case, though, according to the Ifalik legend, it was not necessary for Ifalik warriors to invade the island and massacre the inhabitants. They had attended to that themselves, and Ifalik men had only to kill a lone survivor.

There are two inhabited islands at Faraulep, and one uninhabited. At one time, there were no people left on the whole atoll. If asked why that was, a Faraulep man will say that men from another island came fighting, and killed the Faraulep people. That is a lie.

What really happened is this. One night a party from one of the inhabited islands at Faraulep went out to fish with torches. The men from the other island made a surprise attack upon them and killed them. They went back home thinking they had killed all the people of the other [161] island.

But one man remained, a man named Nagelimwara. He had hidden himself under a fishing net, and so escaped. When the invaders had gone, he came out again. There were no more people. So he took a small canoe and went out fishing. He found plenty of fish on top of a coral head that extended up into shallow water.

Then he went back to the island still inhabited, and told the chief he had better send out men to catch the plentiful fish he had found. He would show them the place. So all the men went out with him.

When they got to the place where the coral head stuck up into shallow water, they saw that the fish were indeed plentiful. Nagelimwara told them all to jump overboard to catch them. So everybody went overboard except himself. He had a short stick with him. Every head that showed above the surface he would hit with his stick. Thus he killed all the men from that island, except the chief, who had remained behind.

Then Nagelimwara took some fish, and went ashore. He called to the chief to come get his share. The chief came, and when he had taken some fish, Nagelimwara hit him with his stick and killed him. Then he went on into the houses and killed the women and the boys and the girls.

So it was the Faraulep people themselves who put an end to the population on that island. 'All Faraulep men 'e fight.'

In the course of time a canoe from Ifalik visited the island, and found that there were no more people there except the one man. The Ifalik men killed him. Then they went back to Ifalik to get some Ifalik people and put them on Faraulep, and repopulate the island, as they had done with the others. So they sent women and men from every clan. And ever since then, a Faraulep man has been all the same as an Ifalik man.

After finishing this tale, Tom raised his face and eyes skyward, to indicate an immense lapse of time, and said

'Be - fore, be - fore. Not now.'

After a few minutes, he repeated this, adding 'Ifalik man not kill 'im that Faraulep

man.' There were two canoe-loads of men from Faraulep visiting on Ifalik at the time. Evidently Tom wanted to forestall any worry on my part about the Ifalik people killing them, by relegating all such unpleasantness to the remote past.

Warfare, indeed, seems to have gone out of mind to some extent since the German expedition of 1909. Sarfert collected barbed spears and clubs with points or little blades at both ends. We saw nothing of the kind.

Tom need not have troubled to deny in advance a supposed Faraulep version attributing the massacre of the earlier population there to invaders from afar (presumably from Ifalik). At least Hambruch collected on Faraulep in 1909 a story about depopulation by civil war and repopulation from Ifalik, in essentials like the one just given, but with a number of additional details. The man whose name I recorded as Nagelimwara (final 'a' silent) is there called Nargetumar. He lived on 'Pix', evidently the islet called 'Pigue' on our charts (apparently from a French version.) I heard it as 'Pik', and the Japanese call it 'Piiku'. [162]

Hambruch's version begins as follows: During a visit on the neighboring islet called (like the whole atoll) Faraulep, Nargetumar insulted the people, then on his return to 'Pix' warned the people there of an impending attack from Faraulep. The men of both islets made spears. Those of Pix were the first to attack, invading Faraulep while the men were out fishing; killing women and children first, then the men--except for a few as they came ashore from their fishing.

The next incident in Hambruch's Faraulep version is lacking from my Ifalik one. The survivors on Faraulep are said to have asked a visiting Yap man to help them against Pix. He agree, and by magic raised a typhoon, which indeed destroyed all but 20 people on Pix, but on Faraulep killed all but one. This one, named Uerlipar, killed the survivors on Faraulep by the ruse of offering them fish, as in the Ifalik version. Then he went to Woleai, married a woman there, and at last returned to Faraulep. By that time people from Ifalik had taken over Faraulep, so Uerlipar went back to Pix and stayed there."

(1947-48)

Woleaians
Ifalik

"Eaurupik

By these three legends, the people of Woleai, Lamotrek, and Faraulep were accounted for as descendents [sic] of colonizers from Ifalik. Of the islands nearest to Ifalik, there remained only Eaurupik. I asked Tom if there was a legend about that.

'Eaurupik too', he replied. 'All same size' (a favorite expression of his for 'just the same'.) Ifalik more high.' But no further details were forthcoming."

(1947-48)

"Interpretation

What these legends do, obviously, is to affirm and reinforce the sentiment of rank. The fact that the natives feel this to be the main point of the stories is plain in Tom's triumphant conclusion to the one about Lamotrek. He repeated this phrase in saying that the same was true of Eaurupik. 'Ifalik more high.' This significance is emphasized again by the penis of Maur, carved on the front post of the men's house and constituting a climax to the symbolism of rank that clusters about the site Katēlū. The same emphasis appears once more in the exultant little song about Lamotrek.

This general effect of the legends works out more specifically in two functions, one of them social, the other psychological. The social function is to strengthen the institution of government by validating the principle of rank on which the Ifalik system of government is based. The psychological function is to meet the human want of prestige by giving everyone in Ifalik the satisfaction of feeling himself superior to the people of surrounding atolls. This craving for prestige is sharpened among the people of Ifalik by their traditional subordination to the chiefs of Gatschapar in Yap. The legends help them to work off the sting of this by superordination over somebody else.

Within this general framework, still more specific use is made of two of the legends, those telling of the conquest of Woleai and Lamotrek. These supply an origin and validation for the high status of the two chiefs at the top of the local hierarchy of rank. Mailias, [163] it is said, was the first to receive the title of Kovalū, or paramount chief,

because of the military ability he showed in planning the attack on Lamotrek, with its smoke screen and ambush. Ever after, succession to the highest chieftainship has remained in his clan, which has taken its name, Kovalū, from his title. Similarly, Maur became second-ranking chief because he instigated the successful attack on Woleai.

In general, Maur is a more prominent traditional figure than Mailias. He is celebrated, not only in the Woleai legend, but in the carving on the front post of the men's house, and in another tale or myth which ascribes to him the invention of the torch and dip-net technique of catching flying-fish (p. 83J-K). In the stories collected by Sarfert, Maur was even named as the first settler of the island. In spite of Maur's prominence, the title descending from Mailias outranks that descending from Maur. Tom explained why. Mailias won glory as a warrior, Maur as an orator, and prowess in war is greater than prowess in talk."

"Eastern Influence

The only story attributing important influence on Ifalik to an island farther east is that about the lore of seamanship (p. 67). The point of origin named in this myth* is Bwennap, said to be in sight from Puluwat. A version of this story is given in the German monograph on Woleai (Kramer, p. 285). The locality there is Polap, evidently what our charts call Pulap, ehich, judging by the charts, would indeed be barely in sight from Puluwat. And a footnote adds that on Lamotrek, Polap is called Bon'nap. This seems to locate the traditional origin of the lore of seamanship. Locating a mythical island may not be worth all that troublt; but ascription of the lore of seamanship to an island farther east does seem significant.

Names of two varieties of bananas ascribe to them an eastern origin; wIrIs Truk, Truk banana, and wIrIs Valupē. Valupē is said to be Ponape. The prized red paint made from turmeric root is said to have reached Ifalik in the old days by trade with either Yap or Truk. Tom used to translate the native name for it, rang, either as 'Yap paint' or 'Truk paint'. Texts of several love songs specifically mention Truk as

---

"* The story about the lore of seamanship is called a myth rather than a legend because of its supernatural character and its function of explaining the origin of an institution.

the source of this paint or of other finery: a loin-cloth, a comb. Other islands to the east are also mentioned in songs; among them Namoin (Nomoi).

From all accounts, native and foreign, the language spoken on Ifalik and neighboring atolls resembles that of islands to the east, at least as far as Truk, more than it resembles the language of Yap. If this is substantiated by adequate linguistic comparison, it will indicate relationship between Ifalik and islands to the east much more fundamental than the bits of diffusion suggested by the details just given.

What this eastern influence amounts to--its relative strength and age as compared with influence from Yap--could only be determined by a thorough cultural comparison beyond the scope of this local monograph."

116, 177 Ifalik

"Spiro came upon one bit of Christian tradition when questioning Gargeligar, who might be called a native priest, about sickness and healing. Gargeligar said that at one time there was no sickness. When asked further, he gave a fairly full version of the story of Adam and Eve, applied to ancestors of the Ifalik people, --whether on Ifalik or not, he was not certain. The account of an original state of blissful ignorance, replaced by suffering as punishment for eating forbidden fruit, seemed little changed. Indeed, it fits readily into the native ideology, with its concept of punishment for violation of a taboo. The serpent was omitted from the first version, but remembered overnight. Gargeligar said he learned the story from his grandmother, which makes a Spanish source more likely than any other."

1: Burrows--164 (1947-48) Woleaians
116, 177, 212, 797 Ifalik

"The name 'Yfaluc' appears in a list of names of islands collected by the Spanish Jesuit priest Paul Clain from 1678 to 1696; but the Spanish, though they were settled on Guam in the 17th century, and had some claim to all this part of the Pacific, never visited Ifalik, so far as available evidence shows. During the 19th century they sent missionaries to most of the islands round about, but for some reason omitted this one. The people of Ifalik know about these batre (padre), and how they opposed the native religion. In 1947 some visitors from Woleai rather pointedly stayed away from a native religious ceremony held on Ifalik during their stay. This was understood as the effect of a missionary's work on Woleai long ago, and caused no comment.

Traces of Spanish or missionary influence on Ifalik are few. Perhaps the most important is the system of writing known to some of the natives. It came to Ifalik from Woleai, where it was taught by a missionary. Maroligar knew enough of it to keep a note-book in which he had written some song texts. The letters were obviously derived from our alphabet. I did not attempt to learn or analyze this writing. It seemed to be adequate for recording the text of a song, but was known only to a few, and very little used even by them."

1: Burrows--164-165 (1947-48) Woleaians
116, 177 Ifalik 1-1

"Islands more or less closely resembling Ifalik in name and position appear on several charts of the early 18th century. These charts were drawn partly on the basis of names and sailing directions obtained from native informants. The first European vessel to sight the island appears to have been the missionary ship 'Duff', Captain James Wilson, which reached there on the 27th of October, 1797. The 'Duff' did some trading with the natives, but Wilson's account of the voyage has nothing further to say about them.

Some whalers and perhaps other foreign ships called at Ifalik between the visit of Wilson and the next one on record, that of Captain Frederick Lutké. He called at the 'Wilson Islands' on April 3d, 1828, and noted the native name, 'Ifalouc'.

Lutké noted that the natives differed from all other Caroline Islanders he had seen in their 'boisterous spirit' (humeur criarde). Two of them went overboard with loose pieces of ironware. Others tried to detach pieces that were fastened. Lutké recovered the stolen pieces by notifying the chief, who was aboard, that he would not be allowed to leave the ship until the iron was returned. Von Kittlitz, who called about a generation later, was told by whalers that the natives of this island demanded exhorbitant prices for their wares. At least one other visit is recorded during the 19th century, that of the English trader [165] Cheyne, and presumably there were several that never got into print. My informants recalled that an American named Keefe used to put in at Ifalik before the German times. He was in partnership, they said, with another American

named Louis or Luis, who kept a trading post on Lamotrek. A daughter of his, supposed to be enormously rich, was said to be still living on Woleai. Keefe is pretty surely D. D. O'Keefe, celebrated for importing stone money to Yap from the Palaus. (He claimed American citizenship.)"

1: Burrows--165
116, 177

(1947-48)

Woleaians
Ifalik 1-2

"For short periods during the latter part of the 19th century and the first years of the 20th, foreign traders lived on Ifalik. Damm mentions a white trader whom the natives called 'Sau'. He was there while Olaitiu was paramount chief, but left before the typhoon of 1907, when Olaitiu was lost at sea. During the typhoon, Damm reports, there were three Japanese on the island; but they left immediately after. However, these traders can not have had very much to sell. The best proof is that when the German expedition visited the island in 1909, all the adzes in use were of shell, though some of the drills had iron points.

A decided change came after the Germans, who took over the whole area at the turn of the century, brought in more transportation. They developed a fairly regular trade in copra. They also took natives as laborers on copra plantations as far away as Samoa, and as phosphate diggers, not only on nearby Fais but, if my information is correct, on Angaur.

German methods of labor recruiting are described in the following excerpts from a native song:

They come to the men's house
Where the people are assembled,
And seize men to take them away.

They came in the afternoon

And hunted men by night.
Nobody could sleep for fear of them."

In front of the men's house
The Germans line up the Caroline men.
They are pleased to see so many--
They have captured ten,
Strong men all.

'Come along! Get into the raft!'
They feel the arms of the captives,
And chuckle with glee
To find them so strong.
The first mate takes them aboard.

German influence, though decidedly stronger than any that had preceded it, still left few traces by 1947. Tom used to say 'deutsch' for German, and had a memory of Germans as men with very white skins and knotty muscles. Perhaps the greatest change was in wider knowledge of the outside world, and in replacing the 'boisterous spirit' of Lutke's day by a more submissive one."

1: Burrows--166
116, 177

(1947-48)

Woleaians
Ifalik

"Damm's mention of three Japanese on Ifalik in 1907 has already been noted. My informants told a somewhat different story. They remembered only one Japanese, a little old man married to a woman from Woleai. Tom told me, after consulting others, that this Japanese lived on Ifalik for 10 years; but since they do not keep track of years, this means only that he was there for a considerable time. During the typhoon of 1907, he had to swim for his life, but with native help, succeeded in getting to higher ground. He worked for the Germans--presumably the Jaluit Company, which is said to have maintained a station on Ifalik.

The Japanese took over the islands in 1914. After World War I, when the area was mandated to them by the League of Nations, they resumed the copra trade. They had a trading store in Rauau district, but kept it closed except when their ship was in port. The most conspicuous effect of their regime on native life is in cooking. The native earth oven is now used only for cooking the meat of fairly large animals: pig, turtle, and such large fish as bonito and tuna. As these are not part of everyday diet it may be said that the earth oven is used only for festive occasions. Ordinarily household cooking is done mostly in Japanese iron pots or mess-kits, many of them fitted with tight covers for cooking rice.

A few other Japanese articles are in fairly general use: small fish nets of cotton cord, fish-hooks, tools, cloth, and dyes for cloth of native weave. A little shrine in the men's house has a Shinto look, though used for divination of a native sort."

1: Burrows--166 (1947-48) Woleaians
116, 159, 609, 177 Ifalik

"The Japanese gave the people some medical service when their ships were in port, and put some boys from Ifalik to school in Yap. Talimeira, a decidedly intelligent boy assigned by the chiefs to work for us, had spent several years at this Japanese school. He seemed able to speak and read Japanese fairly well, as far as we could judge. Certainly he picked up English amazingly fast while we were there. As to his attitude toward the Japanese, he was non-committal. Probably he got along well with them, as he would with anybody. But he had had enough of school. Asked whether he would like to go to an American school and learn to be a doctor, he smilingly but firmly declined. He wanted to spend the rest of his life in Ifalik, though he had no prospect of a chiefly title or other preferment. Thinking the matter over, we wondered whether this might not be one more proof of his superior intelligence."

1: Burrows--166-167 (1947-48) Woleaians
116, 466, 609, 177 Ifalik

"Tom and other older men told us several stories of the domineering behavior of the Japanese. Though celebrated for courtesy among themselves, they evidently had none of it to spare for their Micronesian wards. This was particularly disagreeable to the people of Ifalik, because of the high value they place on courtesy or, as Tom called it, 'fine talk'. These stories were no doubt intended partly to flatter us. It might be supposed that, since the Japanese were recent enemies of our country, we would be pleased to hear an unfavorable account of them. Yet we saw no reason to suspect the natives of lying.

'You sit right down on the mats beside us to talk with us', they said. 'The Japanese used to pile one box on top of another. Then one of them would get up on the highest box and talk to us. Very bad talk.'

More specific was their account of the Japanese method of recruiting labor, which had advantages over the German method from the point of view of the recruiters, but not from that of the islanders. According to this [167] account, when the Japanese wanted men--which they did mostly for phosphate mining on Angaur--they would come ashore, seize the chiefs, and then make known the number of laborers they wanted. If these were not quickly forthcoming, they would beat the chiefs."

1: Burrows--167 (1947-48) Woleaians
116, 177 Ifalik 1-2

"The first American contact during World War II was unfortunate. The Japanese had a landing strip on Woleai, 30 miles away. During the period when the Americans, without attempting to land in the Carolines, were neutralizing Japanese bases there and leaving their garrisons to 'wither on the vine', while Americans by-passed on both sides, Woleai was bombed often enough to keep the air-strip out of use most of the time. Americans flew now and then over Ifalik; and one of them sprayed the atoll--or at least Rauau district--with a machine-gun. I believe the native account of this because they said they could hear the bullets cutting through the leaves, a detail they would not be likely to invent. No damage was done. The chief WolpaitIk was in the lagoon, tending a fish-trap. The natives now make a funny story of his frantic scramble ashore. Yet they were sufficiently afraid of American planes so that when the first of several passed over at night during our stay, and flashed a spot-light on Falālap, they were rather panicky, and we were suspected of getting information to be used for their destruction, and of communicating with the plane with a flash-light. (I had gone out on a stone pier to watch it pass, and called to Spiro, who was in the lighted tent; but I had no flash-light.) We assured them that American planes, the only ones in the area, would do them no harm; and after they found that the first one had passed over peaceably, they were little disturbed by the others.

This machine-gunning may have been a mistake, for the aerial photograph of Ifalik used to illustrate this report was labelled 'Woleai'. Or it may have been intended to

intimidate any Japanese or supporters of theirs who happened to be on Ifalik. Or, finally, it may have been a case of trigger-happiness. In any case, the terror it inspired seems not to be insuperable."

1: Burrows--167-168
116, 787, 609, 177

(1947-48)

Woleaians
Ifalik 1-3

"The last stanza or section of the long religious invocation said to have been sung by the god TIIItr, when he took possession of the body of his native oracle Gargeligar, predicts an American victory over Japan. Both Gargeligar himself, who was the mouthpiece of the god, and Tom--ordinarily inclined to make light of Gargeligar's pretensions--assured me that this prophecy was uttered long before American planes reached that part of the Pacific. I wondered if the name of the victors might have been changed in the process, and even asked about it; but of course it was consistently denied. This part of the song, as worked up from Tom's translation, follows:

The war will soon be over.
The end of the fighting is near.
Soon the Americans will come.
All you women and children who offered me flowers,
Fear no more!

A passage so similar as to seem referable to the same revelation appears in a prayer or invocation to cure illness of the head, which was given by Gargeligar to Spiro. Gargeligar said it was given to him [168] by the god TIIItr, who in turn got it from his grandfather, omniscient Aluelap. Tom's translation, as edited by Spiro, follows:

Japan will succumb to America.
I will aid the god of America, I will end the war,
The war of men in combat.

For the Caroline people fear the war,
Greatly fear the war.
The girls and boys who make flowers for the gods
Fear the war.

Two other, less important mentions of America occur in the texts of love-songs. In one, the infatuated woman sings 'I am caught fast, as with an American fish-hook.' I asked Tom about the age of this song. He said it was written long ago, but that the people knew of the excellence of American fish-hooks even then. Since the trader Keefe called himself American, this may be true.

The other mention was in a song written about the chief Maroligar, during his youth, by the woman who is now his wife. The lines were:

Fe la gili ameriki
Naro pia fili ma jem(u.

Tom translated it: 'You are like an American flag in my heart.' This time, particularly, I suspected that Maroligar might have changed 'Japanese' to 'American' in dictating the song; in baseball talk, might have pitched Tom a fast one, too hot for him to handle. For Tom, in translating, seemed a bit confused; and in his first muttering, said something about 'Spanish man', which was his way of saying 'Japanese'. (He had the two peoples distinct in his mind, but confused the English words for them.) I attempted to corner him with questions; but, even if my suspicions were right, he and

Maroligar were on their guard now. However that may be, I could not shake their story. Because of the importance of kindly talk, I did not think it worth while to press the matter. After all, even if the name was changed, that very fact shows that they are anxious to please."

1: Burrows--168-169 (1947-48) Woleaians
116, 609, 177 Ifalik

"The substitution of an American flag for a Japanese flag at the top of the OngarIk, or front post of the men's house, has been mentioned in discussing symbols of rank. Maroligar took his time about making the change. The suggestion was made--at least to Tom, to report to the chiefs--on September 4. It was not until November 23 that Maroligar began chipping off the Japanese flag. Still, I never knew the natives to hurry unless there was desperate reason to, as when a thatched roof caught fire, or a school of bonito was sighted in the lagoon. And this time there was no particular need to hurry.

Once, early in the course of our stay, WolpaitIk said to the other chiefs 'We'd better do whatever these Americans want us to. Otherwise--nomore chiefs.' WolpaitIk, it seemed to me, covered a very sensitive nature with a bluff front. He was given to bluff statements, which might be taken seriously or jokingly. Undoubtedly there is some fear in their attitude toward Americans. What they have heard of the bombardments of Woleai and Yap--some of their young men were in Yap at the time, and they probably had eyewitnesses on Woleai, too--gave them a great impression of American power. But they usually spoke of it--to us, at [169] least--with admiration rather than fear. Even in talking of the machine-gunning on Ifalik, they tended to make a joke of it.

But our best evidence of their attitude toward Americans is their treatment of us. Their kindliness, helpfulness and solicitude have been evident throughout this report. And we are convinced that fear had very little to do with it. While they could be

intimidated, there seems to be no need of that. Kindly treatment is both easier and more profitable, for they repay it in full."

"Religion, for the purpose of the following description, will be defined broadly and loosely, as any belief or activity that involves the supernatural. The supernatural, in turn, will be defined as an order of phenomena different from the common run and involving power of a mysterious kind, greater than everyday, well understood kinds of power.

Here and there in the foregoing pages there has already been mention of beliefs and acts that fall within this definition. They could not very well be saved up for a separate chapter, for the people of Ifalik are not inclined, as we are, to seal off religion from the rest of life. Their religion has been particularly evident in the accounts of fishing and navigation, activities which involve risk of failure and consequent disaster. Religion pervades everything they do.

For all the pervasiveness of their religion, the people of Ifalik make a clear distinction between natural and supernatural, or secular and sacred realms. As we shall see, the supernatural has its own personnel and its own geography. The distinction was consistently emphasized by Tom though he did not always draw the boundaries just where we might have done. Whenever anything came up that he regarded as religion, he would label it, 'talk for god.' Except in connection with canoe-building and navigation, he did not profess to understand much about it, and would nearly always consult the chiefs before giving any information. This seems to have been partly due to a special caution about revealing the sacred lore - another sign of a distinction between that and other

information. The people of Ifalik know that on all the islands round about, white men have attacked and, to a greater or less extent, destroyed the native religion. Because they still cherish their old faith, and get reassurance from it where they most need reassurance, they were naturally reluctant to expose it to attack by us or other foreigners.

Early in our stay, I made the mistake of failing to observe this distinction. Because the people seemed so frank and helpful, I decided to begin at the beginning in collecting tales, and asked about the creation. I got nowhere with my questions. They told me that all such matters had been forgotten. They, or rather their fathers, had made the same excuse to Sarfert thirty-eight years before; yet he had obtained some information. I gave them bits of this, following the newspaper man's technique of showing that something is already known, and thus suggesting that they might as well be frank. The chiefs did not remember Sarfert's brief visit, and were rather irritated and suspicious. They wanted to see the German book. But I had no copy, only brief notes I had taken, and fuller excerpts translated by Spiro. They admitted they knew the names of the gods he had recorded, but insisted they knew nothing more about them. At last it dawned on me that it was too early to try for that kind of information, and I asked for other kinds of stories, much to the relief of all concerned.

After the two-day ritual to be described later, I returned to the attack. At that time I was spending half of every day taking song texts; and it seemed appropriate to ask for the songs that formed part of the ritual. The chiefs began to give them, but - if I am

right about what happened - word of this reached Gargeligar, who may be called the native priest, and he objected. At least he spoke with the chiefs, whereupon the word issued 'No more songs.' Without questioning their decision, I made a little speech to them, which was translated by Tom. I thanked them for the songs already given, which would be most valuable; and regretted I could not have more. I added that I approved of what little I had seen of their religion and that, as far as Spiro and I were concerned, we would not try to change it, nor recommend any change to other Americans. [171] Fortunately for the purpose, I meant every word of it. It seemed to make the desired impression, for in a few days the flow of song texts was resumed, and eventually even the other religious ones were forthcoming - with only one exception that I know of. Meanwhile Spiro got around to interviewing Gargeligar. Partly in consultation with the chiefs, he obtained a number of the myths which, when I first inquired, had been ostensibly forgotten.

This chapter is intended to give a more comprehensive and systematic description of the religion than could be derived from the bits that come out in describing other activities. It will begin with what is available about beliefs; then will examine religious behavior. The account is by no means exhaustive. The tales Spiro collected, except for bits that seem essential to this account, will be left to him. Some of the interpretation, of a phychological sort, also belongs to his special problem. For that matter,

it is likely that a number of points, some of which may be quite important, have escaped us both."

116, 773 Ifalik 12

"The same professions of ignorance which stopped my early inquiries were repeated, so far as the creation is concerned, when Spiro investigated this subject later on. 'We do not know how the world began,' they told him, 'but in Yap they know.' While it is possible that they were still concealing something from him, I am inclined to think that by this time they were telling everything, or nearly everything, that he asked for. If that is so, they know of the existence, but do not know of the contents, of the elaborate Yap creation myth, one version of which was recorded by Müller. Another was collected by Lieutenant Kevin Carroll of the U.S. Naval government, but so far as known has not yet been published.

Fragments of another creation myth, which accounts for the parentage of some of the gods of Ifalik, were collected on Lamotrek by Doctor Augustin Kraemer of the Hamburg expedition. According to this, the mother of all living beings was a great reef called Oledjapdjap (probably Wolraprap in my orthography). The reef gave birth to a primal couple, Iat and Iol. (Iat as an ordinary word means 'up' or 'above.' This suggests that Iol may mean 'down' or 'below.' The usual form for that is Ilalo, with the final vowel commonly silent.) Iat and Iol were the parents of three great gods: Saulal, lord of the underworld (thought of mainly as under the sea); Sauaur, lord of Aur, the land whence breadfruit came; and Aluelap, lord of all. A footnote to Kraemer's monograph (p. 143) says that this account was also found on Elato, and adds: 'Siehe auch Ifaluk, wo Ham. arbeitete (See also Ifalik, where Ham. worked). 'Ham.' is probably Paul Hambruch,

one of the ethnographers of the German expedition. But I find no mention in the Ifalik monograph of his ever having worked there. However, if the course of events dimly suggested by some other data really took place - that is, if the early culture of Ifalik was partly overlaid by relatively recent dominance of Yap - it seems not unlikely that some such creation myth may once have been believed on Ifalik, but later discarded out of deference to the overlords from Yap. Certainly their dominance is partly, perhaps primarily, religious."

1: Burrows--171-172 (1947-48) Woleaians
116, 773 Ifalik

"The chiefs admitted, even in response to my unwelcome early questions, that they knew of the existence of two of the divinities mentioned in this Lamotrek myth: Saulal and Aluelap. If Sau means 'lord,' (as it does in some western Polynesian islands), then 'Saulal' would be 'lord of the underworld,' for the depths of the sea are called ilalo (below). 'Sauaur' would then mean 'lord of the south,' for 'south' is i auru (final vowel generally silent). In song texts i auru frequently means 'the southern sky.' The name of the other divinity, Aluelap, means 'great spirit.'

The German monograph on Ifalik gives still another fragmentary account of [172] creation: 'Solal created heaven and earth by taking a grain of sand in his hand and, while reciting a spell, rolling it from one hand to the other.' "

1: Burrows--172 (1947-48) Woleaians
116, 776 Ifalik

"The mystery which seems to cover the creation in the minds of the present inhabitants of Ifalik does not extend to the supernatural beings and places which, according to their belief, still exist. The general name for a supernatural being is alús. They are classified in several ways. According to where they live, they include alús lang or alús i lang, who live in the sky; alús tat or alús i tat, who live in the sea; alús salop or alús i salop, who live on land; and alús liol, or alús i li wol, who live in the trees. According to their behavior toward men, they are classed as alús mwan, good or beneficent gods, and alús ngau, bad or maleficent gods. There is some correlation between habitat and character of the gods; that is to say, gods of the sea are generally bad, and are among the most dreaded of all. Gods of the trees are also generally maleficent, but the harm they do (the commonest kind, that of inflicting disease) is in punishment for what we would call asocial conduct - disobeying the chiefs or lingering in the woods to shirk communal labor. Gods of the sky may be either good or bad, but among the sky-dwellers are the great beneficent gods.

Gods are of either sex. Gargeligar told Spiro that female gods are worse than male ones. Most of the important beneficent ones, including all the gods of navigation, are male."

1: Burrows--172 (1947-48) Woleaians
116, 776, 769 Ifalik

"Ghosts of the dead (ngolu) constitute a special class of alus. They are among the most prominent in native belief and, though some are benevolent, among the most feared. Whether they are good or evil depends upon their character while in the flesh. A good (kindly) human being will become a good alus, while an evil (malicious) human being, even one who dies in childhood, will be an evil ghost. They are thought to linger about the places they inhabited before death, and to retain something of their former appearance. In general, ghosts of the recent dead seem to be most prominent in the native mind. Ghosts when seen - which happens not infrequently - are often recognized.

Ancestral ghosts whose lifetime may have been in the remote past are also influential. They are associated with homesteads inhabited by their descendants in the female line. Every homestead, as a rule, has one or more such ancestral ghosts. They are commonly helpful to their descendants, yet may do the kind of damage most frequently attributed to supernatural beings, that of inflicting disease. The sickness that took the life of the chief Paliuilimar while we were on the island was attributed to an alus associated with his ancestral homestead. Its particularly deadly character may have been due, though, to a strain other than ancestral; for Gargeligar said after his diagnosis that this was 'partly a sea-spirit'."

"Tom said that the gods of navigation live in a part of the sky reserved for them, but did not give it a name. Since Virár is one of these gods, it might be inferred that this place is Ururio (Ruialo), named as his home. Yet the myths about seamanship are set largely in Bwennap, which seems identifiable with the earthly island Pulap (p. 163). Longolap and Longorik travelled from there to Pie li Eluluei (Sands of Aluluei). Pie li Eluluei resembles Bwennap (but not Pulap) in having only sand and one tree above ground, but a large and populous place below, abounding in all food-producing plants. Sarfert-Damm name another residence of Aluluei - the island Piemal, three months' journey by canoe to the south of Ifalik.

Naturally, the gods of navigation were accomplished travelers. Aluluei went from Bwennap to the strangely similar Pie li Eluluei by magic. Valur and his brother Wëriëng went by canoe from Bwennap to Truk; and Valur, after he changed his name to Sagol, visited Ifalik and all the islands about. Since the canoes of these gods roam the skies as well as the seas, there is no great difficulty in supposing that they could take off from one medium to the other, like a sea-plane. Nevertheless, the information at hand does not enable us to plot the celestial islands on a chart."

"Fig. 22. - GENEALOGY OF THE GREAT GODS

Names in parentheses and relationships shown by dotted lines were not recorded in 1947-8, but only by the German expedition of 1909. Capitalized names were recorded by both German and American expeditions. Names without parentheses or capitalization were recorded only by the American ethnographers in 1947-8. Names of female beings are underlined.

1: Burrows--172-173 (1947-48) Woleaians
116, 775 Ifalik 1-3

"Another account of life after death seems inconsistent with this one of ghosts haunting the places they frequented in their former life. It is said that the soul of every human being, after death, sets out for the sky, along a road for ghosts. The people of Ifalik do not name a series of earthly points along this road, as those of some Pacific islands do. Names of two dangerous places along the road were mentioned in a song, and there may be more. One is Rourou, a lake of fresh water into which evil spirits throw the new ghosts, if they catch them. Those cast into Rourou are never heard of again. Others are similarly disposed of in Piseram, a dismal place a good deal like a taro swamp. The main hope of escape is in guidance or rescue by more experienced friendly ghosts, who on earth were relatives of the newly dead. Even when a ghost succeeds in reaching the sky, he may not be happy there. All depends on whether he falls in with friendly or malicious companions. [173]

The celestial geography is elusive and shifty. The region most clearly mentioned is the southern sky, but there is some mention also of the northern sky and the zenith. Islands are scattered up there as on earth, among sea spaces, which are traversed by the canoes of the gods. Two such islands are named in the myth of Galét: Ulimatau (also recorded as Ulimatol), home of Galét and his associates; and Ururio or Ruialo, home of Virár, who made off with Galét's wife and took her there. The home of TIIltr is said to be in Lengililo or Langiliol. (The names of these sky-islands seem to shift about as much as their location.)"

Fig. 23. - GENEALOGY OF THE GODS OF NAVIGATION

Parentheses and capitals are used as in Fig. 22. No names are underlined, as there are no females in this genealogy.

"A list of the supernatural beings whose names were collected, with a summary of what is known about them, follows:

Major Gods

Aluelap - Forefather of the major gods. Human in form, but of immense size. Lives usually in his house Fatremal, in the southern sky (Sarfert-Damm say in the zenith). Has another house, Langilimware, in the northern sky. A third house of his, Mwauliare, is mentioned in a dance-song said to have come from Eaurupik. On Ifalik, the homestead Weluara on Falālap is said to be his (though also used as a human dwelling); and one of the four rods in the shrine at one end of the house is the place where offerings are left for him.

Aluelap established the tabus, except those governing sexual conduct (see Autran, below). Though he alone is omniscient, he sleeps most of the time. Formerly his eyes were always closed. His daughter-in-law Lamanu used to massage his arms and bathe him.

One day he asked her, 'Who are you?'

'Lamanu.'

'Alas, I can not see you!'

Aluelap was determined to see. He called to his son, Lugeilang, 'Come, open my eyes, that I may see your wife, and the land, and the people!'

Lugeilang told the people what his father wished.

They cut down a coconut tree and, using the log for a lever, pried [174] Aluelap's eyelids apart. Still he could not see, for all sorts of foreign objects had lodged in his eyes. At last a man took a paddle and knocked them all out.

Aluelap was overjoyed. 'Oh, I see land! I see people!'

When Aluelap had gazed his fill, he went to sleep again. To this day, he sleeps most of the time. Yet, being omniscient he knows when any evil spirit comes ashore on Ifalik. Then he sends a lesser god, one of his descendants, to drive the demon away. Sarfert was told that Lugeilang was sent on these errands. The people of Ifalik today say it is Lugeilang's son TIlItr, with TIlItr's son TIlItal.

Aluelap is also awakened when any question comes up that none of the other gods can answer. His son pries his lids open and asks the question. He answers it, then falls asleep again.

Lamagei - Wife of Aluelap. No further details.

Saulal - lord of the underworld. According to the creation myth recorded by the Germans on Lamotrek, a son of Iat and Iol, hence a brother of Aluelap. According to Sarfert-Damm on Ifalik, has no parents or other relatives, but was the creator of the universe. His body, according to the same source, is half man, half lawud (some sea creature; Tom's attempt at explanation suggested a surgeon-

fish). Inhabits a large house in the underworld called Falisat. All that was told me on Ifalik is that he rules the underworld and the supernatural beings that live there.

Autran - a goddess; according to Sarfert-Damm, sister of Aluelap; according to the geneology given by Tom, a daughter of Aluelap. (The Sarfert-Damm version may well be more authentic, as the chiefs of 1947 seemed to know little about her.) Sarfert's informants of 1909 said that she was the ruler of earth and, though never married, the mother of all mankind. According to the same source, her house, named Lamolu, is in Garpar (Gatschapar) in Yap; and the chiefs of Garpar, in collecting tribute on Yap, are acting as her agents.

Autran established the tabu against sexual relations within the clan.

Lugeilang (or Lugweilang) - Son of Aluelap and Lemagei. When he was born, Aluelap assembled all the sky-dwellers to suggest names for his son.

A large star, Visitrax (apparently our Venus) said
'Let him be called Dung!'
'What!' cried Aluelap indignantly. 'My son called Dung!'
Other names were suggested by the felā fish and by the crab, but they did not please Aluelap.
Finally the star Mailap suggested the name Lugeilang.
'What does that mean?' asked Aluelap.

'It means 'He who lives in the sky' , the star replied.
Aluelap was greatly pleased. 'Yes,' he said. 'Let that be his [175] name.'

As a punishment for suggesting a name that means filth, it was ordained that the star Visitrax should have no fixed abode. Always it must travel. During one season it lives in the east, during the other in the west. Thus, in the trade-wind season, when Visitrax shines in the east, people have light after sunset to defecate by.

Lugeilang descended to earth and married a mortal woman. She bore him first a mortal son, Gio; then the god, Wolfat. He still descends to earth from time to time, Sarfert was told, to supervise men and their activities. If they are idle, he reports to Aluelap, who sends wind and rain, and to Saulal, who stirs up the sea into great waves. Typhoons, therefore, are punishment for men's laziness; and their severity is in proportion to the misbehavior.

Lugeilang is credited by Sarfert-Damm with teaching mankind the art of tattooing. For the account given in 1947, see below under Wolfat.

(Lamanu or Ilaamalul - human wife of Lugeilang, does not properly belong in the list of gods. What was told of her and her mortal son, Gio, appears under Aluelap, Lugeilang, and Wolfat.)

Wolfat - Second son of Lugeilang and his human wife, Lamanu. According to Sarfert-

Damm, he was born on earth while his father, summoned by Aluelap to help repair the house Fatremal, was revisiting the sky. To judge by the number of tales told of him, Wolfat is the most prominent figure in the mythology of Ifalik. Sarfert collected several of these tales, and in 1947 Spiro collected similar versions of these and some others, forming a little cycle of ten apparently distinct tales. Wolfat also figures in the favorite myth of Galét, of which three versions were collected, and in the story told in 1947 of the origin of tattooing.

Lugeilang and Lamanu feared that if Wolfat knew he had a human elder brother, he would kill him. So they concealed Gio in the underseas world of Saulal. One of the stories tells how Wolfat learned of his brother's existence, waylaid him and killed him. One of the motifs that recurs in the tales is that Wolfat himself can not be killed, even with a gun.

In several tales Wolfat's role is that of a trickster. He delights in taking on all sorts of fantastic forms, in order to deceive those sent to look for him. In other tales, which verge on fables because a moral is implied in them, Wolfat takes the form of a small boy and asks groups of boys whom he meets to share their playthings with him. All but one refuse. He punishes all but the single generous one. This incident forms a theme with variations, the variations consisting mainly in different playthings and different punishments. The moral suggested is 'Be kind and generous to strangers'; but it is not explicitly stated.

In a tale told to me, Wolfat is credited with inventing tattooing, and teaching the art to mortals. He first tattooed himself in the sky, then came down to earth to visit a mortal sweetheart. By the light of the fire in her house, other women saw the beautiful decoration, and asked Wolfat's sweetheart to persuade him to teach their lovers how to beautify themselves in this way. This myth, which will be given more fully in the study of native arts, forms a charter for this institutionalized form of art.

With this exception (and this is attributed by Sarfert-Damm to Lugeilang), Wolfat remains a rather remote mythological figure, in spite of the compara- [176] tively rich lore clustered about him. He is not credited with any continuing relationship with mankind; nor is he invoked in any of the religious dance songs or incantations.

TIIItr - this son of Lugeiland and brother of Wolfat might be called the patron deity of Ifalik. It is he who is sent down to the atoll by Aluelap to drive off evil spirits, give instructions about curing disease, find and bring to port canoes blown off their courses, and teach mankind the songs by which he and his heavenly relatives can be properly invoked. This he does either by answering the questions addressed to him by favored human beings, or by taking possession of them and speaking or singing with their voices.

TIIItr's house, Ngiligejáp, is in the part of the sky called Lengilialo or

Langiliol. He and his son and sister listed below, are not mentioned in any of the religious dance songs, except the one used in invoking him. Some healing incantations collected by Spiro from Gargeligar, TIIItr's oracle during our stay on the atoll, also call on him by name.

The scarcity of lore about this god suggests that he may have been invented -- or, as a believer might say, born - in comparatively recent times. Gargeligar, with the confirmation of others present when I interviewed him, said that the first parts of the invocation were known before his time, though TIIItr first sang the last parts through his mouth. The god is named in the third line of the invocation, which (in my rewording of Tom's translation) begins:

Night - it is night now.
Tomorrow, when daylight dawns,
The god TIIItr will speak to us all.

Recent though this god may be, then, Gargeligar seems at least not the first to be possessed by him. An old man, Orgalebwā, who lived in the homestead Weluāra, known as the house of the great gods, was possessed by a god at the time we witnessed the ceremony which includes this invocation. I understand at the time that the god was Aluelap, but this is contrary to the account later given of Aluelap's remaining in the sky and sending other gods to earth. So Orgalebwā may have been possessed by TIIItr as Aluelap's representative.

TIIItal or TIIIlalo - son of TIIItr, mentioned in the invocation as descending to earth with his father and helping to supervise and protect the people.

Leurulalo - sister of TIIItr, mentioned in the invocation as interceding for the people.

Gods of Navigation

Aluluei - master of the lore of seamanship. His role in bringing it to Ifalik is recounted in the myths given in the chapter on Navigation. Said to have lived on Bwennap which, in spite of the underground extension attributed to it, seems to be identifiable with the earthly island Pulap. Other homes of his are (Sarfert-Damm) Piemal, far south of Ifalik; and Pie li Eluluei or Sand of Aluluei.

Paluelap - according to Sarfert-Damm, a son of Aluelap and father of Aluluei. According to Tom's genealogy of the gods of navigation, one of the sons of Aluluei. Figures in the myths of seamanship and is invoked in a ritual to be described later. The name means 'great navigator'. [177]

Farewai - divine weather forecaster. His genealogical position uncertain; there may be two gods of this name. The genealogy given by Tom makes him a brother of Aluluei, as does that of Sarfert-Damm. The same name appears also in Tom's genealogy as a son of Aluluei. This is another Farewai, Tom explained.

Metseleilag - Named in Tom's genealogy, without further details, as brothers of
Teraolemetau - Aluluei.

Valūr - who changed his name to Sagōl - god of the fish who guide navigators. One of the sons of Aluluei. One of the myths about the lore of seamanship tells how he changed his name, after foiling the attempt of his brother Wëriëng to kill him.

Wëriëng - god of the sea-birds who guide navigators. Another son of Aluluei. Tried to kill his brother Valūr, who had been carring [sic] on an adulterous affair with Wëriëng's wife.

Segur - another son of Aluluei. Associated with the other gods of navigation, but without any exclusive powers, so far as known.

Longolap -
LongorIk - sons of Aluluei. In the myth of the lore of seamanship, LongorIk, the younger son, learned the lore thoroughly; but the uxorious Longolap, distracted by his wife, only learned a little bit, with disastrous results.

Ilekerep - god of the sea-lanes. Invoked in a navigator's prayer for guidance.

Sauta - invoked in a navigator's prayer for enlightenment.

Iolau - classed with the gods of navigation; but the only specific activity recorded of him is that he makes people sick if they eat wot taro without mashing it, or eat any of his six kinds of fish without first singing the proper song over them, to win his approval.

Loulemwau - god of the canoe. Invoked in a navigator's prayer or incantation to lighten

the vessel so that it will stay afloat.

Seimeligarara - a god of canoe building. His building of the first popo canoe told in the myth of Galét.

SemerIk - a god of canoe-building. Not placed genealogically. Invoked in a shipwright's prayer.

Seilangi - another god of shipbuilding, coupled with SemerIk in the shipwright's prayer. According to Sarfert-Damm, a brother of Aluluei. Not named in Tom's genealogy.

Seliwang - (Possibly a variant form of Seilangi.) These two are invoked in a song, to
Tibweau - help repair a canoe-hull which has come apart at sea, by fitting a rope sling about it.

Alulumar - god of house-carpenters. Here grouped with the gods of navigation because mentioned by Sarfert-Damm as one of the sons of Paluelap. Not named in the genealogy given by Tom.

Lauliar - In ordinary speech, this is the name for rainbow. On Ifalik rainbows are thought to bring bad weather. Sarfert-Damm give this as the name of an anthropomorphic spirit who brings storms and destroys canoes at sea unless propitiated [178] by the proper prayer or incantation. Even this will not avail if the people, by their misconduct, have offended Aluelap.

This divinity is of a kind rather rare on Ifalik, being apparently a

personification of a natural phenomenon. The only others recorded are Mesilipik, discussed below, and the two stars who suggested names for the son of Aluelap.

Sarfert-Damm relate that Lauliār came ashore on a driftwood log while a woman named Illegieri was bathing her little boy, Illepanigi. Lauliār seized the child and held it until the woman consented to be his wife. When the boy grew up, Lauliar taught him the invocation by which he can be propitiated, then returned to the sky. A different version, with a shift of name, follows.

Ilepanigi - According to a more detailed story told to Spiro, this is the name of the rainbow spirit who came ashore on a driftwood log, seized a boy (in this version named Sirō or hog) and married his mother (in this version named Meri). This tale is given on p. ____.

Alulevalū or Alus falū (literally, god of the land or island) - chief of the spirits who live ashore, in the trees, and inflict disease on those who disobey the chiefs or shirk communal labor.

Gol - a spirit who causes death.

Sauteti - Saurek - Named in the invocation to TIlltr as evil spirits, whose arrival on Ifalik is occasion for summoning TIlltr to drive them off. The harm they do is apparently the usual one of bringing sickness.

Saiol - a sea-spirit who inflicts sea-sickness. Among the healing incantations given by

Gargeligar to Spiro is one for exorcising him.

Alumaseragu - mentioned in a song as making love to a mortal woman; in comment on the song, characterized as an evil spirit.

Rangwau - (literally, snatch-quick) - waylays ghosts on their way to the sky, throws them into the lake Rourou to drown.

Alúsiwautas - It is not certain whether this is the name of a specific evil spirit, or a generic term for a class of them. 'Comes on top' of people, - that is, takes possession of them. Insanity is explained as possession by such a spirit.

Some Lesser Supernaturals

Totolu - a sky god who puts medicine, made by men, into coconuts, for the use of pregnant women.

Malemelel - invoked in a prayer or incantation to cure sickness of the head.

Legawo (same as Legobwu?) One of the little shrines beside houses, on Falālap, was said to be for this god. The similar name Legobwu occurs in a song, and was explained as that of a god who formerly brought to favored people whatever they desired. In discussing this song, Tom said that this god is no longer active.

Mesilipik - this being, who according to Gargeligar is not regarded as an alús, seems to be a personification of cold. He lives in the seas between the islands, and

[179] comes on the wind, bringing certain diseases: chills, fever, red spots on the body, blood in the feces.

Some Foreign Supernaturals Known on Ifalik

Uapei - the rainbow spirit of Faraulep, invoked in the sur perou dance performed in Ifalik by the men of FalarIk district, but said to have originated on Faraulep. Uapei comes on the rainbow to rescue mariners lost at sea. The people of Ifalik seem not to take this divinity seriously.

Metileru - a sea-demon of Faraulep. According to the FalarIk sur perou dance song, he comes from afar when the wind is in the east, snatches the souls of sick people from their bodies and carried them off in his canoe of flame.

Tagi - invoked in the FalarIk (originally Faraulep) sur perou to heal the sick by rescuing their souls from the canoe of Metileru.

Mwarisepa or Morisepa - said to be the ghost of a boy who died at sea; presumably a boy of Ulithi, for he is invoked in a series of songs attributed to that island. The songs are called by the same name, gapengpeng, as those used to invoke TIlItr on Ifalik; if there is an accompanying dance, it is not performed on Ifalik so far as known. This spirit helps mariners lost at sea; but people of Ifalik seem to have no active faith in him.

Ligeworlealeal - apparently a god of Ulithi, mentioned in a song attributed to that atoll.

Urumwáretr - a god of Woleai, mentioned in a song said to have originated there.
Ilamware - gods of Eaurupik, mentioned in the laūra stick dance, attributed to that island
Rangunengi - Ilamware is a female, mother of the other two.
Rangule -
Malesaro - another god mentioned in the laūra.

The foregoing list is far from exhaustive. A number of mythological characters, like Galét and his associates, are described as living in the sky and associating with gods. Galet and his wife walked on the waves. They have not been listed here because no relations with mankind are attributed to them. Some characters in other tales have supernatural attributes; notably Tungā in the legend about Lamotrek, who was described by Tom as 'all same man, no man.' But no superhuman deeds are attributed to him."

"No individual names were recorded for one whole class of supernaturals, the ancestral ghosts associated with homesteads or lineages. There are said to be at least as many of these spirits as there are homesteads (twenty-nine occupied in 1947, several more that had been occupied within the memory of those living then.)"

1: Burrows--180 (1947-48) Woleaians
116, 784 Ifalik I-2

"The concept of taboo, widespread among Pacific island peoples, prevails on Ifalik in a rather simple form. The term itself, taken into English from a language related to that of Ifalik, is in use there, though the final sound is not voiced and speakers of English can notice it more readily by lip-reading than by listening. Following common practise, the local form is here spelled tabw.

The common expression E tabw can usually be translated 'It is forbidden.' But it is not applied to all prohibitions. Conduct disapproved because it is regarded as queer or foolish is not ordinarily called tabw. Nor is the term applied, commonly at least, to the prohibitions emphasized in the chapter on government; though usage seems to be somewhat elastic here. The term tabw, in a strict sense, refers to prohibitions thought to be sanctioned in a special way. We should call it a supernatural way; yet the sanctions are not, as a rule, thought to be administered by supernatural beings.

Conduct called tabw is thought to be dangerous in itself, to incur automatic retribution. The connection made between the misdeed and the penalty is something like what we have in mind when we say 'Don't get your feet wet, or you'll catch cold'; or 'Don't touch that wire, or you'll get a shock.' Yet an essential difference remains. In the case of taboo the connection between deed and consequence is not, as we should say, rationally explained. It remains somewhat mysterious, and is regarded with some awe, though not to the extent of avoiding discussion of it.

The kind of impersonal power believed to enforce the prohibitions called tabw is that

commonly called, by students of comparative religion, mana, --another term borrowed from an Oceanic language. That word itself, however, was not heard on Ifalik; nor was any other with an equivalent meaning. The power behind taboo seems to have, on this atoll, no explicit name."

1: Burrows--180 (1947-48) Woleaians
116, 764, 784 Ifalik

"The only other term whose meaning is closely related to tabw, so far as learned, is fäm. This expresses a condition which Radcliffe Brown ( ) called 'ritual danger', and is applied to human beings at certain crucial times. When a person is fäm, some kinds of conduct ordinarily permissible become tabw to him; in other words, he has to observe special precautions.

Death is one of the events that can make people fäm. Members of a household in which a death has occurred may not gather or prepare food for three days. Food is prepared for them by neighbors, or by relatives not so closely akin to the dead, and these offerings of freshly cooked food, called agilimēs, are brought to the mourners. Those who are fäm are not prohibited, however, as in some regions of more elaborate taboo, from using their hands to feed themselves.

Sea-burial, a custom found nowhere else in the surrounding area, is enjoined on Ifalik by a taboo on burial ashore. If a body was left ashore, it is said, all the vegetation would wither."

1: Burrows--180-181 (1947-48) Woleaians
116, 843, 784 Ifalik

"Childbirth is another event that imposes this condition. A woman is not surrounded by taboos during most of her pregnancy, except that sexual intercourse is prohibited from the time pregnancy is first diagnosed--commonly by the interruption of the menses --until the [181] external signs become apparent. The duration of this taboo is said to be about a month; intercourse during that time, it is said, would kill the baby. Thereafter intercourse is resumed, and indeed, approved, until a late stage in the pregnancy."

1: Burrows--181 (1947-48) Woleaians 1-2
116, 846, 784 Ifalik

"When labor pains begin, or are momentarily expected, the woman goes to the birth house (im lipelū) on Falalap near the channel. This building is strictly tabw to men. If a man were to enter it, all the food would rot, and all the people suffer famine. Spiro did not succeed in having an exception to this taboo made in his case; even the psychopathic Tarobweliman did not venture into the birth house, so far as known.

While a woman is in the birth house, her close relatives, which means, approximately, her parents, husband, and children; perhaps one or more sisters as well - go to live in a house reserved for this purpose near the birth house. They stay there as long as the mother and child remain in the birth house. The conventional length of her stay is ten days. All are fām during that period. All return together to their home, and at this time the taboos are lifted from all except the parents.

Work other than caring for the child is tabw to the mother for a considerable period. First stated as two months, this was later defined more strictly as follows: if the moon is visible at sunset, or during the rather short interval thereafter before people go to bed, this tabw lasts for one month; if the moon is not visible at that time, for two months. It was also said that the mother may not leave the homestead for three months. The homestead is here defined to include a bit of shallow water opposite the house site, where the baby is bathed. The father too, is subjected to some restrictions, though they are less rigorous, for the same period as the mother. One taboo--on sexual intercourse lasts until the child can walk. The penalty ascribed to violation of this is the same as

that for sexual intercourse during early pregnancy--the death of the baby."

1: Burrows--181 (1947-48) Woleaians
116, 841, 784 Ifalik

"Menstruation is surrounded by taboos, though I did not hear the term fām applied to a menstruating woman. Women are required to spend these periods in seclusion, in little huts built for the purpose on each homestead. They may not visit the taro patches, nor take part in preparation of food. The little huts used for this seclusion are at all times taboo to men. If a man should enter one of them, the people would all fall sick; or, according to another statement, would starve. On the other hand, if a menstruating woman leaves her seclusion hut, the kind of divination called bwei, described later, will not work.

The vicinity of a small tree on Falārlk, close to the channel that separates that island from Falālap, is taboo to menstruating women. The tree is called rongonax, and is said to be the only one of its kind on the atoll. If a menstruating woman were to come near it, a typhoon would spring up, so severe that sea water would wash all over the atoll."

"The artificial pools of fresh water in which coconut husks are soaked to loosen the fibers in preparation for making sinnet are taboo to men. These pools, (called lip wa li gos) are dug among coconut groves, always at some distance from a dwelling. The work of digging them and walling them with blocks of coral may be done by men, or by men and women together. The final use of the fibers prepared partly in them--that of twisting cordage--is exclusively men's work. But the soaking of the husks is strictly women's work, and men may not enter the pools, once they fill up with water. If a man violates this taboo, he will be unable [182] to catch fish for 20 days; and if he tries to, will fall sick."

1: Burrows--182 (1947-48) Woleaians
116, 226, 784 Ifalik

"The other taboo period in connection with fishing follows a successful drive on a school of bonito in the lagoon. After such a catch, none of the men may work, except for smoking the fish and a few other specified light tasks such as making sinnet cordage, for three days. They must also avoid sexual intercourse during that time. If a man violates this taboo, he will be unable to spear any fish the next time a school of bonito is rounded up.

Various minor taboos apply to other kinds of fishing. For example, when fish caught in one of the large traps that are set about driftwood logs at sea were brought to us as a gift, the chief Maroligar offered to cook them for us, and broiled them over a little fire of dry coconut leaves. He explained that if we cooked them in our usual way--in a frying pan--there would be no more driftwood, hence no more fish caught with the big traps. A glimpse of another fishing taboo appeared when some men bringing in a catch of fish shouted a warning, and small boys on the shore went away. One of them tried to tell me why, but I could not understand. Tom explained that women and children must not watch when fish are brought ashore. This taboo does not seem to apply to all kinds of fishing, certainly not to bonito drives, in which the whole population takes part. I failed to find just how far it applies."

1: Burrows--182 (1947-48) Woleaians
116, 226, 784 Ifalik

"Taboo periods are imposed on men in connection with certain kinds of fishing, as described in connection with fishing technology. The longest and most severe is associated with torchlight fishing for flying-fish, when the men must sleep in the canoe-houses for three months, and during that time must abstain from sexual intercourse and from eating preserved breadfruit."

1: Burrows--182 (1947-48) Woleaians
116, 241, 271, 784 Ifalik

"When Tom's wife Lagarajong gave us a demonstration of preparing a bed and planting wot, we all grew thirsty, and Tom cut drinking coconuts for us from a nearby tree. In order to drink them, we had to sit in the clump of coconut trees, which rose like an islet out of the lower land of taro swamp. Tom explained that drinking coconuts on the taro land itself is tabw. This, and the taboo on gardening during menstruation, are the only ones collected in connection with this branch of food production. It would not be surprising if there were a number of others not brought out by my matter-of-fact questions about gardening, and not observed directly because the taro patch is women's territory (though not taboo to men), and we spent only a few hours there."

Woleaians
Ifalik

"Associated with this, to some extent, is one permanent taboo. Women must never enter canoe-houses. They even avoid those sections of the main path along the shore which pass immediately in front of canoe-houses. Along most of the settled part of Rauau there is an alternate path farther inland, among the house platforms. Women going from Falārlk district to Falālap, for example, will leave the main path as it approaches the canoe-house Fan ni Wā, and follow the inland path all the way to the channel. The foreshore is not forbidden to them, however, except for narrow strips directly shoreward from the canoe-houses. Even these are not so strictly taboo as the houses themselves. But if a woman crosses them, she will usually go along the beach, or at least not immediately in front of the canoe-house. Sometimes, as during the nightly rehearsals for the men's dances, women will sit very near the canoe-houses, nearly under their eaves."

1: Burrows--183 (1947-48) Woleaians
116, 372, 252, 784 Ifalik

"The fire on which a sick person's food is cooked may not be used by others. Households in which someone is sick will use two cooking fires, one for the invalid, the other for the rest of the people. Another taboo on sharing fire was exemplified by Tom when he asked Spiro to light a cigarette for a woman. He could not do it himself, he explained, because the woman was a classificatory sister."

1: Burrows--183 (1947-48) Woleaians
116, 784, 787 Ifalik

"Performance of certain religious rites--invocation of a god, the more formal and solemn kinds of divination--imposes a three-day taboo on the man who takes a leading part in them, though not upon others who take less prominent part as spectators and assistants. The activities prohibited during this period are sexual intercourse, giving food to others, or receiving food from them."

1: Burrows--183 (1947-48) Woleaians
116, 835 Ifalik

"The word tabw is used for the incest ban, or prohibition on marriage within the clan or between some other close relatives. This taboo is said to have been ordained by the goddess Autran, though it was not said that she took an active part in punishing violations of it. Since the sanction of death or banishement, inflicted by unquestioned human agency, was said to be the punishment for violation of this rule, it seems to belong to a middle ground between taboos in the strictest sense, with supernatural sanctions, and rules of government, deliberately enforced by men."

1: Burrows--183 (1947-48) Woleaians
116, 685, 345, 784 Ifalik

"Another kind of taboo that is not altogether typical is the prohibition against trespassing on the site of the ancient men's house. As shown in the discussion of symbols of rank, the bad weather thought to follow violations of this rule is, unlike the usual sanction of taboos, attributed to specific supernatural persons--the ghosts of the great men of old who frequented the men's house that used to stand on this site, and still resent any disrespect shown to the place. The taboos against trespassing on the two homesteads associated with the lineages of highest rank are also ways of showing respect to the dead of high rank. I failed to find out whether trespassing on these sites is thought to be punished by ancestral spirits of these chiefly lineages."

1: Burrows--183 (1947-48) Woleaians
116, 396, 784 Ifalik

"The morning fast imposed upon builders of a new canoe on the two crucial days of the job--the beginning, when lines are drawn to shape the hull, and the day of attaching the outrigger--is a ritual precaution to ensure that the vessel will sail fast and well. Though explained to me in this positive way, it could as well be put in the negative form usual in discussing taboos. Eating is taboo to the workmen on these two mornings. The penalty of a violation would be failure in their task, to the extent that the canoe would be slow."

"Some idea of the frequency of communal religious activities is afforded by a list of entries on this subject from the field journal kept during our stay. It must be noted in advance that this records only the more conspicuous events. Such little ceremonies as making flowers for the gods were too numerous to mention. Some performances found noteworthy the first time they were observed were disregarded later on, when they seemed merely 'more of the same'. A few such instances have been inserted in parentheses at about the time they took place, though the exact date can not be remembered. Finally, [184] since the center of ritual was the homestead Weluāra on Falālap, while we lived across the channel on FalārIk, a number of minor ceremonies undoubtedly escaped us altogether. As noted in one of the journal entries, 'They do this often in small groups, and say nothing about it.'

For what it is worth as illustration, the list of journal entries follows, with inserted comment:

July 29.-Just after we arrived, a dance, later found to be a gapeng peng or invocation to a god, was performed for Americans ashore. It was given in front of the men's house on FalārIk, instead of the usual place on Falalap. Though the dance and song are primarily religious, this particular performance seems to have been intended simply as entertainment for the visitors.

A rather long gap between entries here is probably due to the fact that this was the beginning of our stay. We could not yet interpret what we saw, nor talk to anybody except

Tom; and the people did not volunteer information as they did later on, because they did not yet know what we were interested in, and were still a bit shy and distrustful.

August 18.-Ritual to ensure safe arrival of a canoe departing for Faraulep. Most of the other departing canoes shoved off so early in the morning that this ritual was not seen. It is my impression that for the most frequent trip, to Woleai, it was dispensed with; whether because the people of Woleai, who are more or less Christianized, disapproved of it, or because this trip was too short to be considered a serious risk. Actually the ritual acts that accompany the beginning of a voyage do not form an integrated ceremony, but consist of various bits of ritual and incantations, some of them standard, others known only to a few navigators. So it might be hard to find two departures exactly alike, unless they lacked ritual altogether.

August 21.-Shouting overheard from Falālap. Explained as the conclusion of a thanksgiving ceremony given by a few people, probably one household. (Presumably a minor offering of flowers, invocation, and perhaps distribution of 'medicine'.)

August 26.-Funeral of a man who died the night before. (All funerals are preceded by a night of wailing. Women had been wailing over this man for about a week.)

September 12.-Rite of passage for a girl's first menstruation. (The song that accompanies this is also an incantation to drive off wind and rains.)

September 19-20.-The entire population devoted two days to the most elaborate invocation and distribution of medicine we saw. The gods invoked were TIlItr and his son

Tilital.

September 22. -A woman saw an evil spirit. Gargeligar possessed by TIIltr. He and a group of young men roamed about far into the night to exorcise the demon.

October 1. -Gargeligar possessed by a god again. He was instructed [185] to make medicine.

October2. -Gargeligar made medicine on Falālap, distributed it to all comers.

October 4. -Gargeligar on the prowl again, blowing the boatswain's whistle which is supposed to make a noise like a god. Hymn of invocation sung at the homestead Falevelū (a frequent occurrence at several of the more pious homesteads. The head of this household was distinctly a religious man.)

October 8. -Gargeligar once more roamed the island with the young men, singing.

October 9. -Dance to invoke the god on Falālap, followed by distribution of medicine. (A holiday for the whole population, but less elaborate than that of Sept. 19-20.) At night, Gargeligar and his young men walked and sang again.

October 11. -Funeral of a woman on Falālap.

October 12. -Tom drove off a threatening storm by going out on the stone pier at Katelu, blowing his conch horn, singing an incantation, and waving the clouds away.

October 21-23 (approximately). -Maroligar busy early every morning on the stone pier, sitting facing the lagoon, with a kinsman, doing divination with strips of coconut leaf. Said it was for a sick person.

October 23. -Beginning of rehearsals for uru dance, a religious performance, but held this time at my request. (Thereafter until the final performance, rehearsals were held nearly every evening unless it rained, at three canoe-houses; one in Falārĭk, one in Rauau, one in Falālap).

November 1. -Boys went to Falālap with Maroligar to 'make medicine' for his sick kinswoman Nobwŏr.

November 15. -Final daylight performance of uru at Rauau. Whole populace attended, though FalarIk men did not perform. An all-day celebration.

(During a period of rainy weather about this time, I happened upon Tom on the stone pier in Falārĭk, trying his incantation again on a storm coming from the west. He did not repeat the success of the other performance we saw, but kept valiantly at it until drenched.)

November 27. -Invocation and distribution of medicine on Falālap. (By this time the parades of Gargeligar and the young men by night had come to seem commonplace, and were no longer noted.) [186]

December 3. -Overwater head built for us beside pier at Katēlŭ (not the one used by Maroligar and Tom for their rituals), to end our violation of the tabooed site of the ancient men's house. The chiefs attribute the recent bad weather to indignation of the spirits of the great men of old.

December 12. -Offering of food noted at beginning of a feast to celebrate completion of

repairs on a canoe-house. Such offerings were made at the beginning of every communal meal; so such entries might have been made at the conclusion of all the public works listed in the section on economics.
(About this time, another rite of passage was held for first menstruation of a young girl, but not noted in the journal.)

December 26. -Invocation and making of medicine for the sick woman Nobwór. (Noted again on Dec. 28; we were told it was performed for four successive days by Maroligar, after that by Gargeligar.)

December 27. -Lines drawn to guide hewing the hull of a new canoe for Tom's elder son. Workmen observed a partial fast.

December 28. -Outrigger attached to Tom's canoe. Workmen fasted. (This was a different canoe, and different workmen. The fact that the crucial tasks on the two came on succeeding days was a coincidence.)

January 2. -Feast at the homestead Soumat, concluding the series of invocations for Nobwór. The sick woman, now very weak and wasted, lay in one of the houses used for the feast.

January 12. -Ritual for diagnosis and healing of the chief Paliuilimar, who has been suffering for some time from a wasting sickness, apparently the same as that of Nobwór.

January 15. -Funeral of Nobwór.

February 2. -Funeral of Paliuilimar.

In spite of the incompleteness of the list, the entries average less than a week apart, showing that religious services of one kind or another are more frequent in what may be called the church of Ifalik than in churches that hold services only on Sundays. Plainly they are not held at any fixed interval. As a matter of fact, the time for each of the more important ceremonies, in which the whole population takes part, is set by the chiefs, though the initiative is often taken, as the people believe, by a god, who takes possession of some man--most often Gargeligar--and commands that a ceremony be given.

Some of the gaps in the list are due to irrelevant factors, such as our poor observation during the early days of our stay, perhaps sags [187] in interest later on, and such misfortunes as bad weather and fatal disease. Aside from that, I had an impression of something like waves or tides of religious interest. Data are insufficient to test this, except that one concentration of religious feeling is clearly perceptible, from September 19 to October 4-or perhaps, tapering off, to October 9. The big invocation seems to have heightened religious feeling to the point where other events followed in quick succession; a woman saw a demon, Gargeligar was repeatedly possessed by a god, and thereupon roamed the trails with the young men to drive off evil spirits. Observation over a longer period might well show a recurrence of such surges of feeling, possibly even some regularity in them."

1: Burrows--187-188 (1947-48) Woleaians
116, 789 Ifalik

"Casual as the list is, it still shows something of the kinds of rituals that prevail on the atoll, and the interests about which they cluster. An attempt at classification of ritual follows:

1. Invocation of beneficent gods:
   (a) communal, to ward off disease, ensure a plentiful supply of food, or for other purposes, more than one of which may be combined in one ceremony. Involves flower offerings at the shrine (described on p. ___), singing a hymn of invocation, making and blessing a medicinal drink, and a concluding feast.
   (b) invocation by communal performance of the song and dance called gapengpeng. One dance for men, another for women; both performed seated.
   (c) invocation by communal performance of the dances called uru. Performed by men only, mostly standing. The only performance witnessed was held at my request and may have been less heartfelt than usual; at any rate, the religious element in it seemed subordinate to one of merrymaking. The song texts are partly religious, partly a medley including at least one love-song and one lament.
   (d) private incantation by a religious specialist; most often for diagnosis and treatment of disease, or for help in driving off an evil spirit, --these, too, feared mainly for diseases they are believed to inflict.
   (e) by a builder (an individual performance, but commonly in the presence of his

workers), to ensure success in his work.

(f) by a navigator (again individual but in the presence of others) to keep the canoe afloat, ward off storms, and otherwise ensure a successful voyage. One ritual seen was addressed to Paluelap. [188]

2. Exorcism of evil spirits:

(a) communal, by invoking a blessing on square mats (timās) of young white coconut leaf, which are hung about the shore so that they are visible from the sea.

(b) by groups of young men, under the leadership of a religious specialist possessed by a god; the other too may be possessed. They roam the trails by night, singing songs which are both invocations to beneficient spirits and incantations to exorcise evil ones.

(c) private, by a healer who sings incantations to exorcise the evil spirit responsible for illness.

(d) by navigators, who sing incantations to drive off storms or evil spirits."

1: Burrows--188-189 (1947-48) Woleaians 1.2
116, 782 Ifalik

"Offering (iōiō) to a beneficient god.

The general pattern is that these offerings are made by a chief or specialist at the conclusion (or at some crucial stage) of an important undertaking. (Commonly a first offering of coconuts is followed by one of cooked food. The offering is accompanied by a brief spoken prayer of thanksgiving and appeal for continued help in the future). The following seem to be the principal occasions:

(a) by the leader of a communal task (commonly a chief), at the beginning of the feast which celebrates its conclusion. The deity to whom the offering is made varies with the nature of the task.

(b) by a healer, to Lugeilang, who is asked to make the treatment effective. One offering of coconuts, a later one of food.

(c) by a master-carpenter, to Alulemas, when a building is completed. Coconuts are distributed to the workers; the juice that spurts from them when they are opened is regarded as the offering. The prayer offers thanks for success of the task, and asks for help with the next one. [189]

(d) by a shipwright. Such an offering, at an early stage of the work, is described in the account of canoe building. When a canoe is completed, an offering of coconuts is laid beside it for Seilangi. The prayer announces the offering, and asks that the builder's next canoe may be a good one. Later, at the

feast for the workers, a package of fish and taro wrapped in a leaf is put into the sea for Seilangi.

(e) by a navigator, to Aluluei. When a canoe enters the pass through the reef, outward bound on a voyage, the navigator offers, first two coconuts, later food and a new cloth. Asks protection from wind and rain and safe guidance to the port. These offerings are not thrown into the sea. The food is later eaten by the navigator and crew, the cloth kept for use."

1: Burrows--189-[redacted] (1947-48) Woleaians
116, 771 Ifalik

"Plainly these categories [KS: of religious activities on pp. 183-189] are not mutually exclusive. Exorcism of evil spirits is accomplished largely by invocation of beneficent ones. Offerings include invocations. A song may be at the same time a prayer and an incantation. Indeed, religion and magic are so blended throughout that any attempt to separate them would distort the picture.

These forms of worship might be classified in a variety of other ways, but no one basis of classification could be entirely satisfactory. For all its shortcomings, the table above seems to bring out the prevalent pattern."

1: Burrows--189

"Rites of passage. There are only two of these: taurang, to celebrate a girl's first menstruation, in which she is bedecked in finery while a song is sung over her, then leads a parade from her maternal homestead to that of her father; and the funeral, which includes all-night wailing and singing of laments (arūerū), followed by sea-burial."

1: Burrows--189-190 (1947-48) Woleaians
116, 771, 177 Ifalik 1-2

"One ritual that was never seen can not be classified for lack of clear understanding of its purpose. It was a specialty of the second-ranking chief, Maroligar, and involved apparatus kept in the men's house, Katēlū. On one of the middle posts, just below the tie-beams or about 6 feet from the floor, hangs a bag of sennit cord, subconical in shape. A slender wooden rod, about 2 feet in length and 1/4 inch in diameter, is threaded in and out across the top of the bag. Below, about a foot from the floor, is a platform approximately 5 feet square with vertical side-boards. The poles that support the corners continue upward to a height of about 4 feet, where they are connected by cross-pieces. These form a kind of rack, on which are hung cloths as offerings. Other offerings--garlands, tobacco--are sometimes left on the platform. The whole suggests a rude Shinto 'god-shelf' and its form decidedly suggests Japanese influence.

[190] Tom, when asked what this apparatus was and how it was used, said that inside the sennit bag are 12 shells of a mollusc called livou rór, that lives under stones by day, and comes out at night. Ordinary specimens of this creature are eaten. A shell that he brought to show what they are like is a flat spiral 2 or 3 inches in diameter and about 3/8 of an inch thick, with an elaborate pattern of brown markings on a white background. Each of the shells in the bag has a name of its own.

From time to time, Tom explained, people bring an offering to Maroligar, and ask him to perform the ritual. He takes down the bag, opens it, lays the shells on a fine pandanus mat, touches each of them with the stick, and names it. The names are known

only to a few, and Tom was either unable or unwilling to reveal them. He gave no more details about the ceremony, but said that after it is performed there is a taboo on work, for the whole population, for four days. Thereafter 'there is plenty of food of all kinds, both sea food and vegetables.' People bring food from all parts of the atoll, and consume it in a communal feast at the men's house. Obviously Tom's description was minimal. The obvious next step, questioning of Maroligar, was postponed, in the hope that we would have an opportunity to see the ritual performed. But this never happened during our stay, and the interview with Maroligar was still pending when the ship returned and took us away. From Tom's description, the ceremony seems to be a form of invocation. Yet the touching and naming of the shells has the look of divination."

116, 787 Ifalik 1-3

"Several ways of foretelling the future, particularly by means of strips of coconut leaf, are rather generally known. Yet some know more about them than others. In these Maroligar was a specialist, and had been from his youth: for two love-songs composed in his honor mention this skill of his. The list of excerpts from the journal notes that on several successive mornings in November he was seen to go out, soon after sunrise, on one of the stone piers that projected into the lagoon from Katelu. [191]

Another man, a fellow-clansman, accompanied him. They sat facing the water, the other man a little to the rear and to one side of Maroligar. Maroligar tore little strips of leaflet, about a quarter of an inch wide, from a coconut leaf he brought with him. These he manipulated, one by one, for a long time, then stared solemnly out to sea. Asked what he had been doing, Maroligar explained in his rudimentary English, 'Suppose some man, woman, boy, sick. Man come. I make.' He explained that he talked to the strips of leaf; then looked at them, to find what ailed the patient; and so determined what should be done for a cure. Of the strips of leaflet he said 'All men savvy make. No all men savvy talk, look.' The words then, were in a particular form, evidently a prayer or incantation. The whole procedure was an attempt at diagnosis of desease and prescription for it. Maroligar volunteered his opinion that its efficacy was limited: 'Me think, small no-good; small good.'

More specific explanations of two kinds of divination with strips of coconut leaf were obtained from Tom. One, called bwei, is a specialty of sea-captains, hence within Tom's

special sphere of knowledge. He tore off three strips of leaflet and tied a series of simple knots in each. Then he laid them in the spaces between his fingers. The knots, he said, are counted off in a series of fours. The number of the last knot determines the answer to the question in mind. Each of the numbers - 1, 2, 3, and 4 - has a special meaning. These meanings are known only to a few, Tom said, and did not tell me what they are. This kind of divination may be used to determine what evil spirit is inflicting disease. It has to be worked separately for each alus until the one responsible is found.

Another method is called trip or tribwe. (The first pronunciation seems to be the common one in ordinary speech. It may be a contraction of the second, which was recorded in a song text.) Tom said he did not know all the rules of interpretation, but showed no reluctance in imparting what he did know. This attitude, contrasted with his reticence about the form he was supposed to know, suggests a belief that imparting the true lore to an outsider may impair its effect, while there can be no harm in passing along mere hearsay. To make a trip, the four fingers of the left hand are extended, close together, and a strip of leaflet, without knots in it, is wound around them. The answer to the question in mind depends on what part of the hand is reached by the end of the strip. If it comes to the second finger, on the inside of the hand, the augury is good. If it comes to the second finger on the outside of the hand, the augury is very bad. If it reaches the little finger - whether inside or outside was not specified - the omen is favorable.

116, 787 Ifalik

This divination will reveal whether someone far away is alive and well. A song celebrating the homecoming of a seafarer says: 'The coconut leaf told me you were well.' It may also be used to find out whether love is requited. One of the songs about Maroligar describes this:

He sits under a tree nearby
And splits off a strip of leaf.
I must go see how it turns out!
Out there in the sunshine,
Taking another strip, he sees that he will win me;
The charm has told him so.
We were both very happy;
We looked in each other's eyes
And shyness overcame us.

When I told Maroligar about the plucking of daisy petals in our culture, and how they say 'He loves me - he loves me not', he was much pleased at the similarity of custom."

1: Burrows--192 (1947-48) Woleaians
116, 787, 753 Ifalik 1-2

"....other forms of divination may be used to diagnose disease. The most elaborate form we saw, which seemed to involve both diagnosis and treatment, was a ceremony conducted by Gargeligar for the chief Paliuilimar, who was failing rapidly. Gargeligar had already tried other treatments, including the singing of incantations.

Early in the morning of January 12, abouty [sic] forty-five people gathered on the platform about Paliuilimar's house. When we arrived, Gargeligar was smoking inside the house. Outside, near the eaves, two green coconuts with a stem connecting them were lying on the coral gravel. A sort of wooden dagger was laid against the stem.

Gargeligar took position at the outer edge of the platform. The two nuts were placed in the middle of a space between him and the house.

The aged patient, looking very sick, crawled out of the house and sat on a mat under the eaves, facing Gargeligar. Gargeligar stood up solemnly, took the dagger and one of the nuts, and opened the nut by first scoring the husk with the dagger, then plunging its point into the nut. He poured the water from the nut over Paliuilimar's head, then threw the nut over his right shoulder. He did the same with the other nut. Then, taking a bit of coconut leaflet midrib, he pushed back the hair from Paliuilimar's forehead, as if with a brush. As he did this, his lips were moving. Presumably he was reciting an incantation. Then he tossed the bit of midrib up on the thatch of the house. Paliuilimar crawled back into the house.

Gargeligar and two of his kinsmen, whom he was instructing in the healing art, then

carefully examined the cracks he had made in the husks of the two coconuts. He sent the two into the woods to get leaves of aro. While they were gone, he asked for a piece of turmeric paint, which was handed him from inside the house. With this he painted the incision in one of the nuts. Tom murmured to us 'Very bad that nut.'

When his apprentices brought the aro leaves, Gargeligar laid them over the painted incision in the nut as if he were healing it. Tom said to us 'He very happy.'

Gargeligar brought the ceremony to an end by announcing that the disease was inflicted by an evil spirit from Bwënnau. As this was Paliuilimar's ancestral homestead, the spirit was presumably the ghost of an ancestor of his. Yet Gargeligar added that the spirit was also (Tom's translation) 'a little bit sea-god.' As sea-gods are particularly dreaded, this statement was ominous. Far from considering his cure infallible, Gargeligar told Spiro about this time that unless some great change took place, the old chief would die. This prediction proved correct. Paliuilimar died on February 1."

116, 791 Ifalik 1-3

"Specialization in religion among the people of Ifalik is a matter of degree. There is no sharply differentiated priesthood. Yet two men were distinguished, while we were there, as oracles of a god and one other was recognized as a neophyte. Still another was the leading diviner; while several, especially Tom and his fellow-navigators, controlled limited lore and powers in connection with some other specialty.

The oracles were Orgalebwā and Gargeligar. Orgalebwā, old and emaciated, was confined to his sleeping-mat, on the floor of the house at Weluāra which was also the house of the great gods. He was the one upon whom the god descended to assemble the people for the most elaborate invocation ceremony we saw. Gargeligar was the most [193] frequently possessed and far the most active, both as master of ceremonies and as healer. In his capacity as master of ceremonies he was called taubwongbwong. This term, if I understood Tom's explanation, means master of waving to and fro. This refers to the beginning of the full-fledged invocation ceremony, when a fringe of dried coconut leaf, rather like a miniature thatch-sheet, is waved to and from by men who squat about the altar of the great gods and intone the first part of the hymn of invocation. The meaning of this particular bit of ritual has been extended to cover the whole. Sarfert translated what seems to be the same word as Anrufung or invocation. Indeed, Gargeligar told Spiro that bwongbwong is the same as gapeng, the name of the song and dance of invocation; but Tom denied this.

The neophyte was Truesai, son but not heir of the paramount chief. He had not yet

been possessed by the god, Spiro was told. He seemed to be word-perfect in the hymn of invocation; but so did a number of others. He sang part of it as a solo at the great invocation ceremony. He was prominent in dances of Falālap, and walked with the chief mourners - though he was not one of the closest relatives - in at least one funeral procession, when the body of the woman Nobwór was carried from her house to a canoe for burial at sea. Both he and Gargeligar were muscular, handsome men, fond of adorning themselves with flowers and filling the public eye. A foreigner, to whom matrilineal succession is not a matter of course, might well wonder whether one reason for Truesai's taking this road to prominence might be that his father was paramount chief, while he, as a member of his mother's lowly clan (Bwél) had no chance of succeeding to a title, unless one exceptional and even questionable possibility announced by the chiefs - that of a man succeeding his father - were invoked in his case. Everyone seemed to expect that the god would descend on Truesai later, and that he would succeed Gargeligar as taubwóngbwóng.

Divine possession was not strictly limited to Orgalebwā and Gargeligar. They seemed, indeed, to be the first choice of the god TIlltr as messenger of Aluelap. It was through Gargeligar's mouth that TIlltr first sang the two final stanzas or sections of the hymn of invocation. The preceding parts were known before Gargeligar's time. He told us that after the god left him he knew nothing of what had happened. Several times we saw Gargeligar when the god was supposed to be upon him. He was unquestionably in an

exalted state. To us it seemed that, whatever other influences might be at work, he showed every sign of having imbibed freely of fermented toddy. Orgalebwā was the only one I heard speaking in the special way Tom called 'talk for god'. It consisted of a strange intonation, - beginning on a high pitch, descending waveringly to a low one, then starting on the high pitch again. Whether the words uttered differed much from ordinary speech I could not be sure. The people seemed to understand them without difficulty. I could make out nothing; but this was rather early in our stay, when I understood very little even of ordinary speech. From time to time the god descended upon others. The youth Talimeira, assigned by the chiefs to help us, told Spiro that the god had descended upon him during one of the nights of walking and singing with Gargeligar. Asked how he knew, he said that he found himself shaking from head to foot, and singing at the top of his voice. He was distinctly a 'minor,' and in all probability had not had any fermented toddy. At the time of the first great ceremony, before any of this nocturnal activity, the chiefs told Tom to explain to us that we would probably notice the young men walking about at night and singing. They had Tom caution us against thinking that the youths were drunk. The psychological nature of this divine possession falls in Spiro's field on [sic] inquiry."

1: Burrows--193-194 (1947-48) Woleaians
116, 759, 787 Ifalik

"As a prominent healer, Gargeligar was called tautavē or master of medicine. Skill in the healing art is even more a matter of degree than specialization in other matters connected with religion. Indeed, not all healing was religious. Some herbal remedies, like those listed in the chapter on technology, seem to be common knowledge. Others are hereditary, apparently within the lineage. Massage, with a kneading or pinching motion, was practised by various experts, among them Maroligar. Maroligar, [194] indeed, as leading diviner, was probably second to Gargeligar in the healing art. As noted in the excerpt from the journal for December 26, he and Gargeligar both invoked the great gods while the woman Nobwórs was on her death-bed. I did not hear the term tautavē applied to him - as a chief he had no need of lesser titles - but am confident he would qualify for it. Indeed, this seems not to be as formal a title as tamól (chief) or palū (navigator), which are applied exclusively to a few individuals who have been awarded it by 'due process.' As far as I could make out it seems rather elastic, like the title of master-carpenter on houses. At any rate, Gargeligar claimed pre-eminence among healers on the ground that he alone received diagnoses and prescriptions for treatment direct from TIlltr. He would invoke the god, then follow instructions--a different process from divine possession, for then he was supposed to remember nothing of what the god said."

1: Burrows--194 (1947-48) Woleaians
116, 778, 353, 824 Ifalik 1-2

"The visible trappings of religion on Ifalik, like nearly all their artifacts are extremely simple. The so-called 'house of the gods' at Weluāra differs neither in appearance nor use from any other dwelling. The most distinctive building on the atoll, the men's house at Katēlū, has indeed some religious significance. The equipment for Maroligar's special ritual, described on p. _____, is kept there, and a cloth commonly hangs on the front wall as an offering to a god. But the symbolism of this building, as shown in the chapter on government, emphasizes human rank and authority more than religion.

Most conspicuous of religious emblems are what I have called shrines on some of the house platforms, just outside one end - the western end in every case I noticed - of a dwelling. These are little round flower-beds, about a yard in diameter, spread with clean, smooth sand that contrasts with the coral gravel of the rest of the platform. They are called tariaga (once recorded as tariege), but if Tom and I managed to understand each other on this point, the general word for flowers (mware), is also sometimes applied to them. The plants grown on them emphasize verdure and fragrance rather than blossoms: the large 'elephant-ear' leaves of true tar (wot) also prized as food; an occasional sprouting coconut, with leaves two or three feet high; and various aromatic shrubs, such as warung. During a ceremony the greenery was supplemented by a whole fresh coconut leaf and a leafy shoot of aro, stuck into the sand.

Most elaborate of these shrines is that for the great gods at Weluāra. In addition

to the plants, four rods called guruguru, the general name for walking-stick, are stuck into the sand, projecting to various heights. There is one each for the four great gods: Aluelap, Lugeilang, Wolfat, and TIlItr. They are painted or dyed in various colors: one red, one white, one in broad horizontal bands of alternating flame-color and a very dark green, nearly black. The pigment for the flame-colored bands is the prized rang or baked turmeric, imported from one of the high islands."

1: Burrows--194-195 (1947-48) Woleaians
116, 778, 782 Ifalik

"Another conspicuous religious emblem is the timâs, a mat of white young coconut leaf a little more than a foot square, with the pointed ends of the leaflets projecting along one side in a stiff fringe. Numbers of these are plaited by the young men, taken to the house of the god - or sometimes elsewhere - to be endowed with divine power, then hung all about the shores of the inhabited islets. They are suspended from branches which overhang either the beach or - on the lagoon side - the water itself.

The ceremony of blessing these timás is brief, and not of itself an occasion for assembling the whole population. At Weluāra it sometimes accompanies one of the [195] regular ceremonies of invocation. In that case the prayer or incantation that confers power on the squares of mat is part of the regular song of invocation. Once the sound of a conch horn, blowing from FalārIk district, was explained as part of a ceremony of blessing timás. We were told it would be over before we could get there. Whether the usual hymn was also used on that occasion is not certain.

Once in position facing the shore, the squares of mat can be seen from some distance at sea, especially when they are fresh and of a bright ivory color, contrasting with their green background of leaves. They are thought to act as talismans and keep off evil sea-spirits."

1: Burrows--195 (1947-48) Woleaians
116, 789, 778 Ifalik

"Visible emblems (Sinnbilder) accompany invocation to certain particular gods, according to Sarfert. That for Lugweilang is a paddle with two coconut leaves tied about its handle. The adze-head had formerly been used when Lauliār was invoked, or rather exorcised - for the object was to prevent the rainbow-god from destroying canoes at sea. But this adze-head had been washed out to sea in the typhoon of 1907. Carpenters invoking Alulumar used a dancing-staff (guruguru) with a strip of coconut leaflet tied about one end. Maroligar used one of the few carved dancing-staffs seen as a walking-stick, but I never saw it used in connection with the repairs to canoe-houses that he supervised; and when I asked him if he knew how I could get a specimen of such a staff, he readily gave me one of the two he owned. He would hardly have done this if the staff had been a sacred emblem."

1: Burrows--195-196 (1947-48) Woleaians 1-2
116, 778, 178 Ifalik

"For Aluluei, god of navigation, Sarfert found two emblems: a wooden anthropomorphic figure, and a conch-shell horn. Tom's mention of such wooden figures, and his statement that none exist on Ifalik any more, has been noted in the account of navigation. As senior navigator of the island, Tom owned a conch horn; and blew it while singing his incantation to ward off storms. But he did not mention its use in connection with invocations of gods of navigation, though he gave me the texts of a series of prayers of invocations to them.

Curiously, the only other emblems of this kind we saw in use were connected with a deity who, according to Sarfert, had no special ceremony of invocation - Paluelap. The emblems or insignia were of two kinds: strips of white young coconut leaf, which were waved over the hull of a canoe about to set out for another island, then tied around the end-posts; and a mature coconut in its husk, with a strip of leaflet knotted about it. This was knocked along the seams of the hull as the navigator waded about the canoe, singing his prayer or incantation.

Some of the difference between Sarfert's information and mine is obviously due to the fact that neither of us got the whole story. Part of it, though, probably reflects change in the culture during the thirty-eight years between the two visits. Knowledge of this part of the religious lore was confined to a few even in Sarfert's time (and probably always had been). The invocations to Lauliār, he was told, were known only to two men. Details reported to him in 1909 may well have gone out of use by 1947. This seems

particularly likely in the case of visible emblems of which we saw nothing. It was explicitly stated by Tom of the wooden images formerly used by navigators.

On the other hand, the whole cult of TIlItr may have arisen since Sarfert's visit. This god is not mentioned at all in the German monograph, nor in any of the myths we collected. The only texts that refer specifically to him are the hymn of invocation and a healing prayer or incantation that Gargeligar gave to Spiro. Both are said to have been revealed by the god to Gargeligar, who was not an old man in 1947; and of part of the invocation (but not all that includes mention of TIlItr) it is specifically stated that this was the first revelation. [196]

More substantial than this admittedly conjectural interpretation of differences between the two accounts is the fact that, so far as general patterns of behavior are concerned, they corroborate each other."

1: Burrows--196 (1947-48) Woleaians
116, 534, 778 Ifalik 1-2

"One of the most prominent pieces of religious equipment of Ifalik today is obviously recent - a U.S. Navy boatswain's whistle (or, ashore in the United States, a policeman's whistle). Its shrill sound, with a rattle or trill in it because the flow of air is interrupted by a pellet, closely resembles the vocal sound supposed to be the call of a god. Without a whistle, this sound is produced by a prolonged falsetto cry, trilled with the tip of the tongue as in 'rolling an R.' Apparently this vocal symbol is ancient in the culture: in the myth about the lore of seamanship, when the god Seilangi appeared to LangorIk in the form of a bird, he uttered this cry. (Tom, in telling the story, gave a demonstration.) The close resemblance of this call to the sound of a boatswain's whistle made that artifact fit readily into the native culture, but with a meaning very different from what it carries when blown by a Navy boatswain or a traffic policeman. In Linton's terminology, this is a little case of diffusion accelerated by congruity, and accompanied by a change in role and meaning.

Gargeligar had one of these whistles. Its sound at night was usually the first indication to us that the gods were abroad again. Wolpetau, paramount chief, had one too. He held it in his mouth and blew it occasionally during performances of religious dances, when he walked behind the rows of dancers, holding up a bit of tobacco or other little gifts which anyone was privileged to snatch from his hand. The suggestion seems to be that these are gifts of the gods. Attribution of divinity to the chief himself was never suggested, and would surely be denied. For that matter other chiefs, and even

commoners, might distribute gifts in that way if they wished. At least once, Tom took that road to the glory he craved.

Another occasion for blowing the whistles was during one of the nightly rehearsals of the uru dances. According to an ancient custom, women, muffled from head to foot in cloths, came up behind the dancers, and each put a garland on the head of the man of her choice. The complete wrapping-up was explained as a disguise, so that neither the favored men nor the woman's husband could recognize her. If the husband found out, Tom explained, he would be very angry. This institutionalization of jealousy must be left to Spiro to interpret. As to the religious significance of the whistles, it is diffuse and dim. I got no verbal explanation. All that is sure is that the whole performance, song, dance, and all, is essentially a religious ritual. As already noted, it seems to be taken lightly; and the blowing of the whistles may have no more vital connection with the supernatural than the costumes of ghosts and witches worn by children, among us, at Hallowe'en.

A final use of the whistles may have no religious significance at all. At least two of the whistles were sounded one night - and with them, conch trumpets - from canoes on the lagoon, surrounding a circle of seines in which a school of bonito was impounded. So far as I learned, these were simply noise-makers to frighten the fish and keep them from escaping. As noted in the account of fishing, it did not work. The point here is that these instruments seem to be not restricted to sacred uses."

1: Burrows--196-197 (1947-48) Woleaians
116, 783, 881, 764 Ifalik

"*Absence of some religious practises on Ifalik 'stands out like a missing tooth.'* Several such gaps appear among the rites of passage. My observation of the individual life cycle was confined to overt group action; but this is enough to justify the statement that there are no public observances connected with birth, or the coming of [197] age of young men, or marriage, comparable to those noted in connection with the coming of age of young women and with death."

1: Burrows--197
116, 846

(1947-48)

Woleaians
Ifalik

"As to birth, it can not be said that this crisis is entirely unaccompanied by ritual. The taboos imposed on the parents and closest relatives constitute ritual precautions. The observance takes this negative form rather than the positive one of a definite rite of passage, such as a birth or naming feast or some more distinctively religious act."

1: Burrows--197 (1947-48) Woleaians
H6, 754 Ifalik

"More striking, and more obviously significant, is the absence on Ifalik of any form of black magic, - sorcery, witchcraft, or whatever it may be called. We both inquired about this repeatedly, in various connections. Sometimes the questions were not even understood. Whenever they were, the idea of any such behavior was rejected with either indignation or amusement. I am confident that this is not a matter of successfully concealing from us existing practise. Surely some accidental bit of evidence would have betrayed any such practises if they existed. In particular, any such emotionally charged complex should have turned up somewhere in more than three hundred song texts; for instance, in laments for the dead, if death was ever attributed to sorcery. Sorcery can confidently be recorded as absent. The only practise at all like it is exorcism of evil spirits. Since evil spirits may be regarded as scapegoats, personifications of evil, the only action appropriate to them, is aggressive. That is a different matter from aggression against other human beings. Not that such aggression is altogether absent. The chiefs' structures show that gossip exists on Ifalik, as elsewhere. But it hardly ever breaks out overtly; and, from all our evidence, never summons supernatural support."

1: Burrows--197
116, 585

(1947-48)

Woleaians
Ifalik

"Absence of any wedding ceremony is the most conspicuous gap among rites of passage. This is one of the most nearly universal of all rites; witness the generalization in 'Notes and Queries on Anthropology:' 'Ceremonies mark the difference is marked simply by the young man's coming to live in the household of a girl with whom he has usually been carrying on one of the semi-furtive love affairs expected of all young people. This moving in, to be sure, is more than just a change of residence. It is symbolic, and has to bear all the significance expressed elsewhere by elaborate sacraments and exchanges of property. But without more formal, definitely patterned behavior, it can hardly be construed as a rite. Spiro was told that when a girl is unwilling to accept a suitor he may still win her by offering gifts to her kinsfolk. This suggests the bride-wealth so important in many cultures; but it does not, of course, constitute a wedding ceremony."

1: Burrows--197 (1947-48) Woleaians
116, 881, 304 Ifalik

"Specialization on one sex in initiation or coming-of-age rites is not uncommon. But the sex chosen, even in islands relatively close to Ifalik geographically and culturally, is often the male. The writer thinks first of western Polynesia because of previous field work. Initiation rites for young men there cluster about one of the operations loosely called circumcision, or about tattooing, which may itself amount to a rite of passage. But for Ifalik I have no evidence of surgery on the male genitals. Sarfert's informants explicitly denied the existence of any such practise. Tattooing, to be sure, is elaborate, and its origin is attributed to the god Wolfat. (Since this is an art form, a fuller account of it belongs in the forthcoming study of native arts.) But it is optional, and so far as known has always been so. Robertson states explicitly that in the third quarter of the 19th century not all the men were tattooed, and that the practise was in no way compulsory. While rites of passage need not be universally observed, tattooing here is no more than a form of decoration whose use is dictated by individual taste."

1: Burrows--197-198 (1947-48) Woleaians
116, 832, 533 Ifalik

"Another gap in the pattern is love magic. Lovemaking is perhaps the dominant [198] interest during the early years of maturity, and this interest is slow to wane. Throughout life, if only by reflection, it is one of the major interests. Study of sexual life was left to Spiro but this point was apparent even in casual observation and conversation. It is reflected, too, in song texts. The very name of the love song and accompanying dance (bwarux) is forbidden in mixed company, itself an indication that the subject is exciting. Yet love songs are the most numerous, and the most frequently heard of any kind of song. There is divination in the course of lovemaking, and it is mentioned in the songs. If there were any attempt to win love by magic, that would undoubtedly be mentioned too."

1: Burrows--198 (1947-48) . Woleaians
116, 105 Ifalik

"These gaps in religious behavior can be summed up in the statement that the pattern of rites of passage in Ifalik is a scanty, broken one; and that the people do not use magic on each other. Healing magic may look like an exception to the latter statement. But it is not a real exception, for the magic is aimed at the evil spirits thought to inflict disease rather than at the patient. The gaps in the pattern call for explanation; but that can not be attempted here. The explanation would have to be either historical, or psychological, or both. A historical explanation would necessitate comparison of the customs practised on Ifalik with those of surrounding peoples, a task beyond the scope of this local ethnography. A psychological explanation would require fuller data, of a kind that may be afforded by Spiro's line of inquiry, but not by mine."

"One of the prime objectives in the comparative study of human cultures, particularly among American anthropologists in recent years, has been that of dominant tendencies which give the people who live by any particular culture a characteristic motivation. Most of these tendencies may be universally human; yet differences in emphasis and phrasing give each culture a bent of its own.

Some of the explorers along this line have attempted to grasp this characteristic bent as a whole. One name for it--used, for example by Bateson and Mead in 'Balinese Character'--is 'ethos'. Ruth Benedict saw it as 'configuration'. Herskovits uses the metaphor, 'focus'. Others list a number of more specific and limited tendencies, for which they use a variety of names. Beaglehole summed up the 'master ideas' of Pukapukan culture. Kluckhohn listed main 'premises' of the Navaho way of life. Morris Opler brought out prevalent 'themes' in Apache and other cultures. The Lynds listed 'values' that make up 'The Middletown Spirit.'

Without attempting a critique of these related terms and concepts, still less aspiring to supersede them, a different label will be used here, --the well-worn term 'sentiment'. It has two advantages. One is that it emphasizes emotional rather than intellectual content. If there is one point on which all students of human behavior agree, it is that motives are powered by emotion rather than thought. The other advantage is that 'sentiment' suggests a complex, comprehensive unit. That is the kind that emerges from this study of the culture of Ifalik.

The term 'sentiment' is often used by social scientists, but usually by way of sketching in a background, without rigorous definition. Shad's 'Foundations of Character' is generally thought of as a pioneering attempt to make scientific use of it. Roethlisberger, Fritz and Dickson have recently used it effectively in 'Management and the Worker'. They acknowledge indebtedness to Radcliffe-Brown ('The Andaman Islanders'): he in turn acknowledges his debt to Durkheim and others of the French sociological school.

The only explicit definition found, in the hasty search that accompanied the formulation of this chapter, is that offered by Radcliffe-Brown in a footnote: 'Sentiment, --an organized system of emotional tendencies centered about some object.' It seems to serve the present purpose. As viewed here, the 'object' about which a sentiment is centered is some rather general interest or activity. The sentiment, then, includes all the emotions, experiences, principles and lore that concern this object. In particular, it involves one or more values, both positive and negative. When directed to some more specific object, sentiments give rise to attitudes."

1: Burrows--199-200 (1947-48) Woleaians
116, 181 Ifalik 1-2

"What follows is a summary of the sentiments that stand out in the foregoing account of the culture of Ifalik. The list can not pretend to be exhaustive. For example, the sentiment centered about sexual fulfilment is not included, because the sexual life of the people of Ifalik is not included in this study; though the importance of this sentiment was suggested in discussing the absence of a wedding ceremony. Quite unintentionally, the sentiments listed fit the classic formulation of four fundamental human wishes by Thomas and Znaniecki in 'The Polish Peasant in America.' [200]

Seafaring

Seafaring is the object of a sentiment whose strength varies according to sex--being mainly a man's concern--and according to individual character. The importance of this sentiment to the people of Ifalik is attested in most of the foregoing chapters. Canoe-building and navigation are the unrivalled high points of native technology. The principal way for a man to achieve status, as distinguished from inheriting it, is to become a palū or navigator. Another way, of somewhat lower rating yet by no means to be despised, is to become a sennap or masterbuilder of canoes. Some of the most elaborate myths validate or dignify the lore of navigation and canoe-building. The gods of navigation form a distinct group, equal in number to what I have called the 'high gods', and more clearly differentiated in function. Safety at sea is the object of a relatively rich collection of rituals and incantations.

The fundamental positive value in this sentiment is that of adventure or as Thomas and Znaniecki call it, new experience. Presumably it is enhanced by the negative value of monotony or boredom involved in staying at home. The restricted range of experience available on a tiny atoll is oppressively apparent to a visitor from afar. How keenly the natives feel it is hard to make out. One indication, though, is that the youths who loaf in the canoe-houses never tired of hearing and talking about foreign countries. Conversations turned so incessantly to this subject that my patience soon wore out. Spiro's far outlasted mine, but eventually he, too, began to steer clear of chatting with the youths in the canoe-houses. Moreover, this interest motivates more than talk. Within the limits of their capacity these people still love to roam and see the world.

The most powerful negative value in this sentiment is the fear of death at sea. This corresponds to the Thomas-Znaniecki wish for security. It is especially powerful in this culture because their vessels and knowledge of navigation, though admirable in a way, are far inferior to our matchless technology. The risk of seafaring is correspondingly greater. It is probably through fear of losing their menfolk, more than anything else, that women participate in this sentiment. The rituals and incantations for safety at sea are precautions that attest the strength of this fear among men, too. One of the great duties of beneficent gods is to roam the seas, looking for canoes that have gone astray, and bring them back to port."

116, 554, 622 Ifalik

"The sentiment of rank is another that kept cropping up in the preceding pages. In the chapter on Social Structure it was evident in the order of rank of the clans; in that on Government, in the order of rank of the chiefs, whose titles confer rank on their clans. Rank may be called the mainstay of the native system of government. It is emphasized in the richest visible symbolism found in the culture, culminating in the front post (ongarIk) of the men's house, Katēlū. The public meetings, in addition to their practical functions, serve as rituals to emphasize the dignity of the chiefs and the duty of loyalty to them. One of the strictures apparently common in the chiefs' harangues on these occasions--'Don't talk disparagingly about the people of another clan'--shows how this sentiment can become invidious. There would be no need to forbid such talk if there was none of it."

1: Burrows--200-201 (1947-48) Woleaians
116, 554, 771 Ifalik

"Rank figures less prominently in religion than the other sentiments discussed here. That may be because it is a center of less emotional [201] tension. Yet the opportunity to emphasize it afforded by communal rituals was not lost. The chiefs appointed the time for the ceremonies. During the proceedings they sat together, in a prominent position. When Gargeligar reported the admonitions of the god, he included praise of the chiefs and instructions to obey them."

"As already noted, even those who can not claim superiority in the local hierarchy of rank share the glory of outranking other islands. The main point of the legends about depopulation and repopulation of surrounding islands is, in Tom's words 'Ifalik more high.' The most conspicuous visible symbol on the island--the penis of Maur on the front post of the men's house, pointing arrogantly toward Woleai--is a reminder and re-emphasis of the traditional triumph of Ifalik over the neighboring atoll.

The continuing vitality of this aspect of the sentiment of rank was shown by the flurry that attended Spiro's chance remark about the presence of Americans on other islands, doing the same kind of work that we were doing on Ifalik. Without any suggestion from us--at least none that we were aware of--this situation was interpreted as a contest among the islands staged by the Americans. The winning islands would rise in rank, the losing ones would sink. The main thing the Americans wanted of them, so far as the people knew, was cleanliness. This seems to have been the motivation for the first public meeting held during our stay, and the clean-up of the atoll that followed.

Application of the sentiment of rank to Ifalik's acknowledged subordination to Yap, and to the United States, has been considered in the chapter on Foreign Relations. The people seem to 'know their place' and accept it. With regard to Yap, indeed, grumbling is not unknown, as in the song about a hurricane. Another way of getting back at the Yap people, psychologically, for their superior position, may be the prevalent doctrine that Yap men are great liars. The word garpar, name of the village on Yap where the

overlords of Ifalik live, is used as a verb, meaning 'to lie'. We did not hear grumbling about the Americans--of course, we wouldn't. No doubt the people would take satisfaction in ridiculing any stupid or clumsy behavior on the part of Americans; but we saw no instance of this. What we did see was on the other, the positive side. One of the high points of interest in the conversations about the outside world with youths in the canoe-houses was the relative military strength of the world powers. The youths--and at times their elders, too--seemed to revel in our accounts of the size and strength of the United States. Apparently they felt that, belonging in some sense to the American commonwealth, they could share in the glory--or rank--conferred by membership in that mighty nation."

1: Burrows--201-202 (1947-48) Woleaians
116, 554, 157 Ifalik

"The positive value of the sentiment of rank, for those whose position is relatively high, is obvious: the satisfaction afforded by a feeling of superiority. This corresponds to the Thomas-Znaniecki wish for recognition. The negative value, for those whose position is low, is of course humiliation or a sense of inferiority.

As individual rank is so largely settled by birth, a man can not do much to improve his position. Most of those of rather humble status seemed content with their lot. Presumably Spiro will penetrate into this matter farther than I can. But even the foregoing account, focussed as it is on formal, shared patterns of behavior, has repeatedly shown how two individuals were driven by craving for a higher position than their genealogies [202] allowed them. They are the two most prominent individuals on the atoll, in our eyes, except for the chiefs; and there is some doubt about even that exception--namely, Tom and Gargeligar. Though the writer is by no means qualified to diagnose a neurosis, he can not help pointing out how the behavior of these two resembles the standard picture of an inferiority complex."

Woleaians
Ifalik 1-2

"Tom had taken the principal way left open in this culture for gaining status, by making himself the leading navigator of the island; and the other, related way, as well, by becoming a master-builder of canoes. But obviously that was not enough for him. His grumbling about the monopoly on turtle meat possessed by Kovalū clan--the only one that outranked his own--is one instance. Several examples have been given of how he seized upon any chance to gain more glory, --notably the incident of getting his name, along with those of the chiefs, on the board to be hung on the front post of the men's house.

Gargeligar had taken the alternative way of making himself the master of ritual and chief spokesman of the most active of the gods. It is even possible that some of the prominence of this god was his doing. He showed his insatiable ambition even more naively than Tom did. Not only was he the most prominent figure on all ceremonial occasions--an eminence that was his due--but during all communal tasks in which he took part, his voice rose louder and longer than any of the rest.

Both men overdid it, and made themselves somewhat ridiculous. Tom's comment on Gargeligar, if discounted for jealousy, expressed a feeling that seemed general. 'Big mouth--big talk', Tom often said of this rival of his; and once; 'He savvy god--no savvy nothing else.' While work was going on, people seemed to pay little attention to Gargeligar's vehement flow of talk, unless to be amused by it. For that matter, Gargeligar accepted to some extent the role of clown. It was Tom who overstepped the

limits of his position more objectionably and was more distinctly rebuked. The chiefs' decision, after Tom had got his name on the board, that it should be hung up only when a foreign ship was in port, quietly but decisively put him in his place."

1: Burrows--202-203 (1947-48) Woleaians
116, 577, 152 Ifalik 1-2

"A sentiment that in a way counteracts that of rank--at least counteracts any tendency to take advantage of rank by arrogance--is that of kindliness. There is less evidence in the way of formal patterns of behavior to attest the strength of this sentiment than the others. The high value placed on kindliness is probably related to the absence of sorcery, though there is no telling, on the evidence at hand, just what the relationship is.

The particular form of kindliness usually singled out for praise is kindly speech. People are praised for what Tom called 'fine talk'. 'Bad talk' is condemned, and people with a reputation for what we call 'a sharp tongue' are avoided. Or so they say; we never knew an actual instance among this courteous people, who seem to live up to their ideal in this respect amazingly well. Children were sometimes scolded--mostly, so far as I noticed, for a boldness toward us that was considered presumptuous. But the scoldings were mild, as compared with tongue-lashings far from rare in our culture. The only voices I heard raised in serious anger were directed at the psychopath Tarobweliman, whose defiance of the [203] proprieties wore out the patience of his relatives.

People told us repeatedly that they liked us better than the Japanese because of our kindly talk. This was itself a case of the fine talk they value. No doubt there was flattery in it. Yet I think there was truth as well. Naturally our address to them was friendly; a considerable part of our job was to win their confidence and enlist their

help, without which we could never have worked up more than a superficial account of their culture. Besides, it was no strain to talk kindly to these masters of the soft answer.

Fine talk is particularly important in people who are important themselves; most of all in the chiefs. In discussing succession to chieftainship, I once asked Tom if a man who was first in line of succession to a title might be passed over because of undesirable personal qualities. Without stopping to refer the matter to the chiefs--though they were there to be consulted--Tom said oh, yes; if the heir-apparent was given to bad talk, he would never be considered for the title.

Songs in praise of various chiefs extoll their talk more than anything else, referring especially to the formal speeches at public assemblages. Some of the praise is for oratorical skill; a smooth, rich flow of words, 'like coconut oil'. But the main emphasis is on kindliness. More than one of the songs refers to a belief that if the talk of the chiefs is kindly, the people will thrive and live long; if the talk of the chiefs is harsh, the people will perish. How strong this belief is, I have no way of telling; but it accords so well with this sentiment of kindliness, as expressed particularly in speech, that it is pretty surely more than empty words. The positive value in the sentiment of kindliness is the joy of pleasant human relationships. It corresponds to the Thomas-Znaniecki wish for response. That wish is also exemplified in the master-sentiment here mentioned only in passing: that of sexual fulfilment."

1: Burrows--203-204 (1947-48) Woleaians
116, 152, 753 Ifalik

"Above all, the people of Ifalik want to keep alive and well. So do we all, no doubt; but this sentiment is more poignant with them than with peoples who have better assurance that this wish will be granted. The wish, in the Thomas-Znaniecki list, is for security. The positive values are life, health, and, as a means to that end, plenty of food. The negative values are famine, sickness, and death. A special aspect of the same wish and the same values has already been noted under the sentiment of seafaring, where death may come by shipwreck or by drifting off the course.

The population has been diminishing, and the people know it. The fear of death comes closer home to those who are taken sick themselves or who have sickness in their own families or households. They know too well how often sickness among them is fatal.

This dominant anxiety is abundantly reflected in their religion. The prayers of visiting chiefs from Yap are thought to ensure, above all, abundance of food. The main reasons for invoking TIIItr, as agent of Aluelap, are to ask for counsel in the treatment of sickness; or to bless the medicine prepared to keep off sickness; or to drive off an evil [204] spirit, whose main purpose is supposed to be to inflict sickness; or to assure abundant food, so that people will be healthy. Some diseases are attributed to possession by evil spirits. Indeed, the evil spirits that haunt their thoughts are essentially personifications of the fear of sickness and death."

1: Burrows--204 (1947-48) Woleaians
116, 688, 784 Ifalik 1-2

"The same preoccupation appears in the following list of penalties thought to follow violation of a taboo:

Misdeed	Punishment
A man enters the birth house-	famine
A man enters a menstrual hut-	one version, starvation; other version, sickness
A man enters a pool for soaking coconut husks-	he will be unable to catch fish for 20 days; so his household will be short of food
Fish caught in a big trap are cooked in a pan-	no more driftwood, no more fish for the big traps; i.e., shortage of food
sexual intercourse during turu fishing, or immediately before trolling-	failure to catch fish; (shortage of food again)
sexual intercourse during early pregnancy, or between birth and walking-	death of the baby
menstruating woman approaches rongonax tree-	typhoon. (Typhoons are followed by famine.)
menstruating woman visits taro patch-	the taro will not thrive

1: Burrows--204

Woleaians-2
Ifalik

Misdeed
leaving a dead body ashore-

Punishment
the vegetation will wither, and the people will starve."

1: Burrows--204-205 (1947-48) Woleaians
116, 152, 262 Ifalik

"The object of the ritual which only Maroligar can perform is to ensure abundant food. Divination is more often to learn the outcome of sickness, or what evil spirit inflicted it--so that he can be exorcised-- than for anything else.

The high value of food is emphasized in the chiefs' talks to the people. A related value, industry, is prized mainly as a means to abundance of food; 'If you do not work, there will be no food.' The people are exhorted not to steal, --especially not to steal food. They are urged to share--share food especially--with those who lack it, and with the sick.

There is a positive side to the value placed on food. The custom of concluding every communal task, and every ceremony in which all the people take part, with a feast, is evidence of that. The offering to [205] the gods at the beginning of such feasts may be a precaution, but may well have a more positive tone, that of inviting the gods, in token of good will and thankfulness, to share the people's bounty. Tom was fond of saying that Ifalik has plenty of food. So it has, as far as coconuts and pulax go; but the supply of breadfruit depends upon the season, and that of fish is rather scanty."

1: Burrows--205 (1947-48) Woleaians
116, 262, 152, 751 Ifalik

"Food and sickness are discussed as parts of the same sentiment, not so much because of the close connection in our minds between nutrition and health, but because the people themselves make such a connection, if not in the same way as we do. Feeding is a favorite treatment in case of sickness. The text of a song of lament says:

He was suddenly taken sick.
I am afraid he is hungry.

A common theme in laments for dead children can be phrased like this: 'Why did he die? I gave him the best of food, so that he would grow big and strong.'

A commonplace in the interpretation of folklore is that it may reflect past rather than present conditions. For example, the setting of our fairy tales is the life of European peasants in the Middle Ages or earlier. It may be that the emphasis on food just brought out reflects an anxiety that was stronger in the past, when the population was larger, than it is now. But there is no indication that the anxiety over sickness has diminished. On the contrary, since greater contact with foreigners has brought new diseases, it seems likely that this anxiety is stronger now than ever. The bright side of the picture is the prospect that the people of Ifalik and the islands round about will increasingly get the benefit of American medical skill. That may well brighten the tone, and relieve some of the tension, of this strongest of their sentiments."

1: Burrows--206
116, 197

(1947-48)

Woleaians
Ifalik

"The native language of Ifalik is assigned by linguists to the Melanesian branch of the Malayo-Polynesian linguistic stock. It is identical, or nearly identical, with that of the immediately surrounding islands--Woleai, Lamotrek, Faraulep, Eaurupik, and (informants say) Sorol and Ngulu, (called on Ifalik Ngolu). Differences are apparent between this Ifalik (or Woleai) dialect and that of Fais and Ulithi to the northwest, but they are slight. Differences are apparent as near as Satawal to the east, but the people of Ifalik say they have no difficulty in conversing with the people of islands as far as Puluwat, nor even with those of Truk, though there the difference becomes substantial.

The language of Ifalik and that of Yap, however, are not mutually comprehensible, from all accounts. Many people of Ifalik can converse with those of Yap, particularly with their acknowledged overlords in Garpar (Gatschapar) village of Gagil district. But this means that one or other party to the conversation has learned a foreign language."

1: Burrows--206-210 (1947-48) Woleaians
116, 194 Ifalik 1-8

"The orthography used in this report has been adapted from those used by Sam H. Elbert for other islands in the Carolines, and is limited to characters readily made on an ordinary typewriter. It is not consistently phonemic, for the task of working out the phonemes, though begun, was not completed. Nor is the spelling entirely consistent.

The phonemes in use are relatively few. This very fact renders fine distinctions unnecessary in many cases, and a number of the phonemes are pronounced indifferently in several ways which, to speakers of English, are quite distinct. The most widely known of these phonemes of wide range is that which includes l and n, because it has been found on other islands, including Truk. In Ifalik, too, l and n are interchangeable except when prolonged or 'doubled.' Limen, the name of a kind of fish, can as well be pronounced nimel, limel, or nimen, as nearly as I could make out. There does seem to be some tendency to prefer one of these alternative sounds to the other in some combinations; but to determine just what this tendency amounted to would have been a time-consuming task, at which the writer was inexperienced; so it was not attempted. It is clear, at least, that the 'doubled' consonants are not interchangeable. The one most commonly doubled is n. The word fëngenni, 'together', is never heard as fëngelli. Nor is Ella, name of an uninhabited islet on the atoll, ever pronounced Ennā.

Some other phonemes of wide range are the following:

k - g - y - These three palatal sounds -- an unvoiced stop, a voiced stop, and a spirant -- seem interchangeable in initial position. All are sounded very lightly;

thus the word for clan was recorded as ailang for some time before the presence of this initial sound became unmistakable, and the spelling was changed to kailang. The name for the men's house was first recorded as Atelu, later as both Katelu and Gatelu (the G more or less spirantalized). In inter- [207] vocalic position the voiced form is usual, perhaps invariable. It is most commonly a spirant, but is sometimes pronounced so briefly as to sound like a stop. In rapid speech it may be elided; thus lago was often heard as lao. In final position the unvoiced stop seems invariable. The change according to position is tested by the usual practise of dropping final vowels. Thus, the full name of the atoll we spell as Ifalik seems to be Ifalugu, a form recorded only in song texts. It is usually pronounced Ifalo'k; in final position the stop is unvoiced; the sound of the vowel also changes. Similarly, the full name of the island we call Truk seems to be Trugu or Rugu (again recorded only in song texts); but it is pronounced Tro'k or Ro'k.

s, z, sh, j - There seems to be but one sibilant phoneme, which can be pronounced in any of four ways. Thus the word sari, 'child', was recorded as sari, zari, and jari. The sound written as j is like French j, or English si in 'occasion'. This sound is especially favored in songs, but is not uncommon in ordinary speech. The sound sh was noted only in final position; perhaps a matter of unvoicing the j when a final vowel is not sounded.

r, tr, ɾ - The basic pronunciation of this trill-plus phoneme, and perhaps the most frequently heard, is a simple lingual trill. But when the utterance is begun with the tongue in contact with the teeth and hard palate, it is heard as tr, with an initial stop. This is interchangeable with the simple trill in any position, though one form or other seems commonest in some combinations. This is one of the points at which the spelling used is not phonemic, the sound being written as most frequently heard. The third sound is less frequent, yet is the commonest in some combinations, usually in final position. Thus the word mauar (goodwill of any kind; like Hawaiian aloha) was first heard as mauas, though the final s seemed a little queer. More careful observation was induced by occasional hearing of a final trill in this word and in one other, the name of the boy assigned by the chiefs as our helper, Talimeira. We pronounced this at first as Talimeija (j as in joy): but after hearing it occasionally as a trill, careful listening brought out the apical spirant. It seems describable as an attempt at a trill, not pronounced energetically enough to make the tongue flap.

a, ă, - A as in father and a as in hat seem interchangeable. Emphasis appears to pull the sound toward ă. The emphatic, prolonged pronunciation of this sound gives a feline, caterwauling effect to overheard conversations. Here again the spelling is not phonemic. Because of doubt as to whether these two sounds were one phoneme, words are spelled with the sound most frequently heard. [208]

On the other hand, the language consistently makes some distinctions that seem rather fine to the ears of speakers of English. One of these is between w and bw. W is like English w, but sounded very lightly in initial position. The German Sarfert, for example, did not hear it, but wrote Oleai where we write Woleai, Olofat where I write Wolfat. The bw is a voiced spirant, very like a voiced English 'wh'. The fact that the native language distinguishes between the two is beyond doubt. For example, wong means turtle; bwong, night. Another fine distinction is between m (like English m) and mw (an m with rounded lips). The range of sound in vowel phonemes seems in general narrower than in consonant ones, and some of the distinctions observed are difficult for speakers of English. It can not be asserted that the spelling of vowels here is infallible.

The language does not tolerate juxtaposition of consonants. Whereever two consonants are written together, a vowel must be sounded between them. The vowel used is the 'neutral' one often written ə; like English a in 'unapproachable'. (Consonants were written together when the vowel between was not considered phonemic; but this conclusion is vulnerable.

Final vowels are not pronounced unless they are prolonged, or the word is followed by one beginning with a consonant. Even in the latter case, the sound heard is as often the neutral vowel as whatever the final one would be in the complete form. A number of the words written with a final consonant probably have an additional final vowel which was never heard. The kind of systematic linguistic study that would have been

necessary to identify all final vowels was not undertaken.

With this much by way of preliminary explanation and apology, a list of the characters used in writing native words, with the meanings intended, follows:

Vowels

i - like English 'ee' in 'meek'.

I - like English 'i' in 'hit.' Whether this is a distinct phoneme from the preceding one is not certain, but its pronunciation seemed consistent.

e - like English 'e' in 'egg'.

ė - like French 'e muet'; or like 'u' in 'ugly' but with lips rounded.

ë - back, high, unrounded. Not found in English.

a - like English 'a' in 'father'.

ä - like English 'a' in 'hat'. Seems interchangeable with the preceding in many combinations, but others were heard only in the one way.

o - apparently variable, from like English 'aw' in 'law' to more like British-English 'o' in 'got'.

ȯ - like English 'oo' in 'wool'.

u - like English 'oo' in 'boot'. Interchangeable with the preceding in some cases, as rowȯt - rowut. Dropping a final vowel, which unvoices the preceding stop, will change the vowel before that from 'u' to 'ȯ'. [209] Thus 'Ifalugu' becomes, 'Ifalȯk'.

ü - front, lower high, rounded. Not found in English. Like the 'i' of 'it', pronounced with rounded lips.

y - like English 'u' in 'ugly'. In some cases seens interchangeable with 'a'. The 'neutral' vowel, inserted between consonants, is also very like this.

Most of these vowels, perhaps all of them, occur successively. In this case, unlike English diphthongs, both retain about equal duration and emphasis.

Stops

Never aspirated or glottalized.

p - like English 'p' in 'lip' or 'apparatus'; not like the aspirated 'p' of English 'peak'.

pw - rare. Noted only in lipwaix, a kind of fish, and ganipwa, a kind of taro.

kk - like English 'k', but prolonged. Rare.

Stop-Spirant

k - g - As already noted, three sounds seem included in one phoneme; an unvoiced stop like English 'k' (unaspirated), a voiced stop like English 'g', and a spirant usually written phonetically with a gamma. Because of doubt as to whether 'k' and 'g' were always interchangeable, both letters were retained in use. There seems to be no doubt that the stop and the spirant written as 'g' are interchangeable.

Spirants

bw - bilabial, voiced, rounded; like a voiced utterance of English 'wh'.
w - like English 'w'; lightly sounded in initial position.
f - like English 'f' or 'v'; the voiced and unvoiced forms appear interchangeable.
s, z, sh, j - the point that these four sounds seem interchangeable has already been discussed. Because of some remaining doubt as to whether this is always so, they have been written as most frequently heard or, when that was in doubt, as 's'.
x - like German 'ch' in 'ach', or Spanish 'j'.

Nasals

m - like English 'm'.
mw - like an 'm' pronounced with rounded lips. [210]
nn - like English 'n', but prolonged.
ng - like English 'ng' in 'sing', 'winging', but occurs also in initial position.

Nasal-lateral

n - l - these two sounds, like those written with these letters in English, but farther forward (dental), are interchangeable. There seems to be a tendency to favor one or other in some combinations -- for example, the name 'Tarobweliman' was never heard as 'Tarobwenimal' - but in most cases no preference could be noted.

The writing here is as inconsistent as the pronunciation. Words are recorded as most frequently heard, or first heard; but any l can as well be an n, so far as determined.

Lateral

ll - the lateral is not often doubles, but when it is, it is no longer interchangeable with 'n'.

Trill-Spirant

r, tr - the three sounds included in this phoneme have already been discussed. Again the spelling is variable, like the pronunciation, with some attempt to record the trill as most frequently heard, but no way to write the spirant."

1: Burrows--211-222 (1947-48) Woleaians
116, 192 Ifalik 1-18

"The following list contains mostly words of rather general application. Some more specific or technical bits of vocabulary, given in the text, are not repeated here: numerals, names of plants and animals, and of kinds of turtle meat under Geography (some of the commonest species are repeated below); names of the parts of canoe, house, and loom, and of stars (navigation), under Technology: kinship terms -- which have no exact English equivalents -- under Social Structure.

IFALIK TO ENGLISH

ai - you (2d person plural before verb)
al - sun
ăl - road
alax - talk, say, speak
aleal - spoon (of green coconut husk)
alŭs - god, demon
amann - finished
angi - wind
aramat - man, human being
aramatakaua - somebody
arot - finished
ăting - seine, fishing with seine

arío - still fishing, without pole
arŭeru - lament, for the dead
aseal - pregnancy
aso - thatch
asogili - thatch of cured leaf
atiligetau - latch to fasten wall mats
atolief - wick, twisted like rope from crude coconut husk
atuafang - north-east wind
aúlap - much (of food)
aulóng - surf
auralap - south wind

bugum - anus [212]
bwa - if
bwames - moribund
bwarux - serenade (song and dance)
bwău - angling
bwei - kind of divination with coconut leaf
bwél - taro swamp

bwèrbwér - white
bwitog - come
bwogotai - (my) hereditary land
bwyng - heavy

eà - fishing line (made of gilivō, hibiscus bast)
ebòng - broken bone
egakatik - lie
egàrep - near
elepan - loin-cloth
engang - work (general) may be solitary
erotr - dark
eteram - light
etraual tamae - deathly sick
evangelap - north wind
ewai - mouth
ewès - old

fal pai - (my) armpit
faleval - make a canoe

falū - land (island)
fan - work house or storehouse
fan nap - men's house
fan ni wā - canoe house
far (fatr) - pandanus [213]
fäs - laugh
fatevät - thatch a house
fatogi - to plant
fätol - paddle
fätul - eyebrows
faumax - coral gravel
fe - intercourse, sexual
fengenni - together
fɑ - new
fóti - nose

gafitag - same
gai - penis
gajebwón - very short
gajɨ - bring

gajitok - bring
galola - urine
gami - you (pl)
ganei - give (to the speaker)
ganeu - give (to another)
gang - me, I
gapengpeng - invocation of a god by song and dance
gato - basket, round, with handle, to hold bowl
gatrepar - lie (from Gatschapar, a village in Yap)
gatru - happy
gel - you
gelago - dog
geligeli - weed a garden
gesebwal - wind (when aboard a canoe)
gili - mat (sitting)
gilivo - Hibiscus tiliaceus [214]
gilixa - pox? (sickness involving red spots on the body)
gir - we
gitigit - little, small
golgol - cord

gomware - sweetheart
gorōro - blue
guruguru - staff, walking-stick

ia - why
ia rigerik - tried
iauru - south
iät - up
ievang - north
ig - fish
igan - there (not far)
igei - here
igelan - there (far)
ikolevo - chills
ilalo - down
iletoru - west wind
im - house (dwelling)
imailolo - nausea
im mutumae - menstrual hut
ire - he

ire - they
itagula - perhaps
ivä - where
iwa - that's it (it is in the right place)
izamet - enough (of food) [215]
jatok - give (me)
jokŏt - little (of food)

kailang - clan
katiri - fast
kauerei - fishing with, or going about with turu, coconut leaf torch
kepalepan - loin-cloth
kepät - talk, say, speak
kepätepät - talk, say, speak
kĕri - rat
ketagumwaliel - turn (oneself around)
ko - fish hook
korrou - rain
kŏtu - east wind

lago - go
langi - sky
lap - big, much
legao - female baby
leguliwor - ocean (outside the reef)
ligetī - all gone
lip - pit (hole)
lo̱ - big wave (tidal?)
lalai - long
lo̱ko - broom made of coconut leaflet midrib
lu (nu) - coconut
luei - tongue
lugu - within, inside (of)

ma - from
mageru - backrest stone [216]
magetox - assemble
mäi - breadfruit
mako - tatooing, tattooed
makulong - northward (on land - toward Falārīk)

malemin - hurricane
māliel - thick
malieli - talk (in general)
malivilIf - thin
malo̍k - chicken, fowl; malo̍k rowot, hen; malo̍k nwal, rooster
mălu - weak
malu li pei - (my) elbow joint
malu li perei - back of (my) knee
maluelu - slow
malūm - cooking shed
maniling - cloud
māringeri - hard (stiff)
marmar - garland
masetra - dysentery? (blood in the feces)
mătotiu - sit
mauar - good-will
mazūr - sleep
melē - this
melekaua - something
melmo̍rok - thief

mennā - that
mennaxo - drift off the course
mesetat - sea-sickness
mesilipik - epidemic; also, name of a spirit blamed for certain diseases
metā - what
metag - pain [217]
metagtrimwei - sick in the head, headache
metai - (my) eye, (my) face
metala tut - nipple
metamasuro - blind
metär - lagoon side
metōtu - buttocks
mezoazou - strong (wind)
mizelök - seaward side
mongō - eat
morumor - short

na - to, toward
namo - lagoon
namu - mosquito

nangeta - famine
nau - tomorrow
ngi - teeth
ngolu - ghost
ni - in
nibwel - taro patch
nijor - morning
nijor a nau - tomorrow morning
niwel - wood or bush

ọae - (my) lip
onremai - (my) hair
owai - fishing spear

pa - bonito hook
pag - feces
pai - (my) arm
palū - navigator, captain (of a canoe) [218]
pät - thunder
paula - hole

paula - arm
pegInni - dark cloud
pei - sand
pelaperaliperei - (my) foot
perei - (my) leg
perou - beach sandstone
petrau - hungry
pulax - swamp taro

rag - season (5 months)
ral - fresh water
ran - day
rang rang - flame colored
rannu - soft
re - they (before a verb)
rere - message
retra - red
retralo - black
rewa - comb
rouro - yaws

rowot - woman
ru - upon, in (a canoe)

sa - tide
sa gunetox - incoming tide
sa pöretox - high tide
sa wat - low tide
sagai - (my) belly
saīpē - fan (pandanus) [219]
salax - go
sames - die
sangau - sad
sari - child
sari mwan - little boy
sari rowot - little girl
sekut ma sekut - easy
semet e la - it is different
sennap - master-builder
seu e la - same
shewoshu - to grate (food)

shugu - to pound (taro)
si - we (1st person plural inclusive)
sirō - hog, pig
si wolei langi - hurricane
si wolei malemin - hurricane
sibelawe - secret intercourse in the bush
siugao - male baby
siutax - stand
sopal - large adz
sor - talk, converse

taali - rope, large
tabw - taboo, forbidden
tabwol i velu - cape, or point of land
tagale mailap - east
tagolu - back
taif - house platform
taikole - eyebrows
tal - dream [220]
tamae - sick

tamól - chief
tangi - cry
taoro - pass (in and out of lagoon)
tapei - wooden bowl
tar - none, nothing
taramei - overcast sky
tari mwan - a youth
tat - salt water
täu - far
taubwong bwong - master of ceremonies, 'priest'
taui - conch shell, conch shell trumpet
tautavē - healer, (native)
tavē - medicine
tawol - land's end
temwau - sick, nauseated
tër - native cloth, woven on loom
tera - throw
teraia - throw-net
tetar - throw
tibwe - lower, descent; (of a god) descent to earth, take possession of a man

tingi - vagina
toai bwyng - light (in weight)
tobore - drill, (spun by hand)
topoxau - mat (sitting)
trau - heavy
trela - small adz
trelwa - hat of pandanus leaf
tribw - divination with coconut leaf [221]
trimwei - (my) head
triwerep - bay
trou - big scoop net
tru - bone
tubwu - sets (of sun or star)
tubwuli mailap - west
tufai - old person
tufai mwal - old man
tufai rowot - old woman
turu - coconut leaf torch
tut - breast
tutu - wash

ụmu - earth oven
unn - green
urur sari - play-pen for baby

vagilitọ́k - find
väu - stone
veivei - same
verugit - big, much
vori - make, do
vọ́rovọ́r - turtle shell
vus - star

wā - canoe
wait - trolling
wangevale - set a post
wenëng - far up, aloft
werIkar - hard (difficult)
wetau - basket [222]
wIr - banana
wọ́lwọ́l - vegetation, plant, wood

wórawóra - lightning
wot - taro (true taro)
wotr - reef

xai - we (1st person plural exclusive)
xauolotiu - put, place"

1: Burrows--223-234
116, 192

(1947-48)

Woleaians
Ifalik 1-19

"adz, large - sopal
adz, small - trela
aloft - wenëng
angling - bwău (see also bamboo)
anus - bugum
arm - paula
arm (my) - pai
armpit (my) - fal pai
assemble - magetox

baby, female - legao
baby, male - siugao
back - tagolu
backrest stone - mageru
bamboo - bwău
banana - wIr
basket - wetau
basket, round - gato (go hold bowl)
bay (identation in coast) - triwerep
belly (my) - sagai

big - lap, verugit
black - retralo
blind - metamasuro
blue - gorōro
bone - tru
bonito hook - pa
bowl, wooden - tapei
boy, little - sari mwan
bread fruit - mäi
breast - tut [224]
bring - gajī, gajitok
broom - loko
builder, master - sennap
buttocks - metōtu

canoe - wā
canoe house - fan ni wā
canoe making - faleval
cape (point of land) - tabwol i velu
captain (of a canoe) - palū

chicken - malok; hen, malok rowot; rooster, mwalok mwal
chief - tamol
child - sari
clan - kailang
cloth, native - tër
cloud - maniling
cloud, dark - pegInni
coconut - lu (nu)
comb - rewa
come - bwitog
conch shell - taui
conch trumpet - taui
converse - sor
cooking shed - malūm
cord - golgol
cry - tangi

dark - erotr
day - ran
demon - alus [225]

descend - tibwe
die - sames
different - ṣemet e la
difficult – werIkar
disease - tamae: backache, tagumol; stomach-ache, metagiseni; sore leg, metag i leperei; broken bone, ebong; cut, kopitok; chills, ikolevo; fever, isamesilibwex; dysentery (? blood in the feces) masetra; 'red spots on the body', gilixa; sea-sickness, mesetat; yaws, rouro
divination - bwei, tribw
dizziness - maliel
do - vori
dog - gelago
down - ilalo
dream - tal
drift - mennaxo
drill, hand - tobore

east - tagale mailap
easy - ṣekut ma sekut
eat - mongō

elbow (my) - malu li pei
enough (of food) - izamet
epidemic - mesilipik, masen
eye (my) - metai
eyebrows - fätul, taikole

face (my) - metai
famine - nangeta
fan, (pandanus) - saipe'
far - täu
fast - katiri [226]
feces - pag
find - vagilitok'
finished - amann, arot
fish - ig
fish hook - ko
fishing, seine - äting
fishing, still - ario'
fishing, torch - kauerei
fishing line - ea'

flame colored - rang rang
foot (my) - pelaperaliperei
forbidden - tabw
fowl - malok
from - ma

garland - marmar
ghost - ngolu
girl, little - sari rowot
give (to the speaker) - ganei, jatok
give (to another) - ganeu
go - lago, salax
god - alus
gone, all - ligeti
good-will - mauar
grate (food) - shewoshu
gravel, coral - faumax
green - unn

hair - onremai

happy - gatru [227]
hard (difficult) - werIkar
hard (stiff) - māringeri
hat (of pandanus leaf) - trélwá
hau (Hibiscus tiliaceus) - gilivō
he - ire
head (my) - trimwei
headache - metag trimwei
healer, native - tautavē
heavy - bwyng, trau
here - igei
hog - sirō
hole - paula
hook, bonito - pa
hook, fish - ko
house, dwelling - im

house, store--fan
house, work--fan

house platform - taif
human being - aramat
hungry - petrau
hurricane - malemin, si wölei langi, si wölei mal emin

I - gang; (before a verb), i
if - bwa
in - ni
in (a canoe) - ru
inside of - lugu (the distinction between this and 'ni' not clear) [228]
intercourse, sexual - fe
intercourse, sexual (secret in the bush) - sibelawe
invocation (of a god by song and dance) - gapengpeng

knee, back of (my) - malu li perei

lagoon - namo
lagoon side - metăr
lament - arūerū
land (island) - falū

land (hereditary plot, my) - bwogotai
land's end - tawol
latch (to fasten wall mats) - atiligetau
laugh - fäs
leg (my) - perei
lie - egakatik, gatrepar (from Gatschapar, a village in Yap)
light - eteram
light (in weight) - toai bwyng
lightning - worawora
lip - oae
little - gitigit
little (of food) - jokot
loin-cloth - elepan, kepalepan
long - lalai
lower - tibwe

make - vori
man - aramat
man, old - tufai mwal
massage - rere

master of ceremonies - taubwingbwing [229]
mat (sitting) - gili, topoxau
me - gang
medicine - tavē
menstrual hut - im mutumae
moribund - bwames
morning - nijor
morning, tomorrow - nijor a nau
mosquito - namu
mouth (my) - ewai
much - lap, verugit
much (of food) - aulap

nausea - imailolo
nauseated - temwau
navigator- palū
near - egárep
net, throw - teraia
net, scoop - trou
new - fo

nipple - metala tut
none - tar
north - ievang
northward (on land toward Falārlk) - makulóng
nose - fóti
nothing - tar

ocean (outside of reef) - leguliwor (? this term in doubt)
old - ewés
oven (earth) - umu

paddle - fātól [230]
pain - metag
pandanus - far (fatr)
pass (in and out of lagoon) - taoro
penis - gai
perhaps - itagula
person, old - tufai
pig - sirō
pit (hole) - lip

place (v.) - xauolotiu
plant - wolwol
plant (v.) - fatogi
platform, house - taif
play-pen - urur sari
pound (taro) - shugu
pregnance - aseal
priest - taubwongbwong
put - xauolotiu

small - gitigit

soft - rannu
somebody - aramatakaua
something (nearby) - melekaua
south - iauru
speak - alax, kepät, kepätepät
spear, fishing - owai
spoon (of green coconut husk) - aleal
staff - guruguru
stand - siutax
star - vus
stone - väu
strong (wind) - mezoazou [232]
sun - al
surf - aulong
sweetheart - gomware

taboo - tabw
talk - alax, kepät, kepätepät, sor
talk (general) - malieli
taro (true taro) - wot

taro (swamp taro) - pulax
taro patch - bwel, nibwel
tattoed, tattooing - mako
tattooing, specialist in - taupotu
teeth - ngi
that - mennā
thatch - aso
thatch (of cured leaf) - asogili
thatch (v.) - fatevät
that's it - iwa
there (far) - igelan
there (not far) - igan
they - ire
they (before a verb) - re
thick - māliel
thief - melmorok
thin - malivilIf
this - melē
throw - tera, tetar
throw-net - teraia

thunder - pät
tide - sa [233]
tide, incoming - sa gunetox
tide, high - sa pörctox
tide, low - sa wat
tired - iā rigerik
to - na
together - fëngenni
tomorrow - nau
tongue (my) - luei
torch, coconut leaf - turu
toward - na
trolling - wait
trumpet, conch - taüi
turn (oneself around) - ketagumwaliel
turtle shell - vorovor

up - iät
up, (far) - weneng
upon - ru

urine - galola

vagina - tingi
vegetation - wólwól

wailing (for the dead) - tangi
walking-stick - guruguru
wash - tutu
water, fresh - ral
water, salt - tat
wave, big (tidal?) - lo'
we - gir
we (inclusive) - si
we (exclusive) - xai [234]
weak - mälu
weed (v.) - geligeli
west - tubwuli mailap
what - metā
where - ivā'
white - bwerbwer

why - ia
wick (twisted from crude coconut husk) - atolief
wind - angi
wind (when aboard a canoe) - gesebwal
wind, east - kotu
wind, north - evangelap
wind, northeast - atuafang
wind, south - auralap
wind, west - iletpru
within - lugu
wood - wolwol
woods - niwel
woman - rowot
woman, old - tufai rowot
work (general) - engang

yaws - rouro
you - gel
you (pl.) - gami

you (pl. before verb) - ai
youth, a - tari mwan"

"Appendix II. Further Sailing Directions.

A. Ifalik to Faraulep & Return

Guiding Stars - Wolwol, due north, indicates the true direction. But because of prevailing currents, take first Tagalemailepalevang (on the chart as (Tagali) Mailapelivang) for 4 miles; then Tubwulemailepalevang for 1 mile; then Wolwol. After following Wolwol for 1 1/2 miles, Faraulep should be sighted.

Rear Sight - Keep Ella just touching the northwestern tip of Falārik.

Bird - If a metalipangerāle, with long tail feathers, is sighted, the canoe is off its course. Then the star Ulu (whether rising or setting not stated) will bring it in to Faraulep.

Fish - If a shark is sighted, follow the star Metremeiat.

Stars for Return Trip - The star indicating the true direction is Wolwol. To allow for currents, take first Metremeiat for 4 miles; then Metremeital for 1 mile. From there, Wolwol will fetch Ifalik.

B. Guiding Stars, Faiau to Ifalik.

Metremeital for 5 miles; then Tubwulemetara (on chart as (Tubwu li) Metarua) for 2 miles; then Tubwul'Ipu for 2 miles. This will bring the canoe in sight of Ifalik.

C. Rear Sights for Voyage from Ifalik to Lamotrek.

Put Ella just touching the end of the long stone pier on Falālap.
On the return trip, put the islet Falaite just touching the north end of Valipi.

D. Courses from Yap to Ifalik, with Intermediate Stops

First course: 1. Yap to Ulithi; guiding star, Tagal'ulu.
2. Ulithi to Fais; Tagalielieli.
3. Fais to Woleai; Tagatumūra.
4. Woleai to Ifalik; Tagalielieli.

Second Course: 1. Yap to Sorol, Tagalielieli.
2. Sorol to Woleai; Tagalielieli.
3. Woleai to Ifalik; Tagalielieli.

Third Course: 1. Yap to Sorol; Tagalielieli.
2. Sorol to Eaurupik; Tagatumūra.
3. Eaurupik to Woleai; Tagalimēl.

To sail from Ifalik to Yap, the preferred course is by way of Woleai and Sorol. The star Tubwul'ūlu is followed the whole way.

E. Courses from Truk to Ifalik. [236]

First Course: 1. Truk to Satawan, Tubwulimailap.
2. Satawan to Ifalik, Tubwulimailap.

Second Course (recommended because gaps are shorter):
1. Truk to Puluwat; Tubwul'ūlu; (2 nights).

2. Puluwat to Satawan; Tubwulielieli; (1 night).
3. Satawan to Lamotrek; Tubwul'ūlu (1 night).
4. Lamotrek to Elato; Tubwul'ūlu (1/2 day; these islands are in sight of each other.)
5. Elato to Ifalik; Tubwulielieli; (1 night).

F. Courses from Ifalik to Truk.

First Course: Ifalik to Satawan, Satawan to Truk; Tagalimailap the whole way.

Second Course (recommended because distances are shorter).

1. Ifalik to Elato; Tagal'ulu.
2. Elato to Lamotrek; by day, in sight; by night, Tagalielieli.
3. Lamotrek to Satawan; Tagalielieli.
4. Puluwat to Souk; Wolwol. (Why this detour to the south?)
5. Souk to Truk; Tagal'ūlu. [237]

G. From Woleai.

Tagaliwileugo - Faraulep.
Tagalimailap - Vasulos (reef).
Tagalielieli - Ifalik.
Tagalitumūr - Moroe (reef).
Tubwulitumūr - Aurupik.

Tubwusarabwol-Bugueluelueluarem (reef). On the way, one man o' war bird.

Tubwulūlu-Sorol.

Tubwulimwarigari-Ulithi.

Tubwulimēl-Fais. (One of the Ifalik dance songs, the Peiran of Falālap, disagrees. According to its text, the star Tubwulimwarigari will bring a canoe from Woleai to the rock Rimwelivarougoue in Fais.)

H. From Faraulep.

Tagalimailap e li vang -Saipan.

Tagaliwileugo - 1 fish, gapīle.

TagaliugilIk - 1 big fish - seu etag.

Tagalimēl - Faiau.

Pauievang - Kalūa (small reef).

Tagalimailap - Religousām - (reef).

Tagalielieli - one man o' war bird, (called in 'captain's language' neurevas.)

Tagatumūr - Trimaliwelibwugu (reef); farther, Olimarao.

TagalIpu - 2 whales, ualeliga jewetoxu.

Metremeiat - Vasutos (reef).
Wolwol li Iaūru - Ifalik. [238]
Tubwul'Ipu - Woleai.
Metārua - 20 porpoises, guatrIk.
Tubwulielieli - 1 bird with long tail-feathers, metalipangerele; Sorol.
Tubwulimailap - 1 whale, ualimen.
Tubwul'ūlu - 1 red fish, ig i seram; Fais.
Tubwuwileugo - 1 shark, trImeijou, with 2 small fish, sIlelīa, 'under his arm'; 2 big black diving birds, igotōro.
Wolwol li Ievang--many small black birds, asuval; Guam.

I. From Faiau.

Tagalimailap e li vang - Trilial (tinian).
Tagaliwileugo - Saipan.
Tagalimēl - Tipipi (uninhabited island).
Tagal'ūl - Tipapa (uninhabited island).
Tagalimailap - Getūa.
Tagalipauiaūru - 1 shark, laigelalo; his head keeps coming out of water.
Tagalielieli - Pigēla (uninhabited island).

Tagatumūra - Satawan.
Taga limetārua - Lamotrek.
Tagal'Īpu - Elato.
Metremeiat - 1 shark, with 1 man-o'-war bird over him, saumātol.
Wolwol li Iaūru - Olimarao.
Metremeital - 4 whales, nāgmetau.
Tubwulīpu - Vasulos (reef).
Tubwulimetārua (? designation undertain) - Ifalik
Tubwulitumūra - Faraulep.
Tubwulielieli - 1 shark with 2 small fish 'under his arm' - shemeijo.
Tubwulimailap - Fais.
Tubwul'ūl - 1 large fish with black head and white tail, tagural.[239]
Tubwulimēl - Vasielus (reef).
Tubwuwileugo - 1 white man-o'- war bird, gapilē.
Wolwol li Ievang - Guam

J. From Lamotrek.

Tagaliwileugo - 10 small fish, linked together like a chain - fātaleimware.
TagaliugilĪk - Pigello (small uninhabited island, many turtles - Pikelot?)

Tagalimēl - Uraiseivetāl (small reef).
Tagal 'ūlu - Pigennot (small uninhabited island, many turtles - Pikelot?)
Tagalipquievang - 20 big porpoises; very bad, will try to crush canoe.
Tagalimailap - Puluwat.
Tagalielieli - Satawan.
Tagal'Īpu - many birds, tepāl, with strong odor.
Mętręmeiat - 1 whale, uauumaiaūru.
Wolwol li Iaūru - 2 pagennai birds, called in captain's language lairomwara.
Tubwulipauiaūru - Ifalik
Tubwulimailap - Olimarao.
TubwuliugIlĪk - Faiau.
Tubwuliwileugo - Faurĕp (reef).
Tubwulimailapliievang - RūtIk (reef).

K. From Olimarao. (Two versions were given of this. Intended to supplement each other, they disagreed at some points, as noted.)
Tagaliwileugo - many porpoises, called in captain's language naigām.

TagaliugIlĪk - black mwili birds, called in captain's language pongenōr.
Tagalimēl - Tipapa.
Tagalimegarigari - (other version - many mweli birds, called pongulōr.) [240]
Tagal'ūlu - Pigella (uninhabited island).
Tagali pauievang - (other version - Pigella).
Tagalimailap - Pigēnnot.
Tagalielieli - Lamotrek.
Tagatumūra - Elato.
Tagalīpu - 2 paugennai birds, called aurovālu.
Wolwol li Ievang - 1 common shark and 2 very small white sharks called laorumetau.
Metremeital - MIsailealu (reef).
Tubwul'Ipu - Ororang (reef).
Tubwulitumūra - Wēraitogelimware (reef).
Tubwulisarabwol - Ifalik (? one version dubious, as Aurupik is south of Ifalik.)
Tubwulielieli - Aurupik.
Tubwulipauiauru - Ifalik (? one version).

Tubwulimailap - Woleai; Vasulos, one version; other has next star south for Vasulos.
Tubwulipauievang - Gautā, (reef).
Tubwul'ūlu - many porpoises, called in one version Falepeipeilalai; in the other Misailiealu, which the other uses for a reef under Metremeital.
Tubwulimwarigari - 40 fish, arōng.
Tubwulimel - SImweliulibwugu (reef); farther on, Faraulep.
Tubwuliwileugo - many small porpoises, uouwelinIran
Tubwulimailipelivang - OratIk (reef), one version; other has Galuā, apparently a little farther sw, under a star for which no name is listed.
Wolwol li Ievang - Farāp (reef), 1 version; other has Rajeivetāl, and, farther on, Faiau.

L. From Satawal (Satawal-aito).

(This list as given contained only directions toward the east. Two for the nearer islands to the west, however, were given 'in reverse' with the list for those islands - Lamotrek and Faiau - and are added here.)
Tagatumūra - Orejeivetan (reef). [241]

Tagasarabwol - Souk (Pulusuk?).
Tagalielieli - Oroural (reef).
Tagal'ūlu - TruatalevalerIk (reef); farther on, under same star, Truataligapelalei (reef); still farther, under same star, Puluwat.
Tagal'ugIlĪk - Pënënnot (Pikelot? Recorded elsewhere as Pigënnot). From Pëgënnot, the star Tagalielieli will lead to the reef Autaxileor, thence to the reef Autailemetau, and thence to Bwënnap. From Pegënnot, Tagatumūra will lead to Puluwat. From Bwënnap, TubwulIpu will lead to Puluwat.

M. From Yap.

Tagaliwileugo - Gaverot, island; 'steamer and canoe come close, go down in water.' (The name is virtually the same as Gaferut, which is about n. n. e. (?) from Ifalik, but about e by s from Yap.
Tagalimegarigāri - Ulithi.
Tagalielieli - Sorol.
Tagal'Ipu - Tongelap (reef).
Wolwolliiaūru - Ngolu (Ngulu)

Tubwul'Ipu - Gologol (reef).
Tubwulitumūra - Palau.
Tubwulisarabwol - Olāt (long reef).
Tubwulimailap - Philippines.
Tubwulimēl - 1 shark, ugelingaj.
Tubwuwileugo - 1 fish, sōm, whose dorsal fin slants toward the head instead of toward the tail; also seaweed, lem.
Wolwol liievang - 1 whale, walimIl, with many white birds perching on it.

N. From Truk.

Tagaliwileugo - 1 big man-o'-war bird, arIgemoa.
Tagalimēl - Pīsh (inhabited island).
Tagal'ūlu - Tennōmar (sandy island, with low trees and many fish).
[242]
Tagalimailap - Falepei (Ponape).
Tagalipauiaūru - Losap.
Tagalielieli - Leme.
Tagatumūra - Gotū.
Tagalimetārua - Satawal-airek (called Satawan on our charts; the suffix distinguishes it from Satawal-aito farther

west, near Lamotrek, which is called Satawal on our charts.

Tagalīpu - Namoluk ('Mortlock', Tom explained).
Wolwolliievang - Pelap ('much surf')
Metremeital - 1 whale, called uauemaiauru.
Tubwul'īpu - Pijemware.
Tubwulimetārua - 1 fish, lāgvIt.
Tubwulitumūra - 1 big shark, Oleleimwal, will crush a canoe.
Tubwulielieli - Souk. (Pulusuk?).
Tubwulimailap - Puluwat.
Tubwul'ūlu - Tamtam.
Tubwulimel - Bwennap
Tubwuliwileugo - Oloulo ('atoll, white men live there').
Tubwulimailap elivang - Faiau-aiat (East Fayu?).
Wolwol li Ievang - Namoin (Nomwin?).

O. From Guam.

Tagaliwileugo - Pāgang (Pagan?).
Tagalimel - Songorol ('no more people').
Tagal'ūlu - Tipipi.
Tagalipauievang - Tipapa.

Tagalielieli - Saipan.*
Tagaliṣarabwol - Nuta (Rota?).*
Tagatumura - Trilial (Tinian?).*
Tagal'Īpu - Lamotrek.
Mẹtrẹmeiat - Elato. [243]
Wolwol liiauru - Faiau.
Tubwul'Īpu - Faraulep, Ifaluk
Tubwutumūra - Woleai
Tubwulielieli - Yap.
Tubwulimailap - Philippines.
Tubwuwileugo - 1 white man-o'war bird, called Vālemerizu.
Tubwulimailapelivang - Europe. "

"* These were given by points of the compass instead of stars. It seems likely that Tom said 'south' in these cases when he meant 'north'."

116, 123 Ifaluk

The sojourn on Aurepik from the 31st of October to the 2nd of November was short, and quite dramatic. Sarfert found an old man, who was well informed about the local history and legends. The collections were also satisfactory. Then as luck would have it, while the launch was on its way from the island to the ship, it capsized in the surf, and the photographic plates and all the ethnographic material were lost. That is the reason why we can not give any more exact details about the tools in the section devoted to the description of the material possessions, since neither Hellwig, Hambruch nor Krämer had been able to get anything from the natives, who had visited the ship, and they too had undertaken some collecting. Then Sarfert spent twelve days, from the 5th to the 17th of November, on Ifaluk. These natives were eager to cooperate in every way, but they did not know as much about the old religion and history of the island as he had expected. They themselves admitted that they had forgotten a great many of these old beliefs.

2: Damm et al. --1-2 (1909) 1938 Woleaians-1-2
116, 175 Ifaluk

Islanders blown off their course discovered a large number of the Carolines, and described them to Europeans long before the latter actually visited them themselves. In this way the Jesuit father Paul Clain learned about 32 islands between 1678 and 1696, and among them was Yfaluc. However, this is not mentioned on the map, which Clain made, and where he located the position of each island as the natives had shown them to him with little stones, which they stuck in the sand. In 1710 Somera drew another map, following the directions of the Sonserol inhabitants, and again we find the archipelago Faloc. For the sake of completeness, let us refer to Krämer's hint that the island "ban" on Somera's pilot chart (1710) can probably be traced back to Lezcano, and may refer to Ifaluk. On Cantova's native map (1721) we find Ifeluc again. And it is certain that James Wilson discovered it on October 27th, 1797. Wilson first sighted a single island, but when he approached, he saw that there were two narrow islands, which lay very close together; they must have been Feladjik and Moai. He exchanged some things with the natives, but did not make any ethnographical observations.

On the 3rd of April 1828, Lütke found the Wilson Islands again, and identified them as Ifaluk. [2] In 1844 Cheyne visited the island, and observed some fine holothurians on the reefs; that was the extent of his interest in the oceanic island world.

On the 31st of March 1875, the commercial and fishing schooner "Rupak," under B. E. Gall, touched the island, but did not stay there.

2: Damm et al. --1-2 (1909) 1938 Woleaians-2
116, 175 Ifaluk

On the 5th of November, 1909, the Hamburg South Sea Expedition left Sarfert on the largest island, and picked him up again on the 17th of November.

2: Damm et al. --3 (1909) 1938 Woleaians
116, 103 Ifaluk

On their charts the natives called this island group: Faloc, Yfaluc or Ifeluc. After Wilson discovered this atoll in 1797, it was named for him for some time. Then Meinicke said that some other people called it Two Sisters. But these names did not last. Chamisso's authorities, the two natives Kadu and Edak, entitled this group Iviligk or Ibiliek. Lütke writes Ifalouk; the notorious dealer Cheyne likewise uses the native name Evalook, and his compatriot Russel Robertson, has Evalouk; all of these are equivalent to the German spelling: Ifaluk. Since this time the native name has been adopted much more widely. However, you also find Ifalik, which perhaps originated in Chamisso's accounts; this spelling was adopted for the Japanese Government Chart of 1925 (Number 772), and also for the Pacific Islands Pilot of 1933 (6th edition).

Lütke was the first to pay attention to the cartography of this atoll (1828). His chart [AN: see source] corresponds generally to the picture as it is today. But the northern part of the atoll is not correctly drawn, as Lütke sailed south. He shows the northwestern portion of the main island as a separate isle, Fararyk, which joins a large island, Ifalouk; in reality, both of them form the big Feladjik. On the other hand, the location of the two others, which he calls [5] Moay and Ella, is accurate. The Japanese Government Chart of 1925, Number 772, shows the most recent drawing of the atoll [AN: see source].

Location and Size

According to Cheyne, the diameter of the reef encircling the lagoon is about two miles. He estimates the circumference of the group as 5-6 miles, including the reef. With that he is considerably more exact than Meinicke *, who gives the circumference as "over a mile."

* Meinicke, Die Inseln. . . ., II, page 358. His figures are quite different from the other sources; for instance, he says that the group is 5 miles from Oleai, while the latest statement of the [AN: British] Pacific Islands Pilot (1933, 1, page 502) gives it as 30 miles. The difference may be explained by the fact that Meinicke reckons with geographic miles, while the other sources use nautical miles.

The following table gives the latitudes and longitudes of the various sources:

Year	Discoverer and Traveler	lat. N	long. E
1797	Wilson	7° 14′	144° 50′
1828	Lütke	7° 15′17″	215° 29′8″
	Raper	7° 14′	144° 30′
1844	Cheyne	7° 11′	145° 8′
	Gulick	7° 15′	144° 31′
1888	Meinicke	7° 15′	144° 31′
	Sievers	7° 15′	144° 31′
1920	Kolonial Lexikon	7° 15′	144° 31′
1925	Japanese Government Chart	7° 14′19″	144° 25′20″
		to	144° 27′13″

Structurally, Ifaluk is a low coral atoll with a lagoon, that has a circumference of approximately five miles; it is circular, or according to Sievers, almost square.

Lütke said that there were four islands, but actually there are only three: the main island, Felādjĭk, the second largest, Falālăp, which adjoins it to the south, and the little isle, Elă. There is no Ifalouk Island in the circle of atolls, and the one which Lütke called Moay is [6] really Falālăp. A comparison of the first two drawings will prove this. Lütke's mistake is due to the fact that he made a separate little island out of the northwestern portion of the large one. Although Cheyne spoke of only three, Lütke's assertion was upheld over Meinicke until very recent times; Meinicke made Imoai and Falalap one and the same island.

The little sand island Elănelap was first discovered by the Hamburg South Sea Expedition; it is possible that it is one of the newest atolls. But this type of sand island can disappear again very easily in any natural disturbances. During the typhoon of 1907 a little sand island called Măje became merged with the large Felādjĭk, and it is now the new part of Sāgo village.

Lütke (1828)	Meinicke (1888)	Sarfert (1909)	Pac. Islds. Pilot (1933) Jap. Gov. Chart (1925)

116, 133 Ifaluk

—

Moay	Imoai		
Ella	Ella	Elă	Ella
	Falalap	Falālăp	Flalap
		Elănelap	

The reef is typical of atoll reefs; on the southeastern side it makes a large bulge, and it is supposed to have a circumference of five miles. In the south there is a shallow, narrow passage between the Elăn and Falālăp Islands; Sarfert says that the broader one between Falālăp and Felādjĭk is sixty meters wide. There are two landing places on the southwestern tip of Felādjĭk Island.

2: Damm et al. --6-7 (1909) 1938 Woleaians
116, 132 Ifaluk

The island group has not been spared by typhoons; in fact five of them have vented their fury on it. Previously, violent wind and rain caused some damage. Trees were uprooted, but nobody died, although these storms were followed by famine. The typhoon of March [7] 27-28, 1907 devastated the island, and 35 natives perished (24 from Jŏr, 10 from Jiwăn on Falālăp, and one boy from Felādjĭk). According to the local reports, the wind first appeared from the NE, and it lashed the island group broadside, but as yet there was no flood tide. But when it turned SE the water roared over Falālăp and Felādjĭk, and carried everything away. In 1909 you could still see some of the havoc that it had wrought. Hellwig wrote in the Logbook of the Expedition: "The dry, white trunks of great trees, that were bereft of their branches, stood out among the underbrush, and even at a distance you could see the palm trunks lying in rows on the ground."

On the other hand the typhoon did some constructive work; it fused the sand island Măje with the large island, and thus increased the area suitable for building purposes.

2: Damm et al. --8 (1909) 1938 Woleaians
116, 137 Ifaluk

The scenic charm of the group is greatly enhanced by the profusion of coconut palms and bread-fruit trees. According to the [AN: British] Pacific Islands Pilot, 1933, these were only found in numbers on Felādjik and Falālap; Elā, on the other hand, only had a few of them.

2: Damm et al. --8 [2] (1909) 1938 Woleaians
116, 136 Ifaluk

At first it seemed that the island did not have anything except mosquitoes; they appeared at twilight, and came back every night. Sárfert's boy and the interpreter had to keep a smudge fire going all night, or else they could not have stayed on the island. Formerly there were only a few mosquitoes. The following table [AN: omitted here, see source, pages 8-11] gives just a small number of the land animals; naturally there are a great many more in the ocean.

2: Damm et al. --8-10 (1909) 1938 Woleaians
116, 192 Ifaluk

[The vocabulary is omitted, pages 8, 9, 10].

2: Damm et al. --11 (1909) 1938 Woleaians
116, 161 Ifaluk

Only the two larger islands of the atoll, Felādjĭk and Falālăp were inhabited; Elā had never been settled. The population was divided in the following manner:

Year	Source	Felādjĭk	Falālăp	Total
1797	Wilson			about 200
1828	Lütke *			about 150
1852	Cheyne			about 140
1903-4	Sievers			281
1909	Hamburg South Sea Expedition	109	99 (62 in the south, 37 in the north district)	208
1914	Finsch			about 300
1930	Pacific Islands Pilot			305

* Lütke believed that this number was fairly accurate; his companion, von Kittlitz, speaks of a very large population.

2: Damm et al. --12 (1909) 1938 Woleaians
116, 142 Ifaluk

The natives are tall and well built. Their skin is light brown, and the hair is black. Children often have very brown, almost blond hair; it is cut near the shoulders, at least Sarfert never saw hair, that had been allowed to grow to its full length.

The men do not have much beard; whiskers are never worn, but they do have a beard on the chin. Moustaches are kept short, and they are not very popular.

2: Damm et al, --12 [2] (1909) 1938 Woleaians
116, 164, 178 Ifaluk

You seldom find ringworm. However, Sarfert saw a good many large scars, decayed legs, etc. In contrast to the other Carolines (for example Polowat, Satowal) syphilis occurs here. According to the natives, the life span was formerly very long, but people now die in middle life. The health conditions alone can not be responsible for this situation; it is much more likely that the cultural decline plays just as important a part in the premature decease of the inhabitants.

2: Damm et al. --12-13 (1909) 1938 Woleaians
116, 192 Ifaluk

[AN: For a glossary of native terms describing parts of the body see source, pages 12-13.]

The natives were very cordial and friendly to Sarfert. The attitude of the women was most amusing, whether the men were present or not. By nature they were vivacious, but whenever their husbands were around they scarcely uttered a word. During the exchanges they turned away when they wanted to laugh; but their eyes showed what they were thinking, and the eyes glistened in a sly but quite provocative manner.

When Sarfert was alone with them, they made no secret of the fact that they were all crazy about him. They proved it by their caresses and the dancing movements, which they made; even a white haired old woman tried to allure him, and her zealous efforts aroused much mirth. The women all declared that they simply wanted him to give them tobacco; * and they promised, that they would tell all the white men who came to Ifaluk that he was much nicer in every way than they were.

---

* Tobacco has always been a very desirable commodity (Robertson 1876 / 1877 , page 50).

2: Damm et al. --14 [2] (1909) 1938 Woleaians
116, 152, 437 Ifaluk

Sarfert noticed that, when they were bartering, [AN: chiefly tobacco] they always had their minds set on one particular object; if they could not get it they usually took their exchange gifts back again. Then they calmly set ridiculous prices on even the tiniest things, which they were offering. If Sarfert became angry, they explained that the white man could produce all these items easily, and he had an adequate supply, while they did not! Lütke and Kittlitz also noticed this selfish attitude, and they had been warned about these islanders by the whalers.

They were astonished at the phonograph, laughed at it, but kept at a safe distance, and tried to peek into the horn. They thought that a man was hidden inside the apparatus!

2: Damm et al. --15 (1909) 1938 Woleaians
116, 302 Ifaluk

The men use a pair of white ballich shells to pull out their hair; this shaving apparatus is called gum, and it is fastened to a lock of hair....

The hair is worn shoulder length, at least Sarfert never saw it full length. There is no thick growth of beard. Whiskers are not fashionable, but most men have a beard on the chin and a moustache; the former is short, and the latter is very thin.

There is no circumcision. Most of the natives prolong the lips of the vulva by artificial means; the men elongate the labia by pulling, and the women also pull out the hair "because men do not like it."

The early travellers frequently mentioned the amount of tattooing that you see among the inhabitants of Ifaluk. This was still practiced at the time of the Hamburg South Sea Expedition. The majority of the natives were tattooed (to tattoo is mák), but not all of them. Anyone who does not like it, is not required to have it done. Then too the natives could not explain why they used this decoration; it was simply an old custom, that they still observed.

In 1910 there were still two men, who knew how to do tattooing; and a third was living on Faraulip, because he had joined some natives from that island, who had been staying on Ifaluk. The tattooing instruments are the tattooing comb (ralíd), a wooden stick, with a small comb containing several rows of teeth, made of bird bones, [16] and the wooden tattooing hammer (wãu) [AN: see drawings 3 and 4 on page 15 of source]. The coloring matter comes from the resin of the lágidj tree. It is burned, and the soot is caught in an earthen pot, the kind that comes from Yap. Then the soot is scraped together with a coconut leaf. During the operation the patient sits on a special type of mat (djõub) so that he will not interfere with the process. The drawings 5-9 [AN: See

source show the various patterns. Many men are not completely tattooed, but just have it on their arms and the sides of their legs. [17]

Tattooing was probably borrowed from Mogemog. But the natives believe that mankind learned about it through Lugeilän, a heavenly being, who is tattooed himself. They do not know from whom he acquired the art, but they assume that it was from Äluelöb, the highest god of all. When Lugeilän wanted a wife, he went down to earth, and at this time men saw the strange decoration, and learned the various patterns.

2; Damm et al. --17 (1909) 1938 Woleaians
116, 301 Ifaluk

Wooden combs (lōuwá) are favorite adornments for the hair; they are made of little sticks, which are pegged or fastened together [AN: see drawings 10-12 in source]. For dances they are also decorated with feathers.

The customary ear adornment (djüerń) consists of little coconut rings (darak) and of conus shell rings (madj: Hellwig: märče). Drawings 13-18, 25-27 show the multiplicity of the forms and arrangement of the rings. One piece (drawing 20) shows a combination with the precious fáubóbo decoration. Men and women do not wear the same kind of ear adornments. Men [18] have numerous little coconut rings strung like beads into dangling pendants; the women, on the other hand, use larger coconut rings and white sea-shells; they are hung together like chains, and occasionally some tortoise-shell rings are added too; these also appear singly. Then there are even more unusual arrangements:

1. maregís (also unulánï) decoration (see drawing 35); formerly it had two Tridacna pearls attached to a tortoise-shell hoop; European glass beads are used today. (drawing 36)
2. sarún: spindle-shaped decoration for men, made of coconut and shell rings, arranged in various ways (see drawings 28-30). Most of them also have little chains, with spondylus disks attached.
3. legasirá consists of white shell and little black coconut sticks, which are arranged in rows on a coconut string. (see drawing 32) [20]
4. wódj is an old-fashioned triangular decoration for men, made of tortoise-shell; it is seldom used today. (drawing 33).

5. Men wear the wheel-shaped tortoise-shell decoration, that comes from Polowat; but it in no wise shows the variety of forms, that are found on that island. (see drawings 38-40)

6. fáu bóbo (also fáu djuerű) is a triangular little piece of spondylus (fáu is spondylus), which is generally attached to a little chain of shell and coconut disks, fastened to a ring of tortoise shell, and then attached to the lobe of the ear. (see drawings 19-23). Drawing 21 shows glass beads already in use.

7. Drawing 31 is a masculine adornment without any particular name; it consists of a small chain of sea-shell and coconut rings, with their ends held together by means of a strong spondylus disk.

8. Drawing 37 shows a unique type of ear pendant; a piece of tortoise-shell with white glass beads is hung from a coconut ring.

2: Damm et al. --20 (1909) 1938 Woleaians
116, 301 Ifaluk

Nose decoration (djūeru-wṓt). The septum is pierced with a fish-bone, and fragrant flowers are placed in the opening; the blossom of the warṓn is the most popular.

There are many types of decoration for the neck. Necklaces, which seldom have two strands, (mălamar, and măremar) are made of hibiscus threads.
1. they are combined with coconut rings in various arrangements; this is called biligŏlu (drawing 41); similar pieces are in the Berlin Museum.
2. with large coconut rings, which are carefully arranged in rows; dajebă (drawing 42)
3. of smaller coconut rings: dărak (drawing 43)
4. of shell rings: bŭl, but generally these are mixed with coconut rings, (drawings 44-49); often the edges of the small rings or disks are not smooth, but sharpened (drawing 48). These attractive chains are also worn as a loin cloth. They come from Aurepik, Sorol and Fais, and are very costly. One Ifaluk native obtained this kind of chain on Aurepik for a wooden club.
5. of fish teeth: ńiligŭ (drawing 50)
6. of tortoise-shell disks (drawing 51)
7. of coconut beads with a tortoise-shell fish hook attached: kabiligŏ: drawing 52 shows a spindle-shaped decoration of shell with coconut disks at each end.
8. of small white shell and black coconut disks with red spondylus disks in rows between them: fáu mălamar [22] (see drawings 53, 54). This decoration was especially valuable, because the material first had to be bought on Aurepik, and then the things were fashioned on Ifaluk. When Sarfert was on the island of Ifaluk, he found that the king

had forbidden the natives to sell these decorations. He explained this by saying that this adornment belongs to the god Yaṅelap. It really belongs to the state, and has to be handed over for the tribute voyages to Yap. The king of Yap receives these chains. Broad rings of tortoise shell are frequently worn as pendants (see drawing 55); they are called borau. But Sarfert says that they are also used for arm decoration, and in this case they are named lārelak.

2: Damm et al. --23 (1909) 1938 Woleaians
116, 301 Ifaluk

Fluted tall tortoise-shell rings are the most common kind of arm adornment [AN: see drawings 56-58 in source]; occasionally they are made of coconut (drawing 59). They are called wṓdj or dárak, according to the material used. They are frequently turned into ear rings. During the wṓdau dance the natives wear a garālibṓu; it is a peculiar decoration of locks of hair with white sále shells. (see drawing 60).

To decorate the hips there are:

1. gídi: girdles made of white shells and black coconut disks, which are also used as necklaces.
2. dáredar: girdles made of several rows of little shell rings (bṹl) and coconut disks (dárak); they are distinguished by the little fillets of mää́l shells [drawings 61-64 in source]; this is a feminine adornment. Drawing 65 portrays a type that is unique in that two spondylus beads and a glass bead are used instead of the fillets.
3. dedā́r: loin cloth of women's hair, like the ones on Polowat.

2: Damm et al. --23-26 (1909) 1938 Woleaians
116, 291 Ifaluk

Both sexes wear woven loin mats (bălebal) of banana and hibiscus fibers *. Generally they are decorated with long black stripes (garĭl), and then red stripes (garĭl ligodjăl) are interspersed between them occasionally. All of the mats have fringes (Maderăl). The most prized loin mats are the ones with artistic diagonal black stripes (dāb), which have a wealth of different types of patterns (gaiāgi dawŏl). [26]

Young girls wear an apron (siwisif) of leaf strips, which can be made from various kinds of trees; it consists of a front and a back apron, and it is fastened under the gidi girdle.

The hat (bālŭn) is made out of pandanus leaf strips, which are sewed together.

---

* According to Robertson this clothing is similar to what the Oleai natives wear, and it consists of fine pandanus mats.

2; Damm et al. --27 (1909) 1938 Woleaians
116, 241, 177 Ifaluk

—

There is a small selection of edible plants and fruit trees; three kinds of taro (wůlak, wód, file), bananas (widj), coconut palms (lú) and bread-fruit trees (mái). Sugar-cane (wóu) and pumpkins (galawás) were introduced by white men.

2; Damm et al. --27 [2] (1909) 1938 Woleaians
116, 261, 251 Ifaluk

Von Kittlitz made some important comments about the famine, which he found among the natives in the spring and fall. This applied to Ifaluk as well as to Aurepik and Faraulip. It is a question of a shortage of food (including fish), which recurs at regular intervals, and which the natives seek to off-set by preserving bread-fruit.

2: Damm et al. --27 [3] (1909) 1938 Woleaians
116, 241, 462 Ifaluk

The cultivation of taro is considered a feminine task; men only help occasionally, and quite unwillingly. Women plant the tuberous fruit in old ditches, (bóalu), and for this purpose they use a digging stick (gót), which is often sharpened at both ends. It is possible that the other pointed weapons may also be utilized in this fashion. Leaves serve for fertilizer (wáli). Women plant bananas inside and along the ditches too.

The men attend to the care of the coconut palms and the bread-fruit trees. The head chief superintends all the cultivation of the land.

The following varieties of fish are caught: mṓs, jalṓń, debắr, baligắli, ētắm, igeliwṓdj, mắl, moguḗïm, gamädjṻgid, rắli, balijalańắb, mắńar (flying fish), in addition to sharks and turtles. [29]

There are different methods of catching fish:

I. by angling:

a) gāwṓdj: the fish hook is made of tortoise shell (see illustrations 88-90); this is used to get the mṓs, jalṓń and debắr outside the reef,

b) bắ: composite fish hooks; they consist of a shell lure of various kinds (made of white tawắl, violet bajṓk, black Meleagrina, yellowish mắ́l, shining mother-of-pearl jắ́rr, black wắl, plus hooks of tortoise shell, tufts of frigate bird feathers, and the necessary lashings. There are two types of these bắ hooks:

1. with the mother-of-pearl side inside, to catch the balijalańắb.
2. with the mother-of-pearl side outside, for the baligắli and ētắm.

c) gōlimắt or djṻ: a hook of coconut shell for the flying fish (mắńar); it is fastened to an empty coconut, which has been plugged. Several of these fishing contrivances are thrown into the water, and when they jerk or disappear the fisherman knows that he has a bite. The canoe goes out at once, and brings them in with the floats.

d) goráiń: a large wooden hook, used to catch sharks; the shark is also caught with the snare.

The hooks are kept in coconut or bamboo boxes; the cover and bottom are made of wood.

II. Net fishing. Various kinds of nets are made of kalekál, a kind of coconut string, and they are all tied with wugawúg knots.

a) djóu net with a composite frame; the two parts of the frame have special names; the lower section with the handle is the úb; the upper portion the kadúl. There are two forms of this net;

1. with a broken frame (as on Sorol); this is used to take flying fish at night outside the reef, with a torch-light illumination. The following story tells how this night fishing started: in early times the natives did not know how to capture the flying fish at night. One day Módj was in Oleai, and about sunset he started for Fanalur. As he intended to stay there for a couple of days, he took his sleeping mat along. He left for home at twilight, and the sea was so choppy that his mat went over board. [30] He did not discover this misfortune until he arrived in Oleai. He got several men to take coconut torches, and to hunt for his mat. When the canoe was on the open sea, the flying fish appeared and sprang into the boat. Finally the men found the mat, and returned home with a good supply of fish. This was the origin of the night fishing with torches.
2. With a straight frame, for the igeliwódj, mál etc.

b) fă̄u is a large net with a circular wooden frame and no handle. It is used to take the moguĕ̄ĭm and gamädjŭ̄gid inside and outside the reef.

c) ă̄dĭ̄n is the ordinary net with floats (uabă̄s) and sinkers (fa͡ulĭ̄m). It is used to catch various kinds of fish inside the reef at ebb-tide.

d) ŭ̄g is a large, almost square net, which is folded on one side, and closed on one of the narrow sides, that are formed in this way. It is fastened to a stone with a string, and two ă̄dĭ̄n nets lengthen the opening; these are attached to the two vertical sides of the ŭ̄g, and laid out in such a way that they widen out on the sea side in a funnel shape. (See drawings 100-101). [31]

III. The smooth mesafă̄r or goba͡ī spear, which may be three meters long, is used for spear fishing. This type of fishing is combined with the use of the ă̄dĭ̄n nets. Several canoes make a circle of these nets; the fish are driven together, and then speared from the boats.

IV. Fishing with traps is called ŭ̄.

a) ulubă̄m: traps like the one shown in drawing 2 on the third plate [AN: see source].

The names for the different parts are:

entrance - mă̄d
bottom - badjebă̄dj
side wall - bĕ̄ĭg
roof over the entrance - rŭ̄gu

back wall - gábi raised pointed part of the roof - ún.
These traps are laid on the sandy ocean floor, and then sand is heaped around them, so that they can not swim away. Lágum (crabs) are used for bait.

b) úlimerouwóli is the same kind of basket that is used on Sorol; it is used to get the räli. The terms for the various parts of the trap are the same as in a).

This basket is fastened on one side to a wooden float, and then attached by a rope to the canoe, which has to proceed very slowly.

V. Kite fishing is known. The kite (djõligodjáiuk) is made out of bread-fruit leaves; a bait (kaulülu) of cob-webs hangs on the string; [32] elsewhere Sarfert says that the epidermal tissue of the shark is used as a bait.

VI. The natives engage in snare fishing (nim) at different times, and also use various kinds of snares.

a) the läwud, the bait-fish for the shark, is caught with a snare, just as it is on Polowat.

b) Drawing 102 shows the contrivance, used to catch the shark; the central vertical string (karigán) has the bait, which may be one of several different kinds of fish....

c) When the natives want to capture a turtle, they take an ordinary rope, make a noose, and slip it over the head and front feet of the animal. In this way it is easier to haul the prey into the boat. On land, they simply turn the turtle over on its back.

2; Damm et al. --27-32
116, 226

(1909) 1938

Woleaians-5
Ifaluk

VII. Fishing with poison was formerly unknown; later the natives learned about it through the Yap inhabitants. There is no name for this kind of fishing.

2: Damm et al. --32 (1909) 1938 Woleaians
116, 224. Ifaluk

Hunting plays a very subordinate part in the life of the natives, as there are no large animals. Birds are caught

a) with the djóu net.

b) with snares (ním), like the ones used for fishing, only these are larger. The natives lay tubular traps (uligãs or dáwis) for rats; they are woven, and not made of bamboo, as most of the ones on the Carolines are.

2: Damm et al. --32 [2] (1909) 1938 Woleaians
116, 231 Ifaluk

The only domestic animals that Sarfert saw were hens (mălŭk); there were no pigs (sĭlo). He only found two dogs (gelăgu), and all the cats (gadŭ) except one had been destroyed in the last typhoon.

2; Damm et al. --32 [3] (1909) 1938 Woleaians
116, 252, 462 Ifaluk

Women prepare the food, and steam it in earth ovens (felán); these are similar to the ones used throughout Micronesia and Polynesia; you seldom find dishes roasted over an open fire.

2: Damm et al. --32-33 (1909) 1938 Woleaians
116, 372, 177 Ifaluk

According to the natives, Mòdj brought the art of fire-making from Yap. In olden days people did not know how to produce fire (jáf; buleliáf [33] the flame); so they ate everything raw, even meat. Today there are two methods of making fire:

a) the fire drill (liák), síne liák- flat stick, lâu liák- vertical and rotating stick.

b) the fire plane or fire groove (laulít), síne laulít - flat stick, launaulít- grooving stick.

The fire saw is unknown.

To kindle the flame they use the ordinary type of woven fan (saíbo), which is common throughout the Carolines.

felán - hearth, fire place, wurak - smoke, marodj - ash, fafi - firewood.

2: Damm et al. --33 (1909) 1938 Woleaians
116, 262 Ifaluk

The ocean provides the natives with meat dishes; in the list of fish, that we have already given, only the shark is not eaten; this is because it eats men (lódj), because it is poisonous, fâi, sâuufăn, mâudjilă, "because that is the custom."

The plant world supplies the natives with different varieties of taro, kodomŏlu, djâiwŏl, gŏb, waiwâi, gawŭdj, gili, mŏgumog, gäle, läle, fäliob, jalomä, sugar-cane, and pumpkins, in addition to the fruits of the coconut palms, bread-fruit trees, pandanus and bananas. The fruits of the coconut palm are distinguished according to their condition:

lŭ mesŏ - nut with a very hard shell, and meat that is still soft, and easy to remove; the broken surface of the shell is black.

sâu - lŭ mesŏ with a broken white husk, accordingly a very young nut.

šŏu - lŭ mesŏ with meat, which is already hard.

ŭb - lŭ mesŏ without meat.

The green husk of the nut is called bäjenne lŭ; the brown husk is bäjenne šŏu.

When they crack the nuts, the natives say: silŏu; on Faraulip: selŏu; on Yap and Sorol: serŭ.

2: Damm et al. --33 [2] (1909) 1938 Woleaians
116, 272, 262 Ifaluk

Palm wine (kári) is an important food. It is produced in the same way as on Polowat. And the natives prepare it in the morning, at noon and late in the afternoon. Cooked palm wine (lís) is mixed with water before it is drunk.

2: Damm et al. --33 [3] (1909) 1938 Woleaians
116, 276 Ifaluk

The natives enjoy tobacco (dámáko).

Among household implements people have:

a) scrapers, scratchers and graters.
   1. fâuguesŭ: a piece of coral, which is used to grate taro, etc.
   2. wăigañ: coconut scraper of the Central Caroline form.
   3. Tortoise-shell ax (jâufĕli), like the one on the Mortlock Islands, for peeling taro; this has not been used for a long time. [34]

b) crusher (fâulĭbōu) of coral lime to crush taro.

c) spoons (idīt) of coconut husk.

d) shell knives (sār)

e) coconut utensils.
   1. giwuări: small coconuts with a wooden cover, and occasionally with a wooden bottom; they are used to hold small objects and are put in the wŏdâu pouch.
   2. băle: large coconuts for palm wine.

f) wooden vessels of bread-fruit and lăgidj wood.
   1. kabăñebañ: large wood boxes with a cover and short handles; they are used to hold weaving materials.
   2. wăru: large four-cornered wooden boxes for loin aprons, etc.; these are no longer extant.
   3. săb: wooden containers with covers, but without handles of any particular form and size [AN: see drawings 111-118 in source]. The one with a push-cover [AN: See

drawing 118 in source] is peculiar. Fish hooks are kept in these containers.

4. döbi lemálaî: round wooden dishes without feet.
5. döbi lemábu: wooden dishes with noses but no feet; in this type the width exceeds the length.
6. döbi lemáulu: heavy, long wooden vessels.
7. döbi lemowalíel: circular wooden dishes with or without feet, but with handles (leníligágal) [36].
8. döbi úlu: these are the familiar Truk vessels, but there are no more of them to be found on Ifaluk. Hellwig collected a long dish with noses and four feet as a tepi; (this is the same as döbi).

g) baskets.

1. gáto: a small basket made of coconut pinnates with a woven handle (first plate, upper row); this is used to transport food.
2. dúgu: a tall basket of two coconut pinnae; they are used to carry food.
3. gabääs: large circular basket of coconut pinnae with a string handle; this is used to hold banana, pandanus threads, and all the other materials, which are necessary for weaving. [37]
4. wódâu: a long pouch of two coconut pinnae; it is the real purse for both men and women.

5. djūk: a pouch used to carry wood, coconut husks, etc.; it is made of two halves of coconut fronds, woven together. It is similar to an open gilidaudau mat; the ends of the fronds are tied into a handle.
6. wŏdau mān: four-cornered pouch of pandanus leaf strips. Sarfert could only obtain one specimen.
7. gāgadj: a curious form of pouch made of pandanus leaf strips. Smaller specimens were carried in the wŏdau pouch; this one is distinguished because of its plait, which runs diagonally over the middle of the pouch.
8. sigilāla: a high, narrow little pouch, with a cover of pandanus leaf strips. Sarfert could only find one specimen.

h) net pouches of coconut fiber strings.
1. djōudjoāle: large net-like pouches that can be tied together, made either with a narrow or a wide mesh; they are used for loin aprons, etc. [38]
2. djōulimar: boat-shaped net pouches used to get bread-fruit; they are also soaked in these containers.
3. wŏdau: pouch of narrow string weaving.

i) bamboo boxes (giwuāri) for smaller articles (tobacco etc.) have wooden bottoms and covers; they are often decorated with scratched designs. The double box, with a central connecting piece of wood, is a curiosity.

2: Damm et al. --39 (1909) 1938 Woleaians
116, 412 Ifaluk

The tools were: 1. shell axes (delakī) of different sizes. Other axes were unknown. The parts are called mimuēim - handle, fōfo - coconut string fastening, dēla - Tridacna blade.

2. Gimlet; there were two kinds; the plain stick borer (wūlewul, Hellwig: wurawura) with a shark's tooth point, now with an iron point, and the burr (malubōub) with a brace stick and a point of Pteroceras shell.

3. Compasses were unknown.

2: Damm et al. --40 (1909) 1938 Woleaians
116, 321, 301, 415 Ifaluk

Coconut shells are used to fashion bowls, boxes, spoons, but above all, beads for decoration. These beads are made in the same way on Luangiua. Drawing 135 shows some crude pieces, which have been strung on a leaf nerve, and are still to be polished.

2: Damm et al. --40 [2] (1909) 1938 Woleaians
116, 321 Ifaluk

Shell is used for ax blades of Tridacna, fishing hooks of mother-of-pearl, shell beads, decorative disks of conus shell, dye bottles made of barnacles. The men make the red spondylus beads, and this task is especially important. This costly shell is purchased on Aurelik in exchange for loin aprons, knives and similar objects; the Aurelik natives fish for it inside the reef. Men break the shells into little pieces, grind them with a stone, and pierce them with the wúlewul borer. The large mother-of-pearl shell (sálo) was also worked in this manner.

Tortoise shell is used for decorative rings and fish hooks. The back shell of the tortoise is pried loose with a burning stick; then an ordinary bore is used to cut the fish hook out of the shell, and the rough skin of the ray's back polishes it and files it into shape.

The following dyes are used:

1. black dye.
   a) this is procured from black stones, that are found among the pieces of drift wood. A knife is used to scrape some of this stone into a wooden dish, filled with water; then the sap of a coconut is wrung into the same container, and the sap of a leaf of the gili tree is added in the same manner. This dye is used for the threads, which are to be woven.
   b) A large quantity of black coloring is required to paint the boats; it is obtained by burning coconut husks (bējenne); then they are dipped in water, and used on the wood as if they were brushes.
   c) The tattooing color is obtained from the resin of the lagidj tree.
2. red color; there again there are two kinds:
   a) to dye the threads; people peel the bark off the lāle tree, mix it with coral lime, which has been broken into small pieces and burned [42] and then it is all pressed into a wooden container with water (red color - ligodjá).
   b) to paint the boats; the natives take red earth from Yap, which is kept in little string pouches or in containers made of barnacles; this is stirred in water, and they add the sap of a tapped bread-fruit tree. A bird-shaped wooden bowl (dŏbimāb) is used as a dye pot.
   c) Body painting.

Braiding is women's work.

1. pandanus mats (gīagi); there are four types:
   a) faûsibēik is the sleeping mat; it is simply braided out of strips, which are usually about a centimeter wide, although they become narrower.
   b) fólu is an unusual form of sleeping mat; it is double, and in the center there is a strip about 5 centimeters wide; it appears that the two sides of the mat are plaited together through this strip. Sarfert was not able to obtain one of these mats.
   c) jáb is a simple mat for little children.
   d) djóub is the mat on which men sit, while they are being tattooed. At the present time these mats are no longer found.

The pandanus tree (fār) supplies the material for these mats. Women dry the green leaves for a while over the fire, and then spread them out in the open. They are exposed to the rain, but the leaves are not soaked more than three times. They are now put in the sun, and after four or five days they are ready to be worked. The leaves are smoothed with a piece of coconut shell, by drawing them through the hand, and then they are torn in narrow strips.

2. Coconut mats (gilī) are all used for slumber; there are several kinds:
   a) dábárau is a mat of two coconut fronds, with the nerve running through the center. This is because the two were laid together in such a way that the point of one coincided with the twig end of the other.

b) ädólo like a), however, the pinnae are plaited into a braid on the long sides, running parallel to the nerve. [43]

c) gíli dáudáu is a mat made of two half coconut fronds, which are twisted together so that the nerves will form one side, and the braid the other.

d) gíli ebába is a mat like c) except that it is braided out of one whole frond.

The coconut mats are all worked in what we call "cross plaiting."

3. Basket weaving is a woman's task. Coconut and pandanus leaves furnish the material for it.

a) baskets of coconut leaves are gáto, dúgu, gabääś, wódáu, djúk.

b) baskets of pandanus strips are gágadj, sigilála, wódáu mán.

2: Damm et al. --43-44 (1909) 1938 Woleaians
116, 286 Ifaluk

Weaving.

The materials are made of fine banana fibers (wūis) or compact hibiscus fibers (gulifāo); occasionally they are dyed black or red. A wooden needle entwines artistic borders.

The loom (dāl) is fastened to two poles (wīsāl) which are stamped down into the ground, and then attached to the wall of the house or the roof; the similar system is used on Kusae. The girdle for the weaver is tied on the notched board. The weaver is seated on a plank (fāwa). The parts of the loom are called [AN: compare drawing 142]: [44]

Number in the drawing	English term	Ifaluk
1	warp and breast beams	bāb
2	sword	gabōb
3	heald rod	ńūń
4	separating stick	dēba
5	cross staff	olūd
6, 7		dīb
	warp threads	ƙnudōlu

2: Damm et al. --45 (1909) 1938 Woleaians
116, 177, 437 Ifaluk

In olden days there was more commercial activity than in 1909; however, the Ifaluk natives never equalled the skill of the Polowat people in this respect. At the time of the Hamburg South Sea Expedition they still purchased the fine spondylus shells on Aurepik and Truk, and paid for them with loin aprons and knives. The tribute voyages for Yanelap are not so important as they used to be either.

2: Damm et al. --45 [2] (1909) 1938 Woleaians
116, 502, 463 Ifaluk

In 1909 the knowledge required for seafaring was no longer preserved. Not one of all the men on the island knew how to sail by the stars. Only one had a vague idea about trips to Oleai, Faraulip and Lamutrik, but that was all that he knew. According to the islanders, there were still two experienced Ifaluk captains on Yap and Ngulu. Under these circumstances it was impossible to make a sailing chart.

2: Damm et al. --45-49 (1909) 1938 Woleaians-1-3
116, 502, 821 Ifaluk

Fig. 143. Compass Rose (sketch by Sarfert).

A knowledge of the stars is the basis for all nautical information. The natives knew the following stars: (fŭš).

mŏl	Lyra	eruol	Three Kings (in Orion)
ugelĭk	Orion	dumul	Virgo
măriger	Pleiades	djerewol	Raven
ūl	Aldebaran	lup	
măilŏb	Eagle	wolewole	
gŭi	Fish, an enormous star, which travels all over the heavens; ugelĭk and erüŏl belong to it. [46]		
lăke		dagalĭp	
dŏbi		mōlărŭ	
ĭdj		măidjĭk	
mălu		ălalimēi	Milky Way

măllăm moon, the natives knew about the man in the moon, or Liganós: but they had no more exact information about him. The sun had no significance, whatsoever. Sarfert did not give a native term for it. They had no conception of the stars; the Yap inhabitants had told them that they were stones! Shooting stars - jajāle fŭš.

Drawing 143 shows a picture of the compass rose; the horizon was conceived in a rectangular form; point 1 is the place where a star rises in the vicinity of the polar star;

it sinks in number 15, so line 1-15 represents the course of this constellation. The same is true of the other constellations. [47]

Drawings 144, 145 show the position of the stars in the heavens at various times; when Altair goes down , and when it is at the zenith.

The natives know the following directions:

north	jifaṅ	northwest	ilodolifaṅ
south	jŏr	northeast	kodolifaṅ
west	ilodŏu	southwest	ilodolijŏr
east	jŏdou	southeast	kodolijŏr

[AN: the terms for the directions of the winds, pages 47-49 of source have been omitted.]

2: Damm et al. --49 (1909) 1938 Woleaians
116, 502 Ifaluk

The sailing trips, which are still known are:

Ifaluk - Oleai 9-23 of the compass rose.
Ifaluk - Faraulip 1-15 of the compass rose.
Ifaluk - Elato-Lamutrik 21-7 of the compass rose (Lamutrik is visible from Elato!)

Sarfert said that in olden days the natives also dealt with Satoan, which was settled by Ifaluk people, who came by way of Lamutrik.

Only one ship was known to have got off its course; the Hamburg South Sea Expedition saw the arrival of an Ifaluk canoe on Elato; coming back from Faraulip the boat was driven to Olimarau.

There must have been a great many boats in olden times, because Lütke declares that he was greeted by twenty-five, with around a hundred men in the crews. The Ifaluk canoes are similar to the ones of Polowat and the other Central Carolines in that they are made of boards (uá) of bread-fruit wood, and beside the out-rigger they also have the familiar fork-tail crest. There were various kinds of canoes :
a) wāliwuéī: a large sailing boat for long trips. They had their own names, and, as a matter of fact, they were named for the place where the breadfruit tree stood, the one that was used in the construction of the boat. The canoes were divided among the various clans as follows: [50]

The clan:	before the typhoon had:	in 1909:
Lawuáú	8	3 (one boat went directly to Faraulip.)
Sawōlób	1	1
Ledjōuróu	5	1
Gajudólin	3	0
Ságo	4	0
Jiwán	6	3(Of these one was in Faraulip and one in Lamutrik.)

Jŏr 14 1

b) manuwĭ́li: a smaller sailing canoe, used for fishing.
c) kafadŭ́le: a paddling canoe, which will not hold more than 4-5 men.
d) djašemắli: paddling boat for 1-2 men.
e) fofắt: float.

The natives also had play boats of various sizes; small ones were called galắl, and larger ones ligĕ́li. Drawing 146 shows a type, that was unusual in Ifaluk. This kind, which is called gắuat, has a crescent-shaped ornament; they are often seen on Satoan, and there was one of them on Ifaluk before the last typhoon (1907).

[AN: For terms for the various parts of the canoe see source pages 50-51] [52]

The cooking apparatus (felan galigắb) for long trips consists of a four-cornered (50 cm. square) raised frame with slender little sticks, which serves as a grill. This contrivance (drawing 151) stands on legs over the belắf. A small coconut leaf mat (ĭ́lafe) is laid in this polygonal frame, and then sand is sprinkled on top. Fish are roasted here. When the natives are on the high seas coconuts are used for water vessels. The men catch rain water in a hat, which is turned upside down, and its tip sticks into a coconut flask.

2: Damm et al. --52-55
116, 396, 173

(1909) 1938

Woleaians-1-2
Ifaluk

The natives trace their knowledge of boat building back to a mythological origin. Sēlăń constructed the first canoe; he brought this art to the men on Mŏdj Island, which lies a four days journey south from Truk. It is not known who taught the people of Ifaluk how to make canoes. The first settlers of Ifaluk were a man named Mŏdj and his wife, and they came to their new homeland on a raft. But soon after that time, and even while Mŏdj was living, canoes were constructed.

The canoes are made out of bread-fruit wood. First the trees are felled with shell axes, and in this task the brothers and sons of the builder assist him. The king must give his permission for the construction of a large sailing canoe. No particular tabus are attached to this work. Other men help drag the trunks to the canoe house. All the workers sing in rhythm, so that the pulling will be in unison and most effective. [AN: for native text of this work song see source pp. 52 and 54] [54]

... the various planks of the boat are carefully joined together and bound tightly. The joints of the planks are caulked with pieces (bă̄le)of coconut husk fiber (bējĕnne), which are mixed with bread-fruit resin (wĭ̄lis). Then the holes for the binding are smeared with a mixture of burned coconut fibers and burned coral stone (fă̄u), which has been crushed. Drawing 147 shows how the planks are painted with red soil from Yap and black coloring, which comes from coconut hulls, that have been burned and then stirred in salt water.

2: Damm et al. --52-55 (1909) 1938 Woleaians-2
116, 396, 173 Ifaluk

During the canoe building there are four bäniewän conjurations, and these are always when the lines are drawn in the customary manner. On these days all the workers are tapu. Then, when the boat is finished, there is another conjuration, and a trial trip; while this is going on the men sing a certain song. [55] Coconuts are placed beside the boat during these magic spells; there are always two or more, but never three, five or seven. The size of this sacrifice depends entirely upon the quantity of nuts available.

carry the purlins, (falidibáb, no. 1 of drawing 156) into which the djúne are inserted. Girders and empty trusses (no. 2), both of which are called wóu, are stuck part way into the purlins. Just as on Polowat and Satowal, the ridge purlin is úri. The others (no. 3) have various names, according to whether they are attached to the empty truss or to the rafters; [58] in the first case they are kabanák, in the other: kabílal; both are interchangeable. The rafters (no. 4) are called gáto.

The gable walls are arranged in a special fashion. A central post (wadábáo) stands on the gabilibín, beneath which a áudánilálo beam is braced between the side posts. A roof (dábáu) projects over one gable wall; (no. 3 in drawing 155); its empty truss is called kabanák di bín, its rafters gáto di bín. This dábáu overshadows a veranda (bín), which lies at the level of the purlins, and has a pot-board (fáne di bín) in front. A special kind of beam support is not always available for it, as on Hok; the corner posts are šúle, the two long beams lying on them are dalielób , the diagonal one is áudánilálo. This porch was evidently devised to protect the householder from the rain, if by chance he wanted to sit in front of his door. The mats used for covering the roof are jáso.

According to legend, Módj brought the art of house-building from Yap; it is not known who taught it to the inhabitants of that island.

1. The house design.

The frequent typhoons have often destroyed the houses; during the last one only four dwelling houses escaped, (3 on Feladjik, 1 on Fafalap). Then they were not rebuilt with the same care, which had been used before. Formerly there were more houses than there are today, and they were also larger; they had a six-sided plan, and were made of wooden planks. But the natives did not know how to construct houses without using supporting pillars on the four corners. The deceased brother of an old man, who was still alive in 1909, saw this for the first time in Aurepik, in the house of a man from Yap, named Gamelai; and he died on this island away from home. Since that time houses have been built in Ifaluk without any súle. It seems that the natives have never erected any stone foundations, like the ones that are used on Aurepik, but they use the same name for them, bäi.

im is the family dwelling. It is the ordinary rectangular house with a gable roof, that slopes forward, and no special stone foundation. Drawing 155 shows the old form. There are side posts (djúne) set in the framework of the floor (gorás, number 1 of drawing 155), which is made of four beams, and the walls (dibáb, no. 4) stand between them. The ceiling beams (gabilibín, no. 6) rest on the 4 corner-djúne, and then they

malúm is the cook house. Each dwelling house or each family group has a cook house. When the natives were asked why special kitchens are used, they replied that: "the large house is used for sleeping and working (weaving etc.)." The real reason is probably because the preparation and cooking of dishes require light and space.

(1909) 1938

Woleaians
Ifaluk

fanüuá is the boat house. Externally it is like the dwelling house, except that it is open on all sides, and has larger dimensions. (see drawing 157). The canoe houses are erected by the various parts of the villages, and belong to them. Before the last great typhoon the number of canoe houses was considerably larger than it was in 1909. The division of the canoe houses was as follows:

Part of the village:	in 1909:	Number of canoe houses before the typhoon:
Gajudöllin	1	1
Ledjöurõu	1	1
Lawuáu	1	1
Jiwän	1	3
Jör	1	3
Sägo	0	1
Sawölöb	0	1

Sägo and Sawölöb do not have any more canoe houses; the natives in the former part bring their boats to Gajudöllin and Ledjöurõu, while the men in the latter shelter theirs in Lawuáu.

Fenăp is the house for bachelors; the natives called it the "house belong king." These houses are public buildings. Usually women were not allowed to enter them. It was only when the king wanted to address all the inhabitants of the island to give orders or discuss laws, that women and children gathered here with their male relatives.

A long time ago there were no houses of this kind. Under the reign of Dibŏdăn a man from Yap, Fagil by name, was blown to Ifaluk, and he built the first fenăp. The natives built three others on this pattern. According to the Yap style, these all had a stone foundation in the water, and they were joined to the shore by a stone bridge. Two of them were on the main island (one on Ledjŏurou and one on Lawuaŭ) and two on Falalap (one in the south and one is the northern district); the other parts of the village did not have any fenăp, so they had to be content with canoe houses. The typhoon destroyed all of them except one on Lawuaŭ, which is called Kadalŭ, and which served as an abode for Sarfert during his visit. It was 21 meters long, 5 1/2 meters wide and 5 meters high.

All of the men in one section of the village worked on the common canoe house, and when it was completed, they celebrated the event with a dance. Drawing 158 [AN: see source, p. 59] shows the floor plan of the only men's house still standing. The large supporting pillars on the sides (sŭlefan) were made of big stones, and a platform was built on the central post; this was used when the king spoke to the people. Both the pillars and the platform were characteristic of these constructions...

116, 343 Ifaluk

imelibĕ́lu is the lodge for pregnant and menstruating women. Since the last typhoon they have ceased to exist. The women stay in a little house, for there are still many of them adjoining the dwellings. [60]
imosíĺo is the pig sty. These stalls are only known by name.
There is no chicken coop (imelimáluk) for the animals run all around.

2: Damm et al. --60 (1909) 1938 Woleaians
116, 352 Ifaluk

When you make an inventory of a dwelling house, you find the usual tools, and weapons and also:

a) gogōdj: a pillow made of a loin mat, without any pattern.
b) ulūl: head support of wood
c) ujelijáb: head support of very soft drift wood.

The inhabitants do not distinguish between the village and the island; fálü is the word for both. Only Felādjík and Falālap are settled, and on the northern side. The farms lie scattered along the coast. Each house has a water-hole (ganíralu).

All of the land is divided into plots (bugodál), which have special names, and these also apply to the houses, which are built on them.

a) the village Felādjík on the main island is separated into the following districts:(see drawing 159)

1. Sāgo with the huts 1-4
2. Gajudōllin 5-13
3. Ledjōurōu 14-21
4. Sawōlōb 22-27
5. Lawuáu 28-43.

The districts 1-3 are included in Felādjík, the other two, 4 and 5 are Lawuáu. The oldest part of this settlement is Lawuáu, and the other sections were settled from here. This original portion also served as a residence for the king of the island group, Daoreligār [61] and his assistant chief Sairū. A long, long time ago Sāgo is also supposed to have had a chief, but his family died out. [AN: The names of the houses and their inhabitants, pages 61-65 of source, have been omitted.] [65]

b) The village on Falālap Island [AN: see Fig. 160] is divided into two districts, Jór

and Jiwán, in other words, into a southern and a northern part. This settlement is under the authority of Daoreligár, who formerly lived in Jiwán, and later moved over into the home of his wife. If the legend is true, the first chief of this island group, the man from Yap, Mṓdj, settled in Jiwán. [AN: the names of the plots with the houses and inhabitants, pages 66-71 of source, have been omitted.] [71]

c) Elă Island is uninhabited. The land is divided among the various houses. [AN: the names of the plots of land have been omitted.]

The bitter struggles with Oleai and Lamutrik show that the Ifaluk natives were a war-like people. However, they did not have a large array of weapons; they used:

1. The spear (dīlēk) from 1 1/2 to 2 meters long; occasionally it was equipped with a barbed hook, and then it was called rumu dīlēk. [AN: see drawings 161-163 in source]. The natives apparently never used sharks teeth on their spears.
2. The club (liwueïjéï) was a cutting and stabbing weapon in a simple spade shape [AN: see drawings 165-168 in source] or it may be a two-sided weapon, like the ones on Truk (drawing 164). The natives knew nothing about the former customary practice of studding them with sharks teeth.
3. Knuckle-dusters (rasirás) with horn-fish stings, [AN: see drawings 170, 171 of source]. Drawing 169 shows an interesting form, where the simple knuckle-duster is combined with an aṅipuṅipū.
4. The natives learned about stone slings (gaûl) from Truk.
5. Bows (dawír) and arrows were just childrens' toys.

The terms used to describe the family relationships show to what an extent the family circle (lewugodâi sēudŏb or sēukaidŭn) was developed in a narrower and also in a wider meaning; these are the terms for:
grandfather (on the father's side) demăl dămâi.
grandmother (on the father's side) sīne dămâi.
grandfather (on the mother's side) demăl sīne, demăl silēi.
grandmother (on the mother's side) sīne jīne, sīne silēi.
father, husband of the father's sister, husband of the mother's sister dămâi.
mother, wife of the father's brother, wife of the mother's brother, silēi.
brother, son of the father's brother, son of the father's sister, son of the mother's brother, son of the mother's sister, bisīl, and also wisīl.
sister, daughter of the father's brother, daughter of the father's sister, daughter of the mother's brother, daughter of the mother's sister măanăl, also miănâi.
husband, wife, jaûdăg.
son lâûuli or djirimâle.
daughter lâûl or djiridjawŭd.
father's brother wisīl dămâi
father's sister măanăl dămâi.
mother's brother măanăl silēi or manenebēi.

mother's sister wisíl djín.
son's son, son's daughter, daughter's son, daughter's daughter, laúnéi.
wife's father demál djáliganéai.
wife's mother síne ráli ganéai.
wife's brother máanál áli ganéai.
wife's sister wisíl áli ganéai.

(1909) 1938

Woleaians
Ifaluk

The natives marry for love. If a man falls in love with a woman he makes a regular declaration. If she responds, he says: "go and ask your father." If he agrees, he says to his daughter: "Yes, bring him!" Then the girl brings her bridegroom home, and from that time on, he sleeps in the house of his parents-in-law. There is no particular ceremony or celebration, except that more food is served than usual, but the wedding is over.

If the girl does not like the man, but he is determined to have her anyway, he has to pay a certain price. Otherwise, there is no arrangement about payment.

2: Damm et al. --75 [2] (1909) 1938 Woleaians
116, 591 Ifaluk

The man always goes to his wife's house and sleeps there. He also has a right to claim a share of the property of his wife's family. If several children appear in the course of time, the husband's sister takes some of them in her house, in other words, in the house of his father. If that is too small, possibly because it is inhabited by several married sisters, a second dwelling house is erected beside it.

2; Damm et al. --75 [3] (1909) 1938 Woleaians
116, 833 Ifaluk

The natives talked with animation about the forms of coitus. . . On Ifaluk the usual procedure is for the woman to lie on her back, and the man to squat between her knees and to draw her legs over his thighs. Other forms were only known to a few men, who had learned them on Yap and Mogomog. After the intercourse the man cleans the vagina with his Lavalap.

2: Damm et al. --75 [4] (1909) 1938 Woleaians
116, 839 Ifaluk

Erotic abuses. Onanism (sīlisīli) is known, and some people practiced it. Coitus in anum is unknown; according to Sarfert's native from Faraulip it is practiced on Mogemog. Sarfert's interpreter from Mogemog testified that cunnilinctus is also practiced on Ifaluk, and is called monodinii. On the other hand, the women do the same thing only when their husbands are dead, and then call this mǭnorai. Possibly it is a similar custom to the one on Luangiua. We have already discussed the lengthening of the labia of the vulva, and the removal of the pubic hair.

2: Damm et al. --75-76 (1909) 1938 Woleaians
116, 582, 836 Ifaluk

Marriage is forbidden (etăb) with all the women, who live in the same house with a man, that is with his sisters, etc. These restrictions apply to two generations, but not to the third; [76] accordingly, the grandchildren of brothers and sisters are permitted to wed. In olden days, when the population was smaller, father and cousin were allowed to marry. There is no objection to free love between unmarried people, and boys and girls.

2: Damm et al. --76
116, 837, 684

(1909) 1938

Woleaians
Ifaluk

Adultery occurs. If a husband hears about it, he scolds, but does not strike his wife. The adulterer must pay a penalty in the form of loin aprons, wooden boxes, and small or large canoes.

2: Damm et al. --76 [2] (1909) 1938 Woleaians
116, 586 Ifaluk

Divorce is frequent. This is a very simple procedure; either a man leaves his wife, or she says that he must return to his own house. In this case the children are separated too; the boys belong to the man, the girls to the woman. Babies remain with the mother, unless the man's sister wants to have them. If the man marries again, he must pay an indemnity to the wife in the form of aprons, chests, boats etc. This is true for the wife too, only her family takes charge of the payment for her. There is a curious custom that this payment is disregarded if both partners marry again on the same day. In the other case, the one who weds first is the only one to make the payment, even if the other one is married on the following day.

2: Damm et al. --76 [3] (1909) 1938 Woleaians
116, 163 Ifaluk

The women have a good many children. Three (deceased) women had ten, but today the average is between 3 and 5. The cause of this declining birth rate is unknown.

2: Damm et al. --76 [4] (1909) 1938 Woleaians
116, 844 Ifaluk

Birth occurs in a special hut (imelibĕ̆lu); the afterbirth (bă̈̆i) is buried in the sand on the shore.

The woman remains for eleven days in the hut, and does not leave it until the "little moon" has been in the west for five days. Then the chief sends another woman to get her. The natives laughed heartily at Sarfert's question, whether this happy event were celebrated with songs and dancing. For two months the woman does not do any work; she takes care of herself, and looks after the child, which is kept in a cradle (gulóul). The husband and wife are not permitted to sleep together until the child is able to run around. If they disregard this, the child will die.

2: Damm et al. --76-77 (1909) 1938 Woleaians
116, 857 Ifaluk

Children lead a happy and carefree existence; they help their parents, but most of the time they play outdoors, sing, and dance in the moonlight. On all of his expeditions Sarfert was accompanied by a throng of children, who tried to attract his attention by doing all kinds of tricks (standing and running on their hands). Naughty children are always whipped. The smallest boys are allowed to go into the men's house, and so they participate in the life of the men from a very early age. When they reach a certain [77] size, between the age of 4 and 7, the boys receive a loin apron; the natives say this is "because the mothers and sisters do not want to see their boys naked any more." At this time the column of the nose is also pierced with a fish-bone, and a fragrant blossom (waróñ) is inserted in the opening. Little girls receive the apron siwisiñ sooner than they do on Sorol, for example.

nursling sălidali
little boy, little girl sălidali māl or sălidali djāwud.
big boy dăli mál
big girl dalăiwid
man māl
woman djāwud or faifil
bachelor, also widower ?
old maid, also widow libidj
old man dufēi
old woman djāwud dufēi

2: Damm et al. --77 [3] (1909) 1938 Woleaians
116, 764 Ifaluk

When an inhabitant of the island dies, all the people of Ifaluk gather together, cry, scream and sing songs of mourning (dáń). The deceased receives a new loin apron; his throat, upper and lower arms and legs are decorated with strings of white beads, and finally the whole body is smeared with red paint (láń). The face just has a frame of color (see drawing 172). Then the arms are tied together between the upper thighs, the lower thighs are turned back, and bound to the upper ones. If the deceased person is a married man, his widow takes leave of him with móńorai [AN: fellatio]. Then the body is wrapped in a pandanus mat (ǵiagi) about 2 fathoms long, and he is buried with his head turned toward the west (!); the natives did not know the reason for this.

If death occurs in the morning, the burial is about four o'clock; in the other case, it is the next morning at sunrise. The corpse is laid in a box-like coffin (imelimáś) about a meter long, and this is made by all the natives, as soon as they realize that death is imminent. The coffin consists of sticks, which are fastened close together. Since the burial is in the sea, and inside the reef, the coffin is weighted with stones, which are either fastened to it, or laid inside... After serving as pall bearers the men are not etáb [AN: taboo].

2: Damm et al. --78 (1909) 1938 Wolcaians
116, 587 Ifaluk

The interval between the death of one spouse and the next wedding of the surviving partner can be 2-3 months, or only 1/2 - 1 month; the widower or widow determines this according to the affection he feels for the dead spouse.

The same things that we said about the clan relationships on Polowat apply to Ifaluk. The natives here know the Sáupólowat clans, which, as the name indicates, came from Polowat. Similarly, the Wisúsu clan originated in Polowat. The Monáulifer, the Fánimēi, the Gadamán and the Wolēi came from Yap. The last one is under the direction of the Polowat clan, that bears the same name. The Böl clan comes from Pulap; their chieftain (monáinan) was called Marēsú, and lived on Falalap. The Sáuwól clan came from Qleai. Then the Wuído clan, called Dják, and the Sáuwálēi clan under the name Saufalásik are also found here.

2: Damm et al. --78 [3] (1909) 1938 Woleaians
116, 167, 175 Ifaluk

Ifaluk played a special role in the history of the Caroline archipelago, partly because of its wars against Oleai, Lamutrik and Elato, and then also because it colonized anew the islands, which it had depopulated, as well as Sorol and Faraulip. The following facts illustrate the dependency on Yap. At the time of the Hamburg South Sea Expedition, two men from Ifaluk, the only ocean captains left, had taken their boats, and 85 men and 6 women had gone with the steamer to Yap and Ngulu. Nobody knew when they would come back, because the king of Gatšapar kept these tribute payers on Yap for a long time; they had to work for him. So the suzerainty of Yap was still very powerful.

The chiefs are universally respected; when they enter, they are offered seats; children disappear into the corners of the huts, and are not seen.

The chief has a general superintendance over the islands of the atoll; he gives orders for public works, for instance the construction of the men's houses, and large fishing expeditions; then he also lays out the day's occupations; that is, he tells some men to work with the coconut palms, while others are supposed to cultivate the taro fields, etc. He gives these orders in the men's house. People also have to get his permission to construct large boats; this is not required for the smaller ones, or for the building of houses.

2: Damm et al. --78-79 (1909) 1938 Woleaians
116, 622 Ifaluk

The lesser chief is a kind of representative of the head chief. He has to oversee everything, and give an account to the head. [79]

The two lesser chiefs execute the orders of the head chief. They call the population together in the men's house, organize the big fishing expeditions and superintend the construction of the men's house.

2: Damm et al. --79 (1909) 1938 Woleaians
116, 643, 651 Ifaluk

The chiefs have certain specific excises. The head chief can claim a part of the yield of the fields and fruit trees for himself. He receives 1/5 of the catch of every fishing expedition, that one of his subordinates has undertaken, while the under chief gets 1/2 to 3/4 of what is handed over to the head chief. If the fisherman has not taken very much, the minor chiefs have much less, or nothing at all. In this case, the fisherman just gives a share to the tamól igidigit, whom he meets in the men's house immediately upon his return. The chief divides the booty from the common fishing expeditions among all the houses of the atoll (and not among the men); he and the other chiefs renounce their claims all together, or they may take one fish from the ones that are due to a house. If the catch is small, he takes a half, or even less of what a house is supposed to give him.

2: Damm et al. --79 [2] (1909) 1938 Woleaians
116, 643 Ifaluk

A chieftain's successor is his eldest son, or it may be the son of the brother or the sister of the deceased. In the succession the sister's son always has precedence over the son of the brother. If the family of the high chief is nearly extinct, he names his successor before his death; and he also names a guardian to act as regent for a successor, who is a minor.

2: Damm et al. --79 [3] (1909) 1938 Woleaians
116, 173, 643 Ifaluk

A native of Yap, Mŏdj, is said to have been the first high chief; and he settled on Falalap in legendary times. Several of his children then went to Feladjik. . . . Mŏdj had two sons; the elder became the high chief, and the younger the lesser chief. The natives say that this is the origin of the great and the minor chiefs. In addition to these two important chiefs, (tamŏl solŏb), there are also two chiefs of a lower rank (tamŏl igidigit), who also come from the chief's family, and live in Lawuau; they are the men, who execute the commands of the chief, and give his orders to the people. Their position is reminiscent of that of the pŭlepŭle and kōkŏa of Luangiua and Nukumanu, who also belonged to the ruling families.

The names of the high chiefs were:

1. Mŏdj
2. Ällofăs [80]
3. Dădar
4. Aŭăp
5. Maĭliăs
6. Moŭraĭ
7. Soral
8. Gŏrigar; he is supposed to have lived at the time of the first great typhoon.
9. Modurŏk
10. Jalorăk
11. Gawurŏk
12. Malŭdjŏm
13. Idălŭb; he lived at the time of the third typhoon.
14. Ärŭlliămăn
15. Dibădău; he lived at the time of the fourth typhoon.
16. Soligŏu
17. Gilălobăk
18. Olaĭdiŭ, he lived at the time of the fifth typhoon (1907) and disappeared on the trip

to Lamutrik.

19. Daoreligár was head chief of the island group at the time of the Hamburg South Sea Expedition (1909); the second chief was Sairū, lesser chiefs were Duwälior and Älewūdj.

2: Damm et al. --80 (1909) 1938 Woleaians
116, 834, 576 Ifaluk

In the presence of any member of the other sex the rules of etiquette are strictly observed. No improper word may be used; for example, every term applying to sexual relationship, and even the words for apron, bälebal and siwisif, are forbidden. If the group is not a mixed one, the conversation is extremely blunt. Even in the presence of little boys, the men discussed sexual matters, and the children laughed about them. In the same way, the women used obscene language when little girls were around. When Sarfert was alone with the women, they spoke in round about ways of intercourse. When he showed them a waliwot with penis, they imitated coitus movements with it, or suggested this with their fingers. They made no attempt to hide the fact that they wanted to sleep with Sarfert, but they were afraid of their husbands, and of the head chief. This bold and provocative demeanor is in striking contrast to the custom, which requires that in the presence of their husbands, the women shall be restrained, even shy and frightened. Sarfert could always tell the difference. When men were in the group, the women only dared show their affection for him by sly signals, which they made from a distance.

2: Damm et al. --80 [2] (1909) 1938 Woleaians
116, 576, 763 Ifaluk

The customary greeting (gawón) for the people who are leaving is ólamál, and for the ones who are staying it is gosálok. These forms are always used, even if the absence will be for a considerable period of time. There is no particular expression, that is a farewell to the dying.

The men's house and the large fishnets (ädin, ūg) for the big fishing expeditions are considered village property. The canoe houses are the property of the single village districts, Jor and Jiwan.

2: Damm et al. --81 [2] (1909) 1938 Woleaians
116, 423, 592 Ifaluk

Land and soil do not belong to an individual, but to the family; this also applies to the stand of fruit trees. Even the five bugodăl, which the king possesses, are not his personal property, for he shares them with his brothers and sisters. The taro fields belong to the female, the coconut palm stands to the male members of the family. When a man marries, he brings his wife the usufruct of the property of his family. There is a mutual agreement about whether they shall receive their nourishment from the soil of his or her family. If the woman has any children, the husband gives one or two of his family plots to his wife's family. The amount depends upon his own wealth, and in any case they are never whole pieces of property; generally they consist of a taro field for the girls, and several palms for the boys. Some palm trees are always assigned; a group of them on the border of the property is notched in a particular way with a knife, so that a circular mark is made. This group is not for the children; it becomes the personal property of the mother's family. We can still see how the mother was formerly the central point of the family. A family has between one and seven pieces of property. The boundary lines (nibidăli bŭgod) are shown by trees.

The same regulations apply to the household possessions; the huts belong to the family, and indeed to the whole family.

2: Damm et al. --81 [3] (1909) 1938 Woleaians
116, 422 Ifaluk

In addition, the adornments and household implements belong to the family: necklaces, tortoise-shell rings (for women only), knives, boats, dishes, spears, fish hooks, fish lines, fish traps of various sizes, chests, net pouches, looms.
The following items are considered personal property: combs, ear-rings, loin aprons, baskets and giāgi mats.

2; Damm et al. --81 [4] (1909) 1938 Woleaians
116, 768 Ifaluk

Right of inheritance. This is essentially a family inheritance. The personal possessions of the deceased are buried with him, even family pieces of jewelry. He keeps his mat and loin apron, but his basket is burned.

2: Damm et al. --81 [5] (1909) 1938 Woleaians
116, 692, 643 Ifaluk

The chief is always the judge, and the court is the men's house.

2: Damm et al. --82 (1909) 1938 Woleaians
116, 689 Ifaluk

If a man uses bad language, is wicked and wanton or lazy about his work, he is warned by the head chief. If this happens several times, there is a more severe punishment; for example, the head chief takes the canoe away from the guilty party, and keeps it himself.

2; Damm et al. --82 [2] (1909) 1938 Woleaians
116, 682 Ifaluk

If a murder has been committed, the chief orders the other men to bind the culprit, and to bring him to the men's house. Then all the inhabitants of the village assemble, men, women and children. The chief scolds the criminal severely, and then lets him go free; he is punished by being deprived of all of his property, canoes and loin aprons, and these things are given to the family of the victim. The principle, an eye for an eye, and a tooth for a tooth, is not observed, for the murderer is not slain.

2: Damm et al. --82 [3] (1909) 1938 Woleaians
116, 683 Ifaluk

In the case of a fight, if the assailant had just cause for the combat, he is admonished by the chief in the presence of all the villagers. If the affair was more serious, the following penalties are exacted: for injuring an eye, an arm or a leg -- a canoe and two loin aprons;
both eyes, both arms or legs -- two canoes, and as many loin aprons as the culprit possesses;
one finger -- one loin apron;
two or three fingers -- two loin aprons;
four fingers -- two or three loin aprons;
a hand -- three or four loin aprons.

2: Damm et al. --82 [4] (1909) 1938 Wolesians
116, 685 Ifaluk

If theft has been committed, the chief orders the victim to take a similar object from the thief. Occasionally, the chief also scolds the culprit in the presence of the whole population.

2: Damm et al. --82 [5] (1909) 1938 Woleaians
116, 684, 643 Ifaluk

The chief does not intervene in a case of adultery. If the guilty man wants the woman, the husband surrenders her, but at a high price (large canoes, loin aprons, chests, etc.) If the culprit does not wish to take her, he does not pay so much; for example, a small canoe, or a large chest. In any case, the husband leaves his wife. If she has any children, the penalty is larger. The children go into the husband's house, but they are permitted to visit their mother.

2: Damm et al. --83-85 (1909) 1938 Woleaians-1-4
116, 173 Ifaluk

Formerly Ifaluk was uninhabited. The first settlers were Mŏdj and his wife Filidamŏl, who came from Yap. Originally, they came from Kárebar. * The parents of these first inhabitants are unknown on Ifaluk.

Mŏdj and Filidamŏl did not have a canoe, so they came on a raft (fōfát); they travelled over the already settled islands of Mogemog, Fais and Oleai. The natives believe, that they steered by the stars. After they landed, Mŏdj built a house, Ilamái on Falalap, in the northern district, Jiwán; this is no longer standing. He dug for drinking water, and planted coconuts, bread-fruit, etc. which he had brought from Yap.

Occasionally, men and women from Oleai and Faraulip came and settled, and some Ifaluk people went to those islands to stay. The most exciting event was the arrival of some very large devils in human form. These giants were so thorny that big fish were speared on their bodies. They swam to the island, but when they did not find any food, they went peacefully away again.

Under Mŏdj's administration the Ifaluk natives became very warlike.

Battle with Oleai.

Mŏdj went to Oleai, and he liked it so much that he married a woman on this island. But the natives of Oleai did not like him. A quarrel started, and Mŏdj was wounded. He

* This is probably the same as Gatsápar, which is the site of the cult of the god Yonalév.

fled in his canoe, and went back to Ifaluk. Here he called his followers together, they returned to Oleai, and made arrangements for a long stay on the main island. After a while the Oleai people did not have anything more to eat, and so they moved over to Ráur Island. At once the Ifaluk men followed them, and there again they devoured everything. Then the Oleai inhabitants sailed to Bäliau, but once again they were molested by their enemies. The same thing occurred in Otárau and finally in Falálüs. Eventually some of the Oleai natives died of hunger, and the others were weakened. That was the moment for which Oleai had been waiting; he and his companions attacked the enemies, and killed all of them (except his wife and his son). This son became the chief of Oleai. [84]

Hambruch, in his notes about Faraulip, gives another version of a struggle between Ifaluk and Oleai. Móis * was king of Ifaluk, and a guest in Oleai. While an Oleai resident was out fishing, Móis raped his wife. He did this on numerous occasions, until the husband finally surprised him, beat him, and threw him out of the house for dead. About sunrise the rain wakened Móis. He got a piece of wood out of the bushes, and used it to swim back to Ifaluk, as he did not have a canoe. When he got home, some of

---

* probably identical with Módj.

his people took care of him, and after a long time he was well again. Then he went into the men's house, called all the inhabitants together, took off his apron and said: "We will sail and fight the people who live in the direction, where my organ points." His penis pointed toward Oleai. Then the men made a great many spears, took a vast number of canoes and went to Oleai; there they slew everybody, except the maidens. Later there was a

War with Lamutrik

Since there was not much to eat in Ifaluk, Mŏdj ordered his men to go to Lamutrik and take possession of this island. As Mŏdj was very old himself, he named Ällofăs, his future successor, as general of the warriors. Some of the Elato natives had already perished from hunger, and the others went to Lamutrik. Ällofăs followed them, and started a battle at once; he was wounded, and there were dead on both sides. Then Ällofăs returned to Elato, and remained there.

Meanwhile, two months had elapsed, and the expedition had not yet come back to Ifaluk. Mŏdj was anxious about the fate of his soldiers, so he took a few men and went to Elato. When he found Ällofăs there, he inquired why they had not slain all the Lamutrik inhabitants. Ällofăs said that it was because they were too strong. Then Mŏdj ordered his men to make a lot of torches of coconut leaves, and once again the Ifaluk people sailed with the southwest wind to Lamutrik. They made a secret landing on the

uninhabited side of the island, and then attacked the unsuspecting natives. It so happened that the wind blew the biting smoke of the torches into the eyes of the Lamutrik men, and so they could not see. They were all destroyed. Later Mōdj sent a man and two women to Lamutrik, to settle the island again.

Later, the chief Mâiliăs sent people from Ifaluk to colonize two islands of the Faraulip atoll, which had formerly been inhabited. They had fought each other until only one man, Uēliwă [85] was left. When Mâiliăs heard about this, he sent a woman, Nĭman, so that Faraulip might be populated again. This kind of civil war was unknown on Ifaluk; the two struggles with Oleai and Lamutrik are supposed to be the only warlike developments of any significance....

2: Damm et al. --85 (1909) 1938 Woleaians
116, 175 Ifaluk

The head chief Olaidiu lived at the time of the great typhoon of 1907, but he disappeared on a trip to Lamutrik. Under his administration the white merchant Sāu left the island, and that was prior to the typhoon, while three Japanese, who were residing on Feladjik in Lawuāu, left immediately after the disaster.

The high chief Daoreligar ruled in 1909, and Sarfert's Faraulip interpreter declared that he was a very great king. After the last typhoon, which devastated the island under his predecessor, many Ifaluk natives went to Lamutrik, Yap and Palau, in order to avoid a famine. When the island population was assured that it would have enough nourishment, the chief begged Sarfert to see to it that no more people would be removed. He had a similar experience on Aurepik; the natives, who came to Yap, were brought to Nauru.

2: Damm et al. --86 (1909) 1938 Woleaians
116, 772 Ifaluk

To the natives, the universe consists of the heavens (rán), the earth (selób) and the underworld (fariouál or ilól). They knew nothing about the world axis, that is found on Aurepik. The heaven is a large place, like Palau or Yap, and it is inhabited by people, similar to the ones on earth. These beings act like their earthly representatives, but the islanders could not say whether they too have to die, or not.

The underworld is arranged like the earth; that is, it has islands and oceans, and the sun, moon and stars shine when they have disappeared from the earth. It is also inhabited by men. Solál is the king; he is half man, half láwud (fish, snake or eel?); he does not have any parents, or any relatives. The large house, that he inhabits, is called Falisát; that is all the natives knew about it.

2: Damm et al. --86 [2] (1909) 1938 Woleaians
116, 773 Ifaluk

Solál created heaven and earth, by taking a grain of sand, and then rolling it from one hand to the other, while repeating a magic charm. He also created the ruler of the heavens, whose name is Äluelöb (see 2: 776) and his sister Aùdjál, the real queen of the earth.

2; Damm et al. --86-87 (1909) 1938 Woleaians-1.2
116, 776 Ifaluk

The starry heavens are the abode of Äluelŏb. He dwells as king in the house Fadjemál, which stands at the zenith (woliwū), and looks like a stately house on earth. He is larger than human beings, and omniscent; he neither eats nor drinks, and always has his eyes closed. He reposes on a platform in the middle of the house, while the other people sleep on the floor. His wife is Lamagéi. If one of the inhabitants of heaven does not know what to do about something (building canoes, weaving), he asks various people for information, then turns to Lugēilăn and if he does not know, he turns to Olofád. If he still can not find the answer to his problem, he begs Lugēilăn to ask Äluelŏb about it. [87] Then Lugēilăn goes to the king of the heavens, opens his eyes with his hand, and gets the information; and then Äluelŏb goes back to sleep.

Lugēilăn is considered to be the son of Äluelŏb, and people call him the right hand of the king. He has a house, which is near Äluelŏbs, but the name of it is no longer known. His wife is Lămălūl; she is not a heavenly being, for she comes from the earth. When Lugēilăn visited the earth once upon a time, he married her and lived with her. Finally, Äluelŏb sent a messenger to him, ordering him to come back and to call all the residents of heaven together to repair the Fadjemal, because the rain was getting into the building. While he was away, his wife gave birth to Olofád. During Lugēilăn's visit on earth men learned about tattooing.

Lugeilān has to superintend the work that is being done on earth on the various islands (building canoes and houses, fishing etc.). He gives a daily report to Äluelōb, and if the inhabitants of an island are not industrious, but are wasting time eating and sleeping, Äluelōb commands him to send storm and rain; he also orders Solāl to stir up the sea. Then the island is visited by a typhoon, which is of a severity commensurate with the sins of the inhabitants. That is why Oleai was laid waste, and many of the natives died; the same thing occurred on Aurepik and Ifaluk, but with a smaller loss of life. The natives believe that there is no man who is thoroughly good, and nobody is absolutely evil; they think that Lugeilān himself punishes individuals for their misdeeds and failures; he does this by sending disease (mās), and in serious cases, death.

In such cases men have recourse to magic charms. But if this deity has ordained death, and he does so by saying: "this man and that man shall die!"; then there is nothing more to be done.

After five months Lämälūl gave birth to Olofád, who emerged from the sutures of his mother's head. He could walk immediately, and paid no attention to his mother, when she wanted to wipe the blood off. He said he could do that himself, and so he rubbed himself on a coconut palm. That is why a number of palm trunks have a reddish hue. When his mother called to him, that she wanted to cut off his umbilical cord, he replied that he would attend to that, and so he took a knife, and cut it himself.

During his earthly life Olofád saw how all the other boys were drinking from coconuts. So he ran to his mother and asked: "Why do you not give me a nut, when all the others are drinking the milk from this fruit. ?" Then Lämälūl was frightened, because Lugeilán had told her that she would have a son, but that she should not permit him to drink any coconut milk; if he did so, he would leave her and come up to his home in the heavens. Accordingly, she said to him: "You must not drink, for if you do, you will die." [88] And so Olofád lived. But one day he saw all his comrades drinking out of these nuts in the big house, and so he ran to his mother again, and said: "Mother, all of them are drinking nuts, why can I not drink? I want to drink nuts too!" The mother answered sharply: "Then you will have to die." Olofád replied: "Good! I want to drink coconuts too, and if I have to die, it really does not make any difference." But his mother refused to give him a nut, and so Olofád began to scream, and he would not stop. Finally his mother surrendered, and brought him a nut. Olofád took it, and

drank the milk. While he was drinking, he looked up, and saw his father Lugēilān. Then Olofād cried: "I am not going to stay on the earth any more, I am going to my father's house in heaven!" But his mother said: "You shall stay here; what do you want to do there ?" But Olofād kept on screaming. Then his mother prepared food from coconuts, laid it in the fire, and when the smoke rose, she said to her son: "Come in the fire!" When he entered the flame, he rose with the smoke to the heavens. On the way he met some boys, who were playing with some little nōk fish. Olofād said to them: "Come, give me a nōk, I want to play with one too!" But all of them answered: "Why should we give you a fish; they belong to us." Only one boy gave his fish to Olofād, so that he could play with it. Olofād pretended that he was amusing himself with it, then gave it back, and went on his way. But he said to the fish: "When I go, catch the boys and sting them!" And so the fish stung the boys with the stings on their dorsal fins, and only one was spared.

As Olofād went along, he saw some boys playing with little sharks. He asked them to let him have a fish, so that he might play too. But the boys replied: "From whence do you come, and what do you want to do here ?" Only one of them gave him a shark, and he played with it. As he went further , he told all the sharks to bite the boys, and so it happened that only the one boy was saved. And Olofād went farther, and met boys, who were using play boats; they refused to let him join them, and only one boy loaned

him his boat. When Olofád left the boys, he said to the toy canoes: "You boats, go away quickly, so that the boys will not be able to catch you; go away quickly!" Then the canoes sailed away so rapidly that they could not be found. Only the boat of the one boy remained.

Then Olofád came to Fadjemál, and found that the men of the heavens were repairing the house. They went into the forest, to make supporting pillars out of the járo trees. When they saw Olofád, they noticed that he was an earth-dweller, and they resolved to slay him. While they were carrying a large prop on their shoulders to the house, they all walked on one side, and Olofád had to go on the other. When they reached the house, they all dropped the support quickly, so that it would crush Olofád; but he jumped quickly to one side, and was not injured. Then when the men wanted to sink the props in the hole [89] they sent Olofád down to enlarge it and line it with coconut fronds, as that is the custom when you set posts. Olofád took the leaf of the walimáko plant, and stuck some red earth (láb) in his mouth. As soon as he was in the ditch, the men let go of the beam, but Olofád took the nerve of a coconut leaf, and quickly bored a passage through the soft marrow of the trunk, and then he spit out the red earth, and the leaf, which he had chewed. The pulp ran down along the outside of the beam. Then the men thought that Olofád was dead, and they believed that the red sap was blood, and that the remains of the leaves were gall. When the house was finished, Lugēiláń prepared a repast for all the workers inside it. But Olofád crawled up through the hollow in the

marrow of the beam, and sat down out of sight on a diagonal rafter. While the others were eating, he ordered an ant to bring him a little piece of coconut. It did so. Olofád rolled it around from one hand to the other, and said that it should turn into a whole nut. And so it happened. Then he sent for a kernel of sand, and changed it into a stone, following a similar procedure; he cracked the nut, and then all the men looked up, and were very astonished to find that Olofád was again among the living. Then they all realized that Olofád was no ordinary mortal, but the son of Lugēilān. He told Olofád to come down, and to eat with them. And after this no more attempts were made on his life. Olofád was also tattooed in the Fadjemāl. He lives unmolested in the heavens, but occasionally he goes south, west, east or north and sees how the men on earth are singing and dancing, because he loves that; but he always goes back to Fadjemāl.

Another authority of Sarfert added the following episode to this story. Olofád saw the people cutting coconut fronds from the palms to plait the mats for the roofs, and he asked for a knife, so that he might help. But all the men refused his request, save one; he loaned his knife, and Olofád got up on a palm, and cut fronds. When he was tired of work, he gave the knife back, and as he left he said: "All the men are to get stiff where they are, and they are not going to be able to move any more." And so it happened. The men remained rigid, wherever they were, one was climbing, another coming down, the third chopping, and another was carrying the fronds to the house. Only the helpful man, who had loaned Olofád the knife, could move.

Baluelŏb * is another resident of heaven; nothing definite is known about his relationship to Aluelŏb, although many people think that he is a son. [90] He lives with his wife Jiawŏk and his sons Älülüéï, Selän, Farawäï and Ällülümädj in Fadjemäl, and in olden days, like the other residents of heaven, he used to visit the earth. At that time people on earth could also come up to heaven. Balüelŏb is an authority on sails, and he also knows how to mend broken canoes.

His sons also know about seafaring. So Älülüéï sees to it that the natives sail the

* The natives of Mogemog and Polap are supposed to know a great deal about him; the other islanders obtained their information from this source.

right course in their canoes, and that they find the islands, which they want to visit. He keeps bad weather away, and provides a good breeze. In payment for this, the captains have to make bánewan, and lay a sacrifice to him on the canoe; this takes the form of a loin apron and two coconuts. If the sea gets rough, Älülüéï takes this gift, that means, he throws it into the water. Älülüéï lives on Biemál Island, which is south from Ifaluk, and it is supposed to be a three months journey. It is uninhabited, and only has one pandanus tree. The canoe house of Älülüéï also stands here; it is called Gaiméim, and it is the place where the spirit keeps thin coconut thread (galogál) for nets, houses etc.

Selán is the real canoe builder; he made the first boat in Mődj, and taught the art to men. Mődj is a small inhabited island in the east, that lies a four days voyage south from Truk.

Farawáï is a competent judge of the weather. He can tell at sun rise whether it is going to rain or not, and he informs Älülüéï about it. There is no bánewan for him.

Like his father, Älülümädj knows how to repair boats and houses, which have been destroyed by storms and tides. It is no longer known how he taught this art to men.

The air and its inhabitants.

The rainbow is a male spirit, Lauliăr, who is in the service of the king of heaven. The natives did not know anything about his origin. He came to Ifaluk once upon a time, and he was swimming on a piece of drift wood. A woman, whose name was Illegieri, was washing her child Illebanigi in the water, and had laid her loin apron aside. Lauliăr seized the little boy, and refused to give him back until the woman promised to become his wife. Then they went to her house, and Lauliăr stayed until Illebanigi was grown. Then he taught him the banewan, and the Ifaluk natives learned it later from him. After that Lauliăr returned to the heavens.

The natives believe that the earth is ruled by Audjăl, the sister of the king of heaven. She has the normal figure of a woman, and no animal's body. Although she never married, she had a number of children, and they populated all the islands. The inhabitants believe that she is the first mother of humanity. [91] Audjăl demanded tribute from her children, and they paid it faithfully until modern times. Since her house Lamolŭ or Lamorŭ is in Karebar * on Yap, the king of Karebar occasionally sets a time for the various islands to pay their tribute. The amount depends upon what is assembled.

---

* This is Gatschepar on Yap.

The Ifaluk natives bring loin aprons, home made boxes, resin from bread-fruit trees to calk the canoes. In the boat house, where Sarfert stayed, there was a chest with about twenty loin aprons for Aûdjál.

Tree spirits. There are also spirits in the trees, Ällüsiliwōli. Their king is called Jalūlefálu; he gets his orders from Lugēilān, and then conveys them to his subordinates. They pursue the men, who do not obey the earthly chief.

The ocean is also peopled with spirits (Ällüsidäd), who obey Solál. You can obtain their favor by engaging in a bañewañ in the canoe; then Solál orders the spirits to give the fisherman a fine catch.

2: Damm et al. --91-92 (1909) 1938 Woleaians-1-2
116, 789 Ifaluk

Bánewan means the invocation of a deity; several inhabitants of the heavens have a sort of symbol (wálewóli) *, which plays a certain part in the bánewan. It is not known in every case how men learned about it. In this connection the islanders made a reference, which is worthy of note; they said that the people of Mogemog and Polap were the first ones to know how to sail great distances, and that Sarfert would be wise to consult them about this matter. At all events, only certain men understand about bánewan.

1. The bánewan for Lugéilán is used during sickness, because this god lets men get ill. In order to be successful, it is necessary to undertake four different bánewan in an interval of 4-5 days. It is best to do this when the moon is in the west or the east, in other words, when it is small. If the disease is not yet cured, there is nothing to be done. Solál gave these bánewan to Áluelób, who transmitted them to Lugéilán, and also to his sister Áudjál; it was she who taught them to men. In 1909 there were still two men who knew these bánewan. The symbol (wálewóli) is a paddle, with two coconut leaf knots fastened to its handle.

2. There are two bánewan for Láuliár; and they are designed to drive away the rainbow

* According to another version, Sarfert calls this bánewan invocation wáliwól.

which Lâuliăr wants to use to destroy the canoes on the sea. The bă̆newaṅ only succeed [92] however, when the oarsmen have not made Äluelŏb too angry, and when he has not resolved to kill them. These bă̆newaṅ, which were called faruelŭs, were only known to two men, not to the king. An ax (dă̆lăi bă̆lăi) served as a symbol, but the last typhoon took it away; now there is no such wāliwŏl.

3. The bă̆newaṅ of Älülümă̆dj is called bŏuwă̆n. It is employed during house repairs. Using the wāliwŏl, a dancing stick with a coconut leaf knot (uwŭd) on one end, a native utters the charm, pushes the stick against the damaged house, and runs around it.

4. The bă̆newaṅ for Älülüé̆ï is lïolāu; it was a wooden figure, equipped with ray stings; but Sarfert found a second waliwŏl of Älülüé̆ï in the men's house, and this one had the shape of a conch shell (dâui); it belonged to a captain. Both are used to drive rain away. While you are repeating the charm you swing the first wāliwŏl back and forth, and thrust its point in the direction of the storm; meanwhile, the conch shell is blown from time to time.

5. The bă̆newaṅ for Leläṅ is called lümŭliwalewal. It is pronounced during the canoe building, at the time when the bow and the stern crest are added. While this is in progress, a coconut leaf knot is hung around each worker.

6. Baluelŏb has no special bă̆newaṅ; so the ones for Leläṅ and Älülüé̆ï are used for him.

7. Bă̆newaṅ with coconut leaf knots for sea spirits.

2: Damm et al. --92-93 (1909) 1938 Woleaians
116, 775 Ifaluk

The souls of the dead (noli) * stay in the air; the natives do not have a world of the dead, as the Bur people do. * The noli can wander around the earth invisible [93], or they go through the air like a wind. Lugeilan or Aluelöb is the ruler of these souls of the dead.

---

* The following native words are given to complete this: shadow - nuru, name - idæl.

* According to Sarfert, Lugedad is also unknown; but people speak of him as a spirit of the Mogemog islanders.

Aluelöb established the Tapu. (etab; the opposite is daitab). If a man is tabu, no one is permitted to take food or drink from him, or to give him anything. He can not sleep with a woman. Various things cause a person to be tabu, and this state usually lasts four days.

a) If anyone is undertaking a banewan, he is tabu for four days, and in case a cure is operated in this fashion, it applies to the patient too.
b) Women in the menstrual lodge are tabu; during menstruation it is for four days, or until the end of the period; after births, for ten days.
c) If a man is consulting an oracle (buă) for someone, who wants to travel to a distant island, he is tabu for four days.
d) During canoe-building all the workers are tabu, but only on the days when the banewan is undertaken.

Then individuals are tabu for certain specific things; captains, or people, who know the banewan for Allülei, or those who can prophesy (buă) from knotted coconut leaf strips, are not permitted to go to the blood house. Then there is a general tabu on the bread-fruit trees; that means that none of them may be felled.

The natives did not know whether the custom decreeing that women may not go into the canoe house, goes back to an ancient tabu, or not; they just said that it was an old custom. Neither do they know the basis for the custom of not eating certain sea animals;

in general, the shark is not eaten "because it eats people, and therefore, men are afraid of it"; then the bā́ro, lā́wud, lṓdj (poisonous fish) and fâi (ray) are not touched either.

2: Damm et al. --94 (1909) 1938 Woleaians 1-2
116, 534 Ifaluk

Sarfert did not find any real musical instruments, unless you want to put the common conch shell trumpet in this category, and it is more like a signalling instrument. Drums are unknown.

2: Damm et al. --94 [2] (1909) 1938 Woleaians
116, 533 Ifaluk

The natives love songs. In addition to dance songs, there are others (gūli and walugulumāle or gūlumāle), which are composed by women. They are love songs, in which the qualities of the swains are praised. Men do not know anything about composing. Shark and turtle songs, like the ones on Sorol, are not known.

Dancing (wăluk). There are dances for men and women. All of them, with the texts, are supposed to have been brought from Yap and Mogemog. The natives have no idea about the invention of the dance. The Ifaluk people do not know how to devise texts (ewadŭlu); they only knew one man, who died before 1909, who had composed the words for a walugisăb.

a) Men's Dances (jalomăle):

1. Laulă (stick dance). It is danced in two rows, and the performers have their faces turned toward each other. The stick (gŭlugŭlu) is held by both hands in the middle. The song, which accompanies this, is relatively soft, and only rises to a crescendo at the end. The dance consists of single turns, which are distinguished by various movements and speeds; the characteristic feature is the way that the men strike the people standing beside them, and across from them with the ends of the stick. Then places are exchanged frequently, so that no dancer is in the same position, at the end of the dance, and yet he has the same partners beside him and across from him. The striking is quite complicated, and demands great skill. This dance is often performed in groups of four.

2. Kabanăk is a dance that is performed standing; it is rather similar to the walugisăb.

3. Walugisăb is partly a standing, partly a sitting dance.

4. Wuliăl; Sarfert did not see this dance. [95]

b) Women's Dances (jalorăwud); there is only the dăgar, which is partly a sitting and partly a standing dance.

c) Mixed Dances (gabalfielue), in which women and men dance together; they have no particular name.

d) Children's dances and girls' dances are known; the movements are especially graceful and fine. While Sarfert was staying on the island, a youth brought some girl's dances from Lamutrik, and they were performed every evening; even women took part. Sarfert never saw boys dance alone.

Sarfert found all the games (ūlu, Mogemog: rāgam), by watching the children; he never saw men and women playing.

a) gāref'a: ball game. The cubic ball (gāref'a) is plaited of coconut leaves, and it is tossed from one opponent to the other.

b) gedādal: wrestling match, both overhand and underhand grappling are used.

c) limés: jumping with both feet.

d) ligef'ēt: walking on the hands.

e) djūerū: it is a game of tag between two people. Each one erects a pile of sand to serve as his base. Then each opponent tries to catch the other, and to reach his base.

f) liwas: a sand game, in which the players make holes in the sand with their index fingers, while reciting a verse; then they say another verse and pull them out again.

g) dilidīli: a running game; two groups take hold of hands; one runs past the other, and the last one must hold on to a boy in the other row.

h) sawōf'ā: a tug of war between two groups. They take hold of each other after reciting a verse, and then pull in opposite directions.

i) lifolūr: a game like the German "Fox in the hole." A circle is formed, and a "sleeping spirit" kneels in the middle. The players in the group sing, then the spirit

wakes and tries to break through the group, by throwing himself on the arms of the players. In the spot where he gets through the line, one of the guilty children must be the "spirit."

k) fisilāle: a circle is formed, and each player puts his right leg over his neighbor's. Then they sing a song, and everybody makes a quarter turn to the right, and hops around in the circle. The position is so awkward that some of the players naturally tumble down, to the general amusement of all concerned.

l) ńóudâulugubāí: four players stand in the corners of a rectangle, [96], and four others sit between them. The latter put their feet together, and give their hands to their neighbors on both sides. Then the children, who are standing, run around in a circle, and keep the others swaying back and forth.

m) imādirāu: it is the German "blind cow" game. The eyes are bound with a coconut leaf.

n) gafibói: a chain is formed, then the first player crawls between the 2nd and the 3rd, and everyone keeps his arms folded. Then they turn around suddenly, and swing their arms over their heads, so all the players hold hands again.

o) igalimūd: the children squat in a line. Then the last one is grabbed by two larger boys, and swung over the whole row.

For toys they have a ball, bow, toy boats, a bull-roarer (legawūliwuli) of coconut

leaf, a little windmill (legafilǟn) of leaf strips with an axis of coconut nerve, a pipe (gǎdigedik, gǎdik) of coconut leaf.

116, 345, 531 Ifaluk

The men's houses are the only ones, which have colored ornaments (kawoluắl), arranged in a rather artistic decoration. Formerly the central supports and the roof supports (wắu) were very ornate. In the men's house Sarfert found an old beam under the roof; two sides of it were decorated with the rašŭ́m pattern [AN: see drawing 176 of source]. . . while the third had a double rhomboid design, wŏ́wo, which was supposed to represent a fish of the same name (drawing 177 of source).

On the pillar of a small dwelling Sarfert saw the vertical karebắli wulugắlâi pattern, which was supposed to reproduce the tail of the wulugắlâi fish [AN: see drawing 178 of source].

There were practically no wood carvings; however, Krämer found a wooden fish in the chief's house; then the waliwŏ́l for Ällülḗï should also be mentioned among the artistic products.

The year does not have any particular name; it is divided in two parts: edjăk or răk is the season, when the west wind prevails, while ĕwăn or niwăn is the time of the east wind.

The year has twelve months, which are named for the stars; (fŭs); they fall into the following groups: [98]

ĕwăn	edjăk
elüŏl	maîdjĭk
mălu	maîlŏb
ĭdj	sōdă
djelewŏl	lăke
elemaûdj	gŭ *
dumul	ul

Sarfert calculated the 7th of November, 1909 as the 26th day of the month mălu. Each month has 30 days (răau, daûat), which were named for phases of the moon; they are:

1. sugŏru	11. jalowugŭ	21. wosolăn
2. jelĭn	12. olawŭe	22. garodălu jafalăk
3. mädjälĭn	13. olomău	23. sabăr mäimŭli

[Continued on next slip.]

* a fish; this star extends over the whole sky.

[Continued from previous slip.]

4. mädjăl
5. mädjafŭs
6. mädjoăl
7. mädjălo
8. lamädjăl
9. djuawŏn
10. ăbēi
14. mădj (full moon)
15. ŭlu
16. nădŭ
17. gilăi
18. galăuăr
19. sabădj
20. jafelăk
24. ilăi
25. gomālŏ
26. djumalifăl
27. jarofŭ
28. jŏu
29. ifaiñ
30. erăfi.

[AN: the names for the various parts of the day have been omitted.]

(1909) 1938

Woleaians
Ifaluk

The following story tells how the Ifaluk natives learned to write [AN: see drawing 180 of source]. A Truk missionary, who was on his way from Olol to Truk, was blown off his course to Aurepik; several Truk natives were with him. He stayed in Aurepik for quite a while, until a boat came from Oleai with the chief. The latter asked the missionary to go home with him. So the missionary and his Truk inhabitants accompanied the hospitable chief to Oleai, and settled there. At that time there was a merchant on Oleai. The Truk men already knew how to write, and they taught their hosts. Finally they went back home by way of Ifaluk and Lamutrik, and so these islanders learned the letters too.

2: Damm et al. --100 (1909) 1938 Woleaians
116, 197 Ifaluk

Lütke has already given some valuable information about the linguistic relationships of the Caroline Islands. He established the fact that all of the languages are similar, and that from Lukunor to Uluti you find the same roots, although there is a considerable difference in the pronunciation. Others have expressed the same thing; Cheyne declares that the Ifaluk natives speak the same tongue that you hear on Oleai, and that the vocabulary is very like the one on Satowal. Girschner learned that "even today Kusai is spoken on this island."

The following equivalents are observed:

Ifaluk	Satowal
l	n (r)
n, r	l
s	' j
d	s

In the pronunciation we notice:

l is the English l; that is the tip of the tongue is laid firmly against the alveolars, and then removed quickly. s the tongue is high, and close to the gums.

- Demonstrative pronoun. This man here (the man standing near) is ălimătăl, that man there (the man, who is at some distance) is ălimătălă.

Personal pronoun. I is găn, you is găl, he is ĭe, we (including I and you) is gĭdj, we (exclusive) is gamăm, you is gămi, they is ĭle. The same rules apply to the possessive pronoun as on Polowat.

a) To indicate persons and relationships, the following pronouns are used:

my father	demăĭ
your father	demăm
his father	demăl
our father	demăr [101]
your father	demămi
their father.	demăle.

b) on the other hand, compound and preceding pronouns are used for all living creatures (animals etc.)

my dog	lăĭ gelăgu
your dog	lămu gelăgu
his dog	lăl gelăgu
our dog	lăŭre gelăgu
your dog	laŭmi gelăgu

their dog	laúle gelágu

c) the pronoun precedes in the case of trees and flowers.

my coconut palm	gelái lú
your coconut palm	lúmóm lú
his coconut palm	lúméle lú
our coconut palm	lúmáre lú
your coconut palm	lúmi lú
their coconut palm	lúmále lú

d) forms similar to a) are used for lifeless creatures, which have been killed for food, or captured: for example, gelái málúk is my hen (destined for food), gelám ík is your (dead) fish, etc.

Measures are taken from the human body, that means that when Sarfert's authorities speak of "fathoms", they mean the length of the outstretched arms, and the width of the chest.

one fathom	ɛ̆năf	six f.	olonăf [104]
two f.	ruanăf	seven f.	fiŝinăf
three f.	selinăf	eight f.	walinăf
four f.	fanăf	nine f.	diunăf
five f.	limanăf	ten f.	sɛ̆k

Shorter lengths are indicated by simply taking hold of the body, for example:

the first finger joint	makorĭk
the first and second finger joint	makŏlăp
a finger length	segăd
a hand length	sɛ̆băranĭm
a half forearm	sɛ̆djeliwŏr
a forearm	sɛ̆măluk
an arm	sɛ̆bau
an arm and half the chest	sɛ̆dilŏup
an arm and chest	sɛ̆făl
an arm and chest and a forearm (up to the elbow)	gŏbau

an arm and chest and three quarters of the arm, (up to the middle of the forearm)	dalidáne gōbáu
an arm and chest, and an arm (up to the wrist)	dago ƙṅáf
length of the outstretched arms and chest.	ƙṅáf

Woleaians
Ifaluk

The terms right and left are unknown; the natives say sibēkimāsibēik, which means at my sides.

no	idoai
yes	ilā and ńā

Like the majority of the Central Caroline Islands, Aurepik was introduced to Europe through the letter which Father Clain wrote on the 10th of June, 1697; he called the island Yaropie, but it is not mentioned on the map that was included with his letter. If we accept the statement of Krämer, who has made a critical study of the history of the discovery of Micronesia, we find that our island appeared for the first time on the chart of Pilot Somera, who was under Captain Don Francisco de Padilla in 1710. And Krämer believes that his Isla de Casa (House Island) is the same as Aurepik, on account of the peculiar houses on stone terraces, which give the island its characteristic cachet, and make an indelible impression on the visitor. On Cantova's native chart (1721) the atoll is called Eurrupuc, and it reappears under this name on Vaugondys's map (1756).

The information that we find in the Kolonial Lexicon (Vol. I, page 98): "Aurepik was discovered by Hunter in 1791, "is not correct, and it probably goes back to Gulick (1867, page 59). It is doubtless explained by a misunderstanding of Chamisso (Bemerkungen und Ansichten, page 104), who writes: "Compare the Phillip Islands of Captain Hunter, 1791 and the two islands of 1791, to which we have already referred as Eurüpük." However, he did not want to identify it with this group, for on page 98 he mentions it as a separate cluster, which joins Aurepik. I think that Brigham (page 148) is much more exact, when he identifies the Phillips Islands with Sorol. [110]

On the 12th of April 1828, Lütke sighted the Island Eourypyg from the west (Kittlitz:

Eurupyk), but he did not land, and continued his northern route. Although there were a number of boats on the beach, the natives did not come to the ship. Von Kittlitz explains this by attributing it to a tabu laid on the boats, during a yearly festival. In September 1844, Andrew Cheyne visited the island, and on the 25th of March 1876, von Miklucho-Maclay touched the group as he came north on the little trading vessel "Sea Bird," but he did not go on shore.

On the 31st of October, 1909, the expedition ship, the "Peiho" of the Hamburg South Sea Expedition, put Sarfert on land, and he stayed here until the second of November. At that time the "Scott" came from Yap to the island occasionally, and then the Japanese also called here once in a while.

2: Damm et al. --111 (1909) 1938 Woleaians 1 2
116, 103 Aurupik

In addition to the native names Yaropie and Eurrupuc, which were the first ones known, there is also Lütke's spelling Eourypyg which Brigham turned into Eurupig; v. Miklucho-Maclay writes Auropik. However, the majority of the discoverers and whale fishermen gave the group new names; some of them were inspired by the distinguishing characteristics of the islands (Low Islands), while in other cases there was no connection (Kama, of Horsburgh). All of these names appeared in Meyer's Colonial Kingdom and in the Kolonial Lexicon. But both of them use the term of the Reichsmarineamt "Aŭrepik" as the principal cue. The Japanese Government Chart of 1925 gives Eauripik, however. The scientists of the Hamburg South Sea Expedition give the island name in the following manner: Aùrepik (Sarfert), Auripig (Hambruch), Aŭrupeg (Krämer), Jâurupek (Hellwig). In the text that I have before me, Sarfert's spelling is employed.

2: Damm et al. --111 [2] (1909) 1938 Woleaians
116, 131, 177 Aurupik

Lütke made the first exact cartography of the island (1828), but he only saw the archipelago from a distance*, and so he could only give an approximate picture of it. The various Naval Staff charts of the seafaring powers do not give any exact picture of the group either; the first officer Lorenzen of the "Peiho" was the first to survey it and to make a map (see Fig. 183).

/

* Cheyne (1852, page 138) says that you can see the islands at a distance of 12-13 miles from the ship's deck.

2: Damm et al. --112-114 (1909) 1938 Woleaians-1-3
116, 131 Aurupik

Lütke's chart [VMM: see source 2: p. 110, drawing 181] gives an accurate reproduction of the oval form of this atoll; Cheyne also describes it in this way, and he gives the largest diameter of the lagoon as 2 1/2 miles in the ESE-WNW direction. Meinicke says that Aurepik is "a small lagoon island half a mile long," but in reality Lorenzen's map shows that it is 5 1/2 sea miles long. The following table gives the latitudes and longitudes of the different sources: [113]

Year	Discoverer and Traveller	lat. N	long. E
1828	Lütke	6° 39' 44"	216° 49' 2"
	Horsburgh	6° 40'	143° 11'
1844	Cheyne	6° 35'	142° 59'
	Raper	6° 40'	143° 11'
1900	Brigham	6° 40'	143° 10'
1910	Sievers	6° 43'	143° 10'
1920	Kolonial-Lexicon	6° 42'	143° 6'
1925	Japanese Government Chart	6° 41' 12"	143° 4' 49"

In the text, both Lütke and von Kittlitz mention two islands, but Lütke's map shows four.* Cheyne also speaks of two low coral islands; he says that the eastern one, or the main island, is inhabited, and that each one is about a mile long. Meinicke also seems to have utilized one of these sources; perhaps he referred to Cheyne, because he, too, only knows about two little islands on the northern side, of which just the eastern one is inhabited. Miklucho-Maclay claims to have seen three little islands. Sievers gives the same number, and he is correct in stating that two of them are settled. In reality, the reef girdle of the group is studded with five islands: Aurepik, Uau, Ellanidigit, Bägefas, Sidene, but only the main island, Aurepik, on the eastern end of the atoll, and the second largest one, Uau, which lies farthest west, are inhabited. On the southern side of the big island is a landing place that canoes can use at high tide. The table shows the various spellings of the different island names:[114]

---

* Lutke 1835, Volume II, page 148; von Kittlitz, Vol. II, page 163. The difference between the text and the map may be explained by the fact that Lütke knew that two of the islands were uninhabited, and so he did not refer to them in the text.

2; Damm et al, --112-114 (1909) 1938 Woleaians-3.

Aurupik

According to Brigham, the reef has a circumference of 2 1/2 miles, and there is no channel to the lagoon; an insufficient passage is on the SE side, but it permits the natives to bring their canoes over the reef to the beach at high tide. It may have been this difficulty which prevented the inhabitants from taking their boats to Lütke's ship when it sailed past the northern side of the island. The surf is very high, and the British Pacific Islands Pilot says you encounter it on the northern side if there are light southwest winds. It almost cost Sarfert his life; for, as he was going back to the "Peiho", his boat capsized...

2: Damm et al. --114 [2] (1909) 1938 Woleaians
116, 132 Aurupik

This island also suffered a great deal from the dreadful typhoon of March 1907, and you could still see traces of it in 1909." The natives told Hambruch, that the typhoon had carried away a part of the eastern end of the island. Sixty years before, a similar storm is supposed to have devastated the island.

For general information about the climate and temperature on the Carolines, compare Singer (1899, Globus, Vol. 76, page 41).

Woleaians
Aurupik

At first glance, the natives of Eauripik reminded Sarfert of the Sorol inhabitants. There were two distinct types of natives; some had a broad head, and were stocky; the others were slender, and with a narrow head; the latter were not so numerous. The women frequently had masculine features, and their coiffure enhanced this appearance. A number of the women wore most of their wavy hair cut short over the forehead, the rest had it long or parted. So there was no uniformity about it. Miklucho-Maclay apparently did not see any bobbed-heads among the natives, who came to call on him, for he writes that their curly and frizzled hair forms regular "caps". This recalls the costume of the young Rauelimar. The coiffure reminded Miklucho-Maclay of the natives of the islands southeast of Ceram; he concludes that there must be a mixture of Papuan blood on Aurepik.

Usually the women are considerably lighter than the men; the babies were almost as light as European children. Miklucho-Maclay identifies the coloring of the natives whom he saw on the ship as number 37 of Broca's scale.

2: Damm et al. --118 (1909) 1938 Woleaians
116, 152, 609 Aurupik

From the first, the natives were most cordial and friendly to the white man, and they were glad to talk to Hambruch. Hellwig observes that even the smallest children were not shy, although ships come to the island only at very rare intervals.

Z: Damm et al. --118 [2] (1909) 1938 Woleaians
116, 141, 177 Aurupik

You realize how little contact these natives have had with civilization when you learn that Hambruch could not get any anthropological measurements because the natives were afraid of the instruments.

2: Damm et al., --119 (1909) 1938 Woleaians
116, 304 Aurupik

Unwanted body hair is pinched off with two sharp-edged shells (belʃk), in the same way that it is done on Polowat.

Some of the inhabitants wear a moustache and a beard.

2: Damm et al. --119 [2] (1909) 1938 Woleaians
116, 304 Aurupik

Both sexes are tattooed on their arms and legs, and the women also tattoo their hips and the lower part of the body. Miklucho -Maclay ascertained that the arms above and below the elbows were tattooed in bracelet patterns. Mrs. Krämer drew a group of tattoo designs for women and men. Tattooing is fälufer, a tattoo pattern is mäk, a tattoo comb is ralfd, the hammer is dajo. The tattoo coloring matter is made of soot, which is obtained by burning ólat nuts (Calophyllum).

Hair adornment. 1. The natives put the ordinary Carolinian type of combs in their hair, but they are often decorated with feathers. 2. Young boys frequently wear garlands of flowers in their hair.

Ear decoration. Boys and girls pierce the ear-lobes, and widen them with tortoise-shells disks. The hanging ornaments of coconut and shells are so heavy that the ear is often pulled down to the shoulders. Hellwig says that the general term for ear decoration is sŭrŭu. There was as large a variety of shapes and materials as on Ifaluk. Some of them stuck tortoise-shell disks of various sizes into the holes, while others wore pendants of polished conus shells or rings. The most common ear rings were made of [122] coconut beads or disks, which were often clustered together with tortoise-shell rings. Once in a while you would see a spindle-shaped pendant, which was strung with alternate coconut disks (daxax, Hellwig) and shell plates (lĂan, Hellwig).

Flowers and leaves are worn in the pierced nasal septum.

The neck decoration (marremarre, Hellwig) consisted of shells, coconut disks and coconut beads, which were strung by themselves, or mixed together. Hambruch collected a specimen, and learned that it was called tarrăk; he found that the coconut rings are tarrăk ururŭ, and the shell rings pfŭle. Many of the neck decorations are sold in the East; the Polowat inhabitants were glad to buy them.

The knots of leaves had magic significance.

The arm rings (Hellwig: lăxelăxe, Krämer: puósch) were made of tortoise shell (Hellwig: wŏaɣ, Krämer: uóth); they were broad and ribbed as on Polowat and other islands; less frequently you saw arm rings of Tridacna.

Finger rings (Hellwig: xalăxalax) were of tortoise shell. The silver ring which Hellwig found on Aurepik, and which he later traced to Faraulip, is made just like the native rings, despite the foreign material.

2; Damm et al, --123 (1909) 1938 Woleaians
116, 291 Aurupik

Both men and women wear the woven loin aprons, which constitute their clothing. Little girls wore a grass skirt, while the boys were naked, or donned the woven loin apron of the men. a) Grass skirts (Hellwig: bánü; Krämer: pánnü) are worn by girls before they reach adolescence. They consist of pandanus leaf strips (Hellwig: vas), which are tied to a coconut fiber string. b) Woven loin aprons (dóle) are made of hibiscus or banana fibers (Hellwig: wuis, wüis); the latter are softer and have a silky sheen, so they are more expensive than the others. The designs on Eauripik clothing mats are as varied as they are on Ifaluk. Krämer made the following table of mats, but he observed that the notations came from a Faraulip man.

1) dór (Hellwig: dórr); a mat with two narrow black strips along the sides; the center has two broad black and two narrow red strips.
2) gab; a mat with two narrow black border strips and a middle strip of equal width.
3) bulou; see plate 8, left center. [VMM: See source]
4) dóro kiti see plate 8 left below. [VMM: See source]
5) bëig; a mat with two narrow red strips in a black middle field; see plate 8 upper left. [VMM: See source]

c) Hip girdles for women: 1) xrim (Hellwig) made out of human hair, as on Ifaluk. 2) Datar (Hellwig) of coconut disks, in three strands, and with tortoise-shell fillets. These girdles are characteristic of Aurepik; they were sold to Polowat.

d) Hats (dólivat) of pandanus leaves stitched together; these are for both men and women.

2: Damm et al. --124 (1909) 1938 Woleaians
116, 241 Aurupik

The fields of Eauripik were cultivated in the same manner as on the other low islands of the Caroline archipelago. They were planted with swamp taro, common taro and sweet potatoes. Coconut palms and bread-fruit supplied edible fruits. Hellwig also mentions jáxun and kŏpo as plants used for nourishment.

2; Damm et al. --124-125 (1909) 1938 Woleaians
116, 226 Aurupik

For fishing the natives had:
a) a fish spear (kowuâi); it is an ordinary pole;
b) fish hooks (angling rod is wău, Hellwig: wahâu); these are to catch the xăli, large čŏp, mădi, small ătám. (Hellwig). 1. hooks that are fastened together (bă, Hellwig: pă) of many shapes; bait of Meleagrina (Hellwig: săr), less frequently wâi shells or spondylus, tortoise-shell hooks (wŏad), light flies of the feathers of the frigate bird (xatáf), string of ărom fibers. 2. simple tortoise-shell hooks (gāuŏdj). 3. simple coconut hooks to catch flying fish (măñar) in the daytime; an empty coconut serves as a float. 4. wooden hooks (gŏ) for sharks.

The hooks are kept in the familiar covered baskets (Hellwig: sávo, sâuwo, sâub, săp, săob) of bread-fruit wood (Hellwig: kalâuv, xalâu).
c) Nets (djōu, Hellwig: srōu) in the shape that was described in the Polowat volume; Hellwig adds: frame - katté, wood - ūŭ, tying - vâuva. The handle (īb or īboli măñar) is fastened on shortly before the net is used. These nets are used to catch flying fish (măñar) at night in torch light. [125]
d) fish kite (djoligodjâuk) to take the dāx (Hellwig) with a bait of fish (?); this is attached to a line between three and four meters long.
e) snares (nŭm) to catch sharks; the same method is used on Polowat. Râigumeń is invoked before each fishing expedition, and sacrifices are brought to him.

Hunting is not important. There are not supposed to be any rats on the island group, and accordingly the Carolinian rat traps (dáwis) do not exist, although the natives know them by name.

2: Damm et al. --125 [2] (1909) 1938 Woleaians
116, 223, 225, 252 Aurupik

Birds are caught either with the djǒu net, which does not haye a diagonal stick, or with snares (nǔm). There are two varieties of the latter: a) little snares arranged in rows on a wooden stick; b) a noose fastened to a stick. If the natives can seize a turtle on shore, they turn it over on its back; in the water they try to throw a snare over its front feet. The back shell is removed by fire.

Hens are the only domestic animal; there were no dogs or pigs. However, the inhabitants seemed to take great delight in tamed animals. Sarfert saw a pair of herons and two sea-swallows which stayed in the boat house and were not disturbed by the islanders; then Hellwig saw another swallow tied in a boat in the midst of some tools.

116, 372 Aurupik

There are two methods of making fire:

1. by rubbing: the flat stick is called sine laulit, the vertical one is laul, and the whole apparatus is laulit.

2. by "drilling": the flat stick is sil liak, the vertical one laul liak, together they are liak. Hellwig obtained a "fire-wood box (xuluxul) for smokers;" it is made of bamboo reed, and has a wooden cover (pilepil), which is attached to the bottom with a string; it is really a tinder box, like the ones found on Polowat. There are three ways to fan the flame (Krämer: saipa).

The following story tells how fire came to mankind. The thunder fell on a pandanus tree on Yap Island, and it could not get away. It has become entangled in the leaves, and fluttered back and forth like a chicken. Then a woman passed by, [126] Medirädi by name. The thunder called to her, and begged her to set it free. But the woman was afraid that she might get burned. The thunder promised her that she would not be harmed, and so the woman helped it get out. Then the thunder said: "You do not know how to make a fire! Your food is really not good!" So he took two sticks, and showed her how to drill a fire. Finally, he also told her about the earth oven; she should make a hole, put the flame inside, and put the food on top; after a certain time it would be good. When the thunder had spoken, it went up into the air. The woman did as he had bade her, and then she told other people about it. Then they all knew how to make a fire.

For cooking utensils they had first the simple hand scraper (Krämer: valegïer), made of nautilus shell, and the three-legged coconut grater (Hambruch: ueïgännu, Hellwig: wäïgan). Hambruch noted these names for the various parts: perrăk - shell (Hellwig: pelïg), forrofor - binding, ueïgánnu - board, beramă - legs. Then there was another degenerate form, a simple board, without legs, and with iron planes fastened to it.

taro crushers (Hellwig: fäurúpo) of coral stone (Hellwig: päran)

coconut utensils of half or whole fruits, and with or without covers (bŏr, Hellwig: pŏr) were frequently used for water and palm wine.

There are various forms of dishes (Hellwig: tapit, Hambruch: täbbi) of trälle wood:

a) simple and boat-shaped with a flat bottom.
b) raised, with feet, equipped with lugs, and occasionally made quite wide.

Krämer ascertained that the following kinds of baskets are used to keep food:

a) gádo, a tall basket with handles.
b) a borou, a rather long basket with handles, made of the ordinary kind of plaiting.
c) dúgu (Hellwig: tūx), a tall basket with a tuft on the bottom.
d) a bolaú, a basket without handles, which is trapezoidal on its longitudinal axis.
e) léipo, a trough-like basket without handles.

The origin of the shell and coconut disks was very important. According to Dr. Born, the island was an important manufacturing center for spondylus disks and plates, and it supplied the larger part of the Carolines with its products. After the shell was cracked, the little square pieces were pierced, and for this purpose various instruments were used; the coconut disks were drilled with the stick borer (wúrrewurr) or with a shark's tooth (Hellwig's nilibágo) and the sea-shell disks with the drill, (walupâup), which has a special swinging disk of turtle bones (Hellwig: šû lüwón); formerly it had a stone point, but that has been replaced by a wire point. While the drill works vertically, the stick borer is turned with the palm on the leg, so that its point stands up obliquely. Then you press the coconut plates with your free hand against the point. Now the pierced disks are threaded on a coconut leaf nerve, which has been split. Finally they are ground on a board with a piece of coral stone (-fâau), [129] and they are frequently wet with salt water during the process. Hellwig secured one of these half-finished chains from the little eleven-year-old, Marâi. She had just given the string the first grinding, which lasts about six minutes; and she had deliberately left the ends untouched.

Aside from the baskets, the natives braid pouches (Hellwig: yâipáč) of pandanus strips for decoration, etc.; but above all, they make mats:
a) gíagi, of narrow pandanus strips; worked double for sleeping mats;
b) gíli (Krämer: gerri, Hellwig: xedi) out of the two halves of a coconut frond; they serve as sleeping and door mats;
c) tabachau (Krämer) a mat made double with four frond halves;
d) jás, roof mats of coconut fronds.

Weaving (to weave is dódor) formerly played an important role as a household craft, but today this is not so popular on account of the introduction of the European calico. In olden days the material was bananas (ɣemies) and hibiscus fibers (gulivă). Materials woven of the former are costly and, naturally, are preferred to the crude hibiscus fabrics. The fibers are scraped with a stick (Krämer: bäüro) in order to make them supple. The weaving material is kept in round baskets (gabăăi, Hellwig: xabăes) of coconut leaf strips.

The fabrics are placed on a horizontal loom, which has the same bracing box as the one on Satowal, for example. [130] The members of the expedition give the following terms for the various parts of the loom:

Numbers in the drawing	Hambruch	Krämer
1. bracing box	úijă	buijallo
2. foot	bothell e úijă	
3. upper ledge of the box	thumall e úijă	
4. warp beams	berappă	
upper		babanügun
lower		babaripälam
5. bamboo lease rod	tepañŏ	

	thin wood stick	ollotó
6.	sword	c hapob
7.	shuttle	tibua
8.	box girdle of coconut string (xoloxăle)	dăle

Aurepik was an important center of commerce for spondylus ornaments. These red shells are found in such abundance that they have become one of the principal articles of commerce, and they are exported in great quantities to the Yap inhabitants, who pay for them with curcuma roots. There is also lively commercial activity with Lamutrik, Ifaluk, Faraulip and Polowat.

The nautical knowledge of the Aurepik islanders is not inferior to that of the other Caroline natives, for example the Polowat men. Sarfert's authority, Captain Wasäu, had visited all the islands between Ngulu in the west, and Satowal in the east, in his canoe; he had also sailed to the Marianas (Guam, Rota, Tinian and Saipan).

The heavens (star is fūis)

1. Eagle	mailŏb	9. Three Kings (in Orion)	elŭel
2. Aldebaran	ŭl	10. Raven	serewŏl
3. Pleiades	măregĭr	11. Virgo	dŭmur
4. Procyon	măl	12. ?	medărŭ

The courses [CS: omission of sailing voyages, pages 132-133] show how well informed the Aurepik Captains (damól Idit) are. They certainly sailed east as far as Kusae (native name Chatáu)and Ponape, which is called Wulebéi here; perhaps they went even farther; to the north they traveled to the Marianas and to the west to the Philippines (Dawogán). According to the native accounts, Dawogán lies south of Chatowei, * and it is supposed to be much larger and higher than Truk, Yap and Palau. We can not say definitely how far south they had travelled.

---

* This is certainly Tobi; the map of the Polowai Captain Igurăli proves it; (compare Damm and Sarfert 1935, drawing 205).

The canoe (uăĭ) is a wooden boat of the typical Central Carolinian form. The various types have particular names; for example, Sarfert went in a maiwŏle to Uău in the atoll. There is a very small number of them today; on the largest island there were three big sailing canoes, and seven small ones, on the second island there was one small craft. Lütke and his companion von Kittlitz noticed "many boats on the beach" formerly. [CS: Omission of the names for the various parts of the canoe, pages 134-135).

ʔim: the family dwelling. It usually stood on a stone foundation, and had plank walls with doors; the gable walls projected, and they were made of mats, while the roof was of palm fronds. Thanks to these eaves, the floor plan was hexagonal. Then there were also some smaller huts (imomûti) on the ground; they were just faced with mats, and did not have any gable eaves, so their plan was four-sided. Sarfert's interpreter said that girls stayed in these little houses. But Sarfert himself found one of them on Uâu, which was inhabited by an old man, with his family.

malúm: cookhouse; it is open on all sides, and the small gable roof rests on four poles.

fanúa: canoe-house; it is open on all sides; the poles support a heavy roof. The canoe-houses are the abode of the men, for there are no real men's houses. They also sleep here very frequently, when they do not want to be with their wives. However, there were also two little houses on poles on the lagoon side; these also served as sleeping huts, and they were set on poles as a protection against the mosquitoes.

iméribel: menstrual hut, where the women stay during menstruation. The place where the hut stands is called bál. A tabu forbids the ship Captains to approach the place, or to enter the house; apparently this does not apply to the other men.

Chief's house. These houses are conspicuous on account of the stone foundation, which was solid, frequently two meters high, and arranged in such a way that you could climb it just like a flight of stairs; it generally has a hexagonal plan like the house, but there are also four-sided and lower platforms. The most southern of the three chief's houses is erected on an unusually small base.

spirit house: the spirit-house of Ráigumen is apparently nothing more than a leaf roof, set on the ground. It rose on a somewhat remote spot, which was kept neat and clean. Ráigumen's tomb is in the immediate vicinity. [137]

there are no chicken coops, as the animals sleep in the open.

The parts of the house are:
post sūre (number 1 of Fig. 225).
central post ŋalāwer (no. 2); like the other two central pillars, it bears the ridge pole, and it is just like them.
diagonal beams of the length darielab (no. 3); they rest on the posts; cross beams of the gable walls kodom (no. 4);
The roof beams are thick, and are cut polygonally in a transverse section; they are lashed to the diagonal beams which run longitudinally; slender horizontal purlins (kabāŋ-ak) rest on these, then come thin vertical roof rafters (kāto), and on top of them lie the roof mats (jāso). The placing of the beams under the wall is called korādjo. [138]

The roof (bēigilīm) is supported by the ridge pole (ūŋ). The walls of the rectangular house interior (nīm) are vertical planks, which are framed. The gable walls are likewise made of boards; from the level of the roof they slope outward for a little way, and then they run horizontally forming a sort of roof for the veranda. This horizontal [139] piece makes a deep space for storage; for example, a boat lay under it in one house. Beneath this veranda roof of planks is a trellis (nibiŋ) to keep things.

116, 361 Aurupik

There are settlements on the large island and on Uäu. The population on Aurepik is divided into two "farms" (Valiáureg [Krämer], or Waliáudry [Hellwig], and Roñali [Krämer]), but there are only a few huts in each. On Uäu, the colony consists of two larger houses, which stand on high stone platforms. In addition, Sarfert also found a little hut, faced with coconut mats, which was inhabited by an old man. The natives said that this small colony was only used occasionally.

2: Damm et al. --139 [3] (1909) 1938 Woleaians
116, 411 Aurupik

The spear is unknown so the natives only have the fish spear. The stone sling (kaule) is also lacking although the islanders have learned about it from the Truk people. They commonly use the brass knuckles (raserás), which is made in the usual Carolinian manner.

2; Damm et al--140 (1909) 1938 Woleaians

116, 764 Aurupik

Burial. The deceased is wrapped in a mat, and then either buried in the earth, or weighted with a stone and sunk in the ocean. There is no burial in a boat. There were special places for cemeteries.

2: Damm et al. --140 [5] (1909) 1938 Woleaians
116, 173 Aurupik

The history of the Eauripik Island Group is closely related to that of Yap. Miklucho-Maclay heard that Aurepik owes a large number of its inhabitants to Jap Island. This is also preserved in the legend that the Yap native Choiss came to Aurepik, and then created men and women out of a spondylus shell....Accordingly we can perhaps regard Choiss (Chós) as the first chief (damol), and if so, his son Raigumen, who is revered as a deity today, was certainly his successor. Lütke named Rooua as the ruler over Aurepik and some islands lying to the east.

2; Damm et al. --141 (1909) 1938 Woleaians
116, 173, 167 Aurupik

The Hamburg South Sea Expedition obtained the following list of chiefs: Baluelap was the successor of Ligowûw, the husband of the first mother, then Solăn, Ellulué, Mŏdj, Ärüdäl(Eridal); but the natives were unable to give any more exact information about them. However the son of Ärüdäl, Jadŏa (Jädowuă) is remembered as a chief, because it was during his reign that a typhoon devastated the island. It did so much damage that the survivors went to Oleai to escape a famine, and they spent ten months there. When the Aurepik islanders returned home under Manelua, Jadŏa remained in Oleai, where he died. His son Fagil became chief of the people who went back home. He was succeeded by his son, Medăk, who was still ruling in 1909.

The natives believe that the universe can be divided into three parts: the heavens (rän), the earth (selŏb), and the underworld (ilŏl or faliolŏl).

2; Damm et al. --142 [2] (1909) 1938 Woleaians
116, 773 Aurupik

The gods. Solál is the creator of the universe. He erected a tree trunk, climbed half way up, and then made the earth in the form of a disk, with all of its islands and oceans. Then he climbed farther, and at the top of the trunk he formed the heavens, which are horizontal to the earth. When he was through, he told his younger brother, Álülób, who married Nimogéi, to go up to heaven and to rule there. He himself wanted to be king of the underworld. Many people dwell in this realm, and the sun shines at night. Solál is also the god of the sea.

Álülób finally gave the rule to his son Lugēlán, who is king of the heavens at the present time. His wife is Idämälúl. Lugēlán does not work, but he keeps a constant supervision over mankind. When he sees that an island chief is not making his people talk and act in the way that they should, he sends a typhoon to destroy the island. His son Olofád is the celestial messenger; he wanders around all the time, and watches over everything; then he gives an account to his father, Lugēlán, who never leaves the heavens.

2: Damm et al. --143 (1909) 1938 Woleaians
116, 775 Aurupik

The kingdom of the dead. The dead wander around as invisible spirits (ällüs); they can stay on earth or fly through the air like wind. There are no other conceptions, such as you find on Bur, Merir and Songosor. Lugēlān is king of the living and of the dead.

Aurepik has the cult of the great spirit Yăñelap, whose house is in Kadjebăr. * Most of the Micronesian islands pay tribute to him: for example, Mogomog, Feis, Sorol, Oleai, Ifaluk, Faraulip, Lamutrik, Satowal, Polowat, Hok, Truk, Pingelap, Kătāu (-Kusai?), Imāl, Meseliŏl, etc., because he populated the islands. He said to a woman: "Go to this place!" And to another: "Go to that island and beget children!" And so the women went with their husbands to those islands, and populated them. The first mother of Aurepik was Ligowurieliĕl, her husband was Ligowūw; the names of her children are not known. Hambruch on page 143, gives another version of the creation of man and the settling of Aurepik.

Yăñelap does not leave his house, but from time to time he goes up in the air, and looks at his islands. They all bring him tribute in the form of mats, bowls, etc. The natives of Oleai, Ifaluk, Faraulip, Lamutrik, Satowal and Aurepik all made the trip together, and they [143] started from Oleai. The canoes gathered here, and then travelled by way of Feis and Mogemog to Kadjebăr. The "king" of this pilgrimage then brings the tribute into Yăñelap's house where it remains untouched and goes to pieces. When the Hamburg South Sea Expedition was on Aurepik, a number of the islanders were away; they had gone to Kadjebăr, but the king had sent them to do some work on Nauru, and only one member of the group had remained on Yap.

" * It is Ašebăr on Yap (compare Damm and Sarfert, 1935, page 198).

Hambruch heard another legend on Aurepik; it refers to Yanelap, and describes the creation of mankind on our island, but it also throws an interesting light on the origin of deities. Yanelap told the Yap native Choiss to go to Aurepik and then to make some people out of a spondylus shell. Choiss himself had a son, whom he called Raigumen. He is the real god of the seafarers; and he is invoked at the beginning of a sea voyage, when a typhoon threatens, and before a fishing expedition. Various kinds of sacrificial gifts hang in his house (garlands for the hair, mats, coconuts); just a short distance from the hut was his tomb, which was fenced with stones and well kept.

Division of time. The year has twelve months, which are divided between the two seasons: rák (also ledják) and niiwán. The names of the months are:

rák		niiwán	
1.	úl	7.	dúmul
2.	élúel	8.	máidjik
3.	mál	9.	máilób
4.	it	10.	sóda
5.	serewól	11.	náke
6.	eremális	12.	gúi

Each month has thirty days:

1.	sigorú	12.	wolawúl	23.	sabári meímúri
2.	ellín	13.	wolomáu	24.	killéi (like 17th)
3.	mádjálárie	14.	mádj	25.	somaló
4.	mádjále	15.	úre	26.	somálifál
5.	mádjafís	16.	nédu	27.	járofú
6.	mádjáuále	17.	killéi	28.	jóu
7.	mádjadfu	18.	kalaúa	29.	ifáin
8.	jamedále	19.	sábádj	30.	etáfi
9.	jabéi	20.	jáfalák		

10. djíawoṅ 21. koselắṅ
11. jărowugŭ 22. karodắli ắfắlắk [145]

The following expressions indicate times of the day:
nísoro or nimắliŏl about six o'clock.
suorŏ́l about seven o'clock
jắfắlắk about eleven o'clock
uŏle about twelve o'clock, noon
jabắl jắdolowắu about one p. m.
jắdeligŏdj about six p. m.
niwarắwe in the evening.

Faraulep

It is not known when this island group was discovered. Krämer says that the island which Francisco Lezcano sighted in 1686, and which he called Carolina, is probably Fároilap, or our Faraulip; the pilot Somera was the first to ascertain its position on his compass chart, 1710. Meinicke attributes the discovery to the Spaniard Rodriguez, 1696. Some Fais islanders, who were blown to Guam in 1696, brought some definite information about this island group, and Father Clain gave an account of them on the 10th of June, 1697. These natives called the large island Piraulop, and a second one, that lay to the northwest in the reef circle, was Pic.

In 1804 Luis de Torres * came from the Marianas to the group. Then the islands disappeared again from the horizon of the navigators, and Lütke had to make a real search for them. This explains why a good many people even today regard Lütke as the real discoverer. On the morning of the 28th of March 1828, Lütke found the atoll Farroilap, as the natives called it. But he also calls it Fattoilap. This spelling is

" * According to Krämer, 1917, Book I, page 132, Anm. 1. He was the second governor of the Marianas; Chamisso, in the third part of Kotzebue's work has translated into German his important ethnographic notes on the Carolines (compare v. Kotzebue, 1821 Book II, page 130).

probably due to Kadu, who was a native of Ulle (possibly Oleai); he wrote Fatoilep. On the 16th of December of the same year he visited the island group for the second time, but he was not able to [152] make any ethnographic observations, because his authority Alberto, whom he had met on his first visit, was not there.

Hambruch, one of the members of the Hamburg South Sea Expedition, stayed on the island from the 4th to the 18th of November, 1909.

It is not known when the first merchants came; in 1909 some Japanese copra merchants had a station on Pik, and they were building a cutter.

2: Damm et al. --153 (1909) 1938 Woleaians
116, 103 Faraulep

The island became known to Europeans under the native name: Piraulop. Von Chamisso attributes the spelling Farruelap and Faroilep to Luis de Torres, and Fatoilep to the native Kadu. Lütke also used the indigenous Farroïlap. Finsch made this into Faraulap. Meinicke has Faroilap, but he selects Faraulep for the key word of his record. This spelling became adopted rather generally, and it finally changed into Faraulip; this is the way most of the members of the South Seas Expedition heard it, although they noted the following pronunciations: Faráulop and Faróilap (Hellwig), Faraûilŏp, Faróilep, Fa-tja-ü-napo and Fatjaunapo (Hambruch), and Fadjáumaep (Krämer).

2: Damm et al. --154 (1909) 1938 Woleaians
116, 131 Faraulep

Lütke made the first drawing of this island group. This has served as a basis for all the subsequent island maps (Pacific Islands Pilot, 1933, Japanese Government Chart 1925). Location and Size. The following table gives the various measurements:

	lat. N	long. E
v. Chamisso (in v. Kotzebue 1821 Book 3, page 94)	8° 3′	144° 30′
Lütke (according to the map)	8° 34′57″	215° 32′45″
Meinicke (1888 Book 2, page 358)	8° 35′	144° 36′
Gulick (1862 page 59)	8° 34′	144° 37′
Brigham (1900 page 64)	8° 36′	144° 36′
Sievers (1900 Book 2, page 364)	8° 40′	144° 35′
Kolonial Lexicon (Book I, page 600; most southern island)	8° 35′	144° 36′
Japanese Chart 1925	8° 35′45″	144° 33′16″

2; Damm et al. --155 (1909) 1938 Woleaians
116, 133 Faraulep

Lütke said that structurally the Faraulep Island group was that of a typical coral atoll, containing three islets, and with a circumference not exceeding four miles. Hellwig describes it in his Journal in a very plastic manner, and with his own peculiar exactitude: "The atoll has three rather long, thickly wooded islands, which rise somewhat toward the interior; the lagoon is deep blue, with strips of light and dark green and sand banks which have a yellowish hue. Beyond this and the sand beaches you see the reef, which is clearly outlined on the outer side with the dazzling white chains of foam of the surf; this is especially high on the leeward side." His observation that the islands rise somewhat toward the interior is remarkable; on the main island, Faraulip, the rise is 23.8 meters!

2; Damm et al. --155 [2] (1909) 1938 Woleaians
116, 131, 161 Faraulep

The atoll consists of three islands: the large Faraulip, and the second Pfx (Piko [Hambruch], Pig [Reichsmarineant], Pigue [Pacific Islands Pilot]), both of these are inhabited; the smallest island and the one farthest south, Eäd (Eatto [Hambruch], Eat [Reichsmarineant], Eate [Meinicke, Pacific Islands Pilot, Japanese Chart]) was formerly inhabited also, according to Hambruch, but since the devastations of a typhoon it has never been resettled.

The lagoon is accessible on the southern side by three narrow channels, which are only large enough for canoes.

The natives gave Hambruch the following data: a) islands: 1. Faraulip, 2. Pfx, 3. Eâd; b) oceans: 4. lamm; 5. nuguluorro; c) reefs: 6. mädonneï-jefan; 7. fall lipig; 8. furoú; 9 and 10 pallepall; 11. thawuorrŏ; 12. madonneijôù; d) channels: 13. tâùaliăp; 14. tâùuleulea; 15. tâùegiddegidd.

The population has never been large, but we can not discover on what grounds Gulick and Meinicke state that the islands are uninhabited. As a matter of fact, only the smallest island Eäd is uninhabited, and it is [156] quite probable that this situation is fairly recent. The following figures are given:

Year	Total	Faraulip	Pix	Observations	Source
1828	about 60				Lütke, 1835 Vol. 2, p. 326
1903-4	121			1 native merchant	Sievers, 1910, Bk. 2, p. 347, 364. Finsch, 1914, page 64.
1909	155	96	59	14 of them on Yap	Hamburg South Sea Expedition
1912	80				Kolonial-Lexicon Bk. 1, p. 600.
1930	145			10 Japanese are included	Pacific Islands Pilot, 1933, page 503.

2: Damm et al. --155-156
116, 161, 175

(1909) 1938

Woleaians-2
Faraulep

There is a decline of nearly 50% in the population between 1909 and 1912. This can scarcely be attributed to the islanders' fondness for travel. It seems to be due to the progressive decay which Sievers noted, and which Hambruch said was formerly traced to the constant civil wars.

2; Damm et al. --156-157- (1909) 1938 Woleaians
116, 137 Faraulep

Hellwig has already given an enthusiastic description of the picturesque impression which the thickly wooded Faraulip makes on the traveler; and in truth [157] there are many species of flora. Sievers counts coconut palms, bread-fruit trees, bananas, Cystosperma edule, betel palms and pandanus trees. [CS: Omission of the names of the plants.]

2: Damm et al. --157 (1909) 1938 Woleaians
116, 136 Faraulep

Just as on the other low coral islands, there are few land animals. Aside from the domestic ones, Hambruch only found a few species of birds. The mosquitoes are a great nuisance, especially after the rain. [CS: Omission of the vocabulary with the list of animals].

2: Damm et al. --158 (1909) 1938 Woleaians
116, 144 Faraulep

No physical anthropological surveys were made. According to Sievers, the population is similar to that of Feis and Mogomog.

2: Damm et al. --158 [2] (1909) 1938 Woleaians
116, 164 Faraulep

When Hambruch visited the island, the natives were suffering from a severe epidemic of coughing and catarrh. He also discovered the tropical diseases: elephantiasis (pererâup), ringworm (genišewâu), framboesia (rûf) and syphilis (huâu); there was a high percentage of the latter.

2: Damm et al. --160 (1909) 1938 Woleaians
116, 302 Faraulep

The natives rub their bodies with rẽ́ri color and coconut oil. Then they are extremely fond of fragrant flowers and plants, and they like to adorn themselves with them; they use the greenish white blossoms (eắro) of banana trees (uŭ́d), geraniums (xerā́x), a species of lily (madagâu), pawpaws (bấibâi) and peppermint (uanroñú).
Coiffure. The natives believe that their god Lugulĕ́ń introduced this manner of dressing the hair. The men have a thick perruque, which is occasionally parted in front, and then tied in a lock at the back with a leaf strip; or the hair may be combed smoothly back and tied with a leaf strip. The women wear their hair in curls, which are short and frizzled, or it may hang down, and be cut smooth.

The men do not have a very large beard; in addition to moustaches, you often see an imperial or whiskers, especially among older men.

2: Damm et al. --160-161 (1909) 1938 Woleaians
116. 304 Faraulep

Both sexes are tattooed, and both men and women practice the art. They use a tattoo comb (garĭd) and a hammer (merăm) of the usual Carolinian form; to tattoo is măk. The parts of the comb are: the handle - koă, a diagonal piece attached to it - xalemăn; this is fastened to the handle with a particular kind of little stick (tsrŭ). [161] The tattoo coloring (lăm) comes from the soot of burned coconut fibers.

2: Damm et al. --161
116, 301

(1909) 1938

Woleaians
Faraulep

For ear decoration (tsuŏru) the natives put coco-(tagăx), tortoise-shell (buŏxs) or shell (mátš) rings in the pierced lobes of their ears; they may be single or arranged together in various fashions, as on the other islands of Micronesia.

Fragrant plants are the only decoration inserted in the pierced nasal septum.

2: Damm et al. --161-162 (1909) 1938 Woleaians
116, 301 Faraulep

There are necklaces of a great many varieties:

a) of coconut rings or coconut disks (as on Ifaluk, for example)
b) like a, but with white shell disks between them (compare Ifaluk)
c) of red spondylus disks with white shell and black coconut disks between them (compare Ifaluk); they are often made with several strands. The Berlin Museum has a triple chain in the Finsch Collection.

Chain pendants are unusual. Hambruch got one that was carved out of a coconut; it has the same shape as the one from Hok, that is made of Tridacna.

The natives also have the wide necklace collars (tĕo), like the ones drawn by Krämer (Inseln um Truk, 1 Hlbbd, 1935, drawing 15).

They liked best the bracelets of grooved tortoise shell (buŏxs), like the ones on Polowat; these were purchased from Truk. There were also some of [162] coconut (tagăx; compare Ifaluk) and Trochus (lagalăx). Finger rings of coconut husk have only been made recently.

2; Damm et al. --162 (1909) 1938 Woleaians
116, 291 Faraulep

The clothing varies according to the age and the sex of the wearer. The natives believe that Eluelap introduced it in order to prevent incest. Accordingly, a man cannot appear without his loin apron. This does not apply to boys and girls until they are four; they go naked. Then the girls begin to wear a modesty skirt (liwísíf) of fragrant grasses, while the boys don the woven loin apron (xarĭŭr). The women's mat (bĕix) is also woven, but it is considerably wider. The men's loin cloth is in the T shape, but the women's is held on a string (šrím), that is plaited of hair; and over it they generally have a girdle of three to four strands of coconut beads; this girdle (mărămar) is divided into fields by shell fillets. While this is made on Faraulip, it does not apply to the rare girdle, (xídi) bought on Aurepik; it is very wide (up to eight strands) and it is also divided into fields by means of fillets.

Seafarers have clothing that affords better protection; they wear pointed caps, stitched together out of pandanus strips (părĭŋ), and when the weather is really inclement, they use rain caps (palŭŋ), sailing jackets (nikŏt) and coconut dress mats (ua lulíĕ).

The following edible plants and fruit trees are planted or cultivated: different kinds of taro: file e Ifaluk (very small) file e kŏl, uŏt, momŏiga, marĭn.
Colocasia: lăk, pulăk
sweet potatoes: kamŏti
sedum: anŭs, xŏp, eaugŭle.
pumpkins: ewŭrs
sugar-cane: uwău
bananas: uiĕ
Terminabia: fariŏp
Morinda citrifolia: nĕre.
pandanus: fă
figs: xoăn
a peach-like fruit, with a number of disk-like stones: xumŭr
bread-fruit: măj; this fruit begins to grow in the uarĭx month; in măirĭx it starts to ripen, and in măilŏp it is mature; the whole process takes six months. The fruit of the breadfruit provides the natives favorite dish, măra, which is prepared in the same way as the măr of the Polowat islanders.
coconut palm: nĭu
[CS: Omission of the various terms describing the coconut palm, page 163] There is no

systematic planting whatsoever. Bananas, sweet potatoes, coconut palms grow together, but the taro, on the other hand, is planted in fields that are specially prepared. The natives use large rectangular ditches [164] (poadé), which are surrounded by an earth wall (xatū) made of the soil that has been excavated. The men prepare the fields, but the women do the real cultivation; for the taro they use a wooden spade (xuotŏ; handle-erĕ, blade - xăroxăre). The men take care of the coconut palms, but the other fruit trees are left to the women. The chief superintends all the work in the fields; and he punishes anyone who is not doing his task properly. At certain times he also puts a tabu on the uninhabited island Eăd so that no one may go there. This is to protect the stands of coconut palms and tobacco plants; and it is also a means of safeguarding the turtles, which come on land to spawn.

[CS: Omission of the various kinds of fish, that are caught, page 164]
mănar the flying fish, appears four times each year.
1. Angling (angling rod - bâû, the wrapped handle is tigŏ̂u); it is equipped with the following kinds of fish hooks: [165]

a) bă is the hook, that is fastened together; its bait consists of Meleagrina or spondylus, and its hook is made of tortoise shell; the "fly" is made of clipped frigate bird feathers. Terms for the various parts: angling line of hibiscus fibre - eŏr or eŏl, bait - năm, point of the hook - matăl, base of the hook - ramŭm, fly - igŭd. These hooks are kept in wooden chests (sâûp).

b) tĭu is the plain wooden hook, used to catch sharks. Hambruch obtained a rare example; it was a double hook made of a piece of Pteroceras shell.

c) tarăn are the newer angling hooks, made of a piece of bent iron wire.

d) porăli măts is a simple fish hook of coconut husk, which is suspended on a coconut, that serves as a buoy (for its use see Damm and Sarfert, 1935, page 49). This type of fishing is rarely used today.

2. The natives fish with etĭn nets on the reef. The terms for the various parts are xoloxŏl (number 1), tanŭapip (no. 2), eăn (no. 3), bugebŭx (no. 4), metăt (no. 5), net sinkers-fâû u lŭm, net floats - xuapĕs; the latter are often carved in the shape of fish. The large net does not belong to an individual, but to the men's house. [166]

3. For weir fishing they use the following weirs:
   a) a substantial one made of coconut strings (ulipám of the same form as those on Ifaluk. The terms are: floor - bŏxebox, back wall - xapít, side wall - péigil, roof - xuluxŭ́l, raised and pointed portion of the roof - uná́l.
   b) weirs (ule mŏurŏuĕ́d) with a barrel-shaped roof of strong coconut leaf nerves. The names for the various parts are: projecting part of the roof - xromắre, cover - unắre, side wall - xobắr, floor - írắ, door in the rear wall - iríŕ, handle - tanín.
   c) like b) but rectangular.
4. For kite fishing they use a kite (kapĕ́s) made of a bread-fruit leaf, which has been stiffened with a coconut leaf nerve. A tarán hook hangs on the string.
5. Snare fishing is done with a snare (nŏm) fastened to a wooden stick; the bait hangs from another short string.

Special Customs. The chief's permission is required before groups of men can fish together in the large canoes. The "first counsel" oversees the canoes and fishing, and then the chief divides the catch according to certain rules. Loud calling and trumpeting on the conch shells summon the population to come together. The fish are spread out on the beach, and they are tabu until the division is made. Hambruch watched the natives divide 45 large fish (faúfaú and takŭ́'u); a sick old woman received the largest takŭ́'u, Hambruch had two faúfaú, five takŭ́'u and two faúfaú were given to seven guests from

Ifaluk, two takŭ'u to the chief, one takŭ'u to the "first counsel," one takŭ'u to the "second counsel," one takŭ'u to the Oleai native Olapĭl eighteen takŭ'u to the nine houses, ten little cuttlefish (Tinte?) to the crews and the "first counsel," two takŭ'u and the small fish to the boys.

On the second expedition that Hambruch saw, eleven large and 390 small fish were taken (the latter were chiefly caught in the drift wood weirs). They were divided in the following manner: Hambruch got two large fish, the chief two, the "first counsel" one, the "second counsel" one, the Oleai native Olapĭl two large ones and ten little ones, the seven Ifaluk men had three large and sixteen small fish, the nine houses 270 little ones (thirty for each), the canoe superintendent fifteen little ones, eighteen small ones for the eight houses in Pix, fifteen little ones for a man, who had helped build the boat. If the catch is not so large as they had expected, the fisherman goes to the "big house" or to Ponijŏu's spirit house, lays down a sacrifice, and asks for a good haul.

2: Damm et al. --167 (1909) 1938 Woleaians
116, 224 Faraulep

Hunting is not important, since there are few large land animals which can be eaten. Rats are captured in a trap (tăwiš), that is similar in form to the one on Polowat; drawing 242 gives the terms for the various parts. Dogs are eaten too.

2: Damm et al. --167 [2] (1909) 1938 Woleaians
116, 252 Faraulep

All the women prepare the food in the house; the men just cook in the large house; in every case the children are the most eager helpers.

2: Damm et al. --167 [3] (1909) 1938 Woleaians
116, 372 Faraulep

To make a fire (fire - ijăf) the natives use a fire plane (noirĭt; the flat stick - imŏu, the stick drawn through the groove, which this has made - noirĭt) and the fire drill (niauk or liauk; flat stick - ilă, drilling hole - medăd [eye], vertical drilling stick - noirĭt). Tinder (xabăd) is kept in a bamboo box. The woven fire fan (sĕipo) has a long rectangular form.

2: Damm et al.--167-168 (1909) 1938 Woleaians
116, 412 Faraulep

Household implements:

a) knife (sár) formerly of shell, but now a spike that has been pounded into a board and sharpened.

b) taro scraper of Meleagrina shell,

c) coconut grater (uélgan); a small shell (poritox) is fastened to a tripod.

d) spoons (idit) of shell

e) crushers (faierus) of coral stone [168] (fáux) in the same form that is used on Ifaluk (to crush - zus, to rub - egax, to strike - narúna.

2: Damm et al. --168 (1909) 1938 Woleaians
116, 415 Faraulep

Household implements:

f) coconut utensils (tagax) - coconut shell, such as water bottles.

g) wooden boxes (saup) with covers like those on Polowat; they are used to hold small articles, especially fish hooks. Hambruch gives the following terms for the various parts: cover - garap, hole for the string to which it is suspended - piapi, in a notched piece (botil), lower part - xaloal, floor - peigil, wall - ni, groove for the cover - pora ni.

h) bowls (tabbi) with feet, of the same shape as the dobi lemabu of Ifaluk. Then there are also the tabbi bowls, brought from Truk, with the red stripe, which is peculiar to that island group. (floor - rang, feet - perele, noses - madal.)

i) baskets to hold food; the largest ones are used to transport fruits; the former are tux, the latter hix. Special forms are katovas (Ifaluk) and pautau, a basket for transportation.

k) a fish board (bap) to divide the bonito.

l) brooms (naux) of coconut nerves.

m) rat hooks (xor) to hang up food containers, similar to the one shown in Fig. 126, in Sarfert and Damm 1929, page 138.

2; Damm et al. --168 [2] (1909) 1938 Woleaians
116, 264 Faraulep

The natives have no regular meals as we understand them. Children and women eat almost all the time, and the men eat morning, noon and in the evening. The members of the family have repasts together, and so there is no division according to the sexes.

2: Damm et al. --168 [3] (1909) 1938 Woleaians
116, 262, 562 Faraulep

Certain food restrictions apply to the women, and they are never allowed to touch the following kinds of fish: bŭp, liwelŭ, faî, bă̆xo, nawŭt, mŏ̆ru, nŏ̆s, uăt.

2: Damm et al. --168 [4] (1909) 1938 Woleaians
116, 843 Faraulep

Pregnant women are not permitted to have any fish at all, and they have to observe other prohibitions about food. These last for five months after the child is born; if they are disregarded, the natives believe that the guilty woman will be very ill.

2; Damm et al. --168 [5] (1909) 1938 Woleaians
116, 177, 276 Faraulep

Aside from the foods, the natives have a few extras, and first on the list comes tobacco (tomáxo); it can not be strong enough to suit them. This plant was introduced from Guam, and now it is grown on the island, but the American twist tobacco is preferred.

2: Damm et al. --168 [6] (1909) 1938 Woleaians
116, 273 Faraulep

Then palm wine (xarí) is also very popular; it is prepared in the same way as on Polowat.

2: Damm et al. --169 (1909) 1938 Woleaians
116, 462, 322 Faraulep

The men did all the wood work. They made bowls, covers for boxes, coconut graters, combs, weapons, canoes and parts of the huts.

2: Damm et al. --169 [2] (1909) 1938 Woleaians
116, 412, 177 Faraulep

Formerly the most important tool was the shell ax (ɣapăl); it had fallen into disuse in 1909, and only the "sacred axes" had preserved the old form. Shell blades of Tridacna or cassis - porugŭl or tară (the blade is kept sharp with a grindstone [uăre]), cutting edge -metăd, upper side - lugŭl, lower side - năn, handle for the hatchet - fm mĕ ŭm, wrapping - fŏrfŏr. Then finally, there were the tools for the finer work: files - (văim) of coral stone, awls (etâu), drills (purepŭr).

2: Damm et al.--169 [3] (1909) 1938 Woleaians
116, 283 Faraulep

Coconut strings (mŭtŝ) were made in the customary manner; they were soaked in salt water - ni pĕli gŏth, then in fresh water - thŭmu, dried - igapă̂l, beaten (thŭs) with a heavy wooden beater (pĕreix), and finally twisted - xŏloxŏ̂l. Coconut thread - tarikĭt, rope - tă̂t.

Hibiscus strings (gilifŏ̂i) for fish lines are made in the same way as on Polowat.

2: Damm et al. --169-170 (1909) 1938 Woleaians
116, 173, 286 Faraulep

As on all the Caroline Islands, there is little weaving being done today; this is very unfortunate, because the women had developed their skill to an astonishing level of craftsmanship. [170] According to the native legends, there were no woven mats in olden days; and people ran around naked. Then incest occurred at rather frequent intervals, because men could not tell their sisters, children and wives apart. So the god Lugulen told Aifath to bring men a loom, so that they might weave mats, and be able to tell themselves apart. *

Hibiscus bast and banana fibers are woven, but the latter are preferred on account of their superior quality.

"* It seems that the various clans also had certain weaving patterns."

2: Damm et al. --170
116, 286

(1909) 1938

Woleaians
Faraulep

The weaving material is kept in a round basket (xápen), which is similar in form to the one on Aurepik. Plate 13 [VMM: See source] shows the structure of the loom, and Fig. 247 [VMM: See source] the form of the wooden frame. The various parts are called:

the front and back warp beam - pāp
the sword - xabŏp
the heald rod - nūri
the shuttle - thritŏp (it has the same form as the one used on Aurepik)
girdle of the bracing box - tādi.
box with warp beam - puijālf
decoration on the box in red and black - xāu iél iár
diagonal beam over the warp beam - nugūd
beam which serves as a support for the feet - fafá.

2: Damm et al. --171 (1909) 1938 Woleaians
116, 285, 386 Faraulep

The dyeing of mats is done according to the Polowat process. Meerpocken are also used for dye pots, and the dye bowls (tăbbi enăp) are the same shape as the ones on Ifaluk. Red coloring (tśageŏx) to paint the canoes is purchased from Yap. Any piece of wood can be used for a brush.

2: Damm et al. --170-171 (1909) 1938 Woleaians
116, 285 Faraulep

The "king's mat" is a real chart of the patterns, which are in use on Faraulip; in fact, it is really a masterpiece of native handicraft. The various designs (counting from the left) are: 1. sürübu, 2. foirimät, 3. puriifät, 4. boirüd, 5. uvethitaub, 6. pairimüru, 10. xolimäth, 11. pairönunü 13. möida, 16. sib, 17. xougouthip, 18. toirut. The mat design is called metarel; the terms for the different parts are:

lugurel - broad black strips
nigawös - broad light fields between the black strips [171]
narede - narrow black border strip.
thau u wöl - the two diagonal strips (narrower and wider).

The upper diagonal strip in the design of mat no. 307 (plate 12) [VMM: see source] is called taub, the two narrow strips above and below it are pirepit. The parts of the diagonal strip of mat no. 308 are tanabö - a dark hour-glass design, tauf - light rhomboid pattern.

2: Damm et al. --172 (1909) 1938 Woleaians
116, 437 Faraulep

Commerce was arranged on a barter basis, with coconuts for change. A small canoe cost three woven dress mats, and one of these mats was worth a hundred coconuts.

2: Damm et al. --172 [2] (1909) 1938 Woleaians
116, 484, 437, 178 Faraulep

In olden days the natives of Faraulep visited the following islands to do business: Unaṅái, (Oleai), Auripík, Ifalúk, ʟoról (Sorol), Uejêĭ (Fais), Magemúx (Mogemog), Yap, Nólu (Ngulu), Palau, Songosor, Pur, Merir, Lāmutsêx (Lamutrik), Setóuan (Satowal), Sóux (Hok), Unúon, (Onon), Piserás, Tsúk (Truk), Magur, Moirála (Murillo), Ratak, Magíl (Mokil), Ebon, Nutáú, Gátsaùe (Kusai). They also had a lively commerce with the Marianas (Guam, Saipan). Then other islands were visited long ago, but the present generation can not identify them: Uaxú, Solnís, Bahâú, Ánelulu (Honolulu??). These long trips have been given up, on account of the death of the old sea captains, and the lack of interest of the young men; and today there are just a few islands in the immediate vicinity with which the natives deal.

2: Damm et al. --172 [3] (1909) 1938 Woleaians
116, 437 Faraulep

From Lamutrik they get kamŏs, reng color, tortoise shell, and from Truk clothing mats; from Aurepik kamŏs, spondylus necklaces, dance girdles, kid, from Satowal reng color and necklaces from Truk, from Ifaluk and Oleai ropes, nets, woven mats. In exchange the Faraulip people give the mats they have woven, ropes and sleeping mats.

2: Damm et al. --172 [4] (1909) 1938 Woleaians
116, 502, 821 Faraulep

There was naturally little material available about their nautical information. Among the stars (star - fōiɬ) they knew the

polar star -	olūol	Eagle	mailop
?	uolăgor	Three Kings	
?	ugelīga	(in Orion)	ŏliŏl
Procyon	mål	?	ɬarawūon
Pleiades	maraegiri	Virgo	tumur
Aldebaran	oūl	?	metarū
?	matjomáidan	?	tubulūp

2; Damm et al, --173 (1909) 1938 Woleaians
116, 502, 778 Faraulep

Krämer obtained an old string pouch with snail shells; it belonged to the head chief, and was considered to be holy. It hung from the ridge pole of the canoe house, and was supposed to have been used to teach navigation in former times; the snail shells represented islands (or stars?).

2: Damm et al, --173-174 (1909) 1938 Woleaians
116, 502 Faraulep

The compass rose (drawing 249) is on the same pattern as the one in Polowat. [CS: Omission of the native terms for the various points.] [174] The wind directions are:

etők e lap	wind from the west
xotőn e mái	wind from the east
eáùr u lăp	wind from the south
efáń e lăp	wind from the north
xotőu a fáń	wind from the northeast
nető a fáń	wind from the northwest
xotőu eáùr	wind from the southeast
nető eáùr	wind from the southwest

From the east and the west the sea is called la e lapalăp; from the south it is la e l'eáùr, from the north la el'efáń.

2: Damm et al. --175 (1909) 1938 Woleaians
116, 502, 484 Faraulep

Hambruch only heard about one boat, that drifted; it was an empty one, which came from Pur about five years before (about 1904). People were certainly blown off their course, although Hambruch did not hear of any instances of this. Kadu, Chamisso's authority, told about a Faraulip chief, who wanted to sail to Guam, but who was blown to Mogemog; he went home from there.

2; Dämm et al.--175-179 (1909) 1938 Woleaians
116, 396 Faraulep

There were small canoes uă ju mĕn, and large ones uă ju lăp; in structure they did not show any appreciable differences from the canoes of the Central Carolines. [CS: Omission of the words for the parts of the canoe, and the boat tools; page 176 has drawings of the canoe, page 177 some expressions used in sailing.] [178]

Canoe Building. The large canoes for the high seas are built at the command of the high chief, and belong to the community. The following legend tells how men learned about canoe building: once upon a time Eluelap ordered Thelăn to build a canoe on Ponape, so that people might sail between the two islands. A man named Natsău helped him with this work, and so he learned a good deal about the construction of the boat. It was fashioned of bread-fruit wood, and built with shell axes, after fire had hollowed out almost all of the trunk. The keel length was measured (tĕti) as [179] 6 1/2 fathoms (oulăn năf ma kopŏe), in other words, the keel length of a large canoe. This measuring line is dedicated to Thelăn, and on both ends it has coconut pinnates (tjăts). Then as today the caulking material consisted of the heart of the breadfruit tree and young coconut leaves. The canoe was completed in three months, and Thelăn named it uă. Today the work takes between two and three months; the most important tasks are completed in six days. The whole village helps, and an architect (sĭnap) directs the work. Men not engaged in the building take care of the workers. But the process is frequently interrupted to let the wood dry out, and the free time is filled with feasts, which generally last for six days.

2; Damm et al. --179 (1909) 1938 Woleaians
116. 505, 484 Faraulep

The five men on the crew were provided with two hundred coconuts and fifty coconut bottles of water; if they miss their goal, they must use fish, rain water, and if necessary, salt water. The cooking is done in a small sand box (fenán).

2: Damm et al. --180 (1909) 1938 Woleaians
116, 789, 177 Faraulep

As on all the Carolines, the natives practice weather magic with carved wooden figures (xós), equipped with ray stings (sting - pera, ray - fáix); occasionally they are hung with several coconut leaf knots (úwud) and with Seepocken to hold color to paint the statue. They are treated the same way as on Polowat. The much-traveled man Buimén brought this weather magic to Faraulip.

Before a long voyage the natives conjure Thelán in the following way: they blow a conch shell, and then hang it up in the big house where they return. Mats and coconuts are sacrificed to Alülue on the out-rigger. When they pull a sail boat on to the beach they sing a long song (báne), which really resembles a working song. [CS: Omission of the text of the song.]

2: Damm et al. --181-183 (1909) 1938 Woleaians-1-2
116, 342 Faraulep

Types of houses. a) The dwellings (íim) are not alike on the gable sides, because a gable projection on poles appears here and there beside the smooth side of the gable. The huts stand on a fairly large rectangular platform of earth, which is edged with large headstones, and they have a place for the beams as well as board walls with four openings for doors. The roof (eáu er ím) has the typical western Carolinian form, with a ridge pole, that projects for quite a way. Roof mats - ás. The terms may be applied to the various sketches.

Fig. 261: floor plan of a dwelling.

1. fireplace enclosure üóóu e ferán
2. fire-place ferán, position of the hearth nan e ferán
3. ülüt
4. nen ni uróra
5. stone enclosure urór
6. place for the beams goráf, goráro
7. supporting beam for the projecting part of the ridge ɣamárumur.
8. door nerín (see Fig. 262), it turns on pivots (ɣatubetúp), and has a bolt pivot (áti), which fits into a special hole (uaríti). Door post - tsüm, threshold - urár, door moulding - pír i pín.

Fig. 263: interior view of the roof.

1. uŋarüɣ, uŋātšíg (upper ridge pole)
2. ridge pole uŋ́ŋ́
3. ilūtšíg
4. onobēl
5. gāp

Fig. 264 shows how the roof is fastened. It is upheld by supports (no. 2), which are attached to the purlins (no. 1).

Fig. 265 shows the outer side of the gable (píŋ́) of a house with the veranda roof (nugu e píŋ́).

1. lăre līpa píŋ́
2. uól le píŋ́
3. lăraɣi făŋ́ [183]
4. tărē lipa e făŋ́.
5. făŋ́.

The posts supporting the veranda roof are fátr'ím. Figure 266 [VMM: 2: Damm et al. 183] shows the construction of the inner side of the gable (tebâu); this is hung with coconut leaves and only the central post is decorated (see Fig. 267).

1. Central post šoár tebâu
2. íŋ́
3. tíŋ́ tebâu

a) The "large house" (fǎ́l) is the canoe-house, and it is also the real living and sleeping quarters for the men. The supporting pillars are trunks, which have been stripped of their bark and are rough hewn. The house is open on all sides, but the wind side may be hung with mats or palm fronds as they are needed. [184] The exterior seems very crude, and the interior does not look at all comfortable, with its heterogeneous collection of tools (nets, weirs, baskets, ropes, shells, etc.) on the posts and walls, and with its dirty mats on the floor, which are covered by mosquito nets spread on spears.

Parts of the roof framework (side view, Fig. 268) [VMM: See 2: Damm et al. 185).

1. uŋarŭ́x, 2. uŭ́n, 3. bxuŏ́t 4. xǎ́t 5. uó́i 6. gapaŋǎ́x, eǎ́xth is roof mat. The scaffolding of the roof rests on the corner posts, but it is not fastened to them in any way. Fig. 269 [VMM: See 2 Damm et al. 184] shows the frame work from below, with the following parts: 1. lali erŭ́ 2. goi i tjǎ́m 3. and 4. dari e lǎ́pe 5. tí́f 6. wǎ́i i ŭ́p.

b) Ponijŏ́u's spirit-house has a saddle roof and smooth gable sides; the hut is surrounded by a stone pavement.

c) cookhouse (malŭ́m). The leaf roof (eijŏ́l) rests on four crude posts (sura); the projecting portion is supported on both gable sides by four lighter pillars (uǎ́r etŭ́t). Mat walls (tire) are only placed on the wind side; the fire wood lies in this

part of the hut, while the earth oven (ŭ́m) is in the middle, and the other side is intended for scraps.

d) Houses for confinement and menstrual houses (ím malipár) are just dwellings, which are smaller and less well-finished. [185] In the inventory we can put weapons, the household implements that we have already mentioned, head supports (elüdü), cradles (ülóíila) made with a rectangular frame (ealó) which is strung with a string net (metád) and sleeping mats (ɣiági; sleeping place - nanie).

Experts (šínap) build the house, and make the canoes. On Faraulip there were three of these craftsmen in 1909. They are paid the price that they ask; usually they want food. All of the village inhabitants help with the work, and in two weeks or a month it is completed. Bread-fruit wood is the material used. The "big house" is constructed at the command of the high chief; like the large canoes, it is made by the community and belongs to the whole group.

2: Damm et al. --185-186 (1909) 1938 Woleaians
116, 162, 361 Faraulep

There are villages on the main island Faraulip and on Pix; but Hambruch found that the third island Ead was uninhabited, and only stone pedestals overgrown with plants and abandoned taro fields gave evidence that it was formerly settled. The colonies belong to a chief and two sub-chiefs. On Faraulip there are eighteen dwellings, four blood houses and one spirit house. [CS: Omission of the table describing the residents of each one, page 185-186] [186] So in this colony there were 22 men, 28 women, 17 boys, 11 girls; a total of 78 persons, in addition to 14 who were at Yap at the moment. The total population was therefore 92.

2; Damm et al, --186-187 (1909) 1938 Woleaians
116, 162 Faraulep

On Pix Hambruch found 17 dwellings, 14 cookhuts and 2 spirit-houses; with 15 men, 24 women, 10 girls, 13 boys, or 62 persons all together. There was also the abandoned post of the Japanese merchant. Hambruch's survey resulted in the following table:

1. and 2.	oue e rūx	4 men, 5 women, 1 girl, 1 boy
3.	nanūefat	1 man, 2 women, 1 girl, 2 boys
4.	materemēijūr	3 men, 4 women, 2 girls, 3 boys (the house planks were "sewed" together with a rope)[187]
5.	fareiāń	1 man, 4 women, 2 boys
6.	orifāra	2 men, 2 women, 2 girls, 2 boys
7.	oripēi	1 man, 2 women, 1 boy
8.	xateubūr	2 men, 2 women, 2 girls, 1 boy
9.	ralūń	1 man, 3 women, 2 girls, 1 boy.

2; Damm et al, --187 (1909) 1938 Woleaians
116, 411, 721, 177 Faraulep

In former times there were a good many wars (fitéx), and today the natives fight with spears, sticks and knuckle dusters of sharks teeth (rajarás). They hurl stones with their hands. No bows and arrows are used. The victor orders the battle to cease. Declaration of war - máud, armistice - elaméle máud.

Hambruch found that the following terms are used to denote relationships:
grandfather (on the father's side) puije tamai
grandmother (on the father's side) tjin i tamai
grandfather (on the mother's side) tematemax puijetjin
grandmother (on the mother's side) puije tjin temai tjine
father temai tamai
mother iin tjin
brother manieanai
younger brother puiji
older brother mar'npei
sister eietogovei
older sister manieai (this is probably identical with the Polowat term moneal; compare Damm and Sarfert, 1935, page 143).
husband tsoginiane
wife eutay
son sari
daughter nigau
father's brother marinepai e tamai
mother's brother puijid

son's son lán in mán
son's daughter lán in rawút
daughter's son náuin
daughter's daughter náuin rawút
Certain terms are used to designate age:
man mán
woman rawút, faífín
old man itagíl e mán
old woman itagíl e medú e faí.
Hambruch does not list any terms designating children and young people.

2: Damm et al. --189 (1909) 1938 Woleaians
116, 595 Faraulep

Generally the natives are monogamous, but a man can have several wives, and the chief had four.

2: Damm et al. --189 [2] (1909) 1938 Woleaians
116, 582 Faraulep

A man is permitted to marry when he can fish, sail, row, make palm wine; in short, when he can provide nourishment for a woman.

2: Damm et al. --189 [3] (1909) 1938 Woleaians
116, 584 Faraulep

A man asks a girl if she will be his; but the maiden does not reply at once, for she wants to get better acquainted with him. The lovers spend a great deal of time together; the man provides nuts, fish, decorations, etc., and the woman supplies him with mats, food, taro, etc. When she finally agrees to marry him, he goes to her father, and gets his consent; and he takes mats, fish, etc., as a present. If he is refused, it sometimes happens that the girl weds him in spite of her father.

2: Damm et al. --189 [4] (1909) 1938 Woleaians
116, 585 Faraulep

There is a big feast for the wedding; the relatives on both sides prepare it, and the whole village takes part in the celebration. The girl receives taro swamps, two or three bread-fruit trees and some coconut palms as a dowry; the man, on the other hand, pays his father-in-law 30 to 200 coconuts, 3-10 bread-fruit and some taro bowls.

2: Damm et al. --189 [5] (1909) 1938 Woleaians
116, 591 Faraulep

The husband goes to his wife's house, and works there; but occasionally he visits his parents too. At first the bride pays little attention to the housekeeping, for the parents do everything for the young couple; later the married daughter helps too. The young wife does not bother about the house of her parents-in-law; she usually just goes there when they have something to eat.

2: Damm et al. --189 [6] (1909) 1938 Woleaians
116, 836, 864 Faraulep

As a rule, there is no sexual intercourse before the marriage, but this is not always true. The older people instruct the younger ones systematically about it (ria - vagina, ŏunum - clitoris).

2: Damm et al.--189 [7] (1909) 1938 Woleaians
116, 839 Faraulep

Fat people practice cunnilingus, and usually three or four times a month.

2: Damm et al. --189 [8] (1909) 1938 Woleaians
116, 832 Faraulep

The lips of the vulva (fix) are artificially lengthened.

2: Damm et al. --189 [9] (1909) 1938 Woleaians
116, 548 Faraulep

Prostitution exists, and the girls give their mothers the compensation which they receive; there is no special name for them.

2: Damm et al. --189 [10] (1909) 1938 Woleaians
116, 843 Faraulep

A woman knows that she is pregnant when she stops menstruating. Just a little while before her confinement she goes to the menstrual house and stays there for two months. The islanders believe that the child will die if there is any sexual intercourse for five or six months after its birth.

2: Damm et al. --189 [11] (1909) 1938 Woleaians
116, 845 Faraulep

There was no material available about twins.

2: Damm et al. --189 [12] (1909) 1938 Woleaians
116, 846 Faraulep

When the first child is born, the husband's father gives the father-in-law a large quantity of fish, nuts and bread-fruit.

2: Damm et al. --189 [13] (1909) 1938 Woleaians
116, 684 Faraulep

If a man commits adultery, he is punished by having to pay a high fine.

2: Damm et al. --190 (1909) 1938 Woleaians
116, 422, 562 Faraulep

Personal possessions are divided between the sexes;

the man has:	the woman has:
the dwelling	taro swamps
coconut palms	kitchen utensils
tools	occasionally a canoe
fishing utensils	

2; Damm et al. --190 [2] (1909) 1938 Woleaians
116, 423, 562 Faraulep

Together they [KS: men and women] own bananas and bread-fruit trees, while the large canoes and the big canoe-house belong to the village. The chief has to look after the repairs, but the villagers are ready to assist him.

2: Damm et al. --190 [3] (1909) 1938 Woleaians
116, 428 Faraulep

If the husband dies, the wife inherits the taro fields, while the house goes to the next oldest brother of the deceased. Generally this man marries the widow, and also takes the children under his protection. If he dies, the oldest child looks after his mother and sisters.

2: Damm et al. --190 [4] (1909) 1938 Woleaians
116, 462 Faraulep

The work is divided between the husband and wife;

the man:	the woman:
clears the land	cultivates the taro
lays out the bread-fruit plantations	cultivates the sweet potatoes
cooks in the canoe-house	prepares the food .
makes ropes	does the weaving.
builds canoes	
builds the house	

Death (emḗia) and Burial (iragegērī́gi). The parents, sisters and relatives all take care of the sick person; but if he dies, they rub his face carefully with yellow paint (rā́n), and put a little of it on the rest of his body. Finally, they wrap him in clothing mats. Men and women sing mourning songs, and then they carry the corpse to a large boat, which lies to the east; this is done at the behest of Eluelap, who said that the deceased should be taken in this direction. Then the body is carried outside the reef, laid in a net, that is weighted with stones (śrṓu), and sunk in the sea (gaterṓulâux). Burial occurs on the same day as the death. The dead are devoured by fish, and the bones fall to the bottom of the ocean.

2: Damm et al. --190 [6] (1909) 1938 Woleaians
116, 765 Faraulep

After four to five weeks, [KS: after burial] there is a big funeral feast (eáxi gíri méxa), and this is also a means of repaying the friends and relatives for their mats. For three months the widow and widower (nipith) are not allowed to cut their hair.

2: Damm et al. --190-191 (1909) 1938 Woleaians
116, 177, 764 Faraulep

Formerly the dead were buried, and stone pavements were laid over their graves (sětje). Then the Yap natives, who thus fulfilled the wish of the god Yŏnelaf, urged them [191] to bury the bodies in the sea. This applies to the inhabitants of Oleai, Ifaluk, Aurepik and Faraulip. This information of Hambruch is especially interesting because it connects the two types of burial in point of time, and it also shows that the sinking of the dead is tied up with the Yŏnelaf cult. If we consider that there were migrations to the Carolines from the east and the west on the basis of the spread of the aînan, Hambruch's statement shows the most important elements of the wave of culture that infiltrated from the west.

2: Damm et al. --191 . (1909) 1938 Woleaians
116, 565, 621 Faraulep

In addition to the family, there was the clan, as it was described on Polowat. There were the clans Wolēĭ, in which Ligilăk was the monainan in 1909, Ellanaidjau, Sauwōl, Saufalăsik and Monolifer.

The population was divided into the following class groups:

a) high chief (tamōl, e pi mōōn) and his family.
b) three lesser chiefs (poirim, auelig and mānu) and their families.
c) the rest of the population.

2: Damm et al. --191 [2] (1909) 1938 Woleaians
116, 173, 643 Faraulep

The rank of high chief is hereditary, and it is traced back to the first settlers. The first tamol was on Ead, and in olden days there was one on Faraulip and on Pix. The high chief takes charge of the "big" house, orders men to start the community enterprises, keeps an eye on the soil and the fishing, acts as a judge, and watches over the peace in his village. If anyone refuses obedience, he is deprived of his field. If the high chief dies, his brothers inherit the title according to age, and it is only then that the sons of the deceased become chief. Women can never rule, and if there are no direct male successors, the male children of the high chief's family take the office.

Should the high chief be a minor, the poirím acts as regent until the child is adolescent. In case of his death, the poirím no. 2 takes his place, in case there are no sons of the first poirím. In the event of the decease of the young chief, the first poirím becomes high chief.

The lesser chiefs are the spokesmen; they transmit the commands of the high chief, and see to it that they are executed.

The large fishing expeditions are arranged, work is discussed and justice promulgated in the assemblies (xopái), which take place in the "big" house.

2: Damm et al. --191-192 (1909) 1938 Woleaians
116, 423, 565 Faraulep

Real estate is divided between the two class groups: the high chief had 24 plots, in addition to Ead and Pix Islands [192] (at times he put tabus on these properties so that no one might go there), the poirim had 17 lots, the aûelig 20, and the mánu 13. They let the villagers till their possessions, and pay for the labor with coconuts.

2: Damm et al. --192 (1909) 1938 Woleaians
116, 173 Faraulep

Reckoning backwards from 1909, the names of the chiefs are: Sâuerŭ, Gavŭs (about 1885), Parōa, Mareróiisâu, Nēipŏl (about 1804; he is the historic Alberto), Ragetéx, Thamolrăs. * At the time of the Hamburg South Seas Expedition, the two lesser chiefs were Šâuwul and Măroijam.

---

* Lütke (1835, Vol. II, page 344) adds that a certain Kafalu was chief of Ifaluk and Faraulip; this man does not belong to the succession on Ifaluk or on Faraulip; but it is not impossible that he was speaking about a moñaiñan.

2; Damm et al. --192 [2] (1909) 1938 Woleaians
116, 692 Faraulep

The high chief is the supreme judge.

2: Damm et al. - 192 [3] (1909) 1938 Woleaians
116, 685, 627 Faraulep

If any one steals nuts, the whole village is called to the "big" house; it is then blocked off with a rope, and the thief is not allowed to enter until he has made amends to the chief. If the thief cannot be caught, the natives go to his house and take anything that they want.

2: Damm et al. --192 [4] (1909) 1938 Woleaians
116, 578 Faraulep

Insults like manu butšo - confounded fellow, go tḗ pirá manemu eái-do not steal from me! or xo na fēe manemu monáianum - use your own sister! frequently lead to blows. But the contestants seldom fight until one of them dies. If this does occur, the brother of the slain man makes certain demands; otherwise these are not required.

2: Damm et al. --192 [5] (1909) 1938 Woleaians
116, 684 Faraulep

Adultery is punished by fines.

2: Damm et al. --192 [6] (1909) 1938 Woleaians
116, 685 Faraulep

Arson is a serious crime, and it is punished by death; then the house of the culprit is burned too. If anyone dares burn the "big" house, the whole village beats him to death.

2: Damm et al. --192 [7] (1909) 1938 Woleaians
116, 681 Faraulep

If fines cannot be collected, the creditor appropriates an equivalent sum from the debtor, but the chief must first be informed of this procedure.

116, 173, 731

(1909) 1938

Woleaians-1-3
Faraulep

We know nothing about the history of the first settlement of this island group. We only know that the inhabitants were very warlike, that they destroyed each other in one battle after another, and that the island was resettled at a later time by natives from Ifaluk. This was during the reign of the high chief Thamolrâs, and so he is considered to be the first chief. This story gives some information about his epoch:

War between Faraulip and Pix

Nargetumâr, who was a native of Pix, had insulted the people of Faraulip, and they threatened him dreadfully when he left their island. So when he got home, he said to his men: "Get ready! Tomorrow the Faraulip islanders will come to fight us!" Accordingly, the Pix inhabitants made spears for themselves, and the Faraulip men also got ready, but neither side had the courage to start the battle. One night the Faraulip men went fishing, and only a small group remained with the women and children in the village. Then the Pix natives made a surprise attack on them, and killed a large number of people. At dawn the canoes returned and found the massacre. Then the Pix men suddenly overwhelmed the defenseless fishermen in their boats, and only a few managed to escape in the open sea or in the thicket. The Pix islanders remained for a time on Faraulip, and then departed.

At that time a Yap native was staying on Faraulip, so the few survivors went to him, and inquired if he would be willing to help them against Pix. He agreed, and performed

a magic spell; then a high sea (probably a typhoon) came and destroyed many houses on Pix; and many people perished too, so that only twenty were left. But the ocean wreaked havoc on Faraulip too, and all the inhabitants died save one, who had fled into the jungle. The Yap islander died shortly after his conjuration.

The one Faraulip survivor, whose name was Uērlipār, went to the reef, caught 20 oméi fish in baskets, laid them in a ūx basket, and took it to Pix. First he called for the chief. An old man crawled up to him, leaning on canes. "Here, do you want the fish? Come and get it!", said the Faraulip man. The old chief [194] came up, and then the fisherman took him into the canoe and cracked his skull open with the fish club. Then he summoned all of the people in turn, and killed them. Finally he was alone; he did not like that, and so he went to Unaneí (Oleai), and got married; then he returned home to Faraulip with his wife. But upon his arrival, he found a canoe from Ifaluk; the crew had taken possession of the island, and they forbade him to land. So he went to Pix, and settled there. For this reason many of the cultural advantages that are found on Faraulip did not originate there, but came from Ifaluk.

Under the reign of chief Ragetéx a great typhoon struck Faraulip, and it did an enormous amount of damage. It struck Oleai and Aurepik too, but did not do so much harm. This storm killed many people, and destroyed all the palm trees, so the natives did not have anything to eat. Fortunately a canoe appeared from Oleai, it took the survivors

back to that island, and saved them from the worst period of the famine. Then when the trees and plants had started to grow again, the people returned home. Shortly after this, a second typhoon blew across the island; it tore down some huts and a few palms, but did not do any greater damage.

Chief Nĕipŏ̆l is the historical Alberto, whom Lütke and v. Kittlitz met in 1828, and who impressed them with his European manners and his knowledge of Spanish; he had spent two years on the Marianas.

The natives told Hambruch that the first white men came about this time; they did not land, but just stayed in the lagoon. They must have been Spaniards, and Luis de Torres may have been in the group, for he visited the islands in 1804. The natives gave him coconuts and other things, and they received European products from the Spaniards in exchange. They already knew about iron (parăn) *, for they had seen it on Lamutrik, which got it from Guam; it is possible that some of the Faraulip men had gone to Guam themselves.

While Marerŏ̆ï isaŭ was chief, the natives undertook fishing expeditions to an extent that they have not equalled since. During this same period whalers appeared twice (whale - răs); they were American three-masted schooners. Then a German merchant came to Oleai for the first time; this is important because it is a means of determining the date of the chief's rule.

* This word throws a good deal of light on the origin of this new kind of material, for parăn is the Malay word for bush knife, or for a sword with a straight blade.

116, 175 Faraulep

During the reign of chief Gavŭs, a German ship "Karerein" (probably Kathrine) was shipwrecked one night in the channel; its Captain was named [195] Becker. He and his crew (two white men, some Sandwich islanders, and a Samoan)remained for a year and a half on the island. Becker had a weakness for rum; in fact, the disaster was due to his drunkenness; he was later taken to Ponape. One of the white men had a son, who was 25 years old in 1909; so the wreck must have occurred in 1885.

Sauerŭ was the chief in 1909; he had travelled extensively, and was very enterprising. It was under his regime that the merchant O'Keefe and the Japanese settled on the island; one of the latter died on Faraulip. While Hambruch was on the island, he lay at home with influenza. He hoped that a magician could cure him; the magician didn't help him but Hambruch's quinine did.

The natives tell this story about the creation of the world. The original reef (olethapathăp, see Fig. 272, a) lies far below the earth; it brought forth Solăl (♂), Alüelăp (♂) and Eoitšăn (♀). Then Solăl planted a stick in the reef, and it grew very fast. Alüelăp took a little earth, and climbed up on this stick (Fig. 272, h). When he was half way up, he scattered some of the earth, and so he created the world (d), and he put his sister Eoitšăn, who is a being similar to man, over it. Then he went up to the heavens (lăn, f), and moved into the large house (fatšumal, g). He created the first inhabitants of the earth, a woman, whose name was Legobŭ, and the man Nigoburonial-üăl. Both of them lived in the east, perhaps on Ponape, but the natives are not sure about this. At the behest of the god Alüelăp, they begat a number of boys and [197] girls, then they traveled from island to island, and in each place they left a youth and a maiden, in order that they might populate the isles. Then they went farther west, where they encountered some other (!) people. Another version tells how every human being, Kanakas as well as white men come from this first couple.

Solál (Thâuulál, Thâulalŭ) rules the underworld (ilálo); he is a creature half man, and half fish. He created the animals in the sea, and then put an administrator over each island, in order to assure a fine catch for all the inhabitants. The sun shines in the underworld when it is night on earth. The islanders believe that this land is more luxuriant than the world, and they picture it as a kind of Utopia. The primeval reef is here too. Alŭelăp orders Solál to stir up the ocean; this produces typhoons, and people perish.

2: Damm et al. --197 [2] (1909) 1938 Yoleaians
116, 772 Faraulep

In the heavens (lán) there is a very large house (fatšumál), where Alüelăp (also Eluelăp), who is a creature half man and half fish, stays, and where all good people go. Alüelăp created the world, he made the sun which shines on the earth during the day, and then casts its light on the underworld at night. He also made the lightning (worowór) and the thunder (bátš), and he uses them both to get rid of wicked people. Alüelăp is careful to see that everything on earth, in the whole universe in fact, is done in order.

Alüelăp has a wife, but her name is not known; their children are Nimegĕï (♀), who gave men the coconut, and Lugĕĭleń (♂), but there is still another version about the origin of the latter. On Faraulip as on Polowat, Lugĕĭleń is considered to be the confidant of the celestial deity. He had two wives; one in heaven, whose name was Lāmelŭl (Ilamalŭl), and one on earth, Taiaurŏx; she was the mother of his son Olufăth, while the other marriage was childless. The section on legends tells about the deeds of this god, who is known everywhere on the Carolines.

According to legend, Alüelăp had some more adopted children; and among them Thelăń and Paluelăp are especially important for the islanders. The former is the inventor of canoe-building, and it is to him that the natives dedicate the measuring string with two coconut pinnates (tjătš) hanging at the ends, and the canoe ax. The latter made the first sail, and he knows all the paths on the sea. For that reason, when the Captains want to be sure of reaching their goal safely, and of having a calm sea, they sacrifice a coconut and a mat to Paluelăp in the canoe house. His son Elülŭe is his helper in everything.

2: Damm et al. --197-198 (1909) 1938 Woleaians
116, 775 Faraulep

Then the good woman Marăn (moon) also lives in the heavens. She would like to have everyone live, and it is she who lets children be born. Her opposite is Nigesegĕs, who lives in the sky too. She is bad, and lets [198] people die. If anyone on earth has committed a crime, Alüelăp tells Nigesegĕs to have him die. But Marăm opposes this, and says: Sĕ mă! (do not die!). The men die, but they all become little children, and grow up again, so they do not really perish. (Here we seem to be pretty close to the belief in immortality). In olden days people did not die. But when Alüelăp saw how many things they had already accomplished since they were created, and how many things they had made which he did not even have in heaven, he told Nigesegĕs to let them die.

116, 776, 241 Faraulep

The ruler of the air (oiutjăr; the blue of the heaven - li ma râuerâû) is Thâûûr, a brother of Solăl; he is the intermediary between the heavens and the underworld, and he communicates the wishes of Alüelăp and Solăl to mankind. He takes care of the ripening of the bread-fruit, taro, sweet potatoes, and any other foods.

Yoṅelā́f

is regarded as a kind of demon. And since he brings the typhoon, he is greatly feared on the lower Caroline Islands. There is a story about how he became known on the islands:

Once upon a time the Yap men wanted to sail to Palau. But a strong wind rose, and blew them to Oleai. They told the inhabitants that a powerful king, Yoṅelā́f, ruled in Yap, and that all the islands as far as Tarō̃a (Tarawa of the Gilbert Islands) belonged to him. If they did not want to be destroyed by a typhoon, they should bring him some presents in the immediate future. The Oleai islanders were somewhat incredulous about this story, but they were rather frightened, and so they made regular sacrifices to Yoṅelā́f. This cult spread east from Oleai.

Hambruch also heard about a fabulous country, Matā́ṅ, which is supposed to lie in the east, and it is certainly the same thing as the Mēhā́ṅ of Polowat.

Hambruch said that mighty men like Ponijō̃u, who became famous on account of his fish magic, were made local deities, and that the natives sacrificed to them in little spirit huts.

2: Damm et al. --198-199 (1909) 1938 Woleaians
116, 775 Faraulep

Kingdom of the dead, and conception of the soul.
The souls of the dead (faga bŭobu) go up to Alüelăp in the heavens; those of good men enter the fatšumăl, while the bad souls are taken into the fire (iăf), which burns at a considerable distance from Alüelăp's house. After two months they are removed from the fire, and sent back to earth, where they roam around in the air as spirits, and trouble the reefs, the ocean and the thicket. [199] (good spirit - eakatjŭ, bad spirit - eanăne). Then they appear to various people in dreams, and bring them good or bad news. Generally they show themselves to a chief, who thereupon executes the orders of the deceased. Frequently the spirit also enters an ordinary man, who then utters a kind of prophecy (kifini). In 1909 there were no more of these people, because the proper magic charm had perished with the last one of them.

2: Damm et al. --199 (1909) 1938 Woleaians
116, 791 Faraulep

Only a wise man (tâu bǎ́nebaṅ) can make magic. His equipment consists of

a) tšŏripŏ: young coconut pinnates bound around his right wrist.

b) xejapetǎ́x: young coconut pinnates fastened around the neck, and tied with the characteristic knot (buxebŭ́x).

c) ūwŭ́d tǎ́bi'ip: young coconut leaf strips, which are used to rub the patient, while the spells are uttered; then the strips are hung on the canoe mast for Alūlue.

d) xŭ́rup: "medicine", stirred in coconut water, which the patient drinks.

e) xuǎ́li ūwŭ́d: leaf pinnates (ilagĭ́t) of the coconut frond; they are used like c) and then laid in the canoe.

f) popŏ́u: a large palm frond, which is used to drive the demon of disease out of the house.

g) tšŏ́tš: the same kind of medicine bag that is used on Polowat; it is made of coconut fibre from the leaf covering (leaf strips for decoration - eǎ́m, fibre pouch - ūd, medicine - tǎ́fe.)

2: Damm et al. --199-200 (1909) 1938 Woleaians
116, 755 Faraulep

Hambruch watched a disease conjuration; the chief had influenza, and so he called the tau banebau, who had this conversation with him:

"Why are you sick?"

"Alas, I am sick all over, in my head, arms, legs, stomach!"

"Are you a good man?"

"Yes, I am good!"

"I do not believe it!"

"No, I am good!"

"If you were good, Alüelap would not have made you ill. I believe that you have scolded people, or stolen some of their goods...."

[200] [CS: omission of the conjuration.]

2: Damm et al. --200-201 (1909) 1938 Woleaians
116, 789 Faraulep

Another important charm is the matśumáts, the weather magic. There are two types: a) when there has been no rain for a long time, the chief defecates in a sailbreadth (giri), and hangs the excrement up in the big house (fál). [201] The conch shell is also blown occasionally to produce rain. Children sail toy boats for one kind of field magic. This applies to the bread-fruit, which is the most important item of food for the islanders, because they use it to make a kind of preserve, which helps them over the famine. When the ripening season starts - growth and ripening require six months - each boy makes a toy boat (uárits) and sails it as a greeting for the bread-fruit. Alüelap ordered Thauur to tell men about these toy boats.

Woleaians
Faraulep

At certain times there are injunctions (etāb: Polynesian tabu); for example, the chief put tabu signs on his property, so that no one could set foot on it.

The deeds of Olufáth

Taíauóx was to have a child by Lugéileń. She lived on an island (the name is not known) where the woman's body was cut open at birth... Lugéileń said to her: "When the pains start, sigh deeply, pull in the upper portion of the stomach, and then the child will appear!" When she reached this point, Olufáth emerged from her head (bregma). Shortly after he was born, he ran to a palm tree. The mother said: "Wait; you are all covered with blood, let me wash you!" "Oh, I can wash myself!" And he washed the blood off on the palm trunks, which have been red ever since. He grew quickly. Taíauóx said: "Come, I will cut off your umbilical cord!" "Oh, I can do that." And he cut it off. He remained on the earth, and played with the other children. But one day there was a quarrel. Then the children said: "Go to your father!" "I do not have one; alas, he is in the heavens!" And Olufáth ran to his mother. When he began to ask questions about his father, she complained and did not tell him anything.

One night Olufáth was thirsty. The other boys had opened coconuts themselves, and drunk the milk from them, but Olufáth had not; his father had bidden Taíauóx to pour the contents of the nut into a vessel, and to have him drink from that. But now Olufáth cracked a nut himself, and raised it to his lips; then he saw his father. "I want to go to my father! How can I go to him, tell me!" "You shall go to him very soon", said the mother. And Lugeiléń said to Taíauóx: "If my son wants to come to me, light a fire,

and put wood on it until it smokes." Taiauǒx obeyed. Olufáth seated himself on the smoke, and was born up to the heavens. As he arrived, he saw a group of boys who were playing with little boats. "Come and lend me a canoe!" "Who does he think he is? Whence does this strange boy come? We are not going to give him our canoes." And they went on playing. Only one boy let Olufáth play with his boat. Olufáth amused himself with it, then gave it back to the boy and went on his way. But the boats that belonged to the other boys sailed away, and only the one remained.

Elsewhere some boys were playing with sharks, which were still tame at that time. "Let me play too, and lend me a fish!" "Who is he? Where does this boy come from?" And they paid no further attention to him; but one boy [203] loaned Olufáth a fish. After he had played with it, he returned it. Then when the other boys wanted to play with their fish again, they found that the sharks had big teeth; and all of the boys were bitten save only the one. This same episode occurred with the small nex fish (gar?).

When Olufáth climbed a mountain, he saw some men cutting palm leaves to make a new roof for Eluelap's house. "Let me have the knife; I want to cut leaves too!" "Nonsense! Who knows the Boy?" Only one man gave him the knife. Olufáth cut some palm fronds with it. Then night fell. When the men wanted to work the next morning, their hands stuck to the tools, while others, who grabbed hold of the palm trunks or the fronds could not let go of them. And so it was for all of them, save only the one.

A path led past the palm tree; Olufáth urinated on it, and then crouched in the thicket. Lugeilḗń appeared in a little while. He walked in the puddle, made a big fuss, but did not know who had caused it. Olufáth sat in the bushes, and made a sound like a bird: "Hi, hi!" Lugeilḗń went on his way, and he came to the place where the workmen were stuck fast to the trees. Then he knew that Olufáth had come, he was glad, and he set the men free. He entered the big house, and Olufāth came, but not as a man; he looked much more like the bird golṵ́ń. Lugeilḗń said: "Come"! But Olufāth ran away. Then Lugeilḗń cried: "Go away!" And then Olufāth approached. And now he did not look like a bird, but he lay in front of his father like a pile of mud. "Come out!" said Lugeilḗń, and then Olufáth appeared in human form.

The people in the large house said: "One beam has decayed; tomorrow we shall go to get another." Then they all went to sleep, and Olufāth also. When the sun rose, the men hastened into the thicket, cut a post, brought it into the house, and wanted to put it in the place of the soft one. But first they had to dig a hole. They told Olufáth about it. He took the nerve of a palm leaf and a small leaf, stuck them in his loin girdle, and then made the hole. He had scarcely finished it when the men took the post, and rammed it through his body into the hole. They thought that he must be dead now, but such was not the case. When it was night, he took the coconut nerve, hollowed out the post with it, and climbed up through it. He sat down on the ridge pole, and watched how the others ate coconuts and told each other about his death. Then he took the one little piece of

coconut leaf, which he had stuck into his belt on the previous day before he dug the hole; he enchanted it, and out of the little piece of leaf came a nut, which grew larger all the time. He took it and threw it in the midst of the assembly. "See, I am not dead at all!" Then they saw that Olufáth was sitting up on the ridge pole. Later the men in the big house made a fish weir. It was still not completed, for in the interior parts of it had to be drawn together; Olufáth was supposed to do this. He got some wood out of the thicket, put a plant in his mouth [204] and crawled into the weir. The men hastily pulled it up, put it on a canoe, and took it out beyond the reef. Here they threw the weir into deep water, and now they believed that Olufáth was finally dead. But the plant which he held in his mouth, kept him up on top; and he even succeeded in getting out of the weir; then he caught a number of fish, and stuck them inside the basket. He made himself look like a man suffering from ringworm, and then he reached land before the men who had wanted to kill him. And the weir lay full of fish on the beach. Then Lugeilén came, and so the two were together in the big house when the others arrived. When they entered, they said that the man was Lugeilén. "No, it does not look like him. Could it be Olufáth?" "But he lies in the deep water beyond the reef." When they came into the house, they found that it was indeed Olufáth. And he told them about the weir, which was full of fish on the shore. The men went to fetch it at once, and found that it was completely full. Olufáth took a fish and went to the Thunder's house; he took his wife,

gave her the fish, and slept with her. Then the Thunder came and saw what Olufáth had done. When he tried to catch the culprit, Olufáth ran into the big house. The same thing occurred with the wives of the Lightning and the man Poīs; the husbands always discovered that they had been deceived, but they never could catch the agile Olufáth. However, Olufáth almost came to grief with the last one. Poīs was a very strong man, and Olufáth was afraid. So he took a stone, and threw it into Poīs' eye before he fled to the big house. Then he got another fish, and ran with it to Fēla's house. It happened that Fēla was in the thicket, and so Olufáth treated his wife as he had the others. But the husband returned just as he was getting ready to leave. Olufáth ran immediately, because Fēla had a fish line. He caught Olufáth's ear with the hook, pulled him back, and whipped him until he was nearly dead. Fēla also stuck both of his eyes out, and buried them beside his house.

Then Lugeilēń came and looked for his son. He smelled the decay, and found that Olufáth was dead. He made a spell quickly, and Olufáth came back to life. Now he was supposed to go with Lugeilēń, but he did not want to leave until he had killed Fēla. So he entered the house, slew him, knocked his teeth out, and threw them into the sea. Then he joined his parents in the heavens; he loves dancing and singing, and directs them on the squares in the heavens and on the earth.

Lugeilĕn

Two women, Wavŭ and Pugelŭ, lived on the earth. Each one had a daughter, and each daughter had an orange tree (these were introduced by Europeans). But they were not alike, for one bore better fruit than the other. Then one maiden stole an orange from the other [205]. The sister noticed it, and whipped the culprit. Finally they both began to weave a clothing mat at dawn. But one of them stopped at noon, for the other, the weaker woman, had used magic charms, and had completed her task.

Then Nisarĕla came; he seized the one who had completed her mat and took her up to the heavens. A little king, Mesenienŏtu, lived in the eastern part of the heavens, and he married this woman. In a little while, she bore a son, but he did not have a name; he was a good and likeable child. Eluelăp was fond of him, took him, and called him Lugeilĕn. He made him a great king in the heavens.

How Nimĕgei Gave Men the Coconut

In olden days there were palms, but no nuts. Then Eluelăp had a daughter, Nimegĕi. She was pregnant, but she did not give birth to a child; a coconut appeared instead. She filled it with earth, and let it alone. After ten days it sprouted. Nimegĕi did not know what it was. The thing grew quickly, and became a palm tree which had many, many coconuts. Then Eluelăp said to four men: "See to it that nobody steals the nuts from the tree, or carries away the fallen ones!" But Lugeilĕn took one secretly, carried it to

Mogemog, and planted it there. It grew rapidly, and bore a fine crop of nuts. Then all the people sailed to Mogemog in their canoes, and got coconuts. And this is the way that the coconut came to the islands.

The Origin of Thelăn and His Brothers.

Eluelăp had three more sons, Thelăn and Alülemăth. They were carpenters. Thelăn went to the colored people, and Alülemăth to the whites, and taught them how to build canoes. Thelăn built a boat in Mălip on Ponape; and the art spread from there to the west; he also constructed houses, but his mind was always set on practical matters. Alülemăth went to the white men, taught them sciences, showed them how to make ships, and made them clever.

According to another version: two men, Thelăn and Themarüx, are the brothers of Alülemăth. The first two stay with the natives, and Alülemăth with the whites. The three are not the real children of Eluelăp; they really sprang from the woman Legobŭ and the man Nigoburonialüăl, and both of them came from the woman Eoĭtšăn. The couple had the three sons whom I have named; they were very clever, and Eluelăp loved them so much that he adopted them and gave them their names. Another son (of this couple?) is Palŭelap, who has a son Elülŭe. [206]

Eluelăp spoke to his sister Eoĭtšăn: "Create men!" Eoĭtšăn communicated this order to Legobŭ. She obeyed, but she had nothing to eat. When she woke up the next morning,

she found a great deal of food, because she had dreamed about it. But if she dreamed that she did not have anything, nothing was provided in the morning. Eluelăp always let her dream about what she needed to live. Themarŭx built the house, Thelăn the canoe. Palŭelap is the man who points the way on trips, and it is he who invented the sail. His son Elŭlŭe helps him.

The Women Nagē.

Two friends dwelt in Ifaluk: Nagēibiorŭ (1) and Nagēirifan (2). Once when they came to Ifaluk, they began to quarrel. Then Nagē 2 took a coconut husk, filled it with sand, and went out to sea. She scattered the sand in the water, and an island appeared; it was Faliĕu. There were no palms on it, just low underbrush, and so nobody could live on it. This woman had a son, Fagĕm e tau, and a daughter Lewauuŏt, but she died. When the son had grown up, he said to his mother: "Make me a canoe!" The mother made a toy boat for him. "If this canoe ever sails away from you, climb on to it!" Later the boat sailed off, so the lad swam after it, and got into the craft. It carried him to Ifaluk. He saw a number of boys there, and he taught them how to build toy boats. Nagē 1 had stayed in Ifaluk. One day a boy said: "Where does this boy come from, and why have we not seen him before?" Nagē 1 heard this. Since Fagĕm e tau looked very like his mother, she asked him whence he had come. He told her, and then spoke about his mother. Then Nagē 1 took him in her house, and he dwelt with her.

Ponijoū

Ponijoū was a man who died a short time ago. During his lifetime he was renowned on account of his fish magic, which was particularly effective for flying fish. Since he died nobody knows the charm, and so the natives built a small spirit house for him. When Sāuerū is asleep, Ponijoū appears to him occasionally, and tells him that it is a propitious moment for the men to go fishing. If the expedition is not successful, the fisherman goes to Ponijoū's house, and leaves a present. Ponijoū orders and prohibits the fishing expeditions, but the chief is always the intermediary.

How Fire Came to Men.

Eluelāp made fire, and gave it to Olufāth, who hid it in a bamboo, and then brought it to men on earth. He showed them how you can bore a fire with the help of pieces of wood. [207]

How Lugeīlēń Taught Men Coitus.

In olden days women did not have any genital organs, and men knew nothing about sexual intercourse; they could only eat and drink. Then Eluelāp sent Lugeīlēń down to earth, and he came to the man Niparāra, and to the woman Temoṅemōṅ; he said to the latter: "Do you not have a husband?" The woman replied: "Why yes!" "Well, where is he?" "He is fishing." "Is that all you know? Don't you know anything else?" As he spoke these words, Lugeīlēn removed the woman's clothing mat, and he saw that she

did not have any organs. So he stuck two fingers inside, and formed her genitals. Then he used her and finally he departed. Then the husband came home and said: "I have brought some fish, go and fasten the canoe!" "Oh, never mind the boat!" And the canoe remained lying half way up the beach. The woman continued: "I will show you something fine, that I have just learned. I did not know it, and nobody here knows about it. Come, get on top of me!" He obeyed, but his organ refused to stiffen, so she rubbed the penis and so they had intercourse. And all the people came and watched this process. Then the wife said: "Look after your canoe!" "Oh, never mind the canoe, this is nice!" And so they lay together the whole day.

The Bird Bath.

Once upon a time, there was a bird called Báth which always made a great deal of noise with his call "Bri-bri". When you looked at him in the air, he seemed sometimes to be white, but again he was red or black. All the people were very afraid of him, because many of the ones who saw him, died. Then the survivors complained to Olufáth. So he took a young báth bird, put him on the earth, and said that he should remain small, and not make such a noise. When the bird sang on earth, he only managed to make sounds like "kikeriki" and "gakgak". He is supposed to have been a very large bird. (Could they be talking about the hen?) On one occasion two Yap natives noticed

it while they were fishing. They made a charm to catch it, but the bird attacked one of them, and killed him; and he wounded the other. The bird is said to have traveled to Palau, and to have died there.

Dances: (ŭ̈ru). The natives know the stick dance (noi ŭ̈ra), which you find nearly everywhere in the Caroline Islands, and the hand dance (huafă̈rux). The women have a sitting dance (apitax); according to Hambruch, the various phases of it are:

1. a slow introduction, in the form of a choral, hand motions: closing, opening, and turning in measure according to the rhythm of the music, that is sung as an accompaniment to the song. It is in 3/4 time, but at the close it goes more rapidly, and there is a sudden pause.
2. a faster tempo and gestures which accompany a lively song.
3. like 1.
4. clapping the hands.
5. turning the head and twisting; toward the end there are gestures.
6. standing up, arranging the lines, striking the upper part of the thigh, raising the leg, shuffling the feet, turning around, then to the sides and back again, stomach dance (it is displayed in three different ways, very erotic).
7. dissolving into a dance, where there are rows, ballet style.
8. stomach dance, twisting the hips, then shuffling the feet, and toward the end there are movements of the hands, which become gradually slower.
9. coitus dance, imitation of the surrender.
10. like 6.

11. clapping the stomach with the hollow of the hand, then the breast, then a lively song, coitus dance, ballet.
12. like 11.
13. clapping, a woman chanter sings a solo, then it proceeds like 11.
14. walking forwards and backwards, then like 6, and they call: Hŏ́ka, fetắi ŭ́ra tipḗi.
15. coitus dance, provocation, clapping the upper thigh, spreading the upper thighs apart, striking the vulva.

The dancing costume (šrŭ́p) consists of an apron with long coconut pinnates, and the men also wear combs in their hair, which are decorated with feathers and [210] leaf bands around their tufts of hair. The men's dancing sticks are simply sticks or nerves of a coconut frond.

116, 524 Faraulep

Hambruch noted the following toys:

a) boats (maravai) with sails made of taro leaves. We have already referred to their religious significance.
b) String figures (xatóte) which one or two can make; usually there are ten manipulations in one figure.
c) bull-roarer (xánum) of the same form as the ganíni of Aurepik.
d) spinners (nigaferéń) of palm leaf strips, made in the same shape as the ones on Ifaluk.
e) ball (garofá) of the common Carolinian form.
f) different kinds of woven toys: bird (gatáf) of woven leaf strips, married couple, pipe (atífetix), little pouch (?).

2: Damm et al. --211 (1909) 1938 Woleaians
116, 757 Faraulep

There is some medical information. When a person has elephantiasis, the kowădewad plant is thrown in the flame, and then the patient warms himself in front of it. The natives use tsĕ́l as a healing plant for framboesia, and they prick the ulcers in syphilis. Splints of little sticks are used for broken arms.

2: Damm et al. --211-212 (1909) 1938 Woleaians-1-2
116, 805 Faraulep

Division of time. The year is divided into two parts, like our seasons: thâu e fǎ́ń and thâu e rǎ́x. The months (marǎ́m) are named for the stars, and they are in two groups:

thâu e fǎ́ń		thâu e rǎ́x	
ūliūl	November	mâlirūx	May
malū	December	mâiilōp	June
ith	January	thadǎ	July
thǎrebol	February	nǎ́x	August
eremâui	March	xūe	September
tumūlū	April	uūl	October

Each month has 29 days (rǎl), or really nights (pǒńi), which are determined according to the different phases of the moon. The names, beginning with the new moon, are:

ŝegōrū	epêii	xerǎń
elīń	olabuĕ	keretieverǎ́x
mederīń	olomâl	thapǎs merioumūr
mejǎn	mǎxth	komǎla
mejafīth	ourǎ	komalafǎń
mexuǎn	natiouǎ	erofū
mejatūi	kirêi	ēeū

emetatī	kaneuă		efaín
šruobŏn	thapắs		ērăpf
arabogŭ	ewerā́x	[212]	

The day is divided into various parts:

morning, sunrise	nī thorŭ
noon	nuĕl
evening, sundown	nifigắfi
twilight	niga pŭn
midnight	nŭk i ni pŭn
dawn	pŭn e nilṓ

2: Damm et al. --212-216 (1909) 1938 Woleaians
116, 212, 176, 802 Faraulep

The Faraulip natives use a peculiar script (see Figs. 279, 280) which is very similar [213] to the Polowat writing; they also have their own numerals, which the chief Saueeru invented. He teaches them to the young men, who put them to practical use in their copra dealings with the Japanese. The signs were derived from tattoo patterns and Japanese characters which the chief had taken from Japanese newspapers. [CS: Omission of illustrations of writing, and of the numerals, pages 212, 213, 214, 215, 216].

(1909) 1938

Woleaians #3
Faraulep

The vocabulary is very like the one on Satowal.

2; Damm et al. --217 [2] (1909)- 1938 Woleaians
116, 193 Faraulep

There are no articles. Personal pronouns:

I ɣăn
you ɣĕl
he ɣĭ

we (inclusive I and you) ɣăn ema ɣĕl.
we (exclusive, I and he) ɣăn ema mĕ.
we (three) ɣăn mĕn ma jĕli me mĕn
we all (including the person addressed) ɣiligimĕn.
we all (excluding the person addressed) ɣămi
we ilĕgez
you ilegemĕn
they ilagĭda

Possessive pronouns (Hambruch did not obtain all of them).

my	im-mĕĭ	his	im-ameremătera
your	im-mŭm	our	im-mumĕm

Hambruch only gives one form of the demonstrative pronoun: mĕne - this.

2: Damm et al. --217 [3] (1909) 1938 Woleaians
116, 804 Faraulep

The measures of length are taken from the human body:
a span's width (length of the outstretched arms and the chest) ɬanăf.
a half span ɬeteroŭp
an arm ɬepŏi
half an arm (the forearm) ɬemărŭ
middle finger and thumb ɬeăn
middle finger to the knuckle ɬeɬelipotăŏ
index finger length ɬerăt
half an index finger length marŏilăp
one finger marŏi i rŭx

DRUCK UND EINBAND VON J. J. AUGUSTIN IN GLÜCKSTADT - HAMBURG - NEW YORK
PRINTED IN GERMANY

Ernst Sarfert †

Als der vorliegende Band im Satz war und gerade die ersten Korrekturfahnen eintrafen, schloß Ernst Sarfert nach schwerer Krankheit am 19. November 1937 für immer die Augen. Noch bis zuletzt brachte er meiner Bearbeitung seines Südsee-Materiales regstes Interesse entgegen. Infolge beruflicher Überlastung und plötzlicher Erkrankung ist er dann garnicht mehr dazu gekommen, den von mir bearbeiteten Stoff einzusehen.

Ernst Gotthilf Sarfert wurde am 4. November 1882 in Schönau bei Wiesenburg in Sachsen geboren. Er besuchte das Realgymnasium in Zwickau und bezog nach Erlangung des Reifezeugnisses die Universitäten in Jena und Leipzig, um sich dem Studium der deutschen Sprache und Literatur, der Geschichte, Geographie und Völkerkunde zu widmen. 1907 erwarb er mit einer Arbeit über „Haus und Dorf bei den Eingeborenen Nordamerikas" die Doktorwürde und trat am 1. Mai 1907 im Städtischen Museum für Völkerkunde zu Leipzig als Volontär ein. Am 1. Oktober 1907 übernahm er als wissenschaftlicher Hilfsarbeiter, später mit der Dienstbezeichnung Direktorialassistent, die Südsee-Abteilung dieses Museums. Er hatte dann das Glück in den Jahren 1909 und 1910 an der Hamburger Südsee-Expedition teilzunehmen. Nach seiner Rückkehr ins Museum begann er das von ihm zusammengetragene Material zu sichten und zu bearbeiten. Die erste Frucht war eine kleine, aber für die Geschichte der mikronesischen Kulturen um so wichtigere Arbeit unter dem Titel „Zur Kenntnis der Schiffahrtskunde der Karoliner" (Korrespondenzblatt der Deutschen Gesellschaft für Anthropologie, Ethnologie und Urgeschichte Jg. XLII, 1911). Der Ausbruch des Weltkrieges unterband alle wissenschaftliche Arbeit. Sarfert trat sofort als Kriegsfreiwilliger ins Heer ein und kämpfte bis 1918 an der Westfront. Sein großes Werk über die Kultur, Geschichte und Archäologie der einst bedeutsamen Insel „Kusäe" konnte erst 1919 und 1921 in zwei Bänden erscheinen. Mit dieser Arbeit fand leider die wissenschaftliche Betätigung Sarferts, der auch in den Jahrbüchern des Städtischen Museums für Völkerkunde zu Leipzig eine Reihe kleinerer Arbeiten veröffentlicht hat, ein vorzeitiges Ende. Sarfert wechselte aus eigenem Entschluß den Beruf und trat am 1. Dezember 1919 in die Industrie über. Die Bearbeitung seiner übrigen, während der Südsee-Expedition gemachten Aufzeichnungen wurde mir auf seinen Vorschlag hin vom Herausgeber der „Ergebnisse der Südsee-Expedition" übertragen. Ich denke gern und dankbar an all die Stunden zurück, in denen ich mit Ernst Sarfert das Material durchsprechen konnte, er in persönlichen Erinnerungen schwelgte und mich in den Zauber der mikronesischen Inselwelt einführte. Die Sorgfalt, mit der Sarfert seine Forschungen in Feld und Heimat betrieben hat, sichern seinem Namen für alle Zeiten einen ehrenvollen Platz in der Wissenschaft der Völkerkunde.

Dr. Hans Damm.

P. V

[P. Vi Blank]

Vorwort.

Das in diesem Band verarbeitete Material wurde von Paul Hambruch und Ernst Sarfert zusammengetragen, die beide allzu früh durch den Tod aus ihrem Wirkungskreis abgerufen wurden. Auch Hellwig, dem für die Dauer der Expedition das Sammeln von ethnographischen Gegenständen oblag, und Augustin Krämer, dessen Gattin diesem Band neben anderen Skizzen ein Aquarell vom Geisterhaus auf Mogemog beisteuerte, haben das Material vor allem nach der sprachlichen Seite ergänzen können. Durch den Tod der oben genannten Expeditionsteilnehmer ist die Bearbeitung des Materiales insoweit beeinträchtigt worden, als in Zweifelsfällen keinerlei Rückfragen möglich waren. Zum Glück waren die Niederschriften und Skizzenbücher so geführt worden, daß derartige Fälle nur selten eintraten; auf die Wiedergabe unklarer Skizzen und Angaben wurde verzichtet, Widersprüche als solche gekennzeichnet.

Die Dauer des Aufenthaltes war für die einzelnen Forscher sehr verschieden. Konnte dies nicht ohne Wirkung auf die ethnographische Ausbeute bleiben, so war andererseits auch der Mangel an einwandfreien Gewährsmännern hin und wieder fühlbar. *Hambruch* weilte zunächst vom 2. bis 17. Oktober 1909, also zwei volle Wochen, auf der Inselgruppe **Mogemog**. Die hier angetroffenen völkerkundlichen Verhältnisse waren günstig, da die Inseln durch das tragische Schicksal der spanischen Mission in Verruf geraten waren und von Europäern gemieden wurden. Leider wurde die Forschungsarbeit dadurch beeinträchtigt, daß die meisten Männer damals gerade auf Yap weilten, um wegen einer Übersiedlung nach dort zu verhandeln. — Vom 4. bis 18. November besuchte Hambruch auf wiederum zwei Wochen **Faraulip**. Trotzdem eine volle Woche Sturm und Regenwetter herrschten, konnten die Arbeiten dank der Unterstützung von seiten des vielgereisten Inselhäuptlings erfolgreich beendet werden.

Sarfert widmete die meiste Zeit, nämlich 17 Tage, der Insel **Sorol**, die er am 4. Oktober anlief und am 21. wieder verließ. Leider mußte er schon nach wenigen Tagen aus dem Verhalten der Eingeborenen schließen, daß er nicht willkommen war. Ob die von den Eingeborenen zur Schau getragene Unwissenheit und Faulheit nur vorgetäuscht wurden, um den lästigen Weißen bald los zu werden, hat Sarfert nie recht erfahren. Eine unerwünschte Schwierigkeit in der Erforschung dieser Inselkultur ergab sich noch daraus, daß der als Dolmetscher mitgenommene

Yap-Mann, der fließend Mogemog sprach, sich nur schwer mit den Sorol-Leuten verständigen konnte. — Kurz und nicht ohne dramatischen Zwischenfall war der Aufenthalt auf **Aurepik** vom 31. Oktober bis 2. November. Sarfert hatte hier einen alten Mann gefunden, der über Geschichte und Sagen gut Bescheid wußte; auch die Sammeltätigkeit war befriedigend. Da will es das Mißgeschick, daß das Boot bei der Rückkehr von der Insel zum Dampfer in der Brandung kentert und dabei die photographischen Platten mit allen ethnographischen Gegenständen verloren gehen. Deshalb fehlen bei der Schilderung des materiellen Kulturbesitzes genauere Einzelangaben über die Geräte, sofern nicht gerade Hellwig, Hambruch oder Krämer das eine oder andere Stück von Eingeborenen, die den Dampfer aufgesucht hatten, erworben und ihrerseits dazu Erhebungen angestellt haben. — Vom 5. bis 17. November, also 12 Tage lang, weilte Sarfert dann auf **Ifaluk**. Bei aller Willigkeit der Eingeborenen entsprach ihre Kenntnis von der alten Religion und Geschichte keineswegs den gehegten Erwartungen. Die Insulaner gestanden selbst ein, daß sie früher viel mehr gewußt, jetzt aber viel vergessen hätten!

Beim Abschluß dieser mir lieb gewesenen Mitarbeit an den „Ergebnissen der Südsee-Expedition" danke ich der Deutschen Forschungsgemeinschaft und der Hamburger Wissenschaftlichen Stiftung für die zur Drucklegung bereitgestellten Mittel. In diesen Dank möchte ich auch den Verlag, die Druckerei und all die unermüdlichen Helfer vom Hamburger Völkermuseum mit ihrem verstorbenen Direktor Thilenius einschließen, die meinen vielfachen Wünschen stets bereitwillig nachgekommen sind und für ihren Teil dazu beitrugen, daß das Werk vollendet werden konnte.

Leipzig, im Juli 1938. Dr. Hans Damm.

Nach Aquarell von Frau E. Krämer.

Tafel 1 ..... 48 u. 49
Ifaluk: Körbe und Taschen (oben: Hamburg 1843II, 1833II, Länge 31 bzw. 31,5 cm, Höhe 14 bzw. 18 cm; — Mitte: Hamburg 1834II, 1831II, Länge 28 bzw. 46 cm, Breite 18,5 bzw. 34 cm, Höhe 13,5 bzw. 15 cm; — unten: Hamburg 1829II, 1828II, Breite 50 bzw. 48 cm, Höhe 27 bzw. 37 cm).

Tafel 2 ..... 48 u. 49
Ifaluk: 1. Tasche (Hamburg 1841II, Breite 26 ½, Höhe 19 ½ cm). — 2. Zweiteilige Tasche (Hamburg 1836II, Breite 5 ½, Höhe 13 ½ cm). — 3. Tasche (Hamburg 3186II, Breite 28, Höhe 22 cm). — 4. Tasche (Hamburg 1833II, Breite 39, Höhe 23 cm). — 5. Gewebter Lendenschurz (Hamburg 3810II, Länge ohne Fransen 193 cm, Breite 94 cm). — 6. Matte (Hamburg 1869II, Länge 56, Breite 48 cm).

Tafel 3 ..... 48 u. 49
Ifaluk: 1. Vogelnetz (Hamburg 1790II, Länge 141 cm). — 2. Reuse (Hamburg 1794II, Länge 84 cm). — 3. Korb aus Kokosfaserschnur (Hamburg 1961II, Länge 57, Höhe 23 cm). — 4. Netztasche (Hamburg 3812II, Breite 65, Höhe 42 cm). — 5. Netztasche (Hamburg 1809II, Breite 83 cm, Höhe 39 cm).

Tafel 4 ..... 112 u. 113
Aurepik: Männergruppe in Seiten- (oben) und Vorderansicht (unten).

Tafel 5 ..... 112 u. 113
Aurepik. Oben: Frau Etangutang und die Frauen Lagaugeit und Langotang. — Unten: Die Männer Sagalefei, Medach (Häuptling) und Ranelimar. (Alles Krämer phot.)

Tafel 6 ..... 144 u. 145
Aurepik. Oben: Die nördlichste der drei Häuptlingshütten auf hohem Steinsockel. — Mitte: Die mittelste der drei Häuptlingshütten. In der kleineren Hütte wurden Garne zum Weben hergestellt. — Unten: Die südlichste der drei Häuptlingshütten. (Alles Krämer phot.).

Tafel 7 ..... 144 u. 145
1. Aurepik: Segelboot am Strand.
2. Aurepik: Pfahlhütten am Lagunen-Strand.

Tafel 8 ..... 144 u. 145
Aurepik: Links: Gewebte Lendenschurze (Hamburg 3031II, 3029II, 3030II, Länge 143, 164, 172 cm, Breite 52 ½, 56 ½, 55 ½ cm). — Rechts oben: Korb mit Webmaterial (Hamburg 3334II, Durchmesser 40 cm, Höhe 15 cm). — Rechts unten: Faserschurz (Hamburg 3015II, Weite 86 cm, Länge 60 cm).

Tafel 9 ..... 144 u. 145
Aurepik: 1, 2 und 3. Feuerfächer (Hamburg 3021II, 3020II, 3019II, Länge 33 ½, 47, 40 cm, Breite 19, 20, 21 cm). — 4, 5 und 6. Körbe (Hamburg 3014II, 3013II, 3017II, Höhe 42, 24, 19 cm, Breite von 4 – 27 cm, Durchmesser von 5 – 15 cm, Länge von 6 – 38 cm).

Tafel 10 ..... 160 u. 161
Faraulip: Männer in Vorder- und Seitenansicht.

Tafel 11 ..... 176 u. 177
Faraulip: 1. Modell eines Reisebootes (Hamburg 262II). — 2. Tragkorb (Hamburg 280II; Höhe 32 cm). — 3. Krankheitszauber (Hamburg 264II; Länge 75 cm). — 4. und 5. Fischreusen (Hamburg 296II und 297II; Länge 33 und 50 cm).

Tafel 12 ..... 176 u. 177
Faraulip: Gewebte Lendenschurze; obere Reihe: 244II, Länge 146, Breite 45 cm; 308II, Länge 183, Breite 54 cm; 307II, Länge 193, Breite 51 cm; — untere Reihe: 313II, Länge 202, Breite 52 cm; 238II, Länge 198, Breite 58 cm; 257II, Länge 194, Breite 50 cm. (Alles Museum Hamburg).

zwischen Seite
Tafel 13 ..... 176 u. 177
Faraulip. Oben: Königsmatte (Hambruch phot.). — Unten: Am Webstuhl (Hambruch phot.).
Tafel 14 ..... 176 u. 177
1. und 2. Faraulip: Boot beim Segelmanöver.
3. Faraulip: Zusammengebrochenes Bootshaus mit Reusen und kleinem Boot.
Tafel 15 ..... 192 u. 193
Faraulip. Oben: Häuptlingshaus mit Geisterhütte auf Pik. — Mitte: Buthäuser unter einem Banyan-Baum. — Unten: Dorfansicht bei Regenwetter. (Alles Hambruch phot.)
Tafel 16 ..... 208 u. 209
Faraulip: Männer zum Tanz angetreten.
Tafel 17 ..... 240 u. 241
Sorol: Männergruppe; in der Mitte mit Korb) der Oberhäuptling.
Tafel 18 ..... 256 u. 257
1. Sorol: Wohnhaus, davor Pfahl mit Muscheltöpfen und Tasche.
2. Sorol: Bootshaus.
3. Sorol: Inneres vom Männerhaus.
4. Sorol: Inneres vom Männerhaus.
Tafel 19 ..... 256 u. 257
1. Sorol: Kanu am Strand.
2. Sorol: Tarofelder im Busch.
Tafel 20 ..... 272 u. 273
Sorol: Netz (Hamburg 1754[II]; Rahmen 74 zu 40 cm) und Reuse (Hamburg 1695[II], Länge 184 cm, größte Breite 82 cm, Höhe 45—74 cm).
Tafel 21 ..... 272 u. 273
Sorol: 1. Korb (Hamburg 1718[II]; größte Breite 62 cm, Höhe 22 cm). — 2. Tragtasche (Hamburg 1713[II]; größte Breite 31 cm, Höhe 16 cm). — 3. Geflochtener Behälter (Hamburg 1709[II], Höhe 12 ½ cm). — 4. Geflochtener Behälter (Hamburg 1711[II]; Höhe 13 cm). — 5. Korbtasche (Hamburg 1715[II]; größte Breite 68 cm, Höhe 29 cm). — 6. Korbtasche (Hamburg 1716[II]; größte Breite 62 cm, Höhe 22 cm).
Tafel 22 ..... 272 u. 273
Sorol: Gewebte Lendenschurze; obere Reihe: 1697[II], Länge 145, Breite 58 cm; 1700[II], Länge 143, Breite 53 cm; 5307[II], Länge 147, Breite 35 cm; — untere Reihe: 1701[II], Länge 148, Breite 58 cm; 1699[II], Länge 130, Breite 34 cm. (Alles Museum Hamburg.)
Tafel 23 ..... 304 u. 305
1. Mogemog-Mann.
2. Mogemog-Frau Lolitheg.
3. Mogemog-Mann Maralu.
Tafel 24 ..... 304 u. 305
Mogemog. Oben: Frauen in alter Tracht. — Unten: Männer (Oliefang, Toling, Ngulu, Taradj) in alter Tracht. (Hambruch phot.).
Tafel 25 ..... 336 u. 337
1. Mogemog: Wohnhaus.
2. Mogemog: Vorbau eines Wohnhauses.
Tafel 26 ..... 336 u. 337
1. Watoyai: Haus auf Steinsockel mit hochgestütztem Giebel.
2. Watoyai: Haus zu ebener Erde mit hochgestütztem Giebel.
Tafel 27 ..... 336 u. 337
Mogemog. Oben: Dachkonstruktion des Bootshauses Faeiwan auf Watoyai (Hellwig phot.). — Unten: Blick im Männerhaus (Hambruch phot.).
Tafel 28 ..... 336 u. 337
Mogemog: Geisterhaus mit bemalter Vorder- (oben) und Rückseite (unten).

Abkürzungen.

He. = Hellwig, Ha. = Hambruch, Sa. = Sarfert, A. K. = Augustin Krämer, E. K. = Elisabeth Krämer.

Zur Aussprache.

Die Teilnehmer der Südsee-Expedition bezeichneten die Aussprache einzelner Vokale und Konsonanten ganz verschieden. Mit Rücksicht darauf, daß leider keiner der Forscher mehr am Leben war, habe ich an der Schreibung der Eingeborenenworte nichts geändert. So mag es vorkommen, daß vor allem die Aussprache einzelner Konsonanten gleich ist, aber verschieden wiedergegeben wurde.

a, e, i, o, u kurze, unbetonte Vokale
ā, ē, ī, ō, ū lange, unbetonte Vokale
á, é, í, ó, ú lange, betonte Vokale
ă, ĕ, ĭ, ŏ, ŭ kurze, betonte Vokale
a͡u, o͡i, a͡ū gebundene Vokale
ŋ nasales n (z. B. Engel)
ʃ stimmloser Reibelaut wie sch (z. B. Schall)
χ und ch stimmloser, velarer Reibelaut wie z. B. ach
ʒ und th stimmhafter, dentaler Reibelaut wie engl. th z. B. then
ʒ stimmhafter Reibelaut wie j im franz. journal
γ stimmhafter velarer Reibelaut wie das g in sagen bei norddeutscher Aussprache.

Ifaluk.

Nach den Aufzeichnungen von Dr. E. Sarfert bearbeitet
von Dr. Hans Damm.

XXVI

Ifaluk.

Allgemeiner Teil.

I. Äußere Geschichte.

Entdeckung und Erschließung. Eine große Anzahl karolinischer Inseln wurde dem Abendland bereits bekannt, noch bevor sie von Europäern entdeckt worden waren, nämlich durch verschlagene Insulaner[1]. So wurden dem Jesuitenpater Paul Clain von verschiedenen im Jahre 1678 bzw. 1696 angetriebenen Leuten 32 Inseln genannt, unter denen auch »Yfaluc« nicht fehlte. Dagegen findet sich dieses nicht auf der von Clain entworfenen Karte, zu der ihm die Eingeborenen die Lage der Inseln im Sand mit Steinchen aufzeichneten[2]. Auf der Karte des Somera von 1710, die nach Angaben von Sonserol-Leuten gezeichnet wurde, findet sich der Archipel »Faloc« wieder[3]. Der Vollständigkeit halber sei noch auf einen Hinweis von Krämer aufmerksam gemacht, wonach die Insel »*dan*« auf der Pilotenkarte des Somera (1710) wahrscheinlich auf Lezcano zurückgeht und vielleicht Ifaluk bezeichnet[4]. Auf der Eingeborenenkarte des Cantova (1721) findet sich »Ifeluc« wieder[5]. Sicher ist die Entdeckung durch James Wilson am 27. Oktober 1797[6]. Wilson sichtete zunächst eine einzige Insel, die dann beim Nähersegeln zwei eng aneinanderliegende Eilande ergab; er hatte sicher Feladjik und Moai vor sich. Mit den Bewohnern wurden Waren getauscht, ohne daß bei dieser Gelegenheit ethnographische Beobachtungen gemacht worden wären.

Am 3. April 1828 fand Lütke die »Wilson-Inseln« wieder, die er als Ifaluk identifizierte[7].

[6] Wilson 1799, S. 301; ders. 1800, S. 412. — Brigham (1900 S. 79) und Kolonial-Lexikon (II. Bd. S. 88) geben das Entdeckerjahr Wilson's irrtümlich mit 1793 bzw. 1795 an.
[7] Lutké 1835, Vol. II S. 133; v. Kittlitz 1858 II. Bd. S. 152.

1844 besuchte Cheyne die Insel und stellte auf den Riffen »erstklassige« Holothurien fest[1], worin sich sein Interesse zur ozeanischen Inselwelt erschöpfte.

Am 31. März 1875 lief der Handels- und Fischerschoner »Rupak« unter B. E. Gall die Inselgruppe an, ohne sich jedoch länger aufzuhalten[2].

Die Hamburger Südsee-Expedition setzte am 5. November 1909 Sarfert auf der Hauptinsel an Land und holte ihn am 17. November wieder ab[3].

3

II. Geographie.

Name. Die Inselgruppe war durch die Eingeborenenkarten (S. 1) dem Abendland als Faloc, Yfaluc bzw. Ifeluc bekannt geworden. Als Wilson 1797 dieses Atoll entdeckt hatte, führte es eine Zeitlang den Namen seines Entdeckers[1]. Nach Meinicke wird sie »bei anderen« Two Sisters genannt[2]. Doch diese Namen bürgerten sich nicht ein. Chamisso erhielt von seinen Gewährsleuten, den Insulanern Kadu und Edak, für diese Gruppe Iviligk bzw. Ibiliek. Lütke[3] schreibt Ifalouk, der berüchtigte Händler Cheyne nennt die Gruppe ebenfalls mit ihrem Eingeborenennamen Evalook[4], sein Landsmann Russel Robertson[5] schreibt Evalouk, was alles der deutschen Schreibung Ifaluk gleich kommt. Seit dieser Zeit bürgerte sich immermehr der Eingeborenenname für diese Inseln ein[6]. Daneben findet sich aber auch die Schreibung Ifalik[7], die vielleicht in den oben genannten Angaben Chamisso's ihren Ursprung hat; diese Schreibung wenden sowohl die Japanese Governments Chart 1925 (Nr. 772) und auch der Pacific Islands Pilot von 1933 (6. Ausg.) an.

Die **Kartographie** dieses Atolls erfuhr erst durch Lütke (1828) die notwendige Beachtung. Die von ihm angelegte Karte (s. Abb. 1) entspricht in großen Umrissen dem tatsächlichen Bild. Der nördliche Teil des Atolls ist dagegen nicht richtig erfaßt worden, da Lütke seinen Kurs südlich wählte (vgl. Abb. 1). So kommt es, daß auf seiner Karte der nordwestliche Teil der eigentlichen Hauptinsel als kleines Eiland Fararyk auftritt, an das sich eine große Insel Ifalouk anschließt; in Wirklichkeit bilden beide zusammen die große Insel Feladjik. Dagegen entspricht die Lage der beiden übrigen von ihm genannten Inseln

Abb. 1. Plan von Ifaluk nach Lütke (1828).

[1] Cheyne 1852, S. 144; Meinicke 1888, II. S. 358; Brigham 1900, S. 79; auch von Sievers (1910 II. S. 364) und dem Kolonial-Lexikon (1920 Bd. II, S. 88) angegeben.

[2] Meinicke 1888, II. S. 358; leider gibt M. nicht die Quellen dazu an, so daß seine Angabe nicht nachgeprüft werden konnte. Auch von Sievers (1910, II. S. 364) und dem Kolonial-Lexikon (1920 Bd. II, S. 88) übernommen.

[3] Lutké 1835, II. S. 133. [4] Cheyne 1852, S. 137, 144. [5] Robertson 1876/77, S. 50.

Abb. 2. Plan von Ifaluk nach der japanischen Regierungskarte (1925).

Moay und Ella den tatsächlichen Verhältnissen[1]. Das neueste Kartenbild des Atolls zeigt die Japanese Government's Chart of 1925 Nr. 772 (s. Abb. 2).

Lage und Größe. Nach Cheyne[2] ist der Durchmesser des Riffes, das die Lagune umschließt, etwa zwei Meilen. Den Umfang der Gruppe schätzt er auf 5—6 Meilen einschließlich der Riffe[3]. Er ist damit wesentlich genauer als Meinicke[4], der den Umfang ganz allgemein mit »über 1 Meile« angibt.

Die Längen- und Breitenangaben einzelner Quellen zeigt die folgende Aufstellung:

Jahr	Entdecker und Reisende	nördl. Breite	östl. Länge
1797	Wilson[5]	7° 14′	144° 50′
1828	Lütke[6]	7° 15′ 17″	215° 29′ 8″
	Raper[7]	7° 14′	144° 30′
1844	Cheyne[7]	7° 11′	145° 8′
	Gulick[8]	7° 15′	144° 31′
1888	Meinicke[9]	7° 15′	144° 31′
	Sievers[10]	7° 15′	144° 31′
1920	Kolonial-Lexikon[11]	7° 15′	144° 31′
1925	Japanische Regierungskarte	7° 14′ 19″	144° 25′ 20″ bis 144° 27′ 13″

Die **Horizontalgliederung** von Ifaluk ist die eines niedrigen Korallen-Atolles mit einer Lagune von etwa fünf Meilen Umfang[12] und kreisrunder[13], nach Sievers fast quadratischer Form[14].

Die Zahl der Inseln wurde von Lütke mit vier angegeben, während es tatsächlich nur drei sind: die Hauptinsel Feläd͡jſk, die nach Süden sich anschließende nächstgrößere Falaläp und die kleine Insel Elå. Eine Insel Ifalouk im Inselkranz des Atolls gibt es nicht (s. S. 3) und die von Lütke mit Moay bezeichnete

[1] Lutké 1835, II. S. 133. [2] Cheyne 1852, S. 137. [3] Cheyne 1852, S. 144.
[4] Meinicke 1888, II. S. 358. — Meinicke's Zahlenangaben weichen von den übrigen Quellen stark ab; so gibt er die Entfernung von Oleai mit fünf Meilen an, die neueste Ausgabe des Pacific Islands Pilot (1933, I. S. 502) dagegen mit 30 Meilen! Der Unterschied erklärt sich vielleicht daraus, daß M. mit geographischen Meilen rechnet, die übrigen Quellen dagegen Seemeilen zugrunde gelegt haben.
[5] Wilson 1799, S. 302, ders. 1800, S. 412.
[6] Nach der Karte von Lütke.
[7] Cheyne 1852, S. 137, 145.
[8] Gulick (Ms. S. 59).
[9] Meinicke 1888 II, S. 358.
[10] Sievers 1910, II. S. 364, seine Angaben gehen zweifellos auf Meinicke zurück.
[11] Kolonial-Lexikon 1920, Bd. II, S. 88; auch diese Angabe ist wohl Meinicke entnommen.
[12] Lutké 1835, II. S. 133; Robertson 1876/77, S. 50.
[13] Cheyne 1852, S. 137.
[14] Sievers 1910 II. S. 364.

Insel ist, wie ein Vergleich der Karten Abb. 1 und 2 zeigt, mit Falâláp identisch. Lütke's irrige Auffassung erklärt sich daraus, daß er von der Hauptinsel den nordwestlichen Teil als kleines Eiland abtrennte, was jedoch nicht den tatsächlichen Verhältnissen entspricht (s. S. 3). Trotzdem Cheyne[1] bereits von nur drei Inseln spricht, hat sich Lütke's Angabe über Meinicke bis in die neueste Zeit halten können[2]. Meinicke hat mit Imoai und Flalap nicht zwei, sondern ein und dieselbe Insel bezeichnet.

Die kleine Sandinsel Elâñelap wurde erst durch die Hamburger Südsee-Expedition bekannt; möglicherweise handelt es sich um eine Neubildung in jüngerer Zeit, wie wir sie auch von anderen Atollen kennen[3]. Derartige Sandinseln verschwinden aber auch leicht durch irgendwelche Naturereignisse wieder. So wurde durch den Taifun von 1907 eine kleine Sandinsel Mâje mit der Hauptinsel Feläd͡jſk verschmolzen und bildet jetzt den neuen Dorfteil Sâgo.

Lütke (1828)	Meinicke (1888)	Sarfert (1909)	Pac. Islds. Pilot (1933) Jap. Gov. Chart (1925)
Fararyk	Flarik	Feläd͡jſk	Flarik
Ifalouk	—	—	—
Moay	Imoai	—	—
Ella	Ella	Elâ	Ella
—	Flalap	Falâláp	Flalap
—	—	Elâñelap	—

Das **Riff** ist ein typisches Atollriff[4]; es ladet stark nach Südosten aus (vgl. die Karten 1 u. 2) und soll einen Umfang von fünf Meilen haben[5]. — Im Süden ist eine enge, seichte **Passage**[6] zwischen den Inseln Elâ und Falâláp, eine weitere Passage zwischen Falâláp und Feläd͡jſk ist nach Sarfert 60 Meter breit. An der Südwest-Spitze der Insel Feläd͡jſk sind zwei leicht erreichbare Anlegestellen[7].

Die Inselgruppe ist von **Taifunen** nicht verschont geblieben, im ganzen wurde sie von fünf Taifunen heimgesucht. Früher sollen nur heftiger Wind und Regen das Unwetter ausgemacht haben. Es wurden wohl Bäume ausgerissen, aber es kam kein Mensch dabei ums Leben, es sei denn, daß eine Hungersnot als Folgeerscheinung ausbrach. Schlimm waren die Verwüstungen des Taifuns vom

2: Damm et al. OR21 Woleai

27./28. März 1907[1], bei dem 35 Eingeborene verunglückten (24 von Jôr, 10 von Jiwâñ auf Falâlâp und ein Knabe von Felâdjſk). Nach Aussage der Eingeborenen kam der Wind erst aus NO. und faßte die Inselgruppe an der Breitseite; er brachte noch keine Flutwelle. Als er sich jedoch nach SO. drehte, brauste die Flutwelle über Falâlâp und Felâdjſk einher und riß alles vor sich nieder. Die Verwüstungen waren noch 1909 sichtbar. »Massenhaft starrten die weißen, trockenen Stämme entästeter, starker Bäume aus dem niedrigen Busch in die Höhe und selbst von weitem konnten wir die Palmstämme reihenweise am Boden liegen sehen«, schreibt Hellwig im Expeditionstagebuch[2].

Der Taifun leistete andererseits auch eine Aufbauarbeit; er verschmolz die Sandinsel Mâje mit der Hauptinsel und vergrößerte damit das Siedlungsland (s. S. 6).

Allgemeines über **Klima** und **Temperatur** auf den Karolinen vgl. bei Singer 1899 Globus Bd. 76, S. 41.

Banane	*wîdj*		
Taroarten	*wûlach, bûlach* *wôd, wôt* *flla, flle*		

Flora. Ein reicher Bestand an Kokospalmen und Brotfruchtbäumen erhöht den landschaftlichen Reiz der Gruppe[1]. Nach Angabe des Pacific Islands Pilot 1933 (S. 502) war der Bestand an Kokospalmen nur auf Felâdjfk und Falâlâp bedeutend; auf Elâ gab es dagegen nur wenige.

Fauna. Zunächst schien es, als ob die Insel nichts anderes als Moskiten beherberge. Diese Plage setzte gegen Abend ein und hielt Nacht für Nacht an. Sarferts Junge und Dolmetscher mußten nachtsüber ein qualmendes Feuer unterhalten, um ein Bleiben überhaupt zu ermöglichen. Früher soll es nur wenig Moskiten gegeben haben. Die folgende Wörterliste nennt nur eine kleine Zahl von Landbewohnern, die Tierwelt des Meeres überwiegt naturgemäß.

Siedlungsverhältnisse und Bevölkerungsstatistik. Von den Inseln des Atolls waren lediglich die beiden größeren Felâdjfk und Falâláp bewohnt, dagegen war Elâ seit alters unbesiedelt gewesen[1]. Zahlenmäßig verteilte sich die Bevölkerung folgendermaßen:

Jahr	Quelle	Felâdjfk	Falâláp	Gesamt
1797	Wilson[2]	—	—	etwa 200
1828	Lütke[3]	—	—	etwa 150
1852	Cheyne[4]	—	—	etwa 140
1903/4	Sievers[5]	—	—	281
1909	Hamburger Südsee-Expedition[6]	109	99 (davon 62 im Süd-, 37 im Norddistrikt.)	208
1914	Finsch[7]	—	—	etwa 300
1930	Pacific Islands Pilot[8]	—	—	305

[1] Cheyne 1852, S. 137, 144; Meinicke 1888, Bd. II, S. 358; Thilenius usw. 1927, S. 259.
[2] Wilson, ebenso bei Gulick (Ms. S. 59).
[3] Lutké 1835, Vol. II, S. 326; er glaubte, daß diese Zahl den tatsächlichen Verhältnissen nahe kommt (S. 328). Sein Begleiter von Kittlitz (1858 II. Bd. S. 152) spricht von einer sehr starken Bevölkerung.

III. Demographie.

1. Anthropologisches.

Die Insulaner sind hochgewachsen und von gutem Körperbau[1]. Die Hautfarbe ist hellbraun[2], das Haar schwarz. Bei Kindern sieht man oft sehr braunes, ja fast blondes Haar. Das Kopfhaar wird halblang getragen, jedenfalls sah Sarfert langgewachsenes Haar niemals.

Der Bartwuchs ist spärlich: Backenbart wird nicht getragen, dagegen Kinnbart. Der Schnurrbart wird kurz gehalten und ist ebenfalls nicht häufig.

Krankheiten. Ringwurm ist selten. Dagegen sah Sarfert häufig große vernarbte Wunden, angefaulte Beine u. ä. Es handelt sich um Fälle von Syphilis, die hier im Gegensatz zu anderen Karolineninseln (z. B. Polowat, Satowal) vorkommt[3]. — Nach Eingeborenenaussage wurden früher die Leute sehr alt, jetzt sterben sie bereits in den besten Jahren. Dafür wird unmöglich der Gesundheitszustand allein verantwortlich gemacht werden können, es ist vielmehr anzunehmen, daß der Kulturverfall nicht weniger Schuld an dem frühen Hinsterben der Insulaner hat.

2. Psychologisches.

Die Eingeborenen zeigten sich Sarfert gegenüber freundlich und entgegenkommend. Belustigend wirkte das Verhalten der Frauen, je nachdem ob die Männer zugegen waren oder nicht. Die Frauen waren von Natur sehr lebhaft, doch verhielten sie sich in Gegenwart der Männer stumm, sprachen so gut wie gar nichts. Bei Kaufabschlüssen verständigten sie sich lediglich mit den Augen. Mußten sie lachen, so wendeten sie ihr Gesicht ab. Doch konnten die Augen der Frauen, wenn auch nur verstohlen, ganz herausfordernd glänzen.

Als Sarfert mit den Frauen allein war, erklärten sie ihm unverhohlen, daß sie ihn alle übermäßig liebten. Sie gaben es ihm ganz offen durch Liebkosungen und obszöne Tanzbewegungen zu verstehen; daran beteiligte sich sogar eine weißhaarige alte Frau, die wegen ihres Eifers schallende Heiterkeit erregte. Die Frauen erwarteten, wie sie sagten, nichts weiter als recht viel Tabak[1]; sie versprachen, es auch allen anderen weißen Männern, die späterhin noch Ifaluk besuchen würden, zu sagen, wie viel besser er als alle anderen sei.

Beim Tauschhandel beobachtete Sarfert, daß sie es meist auf einen bestimmten Gegenstand abgesehen hatten, wenn sie ihn nicht bekamen, zogen sie meist ihre Tauschgabe zurück. Dabei forderten sie oft beim kleinsten Gegenstand unverschämte Preise mit der ruhigsten und selbstverständlichsten Miene. Als Sarfert darüber ärgerlich wurde, ließen sie ihm sagen, der weiße Mann hätte doch von den Dingen genug, er könnte sie sich doch alle selbst herstellen, sie dagegen nicht! Dieser Eigennutz fiel auch Lütke und v. Kittlitz auf, die durch Walfänger von dem üblen Ruf dieser Insulaner Kenntnis hatten[2].

Über den Phono-Apparat waren sie sehr erstaunt, lachten darüber, hielten sich aber doch in einiger Entfernung und suchten in den Trichter zu sehen. Sie meinten, es stecke ein Mensch darin!

[1] Tabak war seit jeher eine begehrte Ware (Robertson 1876/77, S. 30).
[2] v. Kittlitz 1858, Bd. II, S. 152; Lutké 1835, II. Bd. S. 133/134.

15

Materielle Kultur.

I. Körperpflege und Tracht. Schmuck und Kleidung.

Körperpflege. Zum Epilieren von Körperhaaren benutzt man ein Paar der weißen *bällich*-Muscheln, die an einer Haarschnur befestigt sind (vgl. Abb. 6 bei Damm und Sarfert 1935, S. 29); dieses »Rasierzeug« wird *gâm* genannt. — Einreiben mit roter Farbe *(lân)* bei Toten s. S. 77.

Körpertracht. Das Kopfhaar wird halblang getragen, naturlanges Haar sah Sarfert nicht! Der Bartwuchs ist spärlich. Backenbart wurde nicht beobachtet, dagegen ist Kinnbart und Schnurrbart üblich, ersterer ist kurz und letzterer wächst nur sehr dünn.

Geschlechtsteile. Beschneidung wird nicht geübt. Künstliche Verlängerung der Schamlippen ist üblich; der Mann zieht die Labia mit der Hand lang. Bei den Frauen werden außerdem die Schamhaare ausgerupft, »weil sie der Mann nicht liebt«.

Tatauierung. Schon die ältere Reiseliteratur bringt mehrfache Hinweise auf die starke Tatauierung der Ifaluk-Leute[1]. Sie war auch noch zu Zeiten der Hamburger Südsee-Expedition durchaus üblich. — Der größte Teil der Insulaner war tatauiert (tatauieren = *mâk)*, jedoch nicht alle! Wer die Tatauierung nicht liebt, läßt sie sich nicht anbringen, ein Zwang dazu besteht also nicht! Die Eingeborenen wußten auch nicht den Grund anzugeben, warum sie diesen Schmuck anlegen; es war für sie eine alte Sitte.

1910 verstanden sich noch zwei Männer auf diese Kunst, ein dritter lebte zur Zeit auf Faraulip; er hatte sich nämlich Faraulip-Leuten, die damals auf Ifaluk

Abb. 3 und 4. Tatauierhammer in Vogelgestalt (Hamburg 18211 und 18201), Länge 38 und 49 cm.

weilten, angeschlossen. — Die Tatauierinstrumente sind der Tatauierkamm *(ralîd)*, ein Holzstab mit einem mehrzackigen Kämmchen aus Vogelknochen,

[1] Robertson 1876/77, S. 50.

und der Tatauierhammer *(wâu)* aus Holz (s. Abb. 3 und 4). Die Tatauierfarbe wird aus dem Harz vom *lâgidj*-Baum gewonnen. Man verbrennt es im Feuer und läßt den Ruß an einen Tontopf, wie man solche von Yap erhandelt, niederschlagen.

Abb. 5a u. b.

Abb. 6.

Abb. 7.

Abb. 8.

Abb. 9.

Abb. 5a und b. Handtatauierung (djôulibôu) einer Frau (nach Skizze Sarfert). — Abb. 6. Armtatauierung eines Mannes (nach Skizze Sarfert). — Abb. 7. Beintatauierung eines Mannes (nach Skizze Sarfert); 1. = gûe, eine Fischart, 2. = halûelaû, Mondsichel, 3. = galimât, Fischhaken. — Abb. 8. Unterleibtatauierung (wuâle) einer Frau (nach Skizze Sarfert). — Abb. 9. Oberschenkeltatauierung (gadjâb) einer Frau (nach Skizze Sarfert).

Dieser Ruß wird dann mit einem Kokosblatt zusammengekratzt. Während der Operationszeit benutzt der Patient eine besondere Sitzmatte *(djôub)*, um die Tatauierung nicht zu zerstören (s. Taf. 2). — Die Muster zeigen die Abb. 5—9. Viele Männer hatten keine vollständige Tatauierung, sondern trugen nur an den Armen und Beinseiten Muster.

Die Tatauierung soll von Mogemog übernommen worden sein. Die Menschheit lernte sie nach Ansicht der Eingeborenen jedoch durch den Himmelsbewohner Lugeiläñ kennen, der selbst tatauiert ist. Von wem dieser die Körperzier erhalten hat, weiß man nicht, man denkt an Äluelöb, den höchsten Himmelsgott. Als sich Lugeiläñ eine Frau suchte, ging er zur Erde herab, bei dieser Gelegenheit sahen die Menschen den fremdartigen Schmuck und lernten die einzelnen Muster kennen.

Schmuckgegenstände. Als Haarschmuck sind Holzkämme *(löuwd)* beliebt;

Abb. 10—18.

Abb. 10—12. Kämme (Hamburg 1886II, 1881II, 5770II), Länge 27, 40 ½, 21 cm. — Abb. 13—18. Ohrschmuck (Hamburg: 13 = 5741II, Länge 4 ½ cm, 14 = 3183II, Länge 7 cm, 15 = 3180II, Länge 4 cm, 16 = 5742II, Länge 3 cm, 17 = 5745II, Länge 2,5 cm, 18 = 3181II, Länge 4,3 cm.

sie bestehen aus einzelnen Stäbchen und sind zusammengepflockt oder zusammengebunden (s. Abb. 10—12). Zu Tänzen werden sie noch mit Federn geschmückt.

Der gewöhnliche Ohrschmuck *(djüerâ)* besteht aus kleinen Kokosringen *(darak)* und aus Conus-Muschelringen *(madj;* He.: *mârče)*. Die Mannigfaltigkeit der Formen und die Anordnung der Ringe zeigen die Abb. 13—18, 25—27. Ein Stück (Abb. 20) zeigt eine Kombination mit dem wertvollen *fdubôbo*-Schmuck (s. S. 20). Die Geschlechter tragen den Ohrschmuck verschieden. Die Männer

haben viele kleine Kokosringe im herunterhängenden Ohrläppchen wie Perlen nebeneinander aufgereiht, die Frauen dagegen größere Kokosringe und weiße Muschelringe kettenartig zusammengehängt, teilweise mit Schildpattringen *(uŏdj)* vermischt, doch kommen diese auch einzeln vor (s. unten). Außerdem gibt es noch seltenere Formen:

1. *maregis* (auch *unuldni)*-Schmuck (s. Abb. 35), der früher an einem Schild-

Abb. 19—27.

Abb. 19—27. Ohrschmuck. 19 = 3743[II], Länge 5.7 cm, 20 = 1921[II], Länge 6.7 cm, 21 = 3183[II], Länge 5 cm, 22 = 3184[II], Länge 3 cm, 23 = 3755[II], Länge 4 und 3.5 cm, 24 = 1928[II], Länge 10 cm, 25 = 3633[II], Länge 8.5 cm, 26 = 1931[II], Länge 14.3 cm, 27 = 3179[II], Länge 6.5 cm.

pattbügel zwei Tridacna-Perlen trug, an deren Stelle man jetzt europäische Glasperlen sieht (Abb. 36).

2. *sardn:* spindelförmiger Schmuck aus abwechselnd angeordneten Kokos- und Muschelringen für Männer (s. Abb. 28—30). Sie haben zumeist noch kleine Kettchen, an denen Spondylus-Scheiben befestigt sind.

3. *legasird* besteht aus weißen Muschel- und schwarzen Kokosnußstäbchen, die auf eine Kokosschnur aufgereiht sind (Abb. 32).

Abb. 28—40.

Abb. 28—40. Ohrschmuck. 28 = 1918II, 1919II, Länge 6,5 cm, 29 = 3178II, Länge 8,5 cm, 30 = 1920II, Länge 5,5 cm, 31 = 1924II, 1925II, Länge 4,5 cm, 32 = 1932II, Länge 3 cm, 33 = 1917II, Länge 4,5 cm, 34 = 5152II, Länge 6 cm, 35 = 1927II, Länge 3,2 cm, 36 = 5751II, Länge 3,5 cm, 37 = 5754II, Länge 2,6 cm, 38 = 5750II, Durchmesser 2,5 cm, 39 = 5753II, Durchmesser 2 cm, 40 = 1929II, 1930II, Länge 6 cm.

2: Damm et al. OR21 Woleai

4. *wódj* ist ein alter, jetzt seltener Männerschmuck aus Schildpatt in Dreieckform (Abb. 33).

5. Der von Polowat bekannte uhrrädchenartige Schildpattschmuck wird von Männern getragen, zeigt aber keineswegs den dort vorkommenden Formenreichtum (Abb. 38—40).

6. *fâu bôbo* (auch *fâu djuerâ)* ist ein dreieckiges Spondylus-Stückchen *(fâu* = Spondylus), das zumeist an einem Kettchen von Muschel- und Kokosscheibchen

Abb. 41—49.

Abb. 41—49. Halsschmuck (Hamburg: 41 = 1894[II], Länge 75 cm, 42 = 1901[II], Länge 116 cm, 43 = 1892[II], Länge 93 cm, 44 = 1891[II], Länge 110 cm, 45 = 1885[II], Länge 73 cm, 46 = 1887[II], Länge 100 cm, 47 = 3813[II], Länge 93 cm, 48 = 3176[II], Länge 78 cm, 49 = 3814[II], Länge 60 cm).

in einem Schildpattring hängt, der ins Ohrläppchen faßt (s. Abb. 19—23). Abb. 21 hat bereits Glasperlen.

7. Abb. 31 ist ein Männerschmuck ohne besonderen Namen; er besteht aus einem kleinen Kettchen von Muschel- und Kokosringen, dessen beide Enden durch eine starke Spondylus-Scheibe zusammengehalten werden.

8. Eine einzigartige Form von Ohrhänger zeigt Abb. 37: an einem Kokosring hängt ein Schildpattstück mit weißen Glasperlen.

Nasenschmuck *(djûeru-wôt)*. Die Nasenscheidewand wird mit einer Fischgräte durchbohrt. In der Öffnung trägt man wohlriechende Blumen, vor allem die Blüte des *warôn*.

Der Halsschmuck ist sehr vielseitig. Die Halsketten, selten zweireihig *(mdlamar*, auch *mdremar)* bestehen aus Hibiscus-Schnüren:

1. mit Kokosringen in abwechselnder Anordnung = *biligôu* (Abb. 41); ähnliche Stücke sind im Museum zu Berlin (VI 27142a, 27140).
2. mit großen sorgfältig nebeneinander gereihten Kokosringen = *dajebâ* (Abb. 42).
3. aus kleineren Kokosringen = *dârak* (Abb. 43)
4. aus Muschelringen = *bâl*, in der Regel aber mit Kokosringen vermischt (Abb. 44—49); vielfach sind die Ränder der kleinen Ringe oder Scheibchen nicht glatt, sondern zugeschärft (Abb. 48). Diese Ketten werden auch als Hüftschnur getragen. Diese geschmackvollen Ketten werden auf Aurepik, Sorol und Fais hergestellt und sind sehr kostbar. So hatte ein Ifaluk-Mann eine solche Kette auf Aurepik gegen eine Holzkeule eingekauft.
5. aus Fischzähnen = *niligâ* (Abb. 50)
6. aus Schildpattscheibchen (Abb. 51)
7. aus Kokosperlen mit daran hängenden Schildpatt-Fischhaken =

Abb. 50—54.

Abb. 50—54. Halsschmuck (Hamburg 1902[II], 1888[II], 1906[II], 1903[II], 1904[II]; Länge 60, 67, 90 74, 68 cm).

kabiligâ: die Abb. 52 zeigt an beiden Enden eine spindelartige Verzierung aus Muschel- und Kokosnußscheibchen

8. aus kleinen weißen Muschel- und schwarzen Kokosnußscheibchen mit dazwischen gereihten roten Spondylus-Scheiben = *fâu mdlamar*

(Abb. 53.54). Dieser Schmuck war äußerst wertvoll, das Material dazu mußte erst von Aurepik gekauft werden (s. Handel), die weitere Verarbeitung erfolgte auf Ifaluk (s. Technik). Als Sarfert auf der Insel

Abb. 55—65.

Abb. 55. Schildpattring (Hamburg 1933[II], Durchmesser 12 cm). — Abb. 56—58. Schildpattarmringe (Hamburg 1910[II], 3794[II], 1912[II], Breite 3,3 1, 2, 4 cm). — Abb. 59. Armring aus Kokosnuß (Hamburg 1916[II], Breite 1 cm). — Abb. 60. Tanzschmuck (Hamburg 1907[II], Länge 33 ½ cm). — Abb. 61—65. Hüftschmuck (Hamburg 1897[II], 1898[II], 3174[II], 1896[II], 1937[II]; Länge 100, 110, 125, 115, 67 cm).

weilte, hatte der König verboten, solchen Schmuck zu verkaufen. Als Grund erfuhr Sarfert von ihm, daß dieser Schmuck dem Gott Yanelap gehöre. Er ist eigentlich Staatseigentum und muß für die Tributfahrten nach Yap hergegeben werden. Diese Ketten erhält der »König von Yap« ausgehändigt.

Als Anhänger sieht man nicht selten breite Schildpattringe (Abb. 55), *bordâ* genannt. Sie sollen nach Sarfert aber auch als Armschmuck getragen und dann *lârelâk* genannt worden sein.

Der gebräuchlichste Armschmuck sind die gerillten, hohen Schildpattringe (Abb. 56—58), seltener dagegen sind solche aus Kokosnuß (Abb. 59). Beide werden nach dem verarbeiteten Material *wódj* bzw. *dárak* genannt. Die Verwendung als Ohrring ist üblich. Einen besonderen Tanzschmuck aus Haarschnur mit weißen *sále*-Muscheln (Abb. 60), beim *wódau*-Tanz getragen, nennen sie *garálibóu*.

Als Hüftschmuck gibt es:

1. *gídi:* Gürtel aus weißen Muschel- und schwarzen Kokosscheiben, die auch als Halsketten getragen werden (s. oben)
2. *dáredar:* mehrreihige Gürtel aus kleinen Muschelringen *(bál)* und Kokosscheibchen *(dárak)*, deren besonderes Merkmal sog. »Stege« aus *mádl*-Muschel sind (Abb. 61—64). Es ist ein Frauenschmuck. Eine Sonderform zeigt Abb. 65 insofern, als sich statt der genannten Stege zwei Spondylusperlen und eine Glasperle finden
3. *dedár:* Hüftschnur aus Frauenhaar[1] wie auf Polowat.

Kleidung. Beide Geschlechter tragen gewebte Lendenmatten *(bálebal)* aus Bananen- und Hibiscusfaser[2]. Sie sind größtenteils mit schwarzen Längsstreifen *(garíl)* gemustert, zwischen denen mitunter noch rote Streifen *(garíl ligodjál)* laufen. Alle Matten tragen Fransen *(maderál)*. Besonders geschätzt sind die Lendenmatten mit kunstvoll gemusterten schwarzen Querstreifen *(dáb)*[3], die eine Fülle verschiedenster Einzelmuster *(gaidgi dawól)* zeigen (vgl. Abb. 66—85 und die Taf. 2).

Abb. 66 = *gadjúch* oder *nilibáro* (= Haizähne)

Die Mädchen tragen in ihrer Jugendzeit (s. S. 77) einen Schurz *(siwisł)* aus Blattstreifen — sie können von verschiedenen Bäumen stammen — der aus einem Vorder- und einem Hinterschurz besteht und unter den *gldi*-Gürtel geklemmt wird.

Hut *(bâlân)* aus zusammengenähten Pandanus-Blattstreifen s. Abb. 86.

Abb. 86. Hut (Hamburg 1832[II], Höhe 28 cm).

97

II. Die Nahrungsquellen und ihre Ausnutzung.

1. Landbau.

Die Auswahl an Nährpflanzen und Fruchtbäumen ist nur klein; es gibt Taro in drei Arten *(wûlak, wôd, flle)*, Bananen *(wîdj)*, Kokospalmen *(lû)*, Brotfruchtbäume *(mâi)*. Zuckerrohr *(wôu)* und Kürbis *(galawâš)* wurden von Weißen eingeführt. Bemerkenswert sind die Angaben bei v. Kittlitz, daß die Insulaner, mit denen die Expedition im Frühjahr und Herbst zusammenkam, stets unter großem Nahrungsmangel litten; das fanden sie auf Ifaluk ebenso wie auf Aurepik und Faraulip. Es handelt sich dabei um regelmäßig wiederkehrende Verknappung von Nahrung (auch Fischen), die man dann durch Brotfruchtkonserven auszugleichen versucht[1].

Der Anbau des Taro ist Sache der Frauen, die Männer helfen nur selten und ungern dabei. Die Frauen pflanzen diese Knollenfrucht in den schon in alter Zeit angelegten Gruben *(bôalû)* an und bedienen sich dazu eines Grabstockes *(gôt)*[2], der nicht selten beiderseitig zugeschärft ist (Abb. 87); vermutlich werden auch die als Stichwaffen angegebenen Stücke (Abb. 165—168) als Grabstöcke verwendet worden sein. Zur Düngung *(wâli)* dienen Blätter. — In und außerhalb der Gruben pflanzen die Frauen auch Bananen an.

Die Pflege der Kokospalmen und Brotfruchtbäume obliegt den Männern. — Die Oberaufsicht über alle Landarbeiten hat der Oberhäuptling.

Abb. 87. Grabstock (Hamburg 1786 II, Länge 99 1/2 cm).

2. Fischfang.

Es werden folgende Fischarten gefangen: *môs, jalôñ, debâr, baligâli, ëtâm, igeliwôdj, mâl, mogutîm, gamâdjûgid, râli, balijalañâb, mâñar* (fliegender Fisch), ferner Hai und Schildkröte.

[1] v. Kittlitz 1858, Bd. II, S. 149.
[2] Vgl. dazu Krämer, Der Taro und die Naßkultur (Petermanns Mitteilungen 1928, Bd. 74, S. 165ff.).

Abb. 88—98.

Abb. 88—90. Angelhaken aus Schildpatt (Hamburg 1938II, 1939II, 5834II, Länge 6, 4, 3 cm). — Abb. 91 bis 96. Zusammengesetzte Angelhaken (Hamburg 5818II, 5833II, 1951II, 1953II, 5828II, 5827II; Länge 7, 8 ½, 6, 5, 4, 2 cm). — Abb. 97. Angelvorrichtung für fliegende Fische (nach Skizze Sarfert); Abb. 98. Angelhaken dazu (Hamburg 1945II, Größe 3 cm).

Es gibt folgende Fangarten:

I. Angelfang:

a) *gawódj:* Fischhaken aus Schildpatt (Abb. 88—90), sie werden zum Fang des *mós, jalón, debdr* außerhalb des Riffes benutzt.

b) *bd:* zusammengesetzte Fischhaken, sie bestehen aus einem Muschelblänker verschiedener Art (aus weißer *tawdl* (Abb. 92), violetter *bajók* (Abb. 95), schwarzer Meleagrina (Abb. 93), gelblicher *mädl* (Abb. 94), perlmutterglänzender *jdrr* (Abb. 91), schwarzer *wdl* (Abb. 96), dazu kommen noch Schildpatthaken, Fregattvogelfederstutz und die notwendigen Bindungen. Von diesen *bd*-Haken gibt es zwei Arten:

1. solche mit der Perlmutterseite nach innen, zum Fang des *balijalandb*,

2. solche mit der Perlmutterseite nach außen zum Fang des *baligdli* und *üdm*.

c) *gölimdi* oder *djd:* Haken aus Kokosnußschale zum Fang des fliegenden Fisches *(mdñar);* er wird an einer leeren, verstöpselten Kokosnuß festgebunden (Abb. 97—98)[1]. Diese Angelvorrichtung wird zu mehreren ins Wasser geworfen, am Zucken und zeitweiligen Verschwinden der Nüsse erkennt der Fischer, daß ein Fisch angebissen hat. Das Boot fährt den Angeln nach und holt sie samt Schwimmer ein, sobald ein Fisch angebissen hat.

d) *gordñi:* großer Holzhaken zum Fang des Haies, außerdem wird der Hai noch mit der Schlinge gefangen (s. S. 32).

Die Angelhaken werden in Büchsen aus Kokosnuß (Abb. 107, 108) oder Bambus (Abb. 128—130) aufbewahrt; Deckel und Boden sind aus Holz.

II. Zur Netzfischerei benutzt man verschiedene Netzarten, die alle aus *kalekdl*, einer Art Kokosschnur gearbeitet und mit *wugawdg*-Knoten (Abb. 99) verknüpft sind.

Abb. 99. Netzknoten (nach Skizze Sarfert).

a) *djöu*-Netze mit zusammengesetztem Bügel; die beiden Teile führen folgende Namen: unterer Bügelteil mit Griff = *ddb*, oberer Bügelteil = *kadúl*[2]. Von diesem Netz kommen zweierlei Formen vor:

1. mit gebro[illegible]nem Rahmen (wie auf Sorol) zum Fang des fliegenden Fisches außerhalb des Riffes nachts bei Fackelschein. Wie es zu dieser nächtlichen Fangart kam, berichtet folgende Erzählung: Früher war der Fang des fliegenden Fisches zur Nachtzeit unbekannt. Eines Tages weilte nun Módj in Oleai und fuhr bei Sonnenuntergang nach Fanalur. Da er dort zwei Tage bleiben wollte, nahm er seine Schlafmatte mit. Die Rückreise trat er bei Sonnenuntergang an, es war sehr heftige See und seine Schlafmatte wurde über Bord gespült. Dieses

[1] Sammlung Leipzig Mi. 3870—72. [2] Museum Hamburg 1791. II. 1792 II.

Unglück bemerkte er jedoch erst, als er in Oleai ankam. Er bestimmte einige Männer, sich mit Kokosfackeln auszurüsten und nach seiner Matte zu suchen. Als das Boot auf hoher See war, kamen auf einmal die fliegenden Fische und sprangen ins Boot. Schließlich fand man die Matte und fuhr mit den vielen Fischen nach Hause. So kam der nächtliche Fang mit den Fackeln auf.

2. mit geradem Rahmen zum Fang des *igeliwddj*, *mdl* u. a. (s. Taf. 3 Abb. 1).

b) */du* ist ein großes Rahmennetz mit rundem Holzrahmen und ohne Stiel[1]. Darin fängt man den *mogudim* und *gamädjägid* innerhalb und außerhalb des Riffes.

c) *ädln* ist das übliche Netz mit Schwimmern *(uabds)* und Senkern *(fdllm)*. Mit ihm werden bei Niedrigwasser innerhalb des Riffes verschiedene Fischarten gefangen.

d) *äg* ist ein großes, fast quadratisches Netz, das nach einer Seite zusammengelegt und an einer der damit entstandenen Schmalseiten geschlossen wird. Es

Abb. 100.

Abb. 101.

Abb. 100. Ug-Netz, auseinandergelegt (nach Skizze Sarfert). — Abb. 101. Ug-Netz zusammengelegt (nach Skizze Sarfert).

wird mit einem Strick an einem Stein festgemacht und die Öffnung wird durch zwei *ädln*-Netze verlängert, die an den beiden Vertikalkanten des *äg* befestigt und so ausgelegt werden, daß sie sich nach See zu trichterartig verbreitern (Abb. 100-101).

[1] Museum Hamburg 1793 II.

III. Zum Fischen mit Speeren wird der glatte *mesafár-* oder *gobâ* genannte Speer benutzt, der bis drei Meter lang ist. Diese Fangart wird in Verbindung mit *ädlä*-Netzen angewendet. Mehrere Boote bilden mit diesen Netzen einen Kreis; die zusammengetriebenen Fische werden dann von den Booten aus gespeert.

IV. Fischfang mit Reusen heißt *é*.

a) *ulubdm:* Reuse wie Abb. 2 auf Taf. 3[1]. Die Bezeichnungen für die enzelne Teile sind:

Eingang = *mdd*	Seitenwand = *bîtg*
Boden = *badjebddj*	Dach über dem Eingang = *rdgu*
Hinterwand = *gdbä*	erhöhter spitzer Dachteil = *dé*.

Diese Reusen werden auf den sandigen Meeresboden gelegt und um sie herum Sand gehäuft, so daß sie nicht fortschwimmen können. Als Köder wird *ldgum* (= Krebs) hineingetan.

b) *dlimarowudli* ist die gleiche Reuse wie auf Sorol; sie dient zum Fang des *rdli*. Die Bezeichnungen für die einzelnen Reusenteile sind dieselben wie bei a). —

Abb. 102. Schlinge für den Haifang; b = Knoten (nach Skizze Sarfert).

Diese Reuse wird seitlich an ein Schwimmholz gebunden und durch eine Leine an das Boot, das nur langsame Fahrt machen darf, geknüpft.

V. Drachenfischerei[2] ist bekannt. Der Drachen *(djöligodjduk)* ist aus Brotfruchtblättern verfertigt, an der Schnur hängt ein Köder *(kaüldlu)*[3] aus

[1] Ebenso im Museum Leipzig: Mi 3874.
[2] Vgl. darüber Plischke, Der Fischdrachen. Leipzig 1922 (Veröff. des Städt. Museums für Völkerkunde Leipzig Heft 6). [3] Museum Leipzig Mi 3873.

Spinnweben, an anderer Stelle bezeichnet ihn Sarfert als Hautgewebe des Haifisches.

VI. Den Fang mit der Schlinge *(nfw)* wendet man verschiedentlich an und bedient sich dabei auch verschiedener Schlingenformen.

a) Den *ldwud*, den Köderfisch für den Hai, fängt man mit einer Schlinge wie auf Polowat (vgl. Abb. 98 bei Sarfert und Damm 1929, Bd. I).

b) Den Hai fängt man mit einer Vorrichtung, wie sie Abb. 102 zeigt. Der mittlere senkrechte Strick *(karigdu)* hat den Köder, einen Fisch verschiedener Art; Fig. a zeigt den Verlauf des Zuges, Fig. b genau die Schlinge, in der er verläuft.

c) Zum Fang der Schildkröten nimmt man ein einfaches Seil, bildet eine Schlinge und schiebt sie dem Tier über Kopf und Vorderfüße. So kann man die Beute leichter ins Boot ziehen; an Land wird sie einfach auf den Rücken gelegt.

VII. Fischfang mit Gift war ursprünglich unbekannt, später erhielt man jedoch Kenntnis davon durch Yap-Leute. Ein Name für die Art des Fanges fehlt.

3. Jagd.

Die Jagd spielt nur eine untergeordnete Rolle, da größeres Wild fehlt. Gefangen werden Vögel und zwar

a) mit dem *djöu*-Netz (s. Fischfang)

b) mit Schlingen *(nfw)* wie sie beim Fischfang verwendet werden, nur sind sie hier größer.

Ratten stellt man mit röhrenförmigen Fallen *(uligdu* oder *ddwis)* nach, die geflochten und nicht aus Bambus sind, wie dies zumeist für die Karolinen üblich ist.

Als Haustiere fand Sarfert lediglich Hühner *(mällâk)* vor; Schweine *(sflo)* fehlten. Von Hunden *(geldgu)* sah er nur zwei und von den wenigen Katzen *(gadâ)* waren alle bis auf eine beim letzten Taifun umgekommen.

4. Nahrungszubereitung und Geräte.

Das Essen wird von den Frauen zubereitet und im Erdofen *(fellâu)* — von der in Mikronesien und Polynesien allgemein üblichen Form — gedünstet; seltener ist das Rösten von Speisen über dem offenen Feuer.

Nach Angabe der Eingeborenen brachte Mödj die Kenntnis der Feuererzeugung aus Yap mit. In alter Zeit verstand man kein Feuer *(jâf; bulchâf* =

die Flamme) herzustellen; man aß alles, auch das Fleisch, roh. Heute kennt man zwei Arten der Feuererzeugung:

a) den Feuerbohrer *(lidk)*, *sfwe lidk* = liegender Stab, *lafe lidk* = stehender und rotierender Stab.

b) den Feuerhobel oder Feuerpflug *(lafilt)*, *sfwe lafilt* = liegender Stab, *lafimafilt* = pflügender Stab.

Die Feuersäge ist unbekannt.

Zum Anfachen des Feuers bedient man sich der in den Karolinen allgemein üblichen, geflochtenen Fächer *(sdbo)*.

feldä = Heim, Feuerplatz, *wurah* = Rauch, *marodj* = Asche, *fafi* = Brennholz.

Fleischspeisen liefert den Eingeborenen das Meer; von den auf S. 9 genannten Fischen werden lediglich nicht gegessen der Hai, weil er Menschen frißt, *lödj*, weil er giftig ist, *fä*, *schusfä*, *mafädjlid*, weil es so Sitte ist.

Das Pflanzenreich liefert auf den Tisch verschiedene Taroarten, *kodomälu*, *djdwä*, *gö*, *waiwäi*, *gawäddj*, *gli*, *mägumog*, *gäle*, *läle*, *fäliob*, *jalomä*, Zuckerrohr und Kürbis, ferner die Früchte von Kokospalmen, Brotfruchtbäumen, Pandanus und Bananen. Die Früchte der Kokospalme werden je nach ihrem Reifestadium verschieden bezeichnet:

lä mesö = Nuß mit ganz harter Schale und noch weichem, leicht lösbarem Fleisch; die Bruchfläche der Schale ist schwarz.

sdu = *lä mesö* mit weißer Bruchfläche der Schale, also eine noch sehr junge Nuß,

löu = *lä mesö* mit bereits hartem Fleisch,

lö = *lä mesö* ohne Fleisch.

Die grüne Hülle der Nuß nennt man *bäjenne lä*, die braune Hülle dagegen *bäjenne löu*. Beim Zerschlagen der Nüsse rufen die Eingeborenen *soslöue*, auf Faraulip *soslöue*, auf Yap und Sorol *soroäe*.

Ein wichtiges Genußmittel ist der Palmwein *(hdri)*. Er wird in der gleichen Weise wie auf Polowat gewonnen[1]. Und zwar wird er früh, mittags und am späten Nachmittag zubereitet. Gekochter Palmwein *(lili)* wird mit Wasser vermischt getrunken.

Dem Genuß von Tabak *(dämäko)* wird gern gefröhnt.

An Haushaltungsgeräten kennt man:

a) Schaber, Kratzer und Reiber.

1. *falöuefä*[2]: ein Stück Koralle als Reiber für Taro usw.

2. *wägan*: Kokosnußkratzer von zentral-karolinischer Form.

3. Schildkrotaxt *(jäüfli)* wie auf den Mortlock-Inseln (Taun)[3] zum Schälen des Taro; schon seit langer Zeit nicht mehr im Gebrauch.

[1] Vgl. Damm und Sarfert 1935, S. 69 f.
[2] Sarfert und Damm 1929 Abb. 162.
[3] Desgleichen im Museum Leipzig Mi 3860.

2: Damm et al. OR21 Woleai

b) Stampfer *(ſâûlîðõu)*[1] aus Korallenkalk zum Zerstampfen des Taro (Abb. 104, 105).

c) Eßlöffel *(idlt)* aus Kokosnußschale (Abb. 103).

d) Muschelmesser *(sâr)*.

e) Kokosnußgefäße.

1. *giwudri*: kleine Kokosnüsse mit Holzdeckel, teilweise auch mit Holzboden

103. 104. 105. 106. 107. 108.

Abb. 103—108.

Abb. 103. Löffel aus Kokosnußschale (Hamburg 5800[II], Länge 12 cm). — Abb. 104, 105. Stampfer (Hamburg 1853[II], 1977[II], Länge 10 ½, 20 cm). — Abb. 106—108. Büchsen aus Kokosnußschale (Hamburg 3760[II], 1876[II], 1875[II], Höhe 7 ½, 10 ½ 11 cm).

(Abb. 106—108); sie dienen zur Aufbewahrung kleiner Gegenstände und werden in die *wddâû*-Tasche (s. unten) gesteckt.

2. *bâle:* große Kokosnüsse für Palmwein (Abb. 109).

f) Holzgefäße aus Brotfrucht- und *lâgidj*-Holz.

1. *kabânebau*[2]: große Holzschachteln mit Deckel (Abb. 110) und kurzen Griffen; sie dienen zur Aufbewahrung von Webearbeiten.

2. *wâru:* große, viereckige Holzkästen für Lendenschurze usw.; diese gibt es jetzt nicht mehr.

3. *sâb*[3]: Holzschachteln mit Deckel, aber ohne Henkel von verschiedener Form und Größe (Abb. 111—118). Eigenartig ist die Form (Abb. 118) mit Schiebedeckel. In diesen Behältern werden die Fischhaken aufbewahrt.

4. *döbi lemâlâ:* runde Holzschüsseln ohne Füße.

5. *döbi lemâbu:* Holzschüsseln mit Nasen und ohne Füße. (Abb. 119, 120); bei dieser Art ist die Breite größer als die Länge.

6. *döbi lemâulu:* schwere, längliche Holzschüssel (Abb. 121).

7. *döbi lemowallel:* runde Holzschüsseln mit oder ohne Füße, aber mit Henkel *(lenlligâgal*; s. Abb. 123, 124).

Farbschüsseln (Hamburg 1838[II], 1819[II], Länge 36 bzw. 40 cm).

2. *dägu:* hoher Korb aus zwei Kokosblattfiedern (Taf. 1 unten rechts) zum Essenholen.

3. *gabädi:* großer, runder Korb (Taf. 1 mittlere Reihe rechts) aus Kokosblattfiedern mit Schnurhenkel zum Aufbewahren von Bananen-, Pandanusfäden und anderem zur Weberei benötigtem Material.

4. *wŏddū:* längliche Tragtasche aus zwei Kokosblattfiedern, es ist die eigentliche Handtasche der Männer und Frauen (Taf. 1 unten links).

5. *djâk:* Transporttasche für Holz, Kokoshüllen und dergleichen aus zwei halben zusammengeflochtenen Kokoswedeln. Sie gleicht einer aufgeklappten *gllidaūdaū*-Matte; die Enden des Zopfes sind zu einem Henkel vereinigt (s. Abb. 127).

Abb. 127. Transporttasche (nach Skizze Sarfert).

6. *wŏddū mdū:* viereckige Tragtasche aus Pandanusblattstreifen. Sarfert konnte nur ein Belegstück erlangen (Taf. 1 mittlere Reihe links).

7. *gdgadj:* eine seltene Form von Tragtaschen (Taf. 2 Abb. 1, 3, 4) aus Pandanusblattstreifen. Kleinere Exemplare wurden in der *wŏddū*-Tasche getragen. Das Stück (Abb. 3) fällt durch seinen Zopf auf, der quer über die Mitte der Tasche geht.

8. *sigildla:* hohes, schmales Täschchen mit aufgesetztem Deckel aus Pandanus-

128. 128a. 129. 130. 131.

Abb. 128—131.

blattstreifen. Sarfert konnte nur dieses Belegstück ausfindig machen (Taf. 2 Abb. 2).

h) Netztaschen aus Kokosfaserstricken.

1. *djôudjodle:* große netzartige Taschen zum Zubinden, eng- oder weitmaschig (Taf. 3 Abb. 4.5) für Lendenschurze u. a.

2: Damm et al. OR21 Woleai

2. *djóulimar:* bootförmige Netztaschen zum Holen der Brotfrüchte, die in diesen Taschen auch gewässert werden.

3. *wóddáu:* Tragtasche aus engem Schnurgeflecht (Taf. 3 Abb. 3).

i) Bambusbüchsen[1] *(giwudri)* für kleinere Dinge (Tabak u. a.) haben hölzernen Boden und Deckel, vielfach sind sie mit Ritzmustern verziert (Abb. 128—130). Ein Kuriosum ist die Doppelbüchse, deren mittleres Verbindungsstück aus Holz ist (Abb. 131).

[1] Desgleichen im Museum Leipzig Mi 3867.

37

III. Technik.

1. Verarbeitung von Holz, Kokosnüssen, Muscheln, Schildpatt und Stein.

a) **Holztechnik.** Ihre Erzeugnisse sind Holzschüsseln verschiedenster Art, Deckelkästen mannigfacher Form, Kokosnußkratzer, Kanu- und Hausmaterial. Werkzeuge dazu waren:

1. Muscheläxte *(delakl)* verschiedener Größe (Abb. 132). Andere Äxte waren unbekannt. Die einzelnen Teile heißen ***mimuflm*** = Stiel, *fófo* = Kokosschnürung, *dfla* = Tridacna-Klinge.

2. Bohrer; es gab zwei Arten: den einfachen Stabbohrer *(wálewul*, He.: *wura-*

132.

133.

134.

Abb. 132—134.

Abb. 132. Muschelaxt (Hamburg 184/11, Länge 40 cm, Länge der Klinge 22 cm). — Abb. 133, 134. Bohrer (Hamburg 576/11, 184/11, Länge 29 und 70 cm).

wura) mit Haizahnspitze, jetzt mit Eisenspitze (Abb. 133) und den Drillbohrer *(malubóub)* mit Schwungstab und einer Spitze aus Pteroceras-Muschel (Abb. 134).

3. Zirkel sind unbekannt gewesen.

b) Kokostechnik. Ihre Erzeugnisse sind Schalen, Büchsen, Löffel, vor allem aber Schmuckperlen. Die Herstellung dieser Perlen ist der auf Luangiua ähnlich.[1] Rohe Stücke, die auf eine Blattrippe aufgezogen sind und nun geschliffen werden sollen, zeigt Abb. 135.

c) Muscheltechnik. Ihre Erzeugnisse sind Axtklingen aus Tridacna, Angelhaken aus Perlmuttermuschel, Muschelperlen, Schmuckplatten aus Conus-

Abb. 135–137.

Abb. 135. Kette mit Kokosscheibchen in Arbeit (Hamburg 5802[II], Länge 90 cm). — Abb. 136. Geschliffener Boden der Conus-Schnecke (Hamburg 3187[II], Durchmesser 7 cm). — Abb. 137. Werdegang eines Fischhakens aus Schildpatt (Hamburg 1935[II]–1937[II]; ⅓ natürl. Größe).

Muscheln (ein ungeschliffener Conus-Boden s. Abb. 136), Farbfläschchen aus Seepocken. Von besonderer Wichtigkeit ist die Anfertigung der roten Spondylus-Perlen; es ist Männerarbeit. Diese kostbare Muschel wird von Aurepik gegen Lendenschurze, Messer und dergleichen gekauft, wo sie innerhalb des Riffes gefischt wird. Die Männer zerschlagen die Muscheln in kleine Stücke, reiben sie auf einem Stein ab und durchbohren sie mit dem *wälewul* (s. oben). Auch die große Perlmuttermuschel *(sälo)* wurde in dieser Weise bearbeitet.

d) Schildpattechnik. Ihre Erzeugnisse sind Schmuckringe und Angelhaken. — Das Rückenschild der Schildkröte wird mit einem brennenden Stock losgelöst. Aus dem Schildpatt wird dann mit dem einfachen Bohrer der Haken ausgeschnitten und mit der rauhen Rückenhaut des Rochens geglättet und zurechtgefeilt. Verschiedene Entstehungsstadien zeigt Abb. 137.

e) Steintechnik. Ihre Erzeugnisse sind Stampfer.

2. Seilerei.

a) Kokosschnüre. Die Kokosnußhülle *(bējēnne)* wird drei Monate lang in Wasserlöcher *(liwēligor)* gelegt und gewässert. Falls die Faser noch nicht gut ist,

[1] Vgl. Sarfert und Damm 1929 S. 134.

wird sie mit einem Holzschlägel *(gemân*, Abb. 138) geschlagen und dann in der Sonne ausgebreitet und getrocknet. Es gibt drei Arten von Schnüren:

1. *kâlekal:* die Fasern werden auf dem Knie zu einer einfachen Schnur zusammengedreht. Sie findet beim Kanu- und Hausbau Verwendung.

2. *balteddl:* dicke Schnüre zum Einwickeln der Toten und zum Binden der Kanus. Sie werden mit einem Stock *(maûl)* gedreht.

3. *dâli:* starke Seile für Segel, Anker und dergleichen; sie werden von drei Männern mit einem besonderen Apparat in der auf Polowat üblich gewesenen Art[1] angefertigt.

Abb. 138. Holzschlägel (Hamburg 1871II, Lge. 25½ cm).

b) Hibiscus-Schnüre werden zu Fischleinen *(jâu)* verwendet. — Die Hibiscus *(gilifôu)*-Stämmchen werden vier Tage lang gewässert, um dann genau wie auf Luangiua[2] weiter behandelt zu werden. Aus der Bastfaser werden die Schnüre *(bllebil)* mit dem *wâli*-Stock[3] oder mit der Hand auf dem Knie gedreht.

c) Jalomâ-Schnur wird aus dem gleichnamigen Baum gewonnen. Sie dient zum Anbinden des Fischhakens an den Blänker; das betreffende Schnurstück heißt *dalâligô.*

3. Färberei.

An Farben werden verwendet:

1. schwarze Farbe. a) Zum Färben der Webfäden gewinnt man sie aus schwarzen Steinen, die im Schwemmholz antreiben. Von ihnen schabt man mit einem Messer etwas in eine mit Wasser gefüllte Holzschüssel, dann gibt man den Saft einer Kokoshülle durch Auswringen derselben hinzu und in der gleichen Weise den Saft eines Blattes vom *glli*-Baum. — b) Die zum Bemalen der Boote notwendige große Menge schwarzer Farbe gewinnt man dadurch, daß man Kokoshüllen *(bêjênne)* anbrennt, dann ins Wasser taucht und damit wie mit einem Pinsel über das Holz streicht. — c) Die Tatauierfarbe gewinnt man aus dem Harz des *lâgidj*-Baumes.

2. rote Farbe; auch hiervon benutzt man zwei Sorten: a) Zum Färben von Webfäden; man schabt die Rinde des *lâle*-Baumes, vermengt sie mit fein zerkleinertem und gebranntem Korallenkalk

Abb. 139. Schnurtasche für Farbe (Hamburg 1878II, Höhe 14 cm).

139.

[1] Vgl. Damm und Sarfert 1935 S. 75 und Abb. 182.
[2] Vgl. Sarfert und Damm 1929 S. 158 unter III.
[3] Vgl. Sarfert und Damm 1929 Abb. 174.

Abb. 140. Farbtopf aus einer Meerpocke (Hamburg 58:611, Höhe 8 cm).

und drückt alles in eine Holzschüssel mit Wasser (roter Faden = *ligodjd)*. — b) Zum Bemalen der Boote; man rührt rote Yap-Erde, die in kleinen Schnurtaschen (Abb. 139) oder Töpfen aus Meerpocken (Abb. 140) aufbewahrt wird, in Wasser an und gibt den Saft eines angeschnittenen Brotfruchtbaumes hinzu. Als Farbtopf benutzt man eine *döbimdb*-Holzschale (Abb. 125, 126) in Vogelform. — c) Zur Körperbemalung s. S. 77.

4. Flechterei.

Das Flechten ist Frauenarbeit. Angefertigt werden:

1. Pandanusmatten *(gfagi)*, es gibt vier verschiedene Arten:

a) *fdüldbtik* ist die Schlafmatte aus einfachem Geflecht[1] von etwa ein Zentimeter breiten Streifen, die aber auch schmäler ausfallen können.

b) *fölu* ist eine seltene Form der Schlafmatte; sie liegt doppelt und hat in der Mitte einen etwa 5 Zentimeter breiten Streifen, durch den anscheinend die zwei Seiten der Matte zusammengeflochten sind. Eine derartige Matte konnte Sarfert nicht erlangen.

c) *fdb* ist eine einfache Matte für kleine Kinder.

d) *djöub* ist eine Sitzmatte der Männer, die diese für die Zeit der Tatauierung benutzen (Taf. 2 Abb. 6). Diese Matten gibt es gegenwärtig nicht mehr.

Das Material für die Matten liefert der Pandanusbaum *(fdr)*. Die grünen Blätter werden von den Frauen über dem Feuer etwas getrocknet und dann ins Freie gelegt. Man will sie damit dem Regen aussetzen, doch vermeidet man es, daß die Blätter mehr als dreimal vom Regen durchweicht werden. Sie werden von nun ab nur der Sonne ausgesetzt und sind nach vier bis fünf Tagen für die weitere Bearbeitung fertig. Die Blätter werden darauf mit einem Stück Kokosschale geglättet, indem man sie einfach durch die Hand zieht, und dann in schmale Streifen zerrissen.

2. Kokosmatten *(gfli)* sind alles Liegematten; es gibt folgende Arten:

a) *dädrau* ist eine Matte aus zwei Kokoswedeln, in deren Mitte die Rippe läuft. Das erklärt sich daraus, daß die Wedel bei der Verarbeitung so aufeinander gelegt wurden, daß die Spitze des einen mit dem Stil des andern zusammen zu liegen kam.

b) *dädölo* wie a), jedoch sind die Fiederblätter an den zur Rippe parallel verlaufenden Längsseiten zu einem »Zopf« verflochten.

[1] Vgl. Abb. 226 bei Sarfert und Damm 1929.

c) *gli dâdâ* ist eine Matte aus zwei halben Kokoswedeln, die so zusammengeflochten sind, daß die Rippen den einen Mattenrand und der »Zopf« den andern bildet.

d) *gli ebâba* ist eine Matte wie c), nur daß sie aus einem ganzen Wedel geflochten ist.

Die Kokosmatten sind alle im sogenannten Kreuzgeflecht[1] gearbeitet.

3. Korbflechterei ist Frauenarbeit. Das Material dazu liefern Kokos- und Pandanusblätter.

a) Körbe aus Kokosblättern sind *gâto, dûgu, gabâdâ, wôdâu, djâk* (s. S. 36).

b) Körbe aus Pandanusstreifen sind *gâgadj, sigilâla, wôdâu mân* (s. S. 37).

5. Weberei.

Die Gewebe werden aus feiner Bananenfaser *(wâis)* oder derberer Hibiscusfaser *(gulifâo)* gearbeitet; teilweise sind sie schwarz oder rot gefärbt (s. Färberei). In die Schmalseiten werden mit einer Nadel *(djudâb* s. Abb. 141) aus Holz kunstvolle schwarze Borten eingeflochten (Muster davon s. unter Kleidung).

Der Webstuhl *(dâl)* wird an zwei Stangen *(wisâl)*, die unten etwas in die Erde gerammt und oben an der Hauswand bzw. dem Dach festgebunden sind, befestigt ähnlich wie z. B. auf Kusae.[2] An dem eingekerbten Brett wird der Gürtel für die Weberin befestigt. Unten liegt ein Brett *(fâwa)*, das als Unterlage dient. Die einzelnen Teile des Webstuhles heißen (vgl. die Abb. 142).

141. 142.

Abb. 141. Nadel (Hamburg 1863[II], Länge 26 cm). — Abb. 142. Webstuhl (Hamburg 1861[II], Länge 107 cm).

IV. Handel und Schiffahrt.

1. Handel.

In alter Zeit waren die Handelsbeziehungen lebhafter als 1909; an die Handelstüchtigkeit der Polowatleute kamen die Ifaluk-Eingeborenen jedoch nicht heran. Zur Zeit der Hamburger Südsee-Expedition kauften sie nur noch die begehrten Spondylusmuscheln auf Aurepik und Truk ein und bezahlten dafür Lendenschurze und Messer[1]. Auch die Tributfahrten für Yaṅelap haben nicht mehr die Bedeutung wie ehedem.

2. Nautische Kenntnisse.

Die Seefahrtskenntnisse wurden bereits 1909 nicht mehr gepflegt. So verstand von allen auf der Insel anwesenden Männern keiner mehr, nach Sternbildern zu segeln. Ein einziger hatte noch eine schwache Vorstellung von den Kursen nach Oleai, Faraulip und Lamutrik, damit war aber sein Wissen erschöpft.
Nach Angabe der Insulaner weilten damals noch zwei erfahrene Ifaluk-Kapitäne auf Yap und Ngulu (s. S. 78). Die Aufnahme einer Segelkarte war unter diesen Umständen unmöglich.

Die Grundlage alles nautischen Wissens bildet die Kenntnis des Sternhimmels. An Sternen *(fâš)* bzw. Sternbildern kannte man:

môl = Leier
ugeltk = Orion
mâriger = Plejaden
âl = Aldebaran
mâlöb = Adler
erüôl = drei Könige (im Orion)
dumâl = Jungfrau
djerewôl = Rabe
lûp
wolewôle

gûi = Fisch, ein riesiges Sternbild, das über den ganzen Himmel geht, zu ihm gehören *ugeltk* und *erüôl*

[1] Ob die »großen, weißen Muscheln", die der Expedition Lütke von den Eingeborenen zum Kauf angeboten wurden, für diese Inseln ein typischer Handelsartikel waren, ist aus den Quellen nicht zu ersehen (v. Kittlitz 1858, II. Bd. S. 152).

lâke *dagalíp*
dôbi *mölârü*
ídj *mâdjîk*
mâlu *âlakimêi* = Milchstraße

mâlâm = Mond, man kannte den »Mann im Monde« = Liganôs; über ihn ist nichts Näheres bekannt. — Die Sonne hatte keinerlei Bedeutung, eine Eingeborenenbezeichnung hat Sarfert nicht angegeben. Über die Mondphasen s. S. 7.

Eine Vorstellung über die Sterne hatte man nicht; von den Yap-Leuten hatte man gehört, daß es Steine seien! Sternschnuppen = *jajâle fâš*.

Abb. 143. Strichrose (nach Skizze Sarfert).

Das Bild der Strichrose zeigt Abb. 143, der Horizont wurde rechteckig aufgefaßt: Punkt 1 ist der Aufgangspunkt eines Sternes in der Nähe des Polarsternes, sein Untergangspunkt liegt in Nr. 15, die Linie 1—15 stellt also die Bahn dieses Sternbildes dar. Das Gleiche gilt auch für die übrigen, oben genannten Sterne bzw. Sternbilder, wie es im Band Polowat ausführlich dargelegt wurde[1].

Die Abbildungen 144, 145 zeigen die Stellung von Sternbildern am nächtlichen Himmel zu verschiedenen Zeiten: beim Untergang des Altair und wenn Altair im Zenith steht.

An Himmelsrichtungen kennt man nicht:

Norden = *jlſan*	Nordwesten = *ilodolſſan*
Süden = *jôr*	Nordosten = *kodolſſan*
Westen = *ilodôu*	Südwesten = *ilodolijôr*
Osten = *jôdou*	Südosten = *kodolijôr*.

Die Windrichtungen sind:

Wind aus	Sternpunkt der Strichrose	
N	1,2 und 28	*janlſan* oder *iſanelôb*
NNO	3 und 4	*iſâneläds*
NO	5 und 6	*jodoiſân*

48

Abb. 144. Sternhimmel, wenn Altair im Zenith steht (nach Skizze Sarfert).

Abb. 145. Sternhimmel, wenn Altair untergeht (nach Skizze Sarfert).

Wind aus	Sternpunkt der Strichrose	
O	7 bis 9	*jagódu* oder *jodunuwél*
SO	10 und 11	*koduár*
SSO	12 und 13	*joruläds*
S	14 bis 16	*jañejór*
SSW	17 und 18	*jorüläd jál*
SW	19 und 20	*lodoár*
W	21 bis 23	*janilódo* oder *lodoilób*
NW	24 und 25	*lodoi∫añ*
NNW	26 und 27	*i∫añeläd jál*

Die oben erwähnten, heute noch bekannten Segelkurse sind:

Ifaluk—Oleai = 9—23 der Strichrose
Ifaluk—Faraulip = 1—15 der Strichrose
Ifaluk—Elato—Lamutrik = 21—7 der Strichrose (Lamutrik ist von Elato aus sichtbar!).

In alter Zeit hatte man nach Sarfert auch Verbindung mit Satoan, das durch Ifaluk-Leute, die über Lamutrik kamen, besiedelt wurde.

Von Verschlagungen ist nur eine bekannt geworden; so beobachtete die Hamburger Südsee-Expedition auf Elato die Ankunft eines Ifaluk-Bootes, das von Faraulip auf der Rückfahrt in die Heimat nach Olimarau verschlagen wurde[1]. — Antreibungen von Yap s. S. 59, 83.

3. Kanu

Die Zahl der Boote muß in alter Zeit sehr groß gewesen sein, denn Lütke wurde seinerzeit von 25 Eingeborenen-Booten mit etwa hundert Mann Besatzung begrüßt[2]. — Die Ifaluk-Boote sind wie die von Polowat und anderen zentralkarolinischen Inseln Plankenboote *(ud)* aus Brotfruchtholz und tragen außer dem Ausleger den bekannten Gabelschwanzaufsatz. An Kanu-Arten hatte man:

a) *wäliwuél:* großes Segelboot für Fernfahrten. Sie führten Eigennamen und zwar wurden sie nach dem Namen des Platzes benannt, auf dem der Brotfruchtbaum stand, aus dem das Boot gezimmert war. Die Verteilung der großen Boote auf die einzelnen Sippen ist folgende gewesen:

[1] Thilenius usw. 1927, S. 261.
[2] Lütké 1835, II. Bd. S. 133.

Die Sippe	besaß vor dem Taifun	1909
Lawuâû	8	3 (Ein Boot fuhr gerade nach Faraulip.)
Sawôlôb	1	1
Ledjôurôu	5	1
Gajudôlîn	3	0
Sâgo	4	0
Jiwân	6	3 (Davon eins in Faraulip und eins in Lamutrik.)
Jôr	14	1

b) *manuwîi:* kleineres Segelboot zum Fischfang,
c) *kafadûlé:* Ruderboot für höchstens 4—5 Mann,
d) *djaŧemâti:* Ruderboot für 1—2 Mann,
e) *foſât:* Floß.

Außerdem hatten die Eingeborenen noch Spielboote verschiedener Größe, kleinere hießen *galâl*, größere *ligêli*. — Eine für Ifaluk seltene Bootsform zeigt das Modell Abb. 146. Derartige Boote, *gâuat* genannt, mit halbmondförmigem Aufsatz[1] sind auf Satoan häufig, ein solches gab es vor dem letzten Taifun (1907) auch auf Ifaluk.

Die Bootsteile und Bootsgeräte führen folgende Namen (vgl. dazu die Abb. 147):

Boot *ud*
Bootinneres (Nr. 12 der Abb.) *ni wud*
Kiel (Nr. 15) *djuligâb*
aufsteigender Kiel an den beiden Enden (Nr. 16) *ſaddâwu*
Bug- und Heckaufsatz (Nr. 17) *mâd*
Brücke (Nr. 19) *ebâb*
? (Nr. 20) *jôlak*
Geländer an der Brücke (Nr. 21) *laŋolûwe*
Brückenträger *djuŧa*
Querholz (in Abb. unsichtbar), unter das die *djuŧa* laufen, ist an den zwei mittleren Bänken fest gebunden *waliwôl*
Bootsrand (Nr. 18) *mešâb*
Auslegerseite *balle dâm*
auslegerfreie Bootseite *igedâ*

[1] Vgl. daru Damm und Sarfert 1935, S. 220 Anm. 2.

Außenseite des Bootes:
rote vertiefte Seitenstücke (Nr. 14) *lanî fâri*
erhabene schwarze Fläche und ebensolches Band (Nr. 13) *fâri*
Auslegerbalken (Nr. 1) *dâm*
Auslegerstöcke (Nr. 10) *gîo*
Auslegergabeln *dm*

Ostaß (Abb. 148,149) *gömād*

Über die Art der Takelage, die Befestigung des Mastes *(hakā)* und Segels *(āe)* unterrichtet die Abb. 150.

Die Kochvorrichtung *(felaw galigdh)* für Fernfahrten besteht in einem viereckigen (50 cm im Geviert), erhöhten Rahmen mit dünnen Stäbchen als Rost. Die Vorrichtung (Abb. 151) steht auf Beinen über dem *beldf* (Nr. 8 der Abb. 147).

148.

149.

Abb. 148, 149. Ostäxer (Hamburg 1873[II], 1935[II], Länge 33 und 37 cm).

In dem oben genannten viereckigen Rahmen wird eine kleine Kokosblattmatte *(ilafe)* gelegt und darauf Sand geschüttet. Hier werden die Fische geröstet.

Als Wassergefäße dienen Kokosnüsse. Das Regenwasser fängt man auf hoher See in einem umgestülpten Hut auf, dessen Spitze in einer Kokosflasche steckt.

Die **Kenntnis des Bootbaues** führen die Eingeborenen auf mythischen Ursprung zurück. Sēlān baute das erste Boot; er brachte diese Kunst den Menschen auf der Insel Mōdj, die vier Tagereisen südlich von Truk liegt[1], bei. Wer den Ifaluk-Leuten den Kanubau lehrte, ist nicht bekannt. Die ersten Besiedler von Ifaluk, es war ein Mann namens Mōdj[2] mit seiner Frau (s. Kapitel Innere Geschichte), kamen auf einem Floß (!) in ihre neue Heimat. Doch sollen bereits kurz darauf und zwar noch unter Mōdj Boote gebaut worden sein.

Die Boote werden aus dem Holz des Brotfruchtbaumes angefertigt. Zunächst werden Bäume mit Muschelbeilen gefällt, dabei helfen dem Handwerker Brüder und Söhne mit. Handelt es sich um den Bau eines großen Reisebootes, so muß erst der König seine Erlaubnis dazu geben. An diese Arbeit sind keine besonderen Tapus geknüpft. Die Stämme werden dann mit Hilfe anderer Männer ins Kanuhaus geschleift. Das Ziehen geschieht unter Gesang taktmäßig, um ein plötzliches und kräftiges Anziehen zu erreichen. Der Vorsänger ruft:

Nēbāla sā hā!
Alle: *Sā hā!*
Vorsänger: *Ālāba!*
Alle: *Lāa lāba!*

[1] Es wird damit die Insel Mōdj im Atoll Satoan gemeint sein.
[2] Die Namensgleichheit mit der Insel ist auffällig.

Abb. 150. Skizze der Takelage (nach Sarfert). 1 = djéru, 2 = janaläf, 3 = danigär, 4 = ill, 5 = ulöl.

Abb. 151. Skizze vom Rost für Kochvorrichtung (Längsschnitt und Querschnitt; nach Sarfert).

Vorsänger:	*Momâ sâ!*
Alle:	*Dôa lâ!*
Vorsänger:	*Sfurâ sâdo!*
Alle:	*Lâmò!*
Einer:	*Mddâelawâ!*
Alle:	*Uâ ŧwa!*
Vorsänger:	*Dâ wâa!*
	Môga â!
	Ádilôu!
	Bigirla!
	Mâlâlau!
	Úwudâ!
	Djâ ŧjo — mâ dâla!
	Ído jêwo — lâlâlo!
	Lilli wêrâ — rêba lâe!
	Rêŧwa — usw.!

Die einzelnen Bootplanken — ihre Bezeichnungen sind in der Abb. 152 angegeben — werden sauber aneinander gefügt und durch eine straffe Bindung aneinander gehalten. Die Fugen der Planken werden durch Schnitten *(bâle)* der

Abb. 152. Plankenteile eines Bootes (nach Skizze Sarfert): 1 = bôn, 2 = bâbe, 3 = bâdj.

Kokosfaserhülle *(bêjêwwe)*, die mit dem Harz der Brotfrucht *(wllis)* vermischt werden, abgedichtet und die Bohrlöcher für die Bindung durch ein Gemisch von verbrannter Kokosfaser und gebranntem, zerstoßenem Korallenstein *(fâu)* verschmiert. Die Bootplanken werden in der auf Abb. 147 angegebenen Weise mit roter Yap-Erde und schwarzer Farbe, die man aus gebrannter und in Salzwasser eingerührter Kokoshülle gewinnt, bemalt.

Während des Kanubaues wird viermal *bâiewâi*-Zauber gemacht und zwar stets, wenn die bekannten Linien gezogen werden. An diesen Tagen sind dann alle Arbeiter *tapu*. Auch bei Fertigstellung des Bootes wird nochmals ein Zauber vorgenommen und eine Probefahrt veranstaltet, dazu wird ein bestimmtes Lied

angestimmt. — Bei diesen eben erwähnten Zauberhandlungen werden Kokosnüsse neben das Boot gelegt und zwar sind es stets zwei oder ein vielfaches davon, jedoch nie drei oder fünf oder sieben. Die Größe dieses Opfers richtet sich ganz nach der Anzahl der vorhandenen Nüsse.

Die Werkzeuge sind die für die Holzbearbeitung üblichen (s. S. 39). — Über Kanuhäuser s. S. 58.

Zum **Wetterzauber** benutzte man die gleichen mit Rochenstacheln bewehrten Figurendolche wie auf Polowat[1]; sie wurden hier *udliwol* genannt und galten als sog. *udiwudu* des Gottes *Ālālubi* (Abb. 153, 154).

153. 154.

56

V. Haus und Dorf.

Der Sage nach stammt der Hausbau von Módj (s. S. 52), der ihn von Yap mitbrachte. Wer ihn den dortigen Einwohnern lehrte, ist unbekannt.

I. Die Hausanlage.

Die häufigen Taifune haben sehr oft die Häuser zerstört; bei dem letzten stürzten alle außer vier Wohnhäusern (3 in Feladjik, 1 in Falalap) ein. Doch wurden diese nicht wieder mit derselben Sorgfalt wie ehedem errichtet. Es gab früher nicht nur mehr Häuser als heute, sondern sie waren auch größer, von sechseckigem Grundriß und bestanden aus Holzplanken. Dagegen verstand man es noch nicht, die Häuser ohne Stützpfeiler an den vier Ecken zu bauen. Der verstorbene Bruder eines noch 1909 lebenden, alten Mannes sah dies zum erstenmal in Aurepik am Haus eines Yap-Mannes namens Gamelái, der auch auf dieser fremden Insel starb. Seit dieser Zeit baut man auf Ifaluk die Häuser ohne *fúle*. Steinunterbauten, wie sie z. B. auf Aurepik üblich sind, haben die Eingeborenen angeblich nie errichtet, wenn sie auch dafür den gleichen Namen wie auf dieser Insel, nämlich *bái*, gebrauchen.

Hausarten. a) *fm* = Wohnhaus der Familie. Es ist das gewöhnliche Viereckhaus mit vorgeneigtem Giebeldach und ohne besonderen Steinunterbau. Die alte Form zeigt Abb. 155. — In dem von vier Balken gebildeten Fußbodenrahmen (*gaeái*, Nr. 1 der Abb. 155) sind Seitenpfosten (*djáne*, Nr. 2) eingelassen, zwischen denen die Wände (*dibáb*, Nr. 4) stehen. Auf den 4 Eck-*djáne* ruhen die Deckenbalken[1] (*gabilibín*, Nr. 6), die ihrerseits die Fußpfetten (*falidibáb*, Nr. 1 der Abb. 156) tragen, in denen die *djáne* eingelassen sind. Binder und Leer-Gespärre (Nr. 2), beide *wóu* genannt, sind etwas in den Fußpfetten eingelassen. Die Firstpfette heißt wie auf Polowat und Satowal *fún*[2]. Die übrigen Pfetten (Nr. 3) führen verschiedene Bezeichnungen, je nachdem sie am Leer-Gespärre

[1] Vgl. dazu die schematischen Zeichnungen der Dachkonstruktion bei Sommer, Baukonstruktive Betrachtungen über Hausbauten in NW-Central-Celebes (Zeitschrift für Ethnologie 1918 Bd. 60) S. 374/75.

[2] Damm und Sarfert 1935 S. 120.

57

155.

156.

157.

Abb. 155. Wohnhaus (nach Skizze Sarfert). — Abb. 156. Dachkonstruktion (nach Skizze Sarfert); die Ziffern sind im Text erläutert. — Abb. 157. Bootshaus (nach Skizze Sarfert).

oder an den Sparren festgebunden sind; im erstgenannten Fall heißen sie *kabandk*, im andern *kabllal*, beide wechseln miteinander ab. Die Sparren (Nr. 4) heißen *gato*.

Die Giebelwände sind besonders gestaltet. Auf dem *gabilibin*, unter den ein *aūdānilālo*-Balken zwischen die Seitenpfosten gespannt ist, steht ein Mittelpfosten *(wadābdo*[1]). Einer Giebelwand ist ein vorspringendes Dach *(dābdu)* angebaut (Abb. 155 Nr. 3); sein Leer-Gesparre heißt *kabandk di bin*, seine Sparren *gato di bin*. Dieses *dābdu* überschattet eine Veranda *(bin)*, die in Höhe der Fußpfetten liegt und vorn ein Topfbrett *(fane di bin)* hat. Nicht immer ist dafür ein besonderer Tragbau vorhanden wie etwa auf Hok[2]; die Eckpfosten heißen *sūle*, die beiden darauf liegenden Längsbalken *daltelōb*, der Querbalken dagegen *aūdānilālo*. Angeblich ist dieser Vorbau entstanden, um die vor der Tür hockenden Hausbewohner vor Regen zu schützen. Die Matten zur Dachdeckung heißen *jāso*.

b) *malūm* = Kochhaus. Auf jedes Wohnhaus bzw. auf jede Familiengruppe kommt ein Kochhaus. Nach dem Grund gefragt, warum besondere Küchen benutzt werden, erklärten die Eingeborenen, »weil das große Haus zum Schlafen und Arbeiten (Weben usw.) bestimmt ist«. Der wahre Grund ist wohl der, weil das Zubereiten der Speisen und das Kochen Licht und Raum verlangt.

c) *fanūud* = Kanuhaus. Es hat die gleiche äußere Form wie das Wohnhaus, doch ist es an allen Seiten offen und hat größere Ausmaße (s. Abb. 157). Die Kanuhäuser werden von den einzelnen Dorfteilen errichtet und gehören ihnen auch als eigen. Vor dem letzten großen Taifun war die Zahl die Kanuhäuser wesentlich größer als 1909. Die Verteilung der Kanuhäuser war folgende:

der Dorfteil:	hatte Kanuhäuser 1909	hatte Kanuhäuser vor dem Taifun
Gajudōllin	1	1
Ledjōurōu	1	1
Lawuaū	1	1
Jiwān	1	3
Jōr.....	1	3
Sāgo	0	1
Sawōlōb	0	1

Sāgo und Sawōlōb besitzen jetzt keine Kanuhäuser mehr, der erstere bringt seine Boote bei Gajudōllin und Ledjōurōu unter, der letztere bei Lawuaū. — Über die Zahl der großen Seeboote s. unter Schiffahrt.

[1] Vgl. Damm u. Sarfert 1935 in Abb. 216 Nr. 5.
[2] Vgl. Abb. 223 in Damm und Sarfert 1935.

d) *fendɔ́p* = Haus für die erwachsenen, unverheirateten Männer; es wurde von den Eingeborenen als »house belong king« bezeichnet. Diese Häuser sind öffentliche Gebäude gewesen. Für gewöhnlich war den Frauen der Zutritt verboten. Nur wenn der König alle Inselbewohner zu sprechen wünschte, um Anordnungen zu treffen oder um Recht zu sprechen, kamen auch Frauen und Kinder mit ihren männlichen Angehörigen hier zusammen.

Vor alter Zeit gab es keine derartigen Häuser. Das erste *fendɔ́p* baute ein nach Ifaluk verschlagener Yap-Mann namens Fágil, der unter der Regierung Dibódân ankam. Nach diesem Muster baute man noch drei weitere *fendɔ́p*. Diese waren nach Yap-Art auf einem Steinunterbau im Wasser errichtet und mit dem Ufer durch einen Steinsteg verbunden. Zwei von ihnen waren auf der Hauptinsel (eins in Ledjóuróu und eins in Lawuaû) und zwei auf Falalap (eins im Süd- und eins im Norddistrikt); die übrigen Dorfteile hatten kein *fendɔ́p*, sie mußten sich mit Kanuhäusern begnügen. Der Taifun zerstörte sie bis auf eins in Lawuaû, das den Namen Kadalû führt und Sarfert während seines Besuches als Unterkunft diente. Es war 21 m lang, 5½ m breit und 5 m hoch.

Diese Häuser wurden von allen Männern des betreffenden Dorfteiles errichtet. Die Beendigung der Arbeit wurde immer durch einen Tanz festlich begangen. —

Abb. 158. Grundriß des Männerhauses (nach Skizze Sarfert); 1 = djulón, 2 = šûle lifâ ligóurôm, 3 = góurôm, 4 = šûle fan, 5 = šûle liwâlibfâ.

Den Grundriß des einzigen noch vorhandenen Männerhauses zeigt Abb. 158. Charakteristisch für diese Bauten waren einmal die großen seitlichen Stützpfeiler *(šûlefan)* aus großen Steinen und die an einem Mittelpfeiler angebrachte Plattform, von der der König zum Volk sprach. Die Namen für die übrigen Pfeiler sind in der Abbildung angegeben.

e) *imelibêlu* = Bluthütte für schwangere und menstruierende Frauen. Seit dem letzten Taifun gibt es deren keine mehr. Die Frauen bleiben in einem kleinen Haus, wie es deren als Nebenwohnhäuser noch manche gibt (vgl. Dorfplan).

f) *imostlo* = Schweinestall. Derartige Ställe sind nur dem Namen nach bekannt.

g) *imelimâluk* = Hühnerstall gibt es nicht, die Tiere laufen frei umher.

Zum **Inventar** eines Wohnhauses gehören außer den üblichen Wirtschaftsgeräten (S. 33) und Waffen (S. 72) noch

a) *gogódj:* Kopfunterlage aus einer ungemusterten Lendenmatte,

b) *ulâl:* Kopfstütze aus Holz,

c) *ujelijâb:* Kopfstütze aus ganz weichem Schwemmholz.

2. Die Dorfanlage.

Dorf und Insel sind für die Eingeborenen sprachlich das gleiche, sie nennen beide *fdlü*. Bewohnt sind nur Feläd͡jſk und Falâlâp und zwar beide an der Nordseite. Die Gehöfte liegen verstreut längs der Küste. Jedes Haus hat ein Wasserloch *(ganfralu)*.

Alles Land ist in Grundstücke *(bugoddl)* aufgeteilt, die besondere Namen führen, der auch auf das gegebenenfalls darauf errichtete Haus übergeht.

Abb. 159. Dorfanlage auf Feladjſk (nach Skizze Sarfert).

a) Das Dorf auf der Hauptinsel Feläd͡jſk gliedert sich in folgende Distrikte: (s. Abb. 159)

1. Ságo mit den Hütten 1—4
2. Gajudôllin 5—13
3. Ledjóurôu 14—21
4. Sawôlöb 22—27
5. Lawuâû 28—43.

Die Distrikte 1—3 werden unter dem Namen Feläd͡jſk zusammengefaßt, die beiden übrigen 4 und 5 als Lawuâû.— Der älteste Teil dieser Siedlung ist Lawuâû, von wo aus die übrigen begründet wurden. Dieser älteste Teil diente auch dem König der Inselgruppe, namens Daore-

2: Damm et al. 0821 Woleai

ligâr und seinem Unterhäuptling Sairû als Wohnsitz (vgl. dazu S. 65 und Abschnitt Häuptling). Vor »langer, langer Zeit« soll auch Sâgo einen Häuptling gehabt haben, doch starb dessen Familie aus.

Die Namen der Grundstücke mit ihren Häusern und Bewohnern gibt die folgende Aufstellung:

Nummer im Plan	Auf dem Grundstück:	befindet sich das Haus:	seine Bewohner sind:
1.	Gadeuâli	Gadeuâli	1. das Ehepaar Walidjû und Ilolumâu (♀) mit ihrem dreijährigen Sohn Galigêilâu; 2. das Ehepaar Wolimâle und Lâdarfejâû (♀) mit ihrem Töchterchen.
2.	Wolipfe	Wolipfe	unbewohnt.
3.	Kadofalû	Kadofalû	das Ehepaar Wolobâliwô und Damelâlk (♀) mit ihrem Sohn Ålofaliməl.
	Malegulôb	—	—
	Bêifo	—	—
	Djawulôr	—	—
7.	Felâiâd	Felâiâd	unbewohnt.
	Adêmâlâk	—	—
9.	Gajudôlfn	Gajudôlfn	kleines Kanuhaus.
10.	Gaduejô	Gaduejô	großes Kanuhaus.
11.	Ludôiidôi	Ludôiidôi	1. das Ehepaar Jâlomâlâ und Lisâulidjim (♀) mit ihrer achtjährigen Tochter Ledâuolôn; 2. das Ehepaar Baloelimâr und Limaledfb (♀) mit ihrem sechsjährigen Sohn Garigelimân.
12.	Bagolimâ	Bagolimâ	1. das Ehepaar Daloêlâu und Ligâuwumâli (♀) mit ihrem einjährigen Darewoleâlo und ihrem dreijährigen Madjaleâlo; 2. der Witwer Dâiwês mit seiner erwachsenen Tochter Lisarôdâi, derem Mann Mûl und ihrem dreijährigen Knaben Ilogimâl.

Nummer im Plan	Auf dem Grundstück:	befindet sich das Haus:	seine Bewohner sind:
13.	Ludōiidōli	Ludōiidōli	unbewohnt.
	Nimāko	—	—
15.	Mājfwān	Mājfwān	1. das Ehepaar Arowōl und Ledāūjfli (♀).
			2. das Ehepaar Roñolimār und Lefañomāle mit ihrem fünfjährigen Sohn Sagojroñ und ihrer dreijährigen Ledāūlibēs;
			3. das Ehepaar Biemāle und Ledāūlibā (♀);
			4. das Ehepaar Sagoilfs und Lebadibā (♀) und ihrem siebenjährigen Jalowāliwul;
			5. die Frau Ledaluejōlu.
16.	Fanūña	Fanūña	großes Kanuhaus.
17.	Gamējōl	Gamējōl	das Ehepaar Sagoliāl und Lefagoráte (♀) mit ihrem vierjährigen Āneidfli und der zweijährigen Ledāūlidfli.
18.	Falūgumēi	Falūgumēi	1. der Witwer Fagolodfu mit seinem vierjährigen Sohn Dāūmāk;
			2. das Ehepaar Ailfdj und Ilemāūlo (♀);
			3. die Frau Ledaigomār.
	Falūmēigor	—	—
	Läbagō	—	—
21.	Gabidjāñ	Gabidjāñ	unbewohnt.
22.	Madōl	Madōl	1. das Ehepaar Jalowūr und Lāūgimedāū (♀) mit ihren beiden Töchtern Ladoligār (5 Jahre) und Lāūudjiālo (2 Jahre);
			2. Das Ehepaar Ā'inuā und Legāūdjemāl (♀) mit ihrem vierjährigen Sohn Darofelimōli u. der zweijährigen Tochter Lāūnimāle;

Nummer im Plan	Auf dem Grundstück:	befindet sich das Haus:	seine Bewohner sind:
			3. die Witwe Läšagowå mit ihrem zehnjährigen Säugalimåle und der achtjährigen Lägäisojålo.
	Gabelådj	—	—
24.	Jaŭliwåń	Jaŭliwåń	das Ehepaar Ädjäimåle und Lädaluwälůk (♀) mit ihrem Säugling.
25.	Olifål	Olifål	1. das Ehepaar Djälóń und Lägaŭämål (♀) mit ihren Söhnen Fagolfal (10 Jahre) und Malåiwůk (5 Jahre); 2. das Ehepaar Lfriligák und Läfarabůcho (♀) mit ihrem dreijährigen Sohn Garigéidjå.
26.	Imogidigft	Imogidigft	unbewohnt.
	Galinelő	—	—
	Falebańák	—	—
29.	Falánik	Falánik	das Ehepaar Rólimåle und Ilimälifägi (♀).
30.	Lenó	Lenó	das Ehepaar Duwäliól und Iläbuńumåle (♀) mit ihrem sechsjährigen Sohn Garigeliólu und ihrer zweijährigen Tochter Gareśäi.
31.	Gadalů	Gadalů	Kanuhaus, in dem Sarfert wohnte
32.	Ueïdjóu	Ueïdjóu	1. das Ehepaar Maloiló und Lägamadjfk (♀) mit ihren Söhnen Maloligár (5 Jahre) und Dolowå (2 Jahre); 2. das Ehepaar Gebaguimåle und Lemadjfe (♀) mit dem dreijährigen Jålig; 3. die Frau Djäuodfu.
	Fádalu	Fádalu	Männerhaus.
33.	Rolóń	Rolóń	Kanuhaus.
34.	Falifolů	Falifolů	1. das Ehepaar Sairů und Ledalumåle (♀) mit ihren Söhnen

Nummer im Plan	Auf dem Grundstück	befindet sich das Haus	seine Einwohner sind:
			Fagōlōb (5 Jahre) und Jedjemāu (3 Jahre); 2. das Ehepaar Jalulimāle und Lägädiwolōñ (♀) mit ihrem siebenjährigen Sohn Jāufāgo; 3. das Ehepaar Wädjägänibā und Lemāumale (♀).
	Falipē	—	—
36.	Wolipfe	Wolipfe	das Ehepaar Mäludjā und Lebiliwōle (♀) mit ihren Töchtern Arigēllaū (7 Jahre), Lawāuwule (5 Jahre) und Lāūdjimāli (3 Jahre).
37.	Bāurōli	Bāurōli	1. Garemāiōli mit seiner Frau und seinem erwachsenen Sohn Fagojēi. 2. die Witwe Sagōlo, ihr Mann wurde im Boot verschlagen.
38.	Warigfl	Warigfl	unbewohntes Haus am Ende der Insel.
	Waligōli	—	—
40.	Medadjáli	Medadjáli	1. das Ehepaar Mälujudjōu (♀) und Daoreligār, der König der Insel; 2. das Ehepaar Jalolidāl und Lawāūdje (♀) mit ihrem dreijährigen Sohn Mälalial; 3. das Ehepaar Dolomāl und Lāūdaūliāk (♀) mit ihrer sechsjährigen Tochter Dawebūg und ihrem dreijährigen Sohn Sāire.
41.	Gabaligōl	Gabaligōl	das Ehepaar Marōliwā und Lisagogāl (♀) mit ihrer fünfjährigen Tochter Ledaūliwūg.
	Faligūl	—	—
	Lugulinōr	—	—
	Abidjóli	—	—

Nummer im Plan	Auf dem Grundstück:	befindet sich das Haus:	seine Einwohner sind:
	Uluâs	—	—
	Luguliwalifôu	—	—
	Lugusibôk	—	—
	Luguligabidjâñ	—	—
	Ilôut	—	—
	Oliäfâle	—	—
	Faliäligorôu	—	—
	Luguludôidôii	—	—
	Lugulifelâiâd	—	—
	Mäanâs		—
	Luguliwâñ	—	—
	Lugulumalagulôb	—	—
	Wolifôul	—	—
	Lugulilêimak	—	—
	Dawoât	—	—
	Gerimâl	—	—
	Dawogâb	—	am Ende der Insel
	Läsâgo	—	—
	Lañôli Galañâb	—	—
	Bigelimâli	—	—

b) Das Dorf auf der Insel Falâlâp zerfällt in die beiden Distrikte Jôr und Jiwâñ, d. h. also in einen Süd- und Nordteil. Diese Siedlung untersteht dem Daoreligâr, der ursprünglich im Dorfteil Jiwâñ wohnte und erst später ins Haus seiner Frau übersiedelte. Läßt man die Sage gelten, so siedelte sich der erste Häuptling dieser Inselgruppe, der Yap-Mann Mödj, in Jiwâñ an.

Die Namen der Grundstücke mit ihren Häusern und Bewohnern gibt die nachfolgende Liste:

Abb. 160. Dorfanlage auf Falalap (nach Skizze Sarfert).

Abb. 160.

Nummer im Plan	Auf dem Grundstück:	befindet sich das Haus:	seine Bewohner sind:
	a) im Süd-Distrikt (Jór)		
1.	Galiŋáũál	Galiŋáũál	a) die Frau Aŋédjók b) die Frau Lewarodjáŋ [ihr Mann ist in Lamutrik] mit ihrer dreijährigen Tochter Lädfumár.
	Gaũáŋ	—	—
	Falapí	—	—
4.	Falipó	Falipó	der Mann war in Faraulip, seine Frau Lawuáidjou, ihre Kinder: Dilibuá, ein Knabe von 3 Jahren, Mawuáilídj, ein solcher von 5 Jahren.
	Gadéolán	Gadéolán	unbewohnt.
6.	Gauluilá	Gauluilá	unbewohnt.
7.	Faligiligáu	Faligiligáu	die Witwe Laraŋuwuá und ihr zehnjähriger Sohn Idawuéór.
8.	Walegajúru	Walegajúru	a) die Frau Jáũuwél mit ihren zwei Söhnen Fagir von 10 und Débal von 1 Jahr und ihrer Tochter Lewallfer von 3 Jahren. b) die Frau Darabuá.
	Urolám	—	—
10.	Falidjóli	Falidjóli	der Mann Farelimál und die Frau Laraliwuól mit ihren beiden Knaben Álúdáu von 4 und Maleffl von 2 Jahren und einem kleinen Mädchen.
11.	Walidjádj	Walidjádj	die Witwe Lerarámár mit einer erwachsenen Tochter Lefaráide, deren Mann in Lamutrik ist; zu diesem Ehepaar gehört ein fünfjähriger Knabe Olobaidík und Säugling.
12.	Galiŋawís	Galinawís	die Frau Daolimár mit ihrem Sohn Gawuól von 4 Jahren und ihrer Tochter Lisaũeliálo von 2 Jahren.
	Gomadomáu	—	—
	Fáliworád	—	—
	Galodjáŋ	—	[ehemals ein Haus].
	Dawolibéi	—	—

Nummer im Plan	Auf dem Grundstück:	befindet sich das Haus	seine Einwohner sind
17.	Gabelâm	Gabelâm	der Mann Dâilîm mit seiner Frau Lajebô und ihren Töchtern Jalolôn und Lawâudjôn von 10 bzw. 5 Jahren und ihrem Sohn Lâûwelîm mit 3 Jahren.
18.	Hûk	Hûk	a) der Mann Medâjâr, seine Frau Ledamilalûk und ihre vierjährige Tochter Lemäliowuâ; b) die Witwe Wuâlimâd mit ihrer sechsjährigen Tochter Ledaručâl, ihrem vierjährigen Sohn Janelîd und ihrer erwachsenen Tochter Lefaroâ, die mit Lugulimâl verheiratet ist; beider Kind ist verstorben.
	Jâûuâl	—	—
	Gošêî		—
	Faliâlo	—	—
	Mawûnu	—	[früher mit Haus].
	Luguliwuól	—	—
	Sädûlu	—	—
	Mimalôk	—	—
	Falimâlâd	—	—
	Gelawû	—	—
	Djiwolôn	—	—
	Mälûâ	—	—
	Lugulialâm	—	—
	Kabiliwôli	—	—
	Kabilifâlû	—	—
	Lamoliôr	—	—
Die folgenden liegen im Busch:			
	Mešalûk	—	—
	Djolôn	—	—
	Medâiifôu	—	—
	Weliwôn	—	—
	Lâwuô	—	—
	Sodjûb	—	—
	Läkâûo	—	—

Nummer im Plan	Auf dem Grundstück	befindet sich das Haus	seine Einwohner sind:
	Maruólu	—	—
	Dawoluwódá	—	—
	Faliméĩ	—	—
	Faliméĩ imar	—	—
	Gadeliwól	—	—
	Imanâk	—	—
	b) im Nord-Distrikt (Jiwâñ)		
1.	Woluwuár	Woluwuár	liegt dem Haus Galiñâual im Süd-Distrikt gegenüber; seine Bewohner sind: a) Láru mit seiner Frau Laralaglár und ihrem zehnjährigen Sohn Malâuak; b) das Ehepaar Wirú und Mäduwulór (♀); c) das Ehepaar Saimá und Lachâuämák (♀). d) die Frau Djouwuél, deren Mann gerade in Lamutrik weilte, und ihre erwachsene Tochter Lararigêĩm, ihr zehnjähriger Sohn Gadjewâulódj und ihre achtjährige Tochter Lamalirúrál; e) die Frau Laráuäwuá; f) die Frau Daugalíba.
2.	Wóli	Wóli	die Frau Ledjaŭolimár [ihr Mann weilte gerade auf Lamutrik] mit ihrer fünfjährigen Tochter Saróligár.
3.	Fanugú	—	—
4.	Lämóu	Lämóu	ein Männerhaus.
5.	Fälúl	Fälúl	das Ehepaar Salaliár und Lâñimál(♀) mit einem einjährigen Säugling namens Dawíl, einer dreijährigen Tochter Mäár, einem sechsjährigen Sohn Malíe und einer erwachsenen

Nummer im Plan	auf dem Grundstück:	befindet sich das Haus:	seine Einwohner sind:
			Tochter Ledâûrilûk mit ihrem Mann Diliwuâ und ihrem kleinen Kind.
6.	Mâdâligôb	Mâdâligôb	die unverheiratete Frau Lâmoromâl mit ihrem achtjährigen Sohn Mowidjél.
7.	Kabilimâd	Kabilimâd	ein älteres Ehepaar: Rañiêdjôk und Lâḍarâdjâñ (♀) mit ihren Kindern: 1. dem zwölfjährigen Sohn Rañiêligâl, 2. der erwachsenen Tochter Laralurimâñ [ihr Mann war gerade in Faraulip] und ihrer vierjährigen Tochter Dâîfâku, 3. der erwachsenen, bereits verwitweten Tochter Gadjugulôñ mit ihren zwei erwachsenen Töchtern Lädâûorigâl und Läduwidjai, von denen die letztere mit Darûelîm verheiratet ist, beider Kind ist verstorben, 4. der erwachsenen Tochter Dâûloñ und ihrem Mann Djimâl, ihren beiden Kindern: dem vierjährigen Mädchen Ledamilidjâñ und einjährigen Knaben Giibâ, 5. der erwachsenen, bereits verwitweten Tochter Laraûlulûk mit ihrem vierjährigen Knaben Faraûmâl.
8.	Ilidjâlu		a) die Witwe Larâñidjâl mit ihren Kindern: 1. ihrer Tochter Laralerimâk, deren Gatten Dârurelibâ und ihren Kindern, einem vierjährigen Knaben Darieligâr und einem zweijährigen Sarôudjik, 2. ihrer erwachsenen Tochter Lâûeligûd, 3. ihrer achtjährigen Tochter Lâwuaûwôdil, 4. ihrem vierjährigen Sohn Âllaûidîl;
			b) der Frau Larâlerumâd, deren Mann

Nummer im Plan	auf dem Grundstück	befindet sich das Haus:	seine Eigentümer sind:
			geradè in Faraulip weilte, ihrem zweijährigen Sohn Igomarâ, ihrem zehnjährigen Sohn Nulimâr und ihrer erwachsenen und bereits verheirateten Tochter Dâuolûk;
			c) dem Ehepaar Darâbimar und Larâdiu (♀) nebst ihren Kindern: der achtjährigen Ledarlerâle, der vierjährigen Dâulimâdj und dem zweijährigen Daruelibûn.
9.	Faliwuâwuâ	Faliwuâwuâ	das Ehepaar Olobaligâl und Laglemedâu (♀) mit ihren Kindern, dem fünfjährigen Udjeliôb und dem dreijährigen Arofaliôk.
	Banân	—	—
	Fedanôn	—	—
	Woliôrîk	—	—
	Idawôl	—	—
	Gemâlôdju	—	—
	Bonilûk	—	—
	Dalimôu	—	—
	Gadewâli	—	—
	Nimâd	—	—
	Bonibâde	—	—
	Bedâlfs	—	—
	Ibâdejaûlûb	—	grenzt an Lamoliôr im Süd-Distrikt.
Im Busch liegen:			
	Lugulôb	—	—
	Bonuân	—	—
	Mârolegulôk	—	—
	Mâronanâli	—	—
	Fidaligolô	—	—
	Nifâdfli	—	—
	Mâlôdâlimôu	—	—
	Gafalugôk	—	—

	Maûudín	—	—

c) Die Insel Elă ist unbewohnt. Das Land ist unter die verschiedenen Häuser aufgeteilt; die einzelnen Grundstücke heißen:

Daboât
Gâujân
Wolifâl
Ledjôurôu
Unugelâu
Walûl
Kâleâl
Daworâb
Luguligaleâl
Woneâlo
Lugudjâdiu
Falidjûk
Lugunôli
Nimâko
Fadjólo.

97

VI. Waffen und Krieg.

Die Ifaluk-Leute waren, wie die erbitterten Kämpfe gegen Oleai und Lamutrik beweisen, ein kampflustiges Völkchen. Die Auswahl an Waffen war jedoch nicht groß. Man kannte:

1. den Speer *(dilêk)* von 1½—2 m Länge, mitunter mit Widerhaken ausgestattet und dann *rumu dilêk* genannt (s. Abb. 161—163). Haizähne an den Speeren will man nicht gekannt haben. Über Fischspeere s. S. 31.

2. die Keule *(lâweljêt)* als Hieb- und Stichwaffe in einfacher grabstockähnlicher Form (Abb. 165—168) oder als doppelseitige Waffe von ähnlicher Art wie auf Truk (Abb. 164). Von einer früher üblich gewesenen Besetzung mit Haizähnen wußte man nichts.

3. mit Hornhechtstacheln besetzte Schlagringe *(rasirâs)*, s. Abb. 170, 171. Eine interessante Form zeigt die Abb. 169 die eine Verschmelzung des einfachen Schlagringes mit einem *anipunipâ* ist.

4. die Steinschleuder *(gâul)* hatte man von Truk kennen gelernt.

5. Bogen *(daulr)* und Pfeil war lediglich Kinderspielzeug.

23.

Abb. 161—171.

Abb. 161—163. Speere (Hamburg 1778[II], 5801[II], 1773[II]; Länge 157, 180 und 203 cm). — Abb. 164—168. Keulen (Hamburg 1775[II], 1777[II], 1976[II], 1774[II], 1776[II]; Länge 187, 145, 156, 190, 136 cm). — Abb. 169—171. Schlagringe (Hamburg 1958[II], 1960[II], 1959[II]; Breite 17 ½, 12, 11 cm).

74

Soziale Verhältnisse und Geisteskultur.

VII. Soziologie.

Aus den **Verwandtschaftsbezeichnungen** wird ersichtlich, wie weit der Kreis der Familie *(lewugodâ sẽudõb* oder *sẽukaidûn)* im engeren und weiteren Sinn gezogen war; man gebrauchte für

Großvater (väterlicherseits) *demâl dämâ.*
Großmutter (väterlicherseits) *sine dämâ.*
Großvater (mütterlicherseits) *demâl sine, demâl silẽi.*
Großmutter (mütterlicherseits) *sine jine, sine silẽi.*
Vater, Gatte der Schwester des Vaters, Gatte der Schwester der Mutter *dämâ.*
Mutter, Frau des Bruders des Vaters, Frau des Bruders der Mutter *silẽi.*
Bruder, Sohn des Vaterbruders, Sohn der Vaterschwester, Sohn des Mutterbruders, Sohn der Mutterschwester *bisll,* auch *wisll.*
Schwester, Tochter des Vaterbruders, Tochter der Vaterschwester, Tochter des Mutterbruders, Tochter der Mutterschwester *mäanâl,* auch *midnâ* (vgl. dazu Damm und Sarfert, 1935 S. 143).
Gatte, Gattin *jãudâg.*
Sohn *lâluli* oder *djirimâle.*
Tochter *lâlul* oder *djiridjawûd.*
Vaterbruder *wisll dämâ.*
Vaterschwester *mäanâl dämâ.*
Mutterbruder *mäanâl silẽi* oder *manenebẽi.*
Mutterschwester *wisll djin.*
Sohn des Sohnes, Tochter des Sohnes, Sohn der Tochter, Tochter der Tochter *lãundi.*
Vater der Ehefrau *demâl djâliganlai.*
Mutter der Ehefrau *sine râli ganlai.*
Bruder der Ehefrau *mäanâl âli ganlai.*
Schwester der Ehefrau *wisll âli ganlai.*

Arbeitsteilung in der Familie. Dem Mann fallen folgende Arbeiten zu: Haus- und Bootbau, Fischfang, Pflege der Brotfruchtbäume und Kokospalmen, Herstellung von Fischnetzen, Schüsseln, Webstühlen, Netztaschen und die Bereitung

von Palmwein *(gdri)*. Die Frau hat neben der Küche und den körperlich leichteren Arbeiten wie Flechten und Weben auch Feldarbeiten zu verrichten, nämlich die verschiedenen Taroarten anzupflanzen und die Bananen zu pflegen, aus deren feinen Blattstreifen Lendenschurze gefertigt werden.

Die **Ehe** ist eine Liebesheirat. »Hat ein Mann sein Herz an eine Frau verloren, so macht er ihr eines Tages etwa beim Zusammentreffen im Busch eine regelrechte Liebeserklärung. Wird die Zuneigung von Seiten des Mädchens erwidert, so spricht der Mann zu ihr: »Geh und frage Deinen Vater!« Ist dieser einverstanden, so sagt er zu seiner Tochter: »Ja, hole ihn!« Das Mädchen holt ihren Bräutigam herbei und dieser schläft von jetzt ab bei ihr im Haus seiner Schwiegereltern. Mit diesem Tag, der durch keine besondere Zeremonie oder Feier gekrönt wird, lediglich das Essen fällt reichlicher als sonst aus, ist die Ehe geschlossen.

Ist das Mädchen dem Manne nicht zugetan und will sie dieser aber trotzdem haben, so muß der Schwiegersohn eine Zahlung leisten. Sonst ist die Entrichtung eines Kaufpreises nicht üblich.

Der Mann zieht, wie bereits erwähnt wurde, stets in das Haus seiner Frau und schläft dort. Damit fällt ihm auch ein Mitnutzungsrecht am Eigentum der Familie seiner Frau zu. Stellen sich mit der Zeit mehrere Kinder ein, so holt seine Schwester einige davon in ihr Haus, also in das seines Vaters. Wird das Haus zu klein, etwa weil es von mehreren verheirateten Schwestern bewohnt wird, so errichtet man daneben noch ein zweites Wohnhaus.

Über die Formen des **Coitus** wurde mit größter Lebhaftigkeit gesprochen, was durchaus zu dem Sittenbild der Eingeborenen paßt (vgl. dazu S. 80). Die auf Ifaluk gebräuchliche Form besteht darin, daß die Frau auf dem Rücken liegt und der Mann zwischen ihren Knieen hockt und ihre Beine über seine Schenkel zieht. Andere Coitusformen waren nur wenigen bekannt, sie haben diese auf Yap und Mogemog gelernt. Nach dem Verkehr säubert der Mann die Vagina mit seinem Lavalap.

Erotische Auswüchse. Onanie *(silisili)* ist bekannt und wurde von einigen geübt. Coitus in anum ist unbekannt; nach Angaben von Sarfert's Faraulip-Mann kommt er auf Mogemog vor. Cunnilingus, den Sarfert's Dolmetscher von Mogemog bezeugte, wird von Männern auch auf Ifaluk geübt und *monodlai* genannt. Umgekehrt tun die Frauen gleiches nur dem verstorbenen Gatten an und nennen dies *mônordi*. Vermutlich handelt es sich um die gleiche Sitte wie auf Luangiua[1]. — Über die Verlängerung der Schamlippen und Entfernung der Schamhaare s. S. 15.

Heiratsverbote. Verboten *(tdâb)* ist die Heirat mit allen Frauen, die in demselben Hause mit einem Mann wohnen, d. h. also mit Schwestern usw. Diese Heiratsverbote erstrecken sich auf zwei Generationen, für die dritte gilt sie bereits nicht mehr, das

[1] Sarfert und Damm 1931, 2. Bd., S. 274.

2: Damm et al. OR21 Woleai

bedeutet also, daß die Enkelkinder von Brüdern bzw. Schwestern, einander heiraten können. In alter Zeit, als die Bevölkerung noch nicht so zahlreich war, sollen bereits Vater und Base haben einander heiraten können. — Dem **freien Liebesleben** wird von unverheirateten und jungen Leuten nach Belieben gehuldigt.

Ehebruch kommt vor. Erfährt der betrogene Ehemann davon, so schimpft er wohl tüchtig, schlägt aber seine Frau nicht. Der Ehebrecher muß eine Sühnezahlung in Form von Lendenschurzen, Holzkisten und kleinen oder großen Booten leisten (s. Strafrecht S. 82).

Ehescheidung ist nicht selten. Diese geht sehr einfach vor sich; entweder verläßt der Mann seine Frau oder die Frau sagt ihrem Mann, er solle wieder sein eigenes Haus aufsuchen. Die Kinder werden in einem solchen Fall auch getrennt: die Knaben gehören dem Manne, die Mädchen der Frau. Säuglinge bleiben bei der Mutter, falls nicht die Schwester des Mannes sie haben will. — Verheiratet sich ein Partner wieder, so muß er den anderen durch eine Zahlung in Form von Schurzen, Kisten, Booten u. a. entschädigen. Das gilt auch für die Frau, nur übernimmt für sie die Familie die Zahlung. Es besteht nun die eigentümliche Sitte, daß diese Zahlung wegfällt, wenn beide Partner sich an demselben Tag wiederverheiraten. Im andern Fall bezahlt nur derjenige, der zuerst heiratet, selbst wenn der andere schon am Tage darauf ebenfalls heiratet.

Die **Fruchtbarkeit** der Frauen ist verhältnismäßig gut. So hatten z. B. drei (verstorbene) Frauen zehn Kinder, jetzt beträgt der Durchschnitt für die gleiche Frauenzahl etwa 3—5. Der Grund für diesen Geburtenrückgang ist nicht bekannt.

Geburt und Krankheit. Die Geburt erfolgt in einer besonderen Hütte *(imelibllu*, s. S. 59); die Nachgeburt *(bdi)* wird am Strand im Sand vergraben. In der Hütte bleibt die Frau elf Tage, sie verläßt diese erst, wenn der »kleine Mond« fünf Tage im Westen stand. Dann läßt der Oberhäuptling die Mutter durch eine andere Frau holen. Sarfert's Frage, ob dieses glückliche Ereignis mit Gesang und Tanz verbunden sei, wurde allgemein und kräftig belacht. Zwei Monate arbeitet die Frau nichts, sondern pflegt sich und widmet sich ganz dem Kinde, das in einer Wiege *(gulôul)*[1] untergebracht wird. — Beischlaf dürfen die Ehegatten solange nicht üben, bis das Kind selbst laufen kann. Wird das nicht beachtet, so stirbt das Kind.

Die Kinder verleben eine schöne ungebundene Jugend: sie helfen wohl ihren Eltern, zumeist aber tummeln sie sich im Freien, singen, spielen und tanzen bei Mondenschein. Sarfert wurde auf seinen Gängen immer von einer Kinderschar begleitet, die seine Aufmerksamkeit durch allerlei Kunststückchen (auf den Händen stehen und laufen) zu finden hofften. Ungezogene Kinder bekommen mit dem Stock Schläge. — Die kleinsten Knaben dürfen bereits ins Männerhaus gehen und nehmen so schon frühzeitig an dem Leben der Männer teil. Wenn sie eine bestimmte

[1] Museum Leipzig Mi 3868; Form ähnlich wie auf Aurepik.

2: Damm et al. OR21 Woleai

Größe erreicht haben, etwa 4—7 Jahre alt sind, erhalten die Knaben einen Lendenschurz, »denn«, so behaupten die Eingeborenen, »jetzt wollen die Mütter und Schwestern ihre Jungen nicht mehr nackend sehen«. Zu dieser Zeit wird auch die Nasenscheidewand mit einer Fischgräte durchbohrt und eine wohlriechende Blüte *(warôn)* hineingesteckt. Die kleinen Mädchen erhalten schon früher als es z. B. auf Sorol üblich ist, den Schurz *siwisîf* (S. 26). Die Namengebung erfolgt nach etwa fünf Monaten.

An **Altersbezeichnungen** gebraucht man für
Säugling *sâlidali*.
kleiner Junge, kleines Mädchen *sâlidali mâl* bzw. *sâlidali djâwud*
großer Junge *dâli mâl*
großes Mädchen *dalâwid*
Mann *mâl*
Frau *djâwud* oder *jâfil*
alter Junggeselle, auch Witwer ?
alte Jungfer, auch Witwe *libîdj*

Greisin *djâwud dufêi*.

Über den **Familienbesitz** s. Rechtsverhältnisse.

Tod und Begräbnis. Beim Tode eines Inselbewohners kommen alle Ifaluk-Leute zusammen, weinen, schreien und singen Trauerlieder *(dâṅ)*. Der Tote erhält eine neue Lendenmatte umgelegt; Hals-, Ober- und Unterarme sowie Beine werden mit weißen Perlschnüren verziert, der Körper wird schließlich ganz mit roter Farbe *(lâṅ)* beschmiert, das Gesicht erhält nur eine Umrahmung aufgemalt (s. Abb. 172). Dann werden die Arme zwischen den Oberschenkeln zusammengeschnürt, die Unterschenkel nach hinten geschlagen und an die Oberschenkel gebunden. Ist der Verstorbene ein verheirateter Mann, so nimmt die Witwe von ihm durch *môṅorai* (s. S. 75) Abschied. Der Tote wird dann in eine etwa 2 Faden lange Pandanusmatte *(glagi)* gehüllt und mit dem Kopf nach Westen(!) aufgebahrt; der Grund hierzu war den Eingeborenen nicht bekannt.

Abb. 172. Gesichtsbemalung bei Toten (nach Skizze Sarfert).

Ist der Tod vormittags eingetreten, so erfolgt die Beisetzung etwa 16 Uhr, im andern Fall erst am nächsten Morgen bei Sonnenaufgang. Die Leiche wird in einen ein Meter langen kistenartigen Sarg *(imelimâs)* gelegt, der von allen angefertigt wird, sobald man den Tod voraussieht. Der Sarg besteht aus dicht aneinander befestigten Stöcken. Da die Beisetzung im Meer und zwar innerhalb des Riffes erfolgt, beschwert man ihn durch Steine, die man entweder anbindet oder in den Sarg legt. Über die Totenbeigaben s. Erbrecht. — Die Leichenträger sind nach getaner Arbeit nicht *etâb* (s. Abschnitt Tapu).

2: Damm et al. OR21 Woleai

Die Wartezeit bis zur nächsten Heirat kann 2—3 Monate, aber auch nur ½—1 Monat betragen; sie richtet sich für den Witwer wie für die Witwe ganz nach der Zuneigung, die dem verstorbenen Ehegatten entgegengebracht wurde.

Die Sippe. Was über die Sippenverhältnisse von Polowat gesagt worden ist[1], gilt auch für Ifaluk. Man kennt hier die Sippen Saûpólowat, die sich, wie schon der Name sagt, von Polowat herleitet. Desgleichen stammt die Sippe Wisúsu von Polowat[2]. Von Yap nahmen ihren Ausgang die Monaûlifer, die Fäniméï, die Gadamân und die Wolêï. Die letztgenannte Sippe untersteht der gleichnamigen von Polowat[3]. Die Sippe Böl stammt von Pulap; ihr Sippenoberhaupt *(monâinaṅ)* hieß Marêšû und wohnte auf Falalap. Aus Oleai kam die Sippe Saûwôl.[4] Auch die Sippen Wufdo unter dem Namen Djâk und Saûwâlêi unter dem Namen Saufalâšik bestehen hier.

Der Staat. Ifaluk spielte in der Geschichte des Karolinen-Archipels eine besondere Rolle, einmal durch seine Kriege gegen Oleai, Lamutrik und Elato, dann aber auch dadurch, daß es die von ihm entvölkerten Inseln wie auch Sorol[5] und Faraulip neu besiedelte (s. S. 83f.). — Das Abhängigkeitsverhältnis von Yap wird durch folgende Tatsache beleuchtet. Zur Zeit der Hamburger Südsee-Expedition waren zwei Ifaluk-Leute, die einzigen noch vorhandenen Hochsee-Kapitäne in eigenen Booten, ferner 85 Männer und 6 Frauen mit dem Dampfer nach Yap und Ngulu gefahren. Wann sie zurückkommen würden, wußte niemand zu sagen, da der König von Gatšapar auf Yap die Tributfahrer — denn um solche handelt es sich hierbei — sehr lange zurückhielt: sie mußten für ihn Arbeiten verrichten! Es ist also die Oberhoheit von Yap noch außerordentlich groß gewesen.

Innenpolitisch steht neben der Sippengliederung die Trennung in Häuptlingsstände und Volk.

Stellung und Aufgaben der Häuptlinge. Die Häuptlinge genießen allgemeine Achtung: wenn sie kommen, macht man ihnen ehrerbietig Platz, die Kinder verschwinden in den Ecken der Hütte und lassen sich nicht sehen.

Der Oberhäuptling hat die Oberaufsicht über die Inseln des Atolls; er befiehlt gemeinsame Arbeiten z. B. den Bau der Männerhäuser, größere Fischzüge, ferner verteilt er die Tagesarbeiten, so überträgt er diesen die Aufsicht über die Kokospalmen, jene heißt er auf die Tarofelder achten usw. Alle diese Anordnungen gab er im Männerhaus bekannt (s. S. 59). Vom Oberhäuptling mußte man auch die Erlaubnis zum Bau von großen Booten einholen, für kleinere Boote oder für den Bau einer Hütte war dies nicht nötig.

Der Unterhäuptling kann als eine Art Stellvertreter des Oberhäuptlings angesehen werden. Er hat auf alles aufzupassen und den Oberhäuptling von allem zu unterrichten.

2: Damm et al. OR21 Woleai

Die beiden niederen Häuptlinge sind die ausführenden Kräfte des Oberhäuptlings. Sie rufen die Bevölkerung zur Versammlung ins Männerhaus, sie organisieren die gemeinsamen Fischzüge und führen die Aufsicht beim Bau des Männerhauses.

Die Häuptlinge erhalten gewisse »Abgaben«. Der Oberhäuptling kann einen Teil der Erträgnisse der Felder und Fruchtbäume für sich beanspruchen. Von dem Fang eines jeden Fischzuges, den einer seiner Untertanen unternommen hat, erhält er $^1/_5$, während der Unterhäuptling $^1/_2$—$^3/_4$ dessen fordert, was dem Oberhäuptling ausgehändigt wurde. Die niederen Häuptlinge erhalten noch weniger oder gehen gar leer aus, wenn der Fischer nicht viel gefangen hat; er gibt dann nur dem *tamôl igidigll*, den er gerade im Männerhaus antrifft, seinen Anteil. — Die Ausbeute an gemeinsamen Fischzügen verteilt der Oberhäuptling an alle Häuser des Atolls (und nicht an die Männer!), er selbst und die übrigen Häuptlinge verzichten entweder ganz oder nehmen sich, wenn auf ein Haus ein Fisch kommt, einen Fisch, bei geringem Fang nimmt er nur die Hälfte oder weniger von dem, was auf ein Haus entfällt.

Nachfolger eines Häuptlings wird der älteste Sohn, gegebenenfalls auch der Bruder oder Schwestersohn des Verstorbenen. In der Nachfolge geht stets der Schwestersohn vor dem Brudersohn. Steht die Familie des Oberhäuptlings vor dem Aussterben, so bestimmt der Oberhäuptling vor seinem Tod seinen Nachfolger, desgleichen bestimmt er für einen noch unerwachsenen Nachfolger einen Vormund als Regenten.

Als erster Häuptling wird der Yap-Mann Môdj genannt, der sich in sagenhafter Zeit auf Falalap ansiedelte (s. S. 83). Von seinen Kindern sind dann einige nach Feladjik gegangen. Das Haus des 1909 regierenden Oberhäuptlings stand noch auf der ersten Siedlerstelle in Jiwân, wenngleich er der Sitte folgend im Haus seiner Frau, in Lawuâû, nächtigte. — Môdj hatte zwei Söhne, von denen der ältere Oberhäuptling und der jüngere Unterhäuptling wurde. So erklären die Insulaner das Bestehen eines »großen« und eines »kleinen« Häuptlings. Außer diesen beiden Großhäuptlingen *(tamôl solôb)* gibt es noch zwei Häuptlinge niederen Grades *(tamôl igidigll)*, die auch der Häuptlingsfamilie entstammen und in Lawuâû wohnen; sie sind, wie bereits oben gesagt wurde, die ausführenden Organe des Oberhäuptlings und geben seine Anordnungen an das Volk weiter. In ihrer Stellung erinnern sie an die *pûlepûle* und *kôkô'a* von Luangiua und Nukumanu, die ebenfalls der Regentenfamilie angehörten[1].

Die Namen der Oberhäuptlinge[2] waren:

1. Môdj
2. Ällofâs

[1] Vgl. Sarfert und Damm 1931 S. 289/291.

[2] Wie sich »Kafalu«, der Häuptling von Ifaluk und Faraulip, in diese Reihe eingliedert, kann nach den wenigen Angaben bei Lütke nicht gesagt werden (Lütke 1835 Vol. II, S. 344).

3. Dâdar
4. Ăuâp
5. Mâiliâs
6. Mōūirâ̄
7. Sorâl
8. Gŏrigar; er soll zur Zeit des ersten großen Taifuns gelebt haben.
9. Modurók
10. Jalorâk
11. Gawurók
12. Malüdjŏm
13. Idälūb; er lebte zur Zeit des dritten Taifuns.
14. Ărülümâ̄
15. Dibâdäu; er lebte zur Zeit des vierten Taifuns.
16. Soligŏu
17. Gilâlobâk
18. Olâ̄diū, er lebte zur Zeit des fünften Taifuns (1907) und blieb verschollen auf der Fahrt nach Lamutrik.
19. Daoreligâr war zur Zeit der Hamburger Südsee-Expedition (1909) Oberhäuptling der Inselgruppe, Unterhäuptling war Sairū, Häuptlinge niederen Grades waren Duwäliŏr und Älewūdj.

Die gute Sitte. In Gegenwart des anderen Geschlechts wird stets streng auf »gute Sitte« geachtet. Es darf dann kein unanständiges Wort, was sich etwa auf den Geschlechtsverkehr bezieht, gesagt werden, selbst die Worte *bâlebal* und *siwisîf* für Schurz sind verpönt. Sind die Geschlechter dagegen unter sich, so werden die derbsten und anzüglichsten Reden geführt. Selbst in Gegenwart der kleinsten Knaben äußerten sich die Männer über geschlechtliche Dinge, die Kinder lachten dazu und freuten sich. Ebenso scherzten die Frauen direkt zotig in Gegenwart der kleinsten Mädchen. Als Sarfert mit den Frauen allein war, sprachen sie in Umschreibungen von Begatten. Als Sarfert ihnen einen *waliwot* mit Penis zeigte, ahmten sie damit Coitusbewegungen nach oder deuteten dies mit den Fingern an. Sie äußerten ohne jede Scham den Wunsch, mit Sarfert zu schlafen, doch hatten sie Angst vor ihren Männern und dem Oberhäuptling. Dieses freche, herausfordernde Verhalten steht in starkem Gegensatz zur Sitte, die verlangt, daß die Frauen in Gegenwart der Männer vor Fremden zurückhaltend, ja scheu und ängstlich sein sollen. Das konnte Sarfert sonst auch immer feststellen. Die Frauen wagten dann nur von fern durch verstohlene Zeichen Sarfert ihr Wohlwollen auszudrücken.

Der gewöhnliche Gruß *(gawŏn)* lautet beim Abschied für den Gehenden »*ošamîla*« und für den Bleibenden »*gosâlok*«. Diese Formen werden immer gebraucht, auch beim Abschied auf längere Zeit. Den Sterbenden gegenüber gibt es keinen Gruß.

91

VIII. Rechtsverhältnisse.

Eigentum. Dorfeigentum sind Männerhaus und große Fischnetze *(ädḥ, ág)* für gemeinsame Fischzüge. Die Kanuhäuser sind Eigentum der einzelnen Dorfdistrikte Jór und Jiwâḥ.

Familieneigentum. Grund und Boden haften nicht an der Einzelperson, sondern an der Familie; das gilt auch für den Bestand der Fruchtbäume. Selbst die fünf bugodâl, die der König besitzt, sind nicht sein persönliches Eigentum, sondern zugleich auch das seiner Brüder und Schwestern. Die Tarofelder gehören den weiblichen, die Kokospalmenbestände den männlichen Familienmitgliedern.

So bringt der Mann seiner Frau die Nutznießung des Grundbesitzes seiner Familie mit in die Ehe. Nach gegenseitiger Besprechung holen sie die Nahrung von der Scholle seiner oder ihrer Familie. Bekommt die Frau Kinder, so übergibt der Mann je nach dem Besitz seiner Familie ein bis zwei Plätze der Familie seiner Frau und zwar nicht etwa ganze Grundstücke, sondern ein Tarofeld für Mädchen und einige Palmen für Knaben. Es werden dabei stets Palmen überwiesen, die am Rande des Grundstückes stehen; sie werden durch eine ringförmige Schlagmarke mit dem Messer besonders gezeichnet. Dieser überwiesene Besitz ist nicht persönliches Eigentum der Kinder, sondern wird Eigentum der mütterlichen Familie. Ganz deutlich sieht man darin noch, wie sehr die Frau einst im Mittelpunkt der Familie stand. — Die Zahl der Grundstücke einer Familie schwankt zwischen eins bis sieben. Die Grenze der Grundstücke *(nibiddli bâgod)* wird durch Baumstämme gekennzeichnet.

Was für den Grund und Boden gilt, trifft auch für den Hausbesitz zu: die Hütten gehören ebenfalls der Familie und zwar der Großfamilie.

Familieneigentum sind ferner Schmuck und Hausgerät: Halsketten, Schildpattringe (nur für Frauen), Messer, Boote, Schüsseln, Speere, Fischhaken, Fischleine, Fischreusen verschiedener Größe, Kisten, Netztaschen, Webstühle.

Persönliches Eigentum sind Kämme, Ohrringe, Lendenschurze, Körbe und *giági*-Matten.

Erbrecht. Das Erbrecht ist in der Hauptsache Familienerbrecht. Persönlicher Besitz wird dem Toten mitgegeben, sogar Familienschmuckstücke. Matte und Lendenschurz erhält er mit, sein Korb wird verbrannt.

Strafrecht. Richter ist in allen Dingen der Oberhäuptling; das Gerichtsgebäude ist das Männerhaus.

Wenn ein Mann schlechte Reden führt, böse und leichtfertig handelt, nachlässig in seinen Arbeiten ist, so erhält er durch den Oberhäuptling eine Verwarnung. Muß das mehrfach geschehen, so erfolgt eine strengere Bestrafung: z. B. wird dem Schuldigen auf Befehl des Oberhäuptlings das Boot weggenommen, das dann diesem zufällt.

Ein Mörder wird auf Befehl des Oberhäuptlings von den übrigen Männern gebunden ins Männerhaus gebracht. Dort versammeln sich alle Dorfbewohner, Männer, Frauen und Kinder. Der Oberhäuptling hält dem Totschläger eine lange und sehr eindringliche Strafpredigt und läßt ihn dann frei; als Sühne werden dem Schuldigen Feldstücke, Boote und Lendenschurze weggenommen und der Familie des Erschlagenen gegeben. Der Grundsatz »Auge um Auge, Zahn um Zahn« findet keine Anwendung, d. h. der Mörder verfällt nicht dem Tode!

Bei einfachen Raufereien wird der Angreifer, falls er Grund dazu hatte, vom Oberhäuptling vor versammelten Dorfbewohnern ermahnt. Ist der Händel nicht ohne Körperverletzung abgegangen, so sind folgende Sühnezahlungen zu leisten:
für Zerschmettern
eines Auges, eines Armes oder Beines ein Boot und zwei Lendenschurze;
beider Augen, beider Arme oder Beine zwei Boote und soviele Lendenschurze, als da sind;
eines (beliebigen) Fingers ein Lendenschurz;
zweier oder dreier Finger zwei Lendenschurze;
von vier Fingern zwei bis drei Lendenschurze;
einer Hand drei bis vier Lendenschurze.

Bei Diebstahl nimmt der Bestohlene auf Befehl des Oberhäuptlings dem Dieb den gleichen Gegenstand weg. Mitunter wird der Dieb noch vor versammelter Bevölkerung vom Oberhäuptling ermahnt.

Bei Ehebruch schreitet der Oberhäuptling nicht ein. Der Ehemann überläßt entweder dem Ehebrecher seine Frau, falls dieser sie nach vorhergegangener Besprechung haben will, und dann muß dieser kräftig zahlen (große Boote, Lendenschurze, Kisten usw.). Will der Ehebrecher die Frau nicht, so bezahlt er weniger z. B. ein kleines Boot oder eine große Kiste. Der Mann verläßt in jedem Fall seine Frau. Hat die Frau bereits Kinder, so erhöht sich in dem letztgenannten Fall die Zahlung noch. Die Kinder gehen ins Haus des Mannes, doch dürfen sie die Mutter besuchen.

83

IX. Zur inneren Geschichte.

Ehemals war Ifaluk unbewohnt. Die ersten Menschen kamen von Yap und zwar war es der Mann Mṓdj mit seiner Frau Filidamṓl. Sie kamen von Kârebar[1]. Die Eltern dieser beiden ersten Einwanderer sind auf Ifaluk unbekannt.

Mṓdj und Filidamṓl kamen nicht im Boot, sondern im Floß *(fṓfát)*; ihre Fahrt führte über die bereits bewohnten Inseln Mogemog, Fais, Oleai nach Ifaluk. Die Eingeborenen glauben, daß sie sich auf dieser Fahrt nach den Sternen gerichtet haben. Nach der Landung baute sich Mṓdj ein Haus Ilamâï auf Falalap im Norddistrikt Jiwâṅ (vgl. S. 65), das nicht mehr vorhanden ist. Er grub nach Trinkwasser, pflanzte Kokosnüsse, Brotfrucht usw. an, die er aus Yap mitgebracht hatte.

Bisweilen kamen auch von Oleai und Faraulip Männer und Frauen an und blieben hier, ebenso gingen aber auch Ifaluk-Leute nach jenen Inseln und blieben dort. Besonders aufregend war die Ankunft »großer, großer Teufel«, aber von Menschengestalt. Diese Riesen waren am ganzen Körper so stachelig, daß sich an ihnen große Fische anspießten. Diese Unwesen kamen angeschwommen und schwammen, da sie hier kein Essen fanden, friedlich wieder weg.

Unter Mṓdj entwickelten die Ifaluk-Leute eine heftige, kriegerische Tätigkeit.

Kampf mit Oleai.

Mṓdj fuhr nach Oleai, wo es ihm so gefiel, daß er hier eine Frau heiratete. Doch die Oleai-Leute mochten ihn nicht. Es kam zum Streit und Mṓdj wurde dabei verwundet. Er flüchtete in sein Boot und suchte wieder Ifaluk auf. Hier rief er seine Gefolgsmannen zusammen, fuhr mit ihnen nach Oleai und richtete sich auf der Hauptinsel zu längerem Bleiben ein. Allmählich hatten die Oleai-Leute nichts mehr zu essen, sie siedelten deshalb auf die Insel Râur über. Sofort folgten ihnen die Ifaluk-Leute und aßen auch dort alles auf. So gingen die Oleai-Leute nach Bäliaṷ, um auch hier von ihren Feinden behelligt zu werden. Dasselbe wiederholte sich in Otârau und schließlich in Falâlûs. Schließlich starb ein Teil der Oleai-Leute vor Hunger, die andern waren vollkommen entkräftet. Das war für Mṓdj der ersehnte Augenblick, mit seinen Leuten über den Gegner herzufallen und alle Oleai-Leute (mit Ausnahme seiner Frau und seines Sohnes) niederzumachen. Dieser Sohn wurde dann Häuptling von Oleai.

[1] Ist wohl mit Gatlapar, der Kultstätte des Gottes Yoṅalâv (vgl. Müller-Wismar 1917, Bd. I S. 324) identisch.

2: Damm et al. OR21 Woleai

Eine andere Fassung von einem Kampf zwischen Ifaluk und Oleai gibt Hambruch in seinen Aufzeichnungen von Faraulip. Móls[1] war König von Ifaluk und in Oleai zu Gast. Während ein Oleai-Mann beim Fischen war, vergewaltigte er dessen Frau. Er tat dies des öfteren, bis der Mann ihn einmal überraschte, ihn verprügelte und für tot aus dem Haus warf. Gegen Sonnenaufgang kam Regen und weckte Móls auf. Dieser holte sich jetzt ein Stück Holz aus dem Busch und schwamm damit nach Ifaluk, denn ein Boot hatte er nicht. Hier wurde er von einigen Leuten nach langer Zeit wieder gesund gepflegt. Er ging darauf ins Männerhaus, rief alle Leute zusammen, band seinen Schurz los und sagte: »Wohin mein Glied zeigt, dort wollen wir hinfahren und die Leute bekriegen!« Sein Penis zeigte nach Oleai. Da machten die Leute viele Speere, segelten in zahllosen Booten nach Oleai und erschlugen alle, bis auf die Mädchen.

Später kam es noch zum

Krieg mit Lamutrik.

Da Ifaluk nur wenig zu essen hatte, hieß Módj seine Leute nach Lamutrik aufbrechen, um diese Insel zu befehden. Da Módj selbst schon sehr alt war, bestimmte er Ällofás, seinen späteren Nachfolger, zum Anführer der Krieger. Zuerst fuhr man nach Elato, blieb hier lange Zeit, bis es nichts mehr zu essen gab. Schon starben einige Elato-Leute an Hunger, da fuhren die übrigen nach Lamutrik. Ällofás folgte ihnen und begann sogleich den Kampf; er wurde dabei verwundet und auf beiden Seiten gab es Tote. So zog sich Ällofás wieder nach Elato zurück und blieb hier.

Inzwischen waren zwei Monate ins Land gegangen und die Expedition war noch nicht wieder in Ifaluk eingetroffen. Módj, der in Sorge um das Schicksal seiner Leute war, fuhr deshalb selbst mit einigen Männern nach Elato. Als er sie dort antraf, frug er erstaunt, warum man denn nicht alle Lamutrik-Leute getötet hätte. Ällofás erwiderte, sie seien zu stark gewesen. Da ließ Módj viele Fackeln aus Kokosblättern anfertigen und alle Ifaluk-Leute segelten mit dem Südwest-Wind nochmals nach Lamutrik. Sie landeten unbemerkt auf der unbewohnten Inselseite und gingen auf die ahnungslosen Lamutrik-Leute los. Es kam noch hinzu, daß der Wind diesen den beißenden Qualm der Fackeln in die Augen wehte und ihnen die Sicht unmöglich machte. So wurden alle Lamutrik-Leute ausgerottet. — Später schickte dann Módj einen Mann mit zwei Frauen nach Lamutrik, um die Insel wieder zu besiedeln.

Auch unter dem späteren Oberhäuptling Mäliás wurden von Ifaluk aus zwei ehemals bewohnte Inseln des Faraulip-Atolls neu besiedelt. Sie hatten sich einst in gegenseitigen Fehden buchstäblich entvölkert, bis nur noch ein Mann namens

[1] Wohl identisch mit Módj.

Ueliwá übrig war. Als Mâliâs davon erfuhr, schickte er ihm eine Frau Nîmañ hin, die dann Faraulip neu bevölkerte. — Derartige Bruderkriege kannte man auf Ifaluk nicht, die beiden oben geschilderten Kämpfe mit Oleai und Lamutrik sollen die einzigen größeren kriegerischen Verwicklungen gewesen sein.

Die Namen der übrigen Oberhäuptlinge s. S. 79f.

Zur Zeit des großen Taifuns von 1907 lebte der Oberhäuptling Olâdiû, der auf einer Fahrt nach Lamutrik verschollen blieb. Unter ihm verließ der weiße Händler »Sáu« die Insel und zwar war dies vor dem Taifun, während drei in Lawuâñ auf Feladjik ansässige Japaner sogleich nach dem Unheil wegfuhren.

1909 herrschte der Oberhäuptling Daoreligâr, der nach Versicherung von Sarfert's Faraulip-Dolmetscher als ein »sehr großer König« galt. Nach dem letzten Taifun, der unter seinem Vorgänger die Insel heimsuchte, wurden viele Ifaluk-Leute nach Lamutrik, Yap und Palau gebracht, um einer Hungersnot vorzubeugen. Als die Ernährung der Inselbevölkerung gesichert war, bat der Oberhäuptling Sarfert dafür einzutreten, daß keine Leute mehr abgeholt würden. Das Gleiche erlebte Sarfert auf Aurepik; die Eingeborenen, die von hier nach Yap kamen, wurden nämlich nach Nauru gebracht.

X. Religion.

1. Das Weltbild.

Das Weltgebäude besteht für die Insulaner aus dem Himmel *(rân)*, der Erde *(selôb)* und der Unterwelt *(farioudl* oder *ilôl)*. Eine Weltachse wie auf Aurepik kannte man nicht. — Der Himmel wird als ein großer Platz wie Palau oder Yap gedacht, der von denselben Wesen wie die Erde bevölkert ist. Diese handeln ebenso wie ihre irdischen Vertreter, ob sie auch sterben müssen wie diese, wußten die Insulaner nicht anzugeben.

2. Naturreligion.

Die Unterwelt ist wie die Erde eingerichtet, d. h. es gibt auch hier Inseln und Meere, ebenso scheinen hier Sonne, Mond und Sterne und zwar dann, wenn sie bei uns untergegangen sind. Die Unterwelt ist auch von Menschen bewohnt. Solâl ist hier König, von Gestalt ist er halb Mensch, halb *lâwud* (Fisch, Schlange oder Aal?); er hat weder Eltern, noch irgendwelche Verwandte. Das große Haus, das er bewohnt, heißt Falisât; näheres wußten die Eingeborenen nicht.

Solâl schuf Himmel und Erde, indem er ein Sandkorn in seine Hand nahm und es unter Hersagen eines Zaubers von einer Hand in die andere kugelte. Er schuf auch den Beherrscher des Himmels namens Âluelôb (s. unten) und ebenso dessen Schwester Âudjâl, die eigentliche Beherrscherin der Erde (s. S. 90).

Der Sternhimmel ist das Reich des Âluelôb. Er wohnt als König des Himmels im Hause Fadjemâl, das im Zenith *(wôliwâ)* steht und wie ein stattliches Gebäude der Menschen aussieht. Er ist nicht nur von übermenschlicher Größe, sondern auch allwissend, er ißt nicht und trinkt nicht und hält die Augen immer geschlossen. Er ruht auf einer Plattform in der Mitte des Hauses, während die übrigen Bewohner auf dem Fußboden schlafen. Seine Frau ist Lamagêl. — Wenn ein Himmelsbewohner in irgendeiner Sache (Kanubau, Weberei) nicht Bescheid weiß, so fragt er wohl bei diesem und jenem, wendet sich an Lugêilân (s. unten) und wenn dieser es nicht weiß, auch an Olofâd (s. unten). Erhält er dann noch keine Auskunft, so bittet er Lugêilân, doch bei Âluelôb selbst anzufragen.

Dieser geht dann zum König des Himmels, öffnet ihm mit der Hand die Augen und holt sich Rat; Äluelôb schläft dann wieder weiter.

Lugeilâñ gilt als Sohn des Äluelôb und wird als die »rechte Hand« des Himmelskönigs bezeichnet. Er wohnt für sich in einem Haus, das nahe bei dem des Äluelôb steht, dessen Name aber nicht mehr bekannt ist. Seine Frau heißt Lämälûl, sie ist kein Himmelsbewohner, sondern stammt von der Erde. Als Lugeilâñ einst die Erde besuchte, nahm er sie sich zum Weib und wohnte bei ihr. Schließlich schickte Äluelôb einen Boten zu ihm, er solle zurückkommen und alle Himmelsbewohner zusammenrufen und mit ihnen das Fadjemal ausbessern, weil es hereinregne. In seiner Abwesenheit gebar seine Frau Olofâd (s. unten). Durch den Erdenbesuch des Lugeilâñ lernten die Menschen die Tatauierung kennen.

Lugeilâñ hat Ausschau nach der Erde zu halten und zu sehen, was auf den einzelnen Inseln an Arbeit (Kanu- und Hausbau, Fischfang usw.) geleistet wird. Er berichtet jeden Tag Äluelôb und falls die Bewohner einer Insel nicht fleißig sind, sondern nur essen und schlafen, heißt ihn der Himmelskönig Sturm und Regen schicken, während er Solâl bestimmt, das Meer in Aufruhr zu versetzen. Dann wird die Insel von einem Taifun heimgesucht, der um so stärker wütet, je größer die Verfehlungen der Insulaner sind. So ist Oleai heimgesucht worden und viele seiner Bewohner sind umgekommen, weil es nach Eingeborenenansicht nicht gut gehandelt hat; nicht anders, wenn auch unter geringeren Menschenverlusten, ist es Aurepik und Ifaluk ergangen. Die Missetaten und Verfehlungen einzelner Menschen — es gibt nach Eingeborenenansicht keinen Menschen, der immer nur Gutes und keinen, der immer nur Schlechtes tut — straft jedoch Lugeilâñ selbst ab; er schickt dann Krankheit *(mâs)* und in schweren Fällen Tod.

In solchen Fällen wenden dann die Menschen einen Zauber an (S. 91). Wenn diese Gottheit jedoch den Tod bestimmt hat und das tut sie, indem sie einfach sagt: »Der und der stirbt!«, so nützt auch das nichts mehr.

Olofâd wurde bereits nach fünf Monaten von Lämälûl (s. oben) geboren und zwar entstieg Olofâd dem Kopf seiner Mutter, da wo die Kopfnähte sind. Er konnte sofort gehen und hörte nicht auf seine Mutter, die ihn von dem Blut säubern wollte. Er sagte, er könne das selbst und rieb sich an einer Kokospalme. Daher haben viele Palmenstämme eine rötliche Färbung. Als ihn seine Mutter rief, sie wolle ihm die Nabelschnur abschneiden, sagte er auch, das mache er selbst, nahm ein Messer und schnitt sie sich ab.

Olofâd sah bei seinem Erdenleben, wie alle andern Burschen Kokosnüsse austranken. So lief er zu seiner Mutter und fragte: »Warum gibst Du mir keine Nuß, alle andern trinken die Früchte aus!« Da erschrak Lämälûl, denn Lugeilâñ hatte ihr gesagt, daß sie einen Sohn zur Welt bringen würde, der aber keine Kokosnuß trinken dürfe, weil er sie sonst verlassen und zu ihm in den Himmel kommen würde. Sie sagte also zu ihm: »Du darfst keine trinken, sonst mußt Du sterben!«

So lebte Olofád dahin. — Eines Tages, als er wieder alle Kameraden im großen Haus Trinknüsse genießen sah, lief er wieder zu seiner Mutter und sagte: »Mutter, alle trinken Nüsse, warum soll ich keine trinken? Ich will auch Nüsse trinken!« Die Mutter erwiderte ihm kurz: »Dann mußt Du sterben!« Olofád sagte darauf: »Gut! Ich will auch Kokosnuß trinken und wenn ich sterben muß, so ist es auch weiter nichts!« Seine Mutter wollte ihm jedoch keine Nuß geben und so fing Olofád zu schreien an und hörte gar nicht wieder auf. Schließlich gab seine Mutter nach und brachte ihm eine Nuß. Olofád nahm sie und trank sie aus. Wie er so trank, sah er zum Himmel empor und erblickte seinen Vater Lugeilân. Da rief Olofád: »Ich bleibe nicht mehr länger auf der Erde! Ich gehe in den Himmel zu meinem Vater!« Seine Mutter aber sagte: »Du bleibst hier, was willst Du denn dort?« Doch Olofád schrie und schrie immerfort. Da richtete seine Mutter ein Essen aus Kokosnuß her, legte es ins Feuer und als der Rauch emporstieg, sagte sie zu ihrem Sohn: »Komm ins Feuer!« Als er hineintrat, stieg er mit dem Rauch zum Himmel empor. Unterwegs traf er Knaben, die mit kleinen *nók*-Fischen spielten. Olofád sagte zu ihnen: »Ach gebt mir einen *nók*, ich will auch mitspielen!« Aber alle sagten: »Was sollen wir Dir einen Fisch geben, sie gehören doch uns!« Nur ein Knabe gab Olofád seinen *nók* zum Spielen. Olofád tat so, als ob er mit ihm spiele, gab ihn dann zurück und ging weiter. Zu den Fischen aber sprach er: »Wenn ich gehe, so fangt die Knaben und stecht sie!« Und so stachen die Fische mit dem Stachel ihrer Rückenflosse die Knaben, nur der eine wurde verschont.

Als Olofád nun weiter ging, sah er Knaben mit kleinen Haifischen spielen. Er bat sie, ihm auch einen Fisch zum Spielen zu geben. Doch die Knaben sagten: »Wo kommst denn Du her, was willst Du hier?« Nur einer gab ihm einen Haifisch und Olofád spielte damit. Als er weiter ging, sagte er allen Haien, sie sollten die Knaben beißen und so geschah es, nur der eine Knabe wurde verschont. Und Olofád ging weiter und traf auf Knaben, die sich mit Spielbooten unterhielten. Als er mitspielen wollte, lehnten sie es ab, nur ein Knabe borgte ihm sein Boot. Als Olofád die Knaben verließ, sagte er zu den Spielkanus: »Ihr Boote geht schnell weg, daß Euch die Knaben nicht mehr fangen können, geht schnell weg!« Da segelten die Kanus rasch weg, daß sie von den Knaben gar nicht mehr eingeholt werden konnten. Nur das Boot des einen Knaben blieb zurück.

Als Olofád nun zum Fadjemál kam, besserten die Männer des Himmels gerade das Haus aus. Sie gingen in den Wald, um Stützpfeiler aus den *járo*-Bäumen zu machen. Als sie Olofád sahen, merkten sie, daß er ein Erdenbewohner war und beschlossen, ihn zu töten. Als sie einen großen Stützpfeiler auf der einen Schulter zum Hausplatz trugen, gingen alle Männer auf einer Seite, Olofád mußte auf der anderen gehen. Als sie ins Haus kamen, warfen alle schnell den Balken weg, damit er Olofád zerschmettern solle. Doch dieser sprang rasch zur Seite und blieb unversehrt. Als die Männer dann den Stützpfosten in die Höhlung versenken

wollten, schickten sie Olofád in das Loch, damit er es noch größer machen und mit Kokoswedeln auslegen solle, wie das auch sonst beim Pfostensetzen geschieht. Olofád nahm das Blatt der *walimáko*-Pflanze und steckte rote Erde *(láb)*[1] in den Mund. Als er nun in der Grube war, ließen die Männer rasch den Balken fallen, doch Olofád bohrte schnell mit einer Kokosblattrippe einen Kanal durch das weiche Mark des Stammes, durch den er die rote Erde und das gekaute Blatt ausspuckte, so daß der Brei am Balken außen herunter lief. Da hielten die Männer Olofád für tot und glaubten, der rote Saft sei Blut und die Blätterreste Galle. Als nun das Haus fertig war, richtete Lugeilán für alle Arbeiter ein Essen im Hause her. Olofád aber kroch durch die Höhlung im Mark des Pfostens empor und setzte sich ungesehen auf einen Querbalken. Während die anderen aßen, befahl er einer Ameise, ihm ein kleines Stück Kokosnuß zu holen. Sie tat es. Olofád rollte es von einer Hand in die andere und sagte, es solle zu einer ganzen Nuß werden. So geschah es auch. Dann ließ er sich ein Sandkorn holen und machte es auf die gleiche Weise zu einem Stein[2], mit dem er die Nuß aufschlug. Da blickten alle nach oben und waren sehr erstaunt, Olofád wieder unter den Lebenden zu sehen. Daran erkannten aber alle, daß Olofád kein gewöhnlicher Erdenmensch, sondern der Sohn des Lugeilán war. Dieser forderte Olofád auf herabzukommen und mitzuessen. Nun trachtete ihm niemand mehr nach dem Leben. Im Fadjemál wurde Olofád auch tatauiert. So lebt er ungestört im Himmel, hin und wieder geht er nach Süden, Westen, Osten oder Norden und sieht zu, wie die Erdenmenschen tanzen und singen, denn das liebt er. Aber immer wieder kehrt er ins Fadjemál zurück.

Ein anderer Gewährsmann Sarferts erzählte noch folgende Episode zu dieser Geschichte. Olofád sah die Leute Kokoswedel von den Palmen zum Flechten der Dachmatten abschlagen und erbat sich von ihnen ein Messer, um mitzuhelfen. Die Männer schlugen ihm aber seine Bitte ab bis auf einen, der ihm sein Messer lieh. Olofád stieg auf eine Palme und schlug Wedel ab. Als er keine Lust mehr zur Arbeit hatte, gab er dem Mann sein Messer zurück und sagte beim Fortgehen: »Alle Männer sollen plötzlich erstarren, wo sie gerade sind, und sollen sich nicht mehr bewegen können!« So geschah es auch. Die Männer blieben steif und starr, wie sie gerade standen, der eine beim Emporklettern, der andere beim Hinabsteigen, der dritte beim Abschlagen, wieder ein anderer, wie er gerade die Wedel zum Haus trägt. Nur der hilfsbereite Mann, der Olofád das Messer borgte, konnte sich frei bewegen.

Auch Baluelób[3] ist ein Himmelsbewohner, über seine verwandtschaftliche Stellung zu Aluelób war nichts Sicheres zu erfahren, manche halten ihn für dessen

[1] Dume gibt es nach Sarfert nur auf den »hohen Inseln«.

[2] Die gleiche Zaubermethode wie auf S. 86.

[3] Über ihn sollen die Mogemog- und Polap-Leute sehr viel wissen; von ihnen erfuhren es die übrigen Inselbewohner.

2: Damm et al. OR21 Woleai

Sohn. Er lebt mit seiner Frau Jiawók und seinen Söhnen Älülüél, Selân, Farawâl und Allülümâdj im Fadjemâl und besuchte in alter Zeit gleich den übrigen Himmelsbewohnern auch die Erde, wie ja damals auch die Menschen zum Himmel Zutritt hatten. Balüelôb ist ein Segelkundiger, der sich auch darauf versteht, zerbrochene Boote wieder herzurichten.

Auch seine oben genannten Söhne verstehen sich auf Schiffahrt. So sorgt Älülüél dafür, daß die Eingeborenen in ihren Booten den richtigen Kurs segeln und auch die Inseln finden, die sie besuchen wollen. Er hält schlechtes Wetter fern und sorgt für gute Brise. Dafür müssen die Kapitäne *bdnewan* machen und ihm einen Lendenschurz und zwei Kokosnüsse als Opfer auf dem Boot auslegen. Wenn eine schwere See kommt, so holt sich Älülüél diese Gabe, d. h. er spült sie ins Meer. — Älülüél lebt auf der Insel Btemâl, die im Süden von Ifaluk liegt und in einer Bootreise von drei Monaten erreichbar sein soll. Sie ist unbewohnt und ist nur mit einem Pandanus-Baum bestanden. Hier steht auch das Bootshaus des Älülüél, Gâmêîm mit Namen, in dem der Geist dünne Kokosschnur *(galogâl)* für Netze, Häuser und dergl. herstellt.

Selân ist der eigentliche Kanubauer; er fertigte auch das erste Boot in Môdj an, einer kleinen bewohnten Insel im Osten, die von Truk aus vier Tagereisen im Boot südwärts liegt, und lehrte diese Kunst den Menschen. Über sein *bdnewan* s. S. 92.

Farawâl ist für das Wetter zuständig. Er sieht bereits bei Sonnenaufgang, ob es Regen geben wird oder nicht und meldet es Älülüél. Für ihn gibt es kein *bdnewan*.

Älülümâdj weiß wie sein Vater, durch Sturm und Flut zerbrochene Boote und Häuser wieder herzustellen. Wie er seine Kunst den Menschen mitteilte, ist nicht mehr bekannt.

Das Luftreich und seine Bewohner. Der Regenbogen ist ein männlicher Geist namens Lâûliâr, der im Dienste des Himmelskönigs steht. Über seine Abstammung wußten die Eingeborenen nichts. Er kam einst in einem großen Treibholzbalken nach Ifaluk geschwommen. Eine Frau namens Illegferi wusch gerade ihr Kind Illebanigf im Wasser und hatte ihren Lendenschurz weggelegt. Lâûliâr ergriff ihn und gab ihn der Frau nicht eher wieder, als bis sie einwilligte, seine Frau zu werden. So gingen sie zusammen in ihr Haus und Lâûliâr verblieb hier solange, bis Illebanigf groß war. Da lehrte er ihm das *bdnewan* (S. 91) und von diesem erfuhren es dann die Ifaluk-Leute. Lâûliâr ging nun wieder zum Himmel.

Die Erde wird nach Eingeborenen-Auffassung von Âudjâl, der Schwester des Himmelskönigs beherrscht (s. S. 86). Sie hat die normale Gestalt einer Frau und keinen Tierrumpf. Trotzdem sie unverheiratet war, bekam sie viele Kinder, die alle Inseln bevölkerten. Sie ist für die Insulaner die Urmutter der Menschheit. —

Ʌudjál verlangte von ihren Kindern Tribut und diesem Befehl wurde getreulich bis in die Jetztzeit nachgekommen. Da ihr Haus Lamolû oder Lamorû in Kârebar[1] auf Yap steht, bestimmt der jeweilige König von Kârebar für die einzelnen Inseln den Zeitpunkt der Tributlieferung. Die Höhe des Tributes ist verschieden, je nachdem, was zusammenkommt. So bringen die Ifaluk-Leute Lendenschurze, einheimische Kästen, Harz von Brotfruchtbäumen zum Dichten der Boote. In dem Bootshaus, das Sarfert bewohnte, stand eine Kiste mit etwa zwanzig Lendenschurzen für Ʌudjál.

Baumgeister. Auch auf den Bäumen leben Geister, sie heißen Ällüsiliwôli. Ihr König ist Jalûlefâlu, der seine Weisungen von Lugeilân erhält und sie dann an seine Untertanen weitergibt. Sie verfolgen vor allem die Menschen, die dem irdischen Häuptling nicht gehorchen.

Das Meer ist ebenfalls mit Geistern (Ällüsidâd) bevölkert, die Solâl unterstehen. Durch ein *bânewan*, das man im Boot vornimmt, kann man sie sich günstig stimmen. Solâl befiehlt dann den Geistern, dem Fischer reiche Beute zu bescheren.

3. Das *bânewan* für die einzelnen Gottheiten.

Bânewan bedeutet Anrufung einer Gottheit; einzelne Himmelsbewohner haben eine Art Sinnbild *(wâlewôli)*[2], das bei dem *bânewan* eine gewisse Rolle spielt. Wie die Menschen davon erfuhren, ist nicht in allen Fällen bekannt. Bemerkenswert ist dazu der Hinweis der Insulaner, daß die Mogemog- und Polap-Leute zuerst weite Strecken zu durchsegeln verstanden und Sarfert sich deshalb in dieser Frage besser an sie wenden solle. Jedenfalls verstehen sich nur ganz bestimmte Männer auf *bânewan*.

1. Das *bânewan* für Lugeilân wird bei Krankheiten angewendet, da dieser Gott ja die Menschen krank werden läßt. Um Erfolg zu haben, müssen vier verschiedene *bânewan* nacheinander in einem Zwischenraum von etwa 4—5 Tagen vorgenommen werden. Am besten dazu ist die Zeit, wenn der Mond im Westen oder Osten steht, d. h. klein ist. Ist die Krankheit auch dann noch nicht gewichen, so gibt es keinerlei weitere Mittel, um eine Heilung herbeizuführen. — Diese *bânewan* wurden von Solâl dem Aluelôb vermittelt, der sie einerseits an Lugeilân, andererseits aber auch an seine Schwester Ʌudjál weitergab, von dieser erfuhren es die Menschen. 1909 waren diese *bânewan* noch zwei Männern bekannt. — Das Sinnbild *(wâlewôli)* ist ein Paddel, an dessen Stiel zwei Kokosblattknoten befestigt sind.

2. Für Lâuliâr gibt es zwei *bânewan*, um nämlich den Regenbogen zu vertreiben mit dem Lâuliâr die Boote auf See zerstören will. Die *bânewan* haben aller-

[1] Ist Gatschepar auf Yap (s. S. 83 Anm. 1).

[2] Nach anderer Version von Sarfert heißt das *bânewan*-Machen *walewôli*.

dings nur dann Erfolg, wenn die Bootsinsassen Äluelöb nicht zu sehr erzürnt haben und dieser sie nicht etwa vernichten will. Diese *bânewan*, die *farueläs* genannt wurden, waren nur zwei Männern, jedoch nicht dem König, bekannt. — Als Sinnbild diente eine Axt *(dâlâ bâlâl)*, die vom letzten Taifun mit fortgeschwemmt wurde; jetzt gibt es kein solches *waliwol* mehr.

3. Das *bânewan* des Ällülümädj heißt *bôuwân*. Man wendet es bei Hausreparaturen an. Mit dem *waliwâl*, einem Tanzstab mit einem Kokosblattknoten *(uwâd)* an dem einen Ende (Abb. 173), stößt man unter Hersagen des Spruches nach dem zusammengestürzten Haus und umgeht es dabei.

Abb. 173. Kokosblattknoten für bânewan (nach Skizze Sarfert).

4. Das *bânewan* für Älülüél heißt *liolâl*; es war eine mit Rochenstacheln versehene Holzfigur (S. 35), doch fand Sarfert noch ein weiteres *waliwâl* des Älülüél in Gestalt einer Muscheltrompete *(dâlâ)* im Männerhaus hängend (Abb. 174); es gehörte einem Kapitän. Beide dienen dazu, den Regen zu vertreiben. Unter Hersagen eines Spruches schwenkt man das erstgenannte *waliwâl* hin und her und sticht mit seiner Spitze auf das Unwetter zu, die Muscheltrompete wird dagegen hin und wieder geblasen.

Abb. 174. Muscheltrompete als bânewan (Hamburg 1857II, Länge 30 cm).

5. Das *bânewan* für Leläñ heißt *lümâliwalewal*. Es wird beim Kanubau gesprochen und zwar dann, wenn Bug- und Heckaufsatz angebracht werden. Dabei wird jedem Arbeiter ein Kokosblattknoten umgehangen.

6. Baluelöb hat kein besonderes *bânewan*, auf ihn werden die des Leläñ und Älülüei mit angewendet.

7. *Bânewan* mit Kokosblattknoten für Meergeister s. S. 91.

4. Totenreich und Seelenvorstellung.

Die »Totenseelen« *(nôli)*[1] halten sich in den Lüften auf; eine Totenwelt wie die Bur-Leute kennt man nicht.[2] Die *nôli* können unsichtbar auf der Erde umher-

[1] Zur Abgrenzung dieses Begriffes seien noch folgende Eingeborenenworte angegeben: Schatten = *nôw*, Name = *idâl*.

[2] Nach Sarfert ist auch Lugeläd unbekannt; man kennt ihn jedoch als Geist der Mogemog-Insulaner.

2: Damm et al. OR21 Woleai

wandeln oder sie gehen durch die Luft gleich einem Wind. Herrscher über die Totenseelen ist Lugeilān bzw. Āluelōb.

5. Tapu.

Āluelōb setzte das Tapu *(etāb;* Gegenteil davon ist *dātāb)* ein. Liegt das Tapu auf einem Menschen, so darf man von diesem weder zu essen noch zu trinken annehmen oder ihm etwas geben. Auch Beischlaf ist dann verboten. — Das Tapu tritt bei verschiedenen Gelegenheiten in Kraft und dauert gewöhnlich vier Tage.

a) Macht jemand *bdnewan*, so ist er vier Tage lang tapu, und falls damit eine Krankenheilung bezweckt wurde, gilt dies auch für den Patienten.

b) Frauen im Bluthaus sind tapu und zwar bei Menses vier Tage bzw. bis Ende des Monatsflusses, bei Geburten zehn Tage lang.

c) Macht ein Mann ein Orakel *(bud)* für einen andern, der etwa nach einer entfernt liegenden Insel fahren will, so ist er vier Tage lang tapu.

d) Beim Bootbau sind alle Arbeiter tapu und zwar nur an den Tagen, an dem das *bdnewan* gemacht wird (S. 54).

Auch sind einzelnen Personen bestimmte Dinge tapu; so dürfen die Kapitäne oder Leute, die das *bdnewan* für Āllūlēt wissen oder solche, die aus geknoteten Kokosblattstreifen wahrsagen *(bud)*, nicht zum Bluthaus gehen. Ebenso liegt ein allgemeines tapu auf den Brotfruchtbäumen, d. h. es dürfen keine gefällt werden.

Ob die Sitte, daß die Frauen nicht das Kanuhaus betreten dürfen, auf ein einstiges tapu zurückgeht, wußten die Eingeborenen nicht; sie behaupteten nur, es sei eine alte Sitte. Ebenso unklar ist der Ursprung der Sitte, bestimmte Meerestiere nicht zu essen: so wird ganz allgemein weder der Hai verzehrt, denn er frißt Menschen und deshalb fürchten ihn die Leute, noch der *bdro*, *ldwud*, *lōdj* (giftiger Fisch) und *fāfi* (Rochen).

Vgl. auch Tod, Geburt, Heiratsverbote.

74

XI. Musik, Tanz und Spiel.

Musikinstrumente im eigentlichen Sinn fand Sarfert nicht vor, wenn man nicht die allgemein bekannte Trompete aus Tritonsmuschel[1] dazu rechnen will, die letztlich mehr ein Signalinstrument ist. Trommeln sind nicht bekannt. — Dafür sind die Eingeborenen umso sangesfreudiger. Neben **Tanzliedern** (s. unten) gibt es noch selbständige Lieder *(gâli*, auch *walugulumâle* oder *gâlumâle)*, die von den Frauen gedichtet sind. Es handelt sich um Liebeslieder, in denen die Vorzüge der Liebhaber gepriesen werden. Männer verstehen sich nicht aufs Dichten. Hai- und Schildkrötengesänge wie auf Sorol fehlen.

Von **Tänzen** *(wâluk)* kennt man Männer- und Frauentänze. Sie sollen alle mitsamt den Texten von Yap und Mogemog eingeführt sein. Über die Erfindung des Tanzes haben sich die Eingeborenen keine Gedanken gemacht. — Die Ifaluk-Leute verstehen keine Texte *(ewadâlu)* zu ersinnen; lediglich von einem 1909 bereits verstorbenen Mann wußten die Insulaner, daß er den Text zu einem *walugisâb* gedichtet hatte.

A. Männertänze *(jalomâle)*: 1. Lâhlâ (Stabtanz). Es wird in zwei Reihen getanzt, wobei die Tänzer mit den Gesichtern einander zugekehrt sind. Der Stab *(gâlugâlu*[2] wird mit beiden Händen in der Mitte gehalten. Der begleitende Gesang ist verhältnismäßig leise und schwillt erst am Schluß stark an[3]. — Der Tanz besteht in Einzeltouren, die sich durch verschiedene Bewegungen und Geschwindigkeiten auszeichnen, kennzeichnend für diesen Tanz ist das Aneinanderschlagen der Stabenden mit Neben- und Gegentänzern. Dabei werden häufig untereinander die Plätze gewechselt, so daß jeder Tänzer am Schluß des Tanzes nie an seinem ersten Platz steht, doch ist die Stellung der Neben- und Gegentänzer zu jedem einzelnen immer die gleiche. Das Schlagen ist gar nicht einfach und erfordert große Gewandtheit. Nicht selten wird in Gruppen zu vieren getanzt.

2. Kabanâk ist ein Stehtanz, der eine gewisse Ähnlichkeit mit dem *walugisâb* hat.

3. Walugisâb ist teils Steh-, teils Sitztanz.

4. Wuliâl; diesen Tanz sah Sarfert nicht.

---

[2] Im Museum Leipzig Mi 3875; formengleich mit Abb. 208 bei Krämer, Truk, Hamburg 1932.

[3] Im Archiv des Hamburger Museums Walze (Org. Nr. 4) mit einem vollständigen und zwei unvollendeten Tänzen.

B. An Frauentänzen *(jalordu:d)* gibt es nur den *dâgar*, der ein gemischter Sitz- und Stehtanz ist[1].

C) Gemischte Tänze *(gabalûdelue)*, bei denen Frauen und Männer zusammen tanzen; sie haben keinen besonderen Namen[2].

D) Kindertänze und zwar Mädchentänze sind bekannt; die Bewegungen sind besonders zierlich und fein. Als Sarfert auf der Insel weilte, hatte ein Junge Mädchentänze von Lamutrik mitgebracht, die jeden Abend getanzt wurden, selbst Frauen nahmen daran teil. — Knaben sah Sarfert nie allein tanzen.

Alle **Spiele** *(ûlu*, Mogemog: *rôgam)* wurden den Kindern abgelauscht; Männer und Frauen sah Sarfert nicht beim Spiel.

a) *gôrefa:* Ballspiel. Der würfelförmige Ball *(gôrefa)* ist aus Kokosblättern geflochten und wird von zwei sich gegenüberstehenden Parteien mit der Hand hin- und hergeschlagen.

b) *gedddal:* Ringkampf, dabei sind Ober- und Untergriff bekannt.

c) *limêl:* gleichzeitiges Springen auf beiden Beinen.

d) *ligefât:* auf den Händen stehen und gehen.

e) *djûerâ:* Es ist ein Fangspiel zwischen zwei Parteien. Jede errichtet einen Sandhaufen als sog. »Ruhe«. Die Parteien suchen sich dann einander zu haschen und nach der »Ruhe« der anderen Partei zu gelangen.

f) *Huas:* Ein Sandspiel, bei dem die Spieler unter Hersagen eines Verses mit dem Zeigefinger Löcher in den Sand bohren und sie dann wieder unter Zitieren eines Verses einreißen.

g) *dilidlli:* ein Laufspiel, zwei Parteien halten sich an den Händen, die eine Partei kreuzt rasch die andere, wobei sich der letzte der einen an einem Burschen der andern Reihe festhalten muß.

h) *sawôfâ:* es ist ein Ziehkampf zwischen zwei Parteien. Diese fassen sich nach Hersagen eines Verses an und ziehen nach entgegengesetzten Richtungen.

i) *lifolûr:* Ein Spiel, das unserem »Fuchs im Loche« ähnelt. Es wird ein Kreis gebildet, in seiner Mitte kniet ein »schlafender Geist«. Die Spieler im Kreis singen, dadurch erwacht der Geist und sucht den Kreis zu durchbrechen, indem er sich auf die gefaßten Arme wirft. Wo er den Kreis durchbricht, muß einer der beiden Schuldigen dann den »Geist« spielen.

k) *fisildla:* es wird ein Kreis gebildet, wobei die Spieler ihr rechtes Bein über das ihres Nachbarn legen. Nun wird ein Lied gesungen und dann machen alle eine Vierteldrehung nach links und hüpfen im Kreis herum. Bei der schwierigen Stellung fallen natürlich einige unter großer Heiterkeit hin.

l) *nôwdâlulugubâl:* vier Spieler stehen in den Ecken eines gedachten Vierecks,

[1] Im Archiv des Hamburger Museums Walze Org. Nr. 3.

[2] Desgleichen Walze Org.-Nr. 1 (von dem Mann Gebagolimâr gesungen); Org. Nr. 2 und 3 (gesungen von dem Mann Molêlê); Org. Nr. 6 von Frauen und Mädchen gesungen.

zwischen ihnen sitzt je ein weiterer Spieler. Diese letzteren stemmen ihre Füße gegeneinander und reichen ihre Hände ihren stehenden Nachbarn zur Rechten und Linken. Die vier stehenden laufen nun in einer Richtung im Kreise herum und bringen dadurch die andern zum Schweben.

m) *imädirdu:* es ist unser »Blindekuhe-Spiel. Die Augen werden mit einem Kokosblatt verbunden.

n) *gafiböl:* Es wird eine Kette gebildet, dann kriecht der erste zwischen dem 2. und 3. durch, wobei die Arme verschränkt bleiben. Dann plötzliches Umdrehen

Abb. 173. Windrädchen (nach Skizze Sarfert); a — Oberseite, b — Unterseite.

mit Schwenken der Arme über den Kopf, so daß man wieder mit richtig gefaßten Händen dasteht.

o) *igalimäd:* die Kinder hocken in einer Reihe hintereinander. Dann wird das letzte von zwei größeren an den Armen gefaßt und mit einem Schwung über die ganze Reihe geschnellt.

An Spielgeräten kannte man außer dem oben genannten Ball, Spielbogen (S. 72), Spielboote (S. 50), Schwirrholz *(legawdliwuli)* aus Kokosblatt, Windrädchen[1] *(legafildu)* aus Blattstreifen mit Achse aus einer Kokosrippe (Abb. 175), Pfeife *(gädigedik, gädik)* aus Kokosblatt (vgl. Faraulip).

[1] Kommt nach Sarfert auch auf Buka vor.

97

XII. Verschiedenes.

Kunst.

Lediglich die Männerhäuser zeigen eine gewisse kunstvolle Ausschmückung durch farbige Ornamente *(kawoludl)*. So waren in früheren Jahren die mittleren Stützpfeiler und ebenso die Dachträger *(wdu)* reich verziert. Sarfert fand im damaligen Männerhaus unter dem Dach noch einen alten Träger, an dem zwei Seiten das *rafdm*-Muster[1] (Abb. 176), dessen Vorlage nicht mehr bekannt war, zierten, während die dritte ein doppel-

176

177.

178.

179.

Abb. 176—179.

Abb. 176. *rafdm*-Muster (nach Skizze Sarfert). — Abb. 177. *wdwo*-Muster (nach Skizze Sarfert). — Abb. 178. *karebäli wulugdlö*-Muster (nach Skizze Sarfert). — Abb. 179. Holzfisch (Hamburg 31849, Länge 43 ½ cm).

zeiliges Rautenmuster, *wdwo* genannt, zeigte, das ein Fisch gleichen Namens sein sollte (Abb. 177).

An dem Pfosten eines kleinen Wohnhauses sah Sarfert noch das senkrechte *karebäli wulugdlö*-Muster, das den Schwanz des *wulugdlö*-Fisches vorstellen sollte (Abb. 178).

Schnitzereien gab es so gut wie keine: lediglich Krämer fand im Häuptlingshaus einen Holzfisch (Abb. 179); ferner wären unter künstlerischen Erzeugnissen noch die *walwdl* für Allülöl zu nennen.

Zeiteinteilung.

Das Jahr hat keinen besonderen Namen; es zerfällt in zwei Abschnitte: *edjdk* oder *rdk* ist die Jahreszeit, in der Westwind vorherrscht, während *dawdl*, auch *nfwdn*, die Zeit des Ostwindes ist.

Das Jahr hat 12 Monate, deren Namen Sternbilder *(fdl)* bezeichnen; sie verteilen sich auf die Jahreszeiten folgendermaßen:

[1] Ist nach Sarfert auch auf Sorol bekannt.

7 [illegible]

čwän	*edjâk*
elüôl	*mâdjîk*
mâlu	*mâlôb*
îdj	*sôdâ*
djelewôl	*lâke*
elemâudj	*gû*[1]
dumûl	*ûl*

Sarfert bestimmte z. B. den 7. November 1909 als 26. Tag des Monats *mâlu*. — Jeder Monat hat 30 Tage *(râu, dâuat)*, die nach Mondphasen bezeichnet werden; ihre Namen sind:

1. *sugôru*
2. *jelîn*
3. *mâdjälîn*
4. *mâdjâl*
5. *mâdjafâs*
6. *mâdjoâl*
7. *mâdjâlo*
8. *lamâdjâl*
9. *djuawôn*
10. *âbôi*

Schrift.

Wie die Ifaluk-Leute zur Schrift (s.Abb 180.) kamen, berichtet folgende Geschichte. Ein Truk-Missionar wurde auf der Fahrt von Olol nach Truk im Segelboot mit mehreren Truk-Leuten nach Aurepik verschlagen. Dort blieb er längere Zeit, bis ein Oleai-Boot mit dem Häuptling kam. Dieser forderte den Missionar

Abb. 180. Schriftprobe eines Ifaluk-Mannes.

auf, mit zu seiner Heimatinsel zu segeln. Das geschah auch. Der Missionar fuhr mit seinen Truk-Leuten in Begleitung des gastfreundlichen Häuptlings nach Oleai und blieb auch für immer hier. Damals gab es schon einen Händler auf Oleai. Die Truk-Leute verstanden bereits zu schreiben und lehrten diese Kunst ihren Gastgebern. Schließlich fuhren sie über Ifaluk und Lamutrik zurück und so lernten auch diese Insulaner die Schriftzeichen kennen.

100

XIII. Zur Sprache.

Lütke hat bereits über die sprachlichen Verhältnisse der Karolinen wichtige Erkenntnisse vorgelegt. Er stellte die Ähnlichkeit aller dieser Sprachen fest, dabei fiel ihm auf, daß man von Lukunor bis Uluti »une même langue radicale« spricht, obgleich beträchtliche Abweichungen besonders hinsichtlich der Aussprache vorliegen[1]. Das kommt auch in den Urteilen anderer zum Ausdruck; so behauptet Cheyne, daß die Ifaluk-Leute die gleiche Sprache wie auf Oleai[2] sprechen, dabei ist eine starke Übereinstimmung des Wortschatzes mit dem von Satowal unverkennbar[3]. Girschner erfuhr, »daß auf dieser Insel noch heutigentages Kusai gesprochen werde.«[4]

Für den Lautwandel lassen sich folgende Gleichungen aufstellen:

Ifaluk	Satowal
l	n (r)
n, r	l
s	' j
d	s

Zur Aussprache wäre zu bemerken:

ł = engl. l, d. h. die Zungenspitze fest an die Alveolaren angelegt und schnell losgelassen. -š = Zunge liegt hoch nahe beim Gaumen.

Demonstrativpronomen. Dieser Mann da (der nebenstehende Mann) = *älimätäl*, jener Mann dort (der etwas fernstehende Mann) = *älimätälå*.

Personalpronomen. Ich = *gåṅ*, du = *gål*, er = *te*, wir (inkl. ich und du) = *głdj*, wir (exkl.) = *gamåm*, ihr = *gåmi*, sie = *tle*.

Für das **Possessivpronomen** gilt das gleiche, was für Polowat gesagt wurde. a) Für Personen- und Verwandtschaftsbezeichnungen hat man nachgestellte (suffigierte) Pronomina:

mein Vater	*demåī*
dein Vater	*demåm*
sein Vater	*demål*
unser Vater	*demår*

[1] Lutké 1835, Vol. II, S. 350.
[2] Cheyne 1852, S. 137.
[3] vgl. Damm und Sarfert 1935, S. 278.
[4] Girschner 1911, S. 129 Anm. 1.

euer Vater *demâmi*
ihr Vater *demâle.*

b) bei allen lebendigen Wesen (Tieren usw.) werden dagegen zusammengesetzte und vorangestellte Pronomina angewendet.

mein Hund *lâ̂ gelâgu*
dein Hund *lâmu gelâgu*
sein Hund *lâl gelâgu*
unser Hund *lâ̂re gelâgu*
euer Hund *lâ̂mi gelâgu*
ihr Hund *lâ̂le gelâgu*

c) für Bäume und Pflanzen wird das Pronomen vorangestellt.

meine Kokospalme *gelâ̂ lâ̂*
deine Kokospalme *lümôm lâ̂*
seine Kokospalme *lümêle lâ̂*
unsere Kokospalme *lümâre lâ̂*
eure Kokospalme *lümi lâ̂*
ihre Kokospalme *lümâle lâ̂*

d) für leblose, zum Essen getötete oder gefangene Wesen gelten Formen ähnlich wie unter a), z. B. *gelâ̂ mälûk* = mein (zum Essen bestimmtes) Huhn, *gelâm lk* = dein (getöteter) Fisch usw.

Zahlworte.

1	*sâu*	80	*walłk*
2	*ruôu*	90	*diuēīk*
3	*selâ*	100	*säwûgu*
4	*fâū*	200	*ruowûgu*

jalōt = fertig.

Bemerkenswert ist dabei die Tatsache, daß die Einer von 5 bis 7 auch unter *dako* in Verbindung mit dem nächsten Zehner wiedergegeben werden; also

dakosāk = 5 oder 6 oder 7
dakoruēik = 15 oder 16 oder 17 usw.

Ebenso sagt man:

dakosāwūgu = 50 oder 60 oder 70, auch 80
dakoruowūgu = 150 oder 160 oder 170, auch 180.

wenig *daidōulōb* oder *galisemīt*
viel *dōulōb*
halb *sēdab*
viertel *darosedāb*
achtel *marōlōb*
drittel *selidāb*
anderthalb *sāu mäsedāb*
alle *jōlo*
gehen *lālak*

Verbum.

Präsens:

ich gehe (jetzt; d. h. ich bin im Begriff zu gehen)	*iwilâlak*
du gehst	*kowolâlak*
er geht	*äwolâlak*
wir gehen (inkl.)	*kaiwilâlak*
wir gehen (exkl.)	*siwilâlak*
ihr geht	*kaisalâlak*
sie gehen	*räwilâlak*

Imperfekt:

ich ging	*ilâko lâlo*
du gingst	*kolâko lâlo*
er ging	*älâko lâlo*
wir gingen (exkl.)	*silâko lâlo*
ihr gingt	*kailâko lâlo*
sie gingen	*rälâko lâlo*

Futur:

ich werde gehen	*iwâlak lâlu*
du wirst gehen	*kowâlak lâlu*
er wird gehen	*äwâlak lâlu*
wir werden gehen (exkl.)	*siwâlak lâlu*
ihr werdet gehen	*kaiwâlak lâlu*
sie werden gehen	*räwâlak lâlu*

Die entsprechenden Formen des Verbums schlafen *mädjûl* sind

ich schlafe	*iwimädjûl* (ich möchte schlafen = *igadû mädjûl*, ich möchte nicht schlafen = *igañâua mädjûl*)
ich schlief	*imädjûlu lâlo*
du schliefst	*komädjûlu lâlo*
ich werde schlafen	*iwämädjûl*

Die **Längenmaße** werden vom menschlichen Körper genommen, d. h. was die Gewährsleute Sarfert's mit »Faden« bezeichnen, ist die Länge der ausgestreckten Arme samt Brustbreite.

ein Faden	*ändʃ*	vier F.	*jañdʃ*
zwei F.	*ruañdʃ*	fünf F.	*limañdʃ*
drei F.	*selindʃ*	sechs F.	*oloñdʃ*

sieben F.	*fišiṅdʃ*	neun F.	*diuṅdʃ*
acht F.	*waliṅdʃ*	zehn F.	*sȧk*

Kürzere Längen bezeichnete man einfach durch Abgreifen am Körper, z. B.

das erste Fingerglied	*makorĺk*
das erste und zweite Fingerglied	*makōldp*
eine Fingerlänge	*segđd*
eine Handlänge	*sābäranĺm*
ein halber Unterarm	*sädjeliwȯr*
ein Unterarm	*sämåluk*
ein Arm	*säbȧ̊u*
ein Arm und eine halbe Brust	*sädilȯ̊up*
ein Arm und Brust	*säjđl*
ein Arm und Brust und ein halber Arm (bis Ellenbogen)	*göbȧ̊u*
ein Arm und Brust und dreiviertel Arm (bis zur Mitte des Unterarms)	*dalidȧ̊ne göbȧ̊u*
ein Arm und Brust und ein Arm (bis zur Handwurzel)	*dago äṅdʃ*
Länge der ausgebreiteten Arme und Brust	*äṅdʃ*

Adjektiva.

Aurepik.

Nach den Aufzeichnungen von Dr. E. Sarfert bearbeitet
von Dr. Hans Damm.

(p. 108 is blank)

107

Aurepik.

Allgemeiner Teil.

I. Äußere Geschichte.

Entdeckung und Erschließung. Aurepik ist wie die Mehrzahl der zentralkarolinischen Inseln dem Abendland zuerst durch den Brief des Pater Clain vom 10. Juni 1697 bekannt geworden und zwar unter dem Namen »Yaropie«[1], auf der diesem Brief beigegebenen Karte findet sie sich jedoch nicht.[2] Folgen wir Krämer, dem das Verdienst zukommt, die Entdeckungsgeschichte Mikronesiens kritisch bearbeitet zu haben, so findet sich unsere Insel erstmalig auf der Karte des Piloten Somera angegeben, der 1710 unter dem Kommando des Don Francisco de Padilla stand. Und zwar glaubt Krämer, daß die darauf verzeichnete »Isla de Casa« (Hausinsel) mit ihr gleich sei, weil die eigenartigen, auf hohen Steinterrassen errichteten Häuser der Insel ihr besonderes Gesicht geben und bei jedem Besucher einen unvergeßlichen Eindruck hinterlassen.[3] Auf der Eingeborenenkarte des Cantova (1721) findet sich das Atoll als »Eurrupuc« und kehrt unter diesem Namen auch auf der Karte von Vaugondy (1756) wieder.[4]

Die im Kolonial-Lexikon (Bd. I, S. 98) zu findende Angabe, »Aurepik wurde wohl schon von Hunter 1791 entdeckt«, ist nicht haltbar und geht wohl auf Gulick (1867 S. 59) zurück. Sie erklärt sich wohl aus einer mißverstandenen Angabe bei Chamisso (Bemerkungen und Ansichten S. 104), der schreibt; »Vergleiche die Phillip-Inseln von Cpt. Hunter 1791 und die two Islands 1791, die wir bereits mit mehr Wahrscheinlichkeit bei Eurüpük angeführt haben.« Damit wollte er aber sicher keine Gleichsetzung mit dieser Gruppe vornehmen, denn auf S. 98 führt er sie gesondert anschließend an Aurepik an. Ich halte die Erklärung von Brigham (1900, S. 148), daß die Phillips-Inseln Sorol seien, für richtiger.

Am 12. April 1828 sichtete Lütke von Westen her kommend die Insel »Eourypyg«, wie er sie schreibt (v. Kittlitz: »Eurupyk«), landete jedoch nicht, sondern fuhr mit nördlichem Kurs weiter (Abb. 181)[1]. Die Eingeborenen kamen, trotzdem viele Boote am Strand lagen, nicht zum Schiff. Die Erklärung sucht v. Kittlitz in einem Tabu, das anläßlich eines Jahresfestes auf die Boote gelegt sein könnte[2]. Im September 1844 besuchte Andrew Cheyne die Insel[3] und am

Abb. 181. Karte von Aurepik nach Angabe von Lütke (1828).

25. März 1876 lief N. v. Miklucho-Maclay[4] auf dem kleinen Handelsschoner »Sea-Bird« die Inselgruppe an, doch fuhr er nicht an Land.

Am 31. Oktober 1909 legte das Expeditionsschiff der Hamburger Südsee-Expedition, der »Peiho«, an und setzte Sarfert an Land, der hier bis zum 2. November blieb. Zu damaliger Zeit besuchte das Schiff »Scotts« von Yap aus hin und wieder die Insel und auch die Japaner liefen hier mehrfach an[5].

II. Geographie.

Name. Außer den zuerst bekannt gewordenen Eingeborenen-Namen »Yuropie« und »Eurrupuc« findet sich noch die von Lütke angewendete Schreibung »Eourypyge« (s. oben), die von Brigham[1] in Eurupig verwandelt wurde; v. Miklucho-Maclay wendet Auropik an. Die Mehrzahl der Entdecker und Walfänger gab der Gruppe jedoch neue Namen: sei es daß kennzeichnende Merkmale der Inselgruppe dazu die Anregung gaben (Low Islands) oder irgendein anderer Name gewählt wurde (»Kama« nach Horsburgh[2]). Alle diese Namen fanden auch Eingang in Meyer's Kolonialreich und in das Kolonial-Lexikon[3]. Beide benutzen jedoch als Hauptstichwort die Schreibung des Reichsmarine-Amtes »Aûrepik«[4]. Die japanische Regierungskarte von 1925 hat dagegen die Schreibung »Eauripik«. Die wissenschaftlichen Teilnehmer der Hamburger Südsee-Expedition geben den Inselnamen in folgender Schreibung an:[5] Aurepik (Sarfert), Auripig (Hambruch), Aûrupeg (Krämer), Jâurupek (Hellwig). Im vorliegenden Text wird die Sarfertsche Schreibung angewendet.

Die erste genauere **Karthographie** dieser Inselgruppe geht auf Lütke (1828) zurück, der den Archipel nur von weitem sichtete[6] und von ihm deshalb nur ein ungefähres Bild geben konnte (s. Abb. 181). Die einzelnen Admiralstabskarten der seefahrenden Mächte (s. Abb. 182) geben ebenfalls noch kein genaues Bild von der Gruppe, das erst durch die Kartenaufnahme des ersten Offiziers Lorenzen vom »Peiho« geschaffen worden ist (Abb. 183).

Lage und Größe. Die ovale Gestalt dieses Atolls hat bereits Lütke in seiner Karte (Abb. 181) richtig wiedergegeben, auch Cheyne[7] beschreibt sie in dieser Weise und gibt den größten Durchmesser der Lagune in OSO—WNW-Richtung mit 2½ Meile an. Meinicke[8] bezeichnet Aurepik als seine kleine Laguneninsel von ½ Meile Länge«, die aber in Wirklichkeit nach Lorenzens Karte 5¹/₂ Sm lang ist. Die Längen- und Breitenangaben einzelner Quellen enthält die folgende Aufstellung:

---

[1] Brigham 1900, S. 62.
[2] Meinicke 1888, Bd. II, S. 339.
[3] Sievers 1910, Bd. II, S. 364; Kolonial-Lexikon Bd. I, S. 98.
[4] Thilenius 1927, S. 245, dazu S. 185, Anm. 1.
[5] Thilenius 1927 S. 245, Anm. 1.
[6] Cheyne (1852 S. 138) sagt, daß man die Inseln bereits auf 12—13 Meilen Entfernung vom Schiffsdeck aus sehen kann.
[7] Cheyne 1852, S. 138, 145. [8] Meinicke 1888, S. 339.

Abb. 182. Japanische Regierungskarte von Aurepik (1915).

Abb. 183. Aurepik. Kartenaufnahme des ersten Offiziers Lorensen vom Expeditionsschiff „Pelle" (1909).

Jahr	Entdecker und Reisende	nördl. Breite	östl. Länge
1828	Lütke[1]	6° 39′ 44″	216° 49′ 2″
	Horsburgh[2].....	6° 40′	143° 11′
1844	Cheyne[3].....	6° 35′	142° 59′
	Raper[4]	6° 40′	143° 11′
1900	Brigham[5]	6° 40′	143° 10′
1910	Sievers[6]	6° 43′	143° 10′
1920	Kolonial-Lexikon[7]	6° 42′	143° 6′
1925	Japan. Regierungskarte[8]	6° 41′ 12″	143° 4′ 49″

Die Zahl der **Inseln** wurde von Lütke und v. Kittlitz im Text mit zwei, auf Lütke's Karte dagegen mit vier angegeben[9]. Auch Cheyne[10] spricht nur von zwei niedrigen Koralleninseln, von denen die östlichste, also die Hauptinsel, bewohnt und deren jede etwa eine Meile lang sei. Meinicke[11] scheint eine dieser Quellen benutzt zu haben, vermutlich hat ihm Cheyne vorgelegen, denn er weiß auch nur von zwei kleinen Inseln an der Nordseite, von denen die östlichste allein bewohnt sei. Miklucho-Maclay meint dagegen drei kleine Inseln gesehen zu haben[12]. Die gleiche Zahl nennt auch Sievers[13], zwei davon gibt er richtig als bewohnt an. In Wirklichkeit ist der Riffkranz der Gruppe mit fünf Inseln besetzt: Aurepík, Uáu, Ellanidigít, Bägefás, Sidéne, von denen aber nur die am Ostende des Atolls gelegene Hauptinsel Aurepík und die am weitesten westwärts gelegene nächst größere Uáu besiedelt sind.[14] An der Südseite der Hauptinsel ist ein Landeplatz für Boote bei Hochwasser[15]. — Die verschiedene Schreibweise der einzelnen Inselnamen zeigt die Tabelle:

---

[1] Gilt nur für die östlichste Insel (vgl. Lütke's Karte).
[2] Meinicke 1888, Bd. II, S. 339.
[3] Cheyne 1852, S. 138.
[4] Cheyne 1852, S. 138.
[5] Brigham 1900, S. 62.
[6] Sievers 1910, Bd. 2, S. 364.
[7] Kolonial-Lexikon 1920, Bd. 1, S. 98.
[8] Gilt für die Hauptinsel.
[9] Lütke 1835, Vol. II, S. 148; v. Kittlitz 1858, Bd. II, S. 163. Möglicherweise erklärt sich die Differenz zwischen Text und Karte damit, daß Lütke von dem Unbewohntsein zweier Inseln wußte und sie deshalb im Text nicht erwähnte.
[10] Cheyne 1852, S. 138, 145. Diese Angabe hat wohl auch Brigham übernommen (1900 S. 62).
[11] Meinicke 1888, Bd. II, S. 339.
[12] Miklucho-Maklai 1877, S. 193.
[13] Sievers 1910, Bd. II, S. 364. Im Kolonial-Lexikon findet sich darüber nur eine kurze nichtssagende Angabe.
[14] Desgl. bei Sievers 1910, Bd. II, S. 364.
[15] Pacific Islands Pilot 1933, S. 301.

Sievers	Reichsmarineamt	Sarfert	Lorenzen	Jap. Karte
Aurepik	Aũrepik	Aurepfk	Aurepiik	Eauripik
Uau	Oão	Uãu[1]	Oão	Oao
—	—	Ellanidigft	Elangkilekit	Elangkileku
—	—	Bägeffis	Behefas	Bekefas
Siting	—	Sidéõe	Sitong	Siteng

Das **Riff** hat nach Brigham[2] einen Umfang von 2½ Meilen und besitzt keinerlei Durchfahrt zur Lagune; ein mangelhafter Durchlaß befindet sich an der SO-Seite, der es den Eingeborenen doch immerhin ermöglicht, bei Hochwasser die Boote über das Riff zum Strand zu bringen[3]. Diese Schwierigkeit mag vielleicht die Insulaner seinerzeit davon abgehalten haben, das im Norden der Insel vorüber-segelnde Schiff Lütke's in ihren Booten aufzusuchen (vgl. S. 110)[4]. Die Brandung ist doch sehr stark und zwar nach dem Pacific Islands Pilot[5] bei leichten südwestlichen Winden an der Nordseite. Sie kostete Sarfert, als er im Boot zum »Peihos« zurückfuhr, fast das Leben; sein Boot kenterte, dabei gingen alle Fotos und Ethnographica verloren[6].

Auch diese Insel litt schwer unter dem gewaltigen Taifun vom März 1907 (s. S. 6 f.)[7], dessen Spuren noch 1909 sichtbar waren. Die Eingeborenen erzählten Hambruch, daß der damalige Taifun einen Teil des Ostendes der Insel weggerissen habe. Schon vor vielen Jahren — es sollen etwa 60 Jahre verflossen sein — soll ein ebensolches Unwetter die Insel heimgesucht haben.

Allgemeines über Klima und Temperatur auf den Karolinen vgl. bei Singer (1899, Globus Bd. 76 S. 41).

1914	etwa 50	Finsch 1914 S. 64.
1930	113	Pacific Islands Pilot 1933 S. 501.

III. Demographie.

Anthropologisches. Die Eingeborenen erinnerten Sarfert auf den ersten Blick an Sorol-Leute. Dabei waren zwei Typen zu unterscheiden: ein breitköpfiger und stämmiger und ein schlanker, schmalköpfiger, letzterer war jedoch nicht so häufig. Auffällig waren die vielfach männlichen Züge bei Frauen; dieser Eindruck wurde noch durch die Haartracht verstärkt. Das leicht gewellte Kopfhaar wird nämlich sehr gern bis auf einen Teil über der Stirn kurz getragen, andere tragen es lang oder gescheitelt. Die Haartracht war also nicht einheitlich. So hat Miklucho-Maclay unter den ihn besuchenden Eingeborenen scheinbar keine kurzhaarigen gesehen, denn er schreibt, daß ihr gelocktes und krauses Haar große »Haubene bilde[1]. Es ist dabei wohl an die Tracht des Jünglings Rábelimár zu denken (s. Taf. 5). Die Haarstruktur erinnerte Miklucho-Maclay an die Eingeborenen der Inseln südöstlich Ceram; er schließt daraus, daß auf Aurepik eine Beimischung von Papuablut »unzweifelhafte ist.

Die Hautfarbe der Frauen ist im allgemeinen bedeutend heller als die der Männer, die Säuglinge waren fast so hell wie die Kinder von Europäern[2]. Miklucho-Maclay gibt die Hautfarbe der ihn auf dem Schiff besuchenden Eingeborenen mit Nr. 37 der Broca'schen Tabelle an.[3]

Hambruch versuchte vergeblich Messungen vorzunehmen, da den Eingeborenen die Instrumente unheimlich waren.[4]

Psychologisches. Die Kürze des Aufenthaltes konnte nur Zufallsbeobachtungen auf diesem Gebiete ergeben. Die Eingeborenen verhielten sich von Anfang an den Weißen gegenüber freundlich, zuvorkommend und mitteilsam. Hellwig bemerkt dazu, daß es für ihn auffällig sei, wie selbst die Kinder und zwar selbst die Kleinsten keinerlei Scheu vor den Fremden zeigten, obgleich sehr selten Schiffe die Insel anlaufen (s. S. 109)[1]. — Wie wenig diese Leute von der Kultur berührt waren, geht auch daraus hervor, daß Hambruch an ihnen keinerlei anthropologische Messungen vornehmen konnte, denn Instrumente waren ihnen fremd und unheimlich.

117

Spezieller Teil.

I. Körperpflege und Tracht, Schmuck und Kleidung.

Körperpflege. Lästige Körperhaare werden mit zwei scharfrandigen Muscheln *(bélik)* abgekniffen, wie es z. B. von Polowat beschrieben wurde.

Körpertracht. Schnurrbart und Kinnbart wurden bei Einzelnen beobachtet (s. Taf. 5); über Haartracht s. oben.

Die **Tatauierung** war wesentlich reichhaltiger als etwa auf den Zentral-Karolinen z. B. Polowat und anderen Inseln. Sie erstreckt sich bei beiden Geschlechtern auf Arme und Beine, bei Frauen außerdem auf Lenden und Unterleib. Miklucho-Maclay stellte bereits fest, daß die Arme ober- und unterhalb des Ellenbogens in Gestalt von Armbändern tatauiert waren[1]. Frau Krämer zeichnete eine Reihe von Tatauiermustern der Frauen und Männer. — Tatauieren = *fálusər*, Tatauiermuster = *mák*, Tatauierkamm = *rallá*, Tatauierhammer = *dájo*. Tatauierfarbe wird aus Ruß, den man durch Verbrennen von *ólat*-Nüssen (Calophyllum) gewinnt, verfertigt. Vgl. die Abb. 184—191.

Schmuckgegenstände. Haarschmuck. 1. Im Haar werden die in den Karolinen allgemein üblichen Kämme getragen, vielfach sind sie noch mit Federn geschmückt (Taf. 5)[2]. — 2. Haarkränze aus Blütenzweigen werden gern von jungen Burschen getragen (Taf. 5).

Ohrschmuck. Die Ohrläppchen werden bei Knaben und Mädchen durchbohrt und durch Einführen von Spannringen aus Schildpatt (Abb. 192, 193) erweitert. Der Behang mit Schmuck aus Kokosnuß und Muscheln ist so stark, daß das Ohr nicht selten bis zu den Schultern in die Länge gezogen wird[3]. — Der gesammelte Ohrschmuck wurde allgemein mit *šáršu* (He.) bezeichnet. Form und Material waren ebenso reichhaltig wie etwa auf Ifaluk. So klemmte man kleine oder größere Schildpattringe in die Ohrlöcher oder man trug darin Gehänge von geschliffenen Conus-Deckeln bzw. -Ringen (Abb. 194). Am häufigsten waren Ohr-

ringe aus Kokosnußperlen oder -scheibchen, die sehr gern zu mehreren mit Schildpattringen zusammen getragen wurden (Abb. 195). Selten war dagegen eine Art spindelförmiger Hänger

192. 193. 194. 196. 195.

Abb. 192—196.

Abb. 192—196. Ohrschmuck. 192 und 193. Spannringe aus Schildpatt (Hamburg 5366II, 5367II; ⅓ nat. Gr.). — 194. Conus-Ring (Hamburg 5339II, ½ nat. Gr.). — 195. Ohrgehänge aus Kokosperlen und Schildpattringen (Hamburg 5364II, ½ nat. Gr.). — 196. Ohrgehänge aus Kokosnuß- und Muschelscheibchen (Hamburg 5360II, ½ nat. Gr.).

(Abb. 196) von abwechselnd aufgereihten Kokosscheibchen (*daxax* He.) und Muschelplättchen (*läan* He.).

In der durchbohrten Nasenscheidewand werden Blumen und Blätter getragen[1].

Der Halsschmuck *(marremarre* He.) bestand aus Muschel, Kokosscheibchen und Kokosperlen, sei es, daß sie einzeln (Abb. 198) oder zusammen vermischt auf-

197. 198.

Abb. 197 und 198. Halsketten (Hamburg 220II bzw. 5347II, Länge 60 bzw. 76 cm).

gereiht waren. Ein typisches Beispiel dieser Art zeigt Abb. 197. Hambruch sammelte dieses Stück und erhielt dafür den Namen *tarrâk*, für die Kokosringe notierte er *tarrâk ururû*, für die Muschelringe *pfâle*. Von diesem Schmuck ist viel nach Osten verhandelt worden; die Polowat-Leute kauften ihn gern[2].

Blattknoten, wie sie Taf. 4 und 5 zeigen, hatten magische Bedeutung.

Die Armringe (He.: *lâxelâxe*, Kr.: *puósch)* waren aus Schildpatt (He.: *wóaθ*, Kr.: *uóth)*, breit und gerippt wie auf Polowat und andern Inseln; nicht so häufig sah man Armringe aus Tridacna[3].

Fingerringe (He.: *xalâxalax)* waren aus Schildpatt (Abb. 199, 200). Der auf Aurepik von Hellwig gesammelte und nachweislich von Faraulip stammende Neusilberring ist trotz des fremdartigen Materials ganz in der Art der einheimischen Ringe angefertigt worden.

II. Die Nahrungsquellen und ihre Ausnutzung.

Der Feldbau wurde in der gleichen Art betrieben wie auf den anderen niedrigen Inseln des Karolinen-Archipels. Die Felder waren mit Sumpftaro, gewöhnlichem Taro und Süßkartoffeln bestanden. An Fruchtbäumen pflegte man Kokospalmen und Brotfruchtbäume. Hellwig nennt noch als eßbare Pflanzen *jáxun* und *kópo*.

Zum Fischfang wurden benutzt:

a) Fischspeer *(kowuâ)*; es handelt sich um eine einfache Stange;

b) Angelhaken (Angelrute[1] = *wâu*, He.: *wahâu)* für den Fang von *xâli*, großen *čôp*, *mâdi*, kleinen *ätám* (He.). — 1. zusammengesetzter Haken *(bâ*, He.: *pâ)* verschiedenster Form (Abb. 203—205): Blänker aus Meleagrina (He.: *sâr)*, seltener *wâi*-Muschel (Abb. 206) oder Spondylus, Schildpatthaken *(wôad)*, Federfliege aus Federn des Fregattvogels *(xatáj)*, Schnur aus *âromā*-Faser. — 2. einfache Schildpatthaken *(gâuôdj)*. — 3. einfache Kokosnußhaken für den Fang des fliegenden Fisches *(mâñar)* bei Tage; als Schwimmer dient eine hohle Kokosnuß. — 4. Holzhaken *(gô)* für Haie.

203. 204. 205. 206. 207.

Abb. 203—207.

Abb. 203—206. Fischhaken (Hamburg 5322II, 5321II, 5325II, 5319II; ½ nat. Gr.). — Abb. 207. Fischköder (Hamburg 5344II, ½ nat. Gr.).

Die Haken werden in den bekannten Deckelkästen[2] (He.: *sâvo, sâlwo, sâlub, sâp, sâob)* aus Brotfruchtholz (He.: *kalâlw, xalâlu)* aufbewahrt.

c) Netze *(djôu*, He.: *srôu)* von der im Polowat-Band[3] abgebildeten Form; Hellwig gibt dazu an: Rahmen = *kattê*, Holz = *âû*, Verschnürung = *vâlwa*. — Der Stiel *(lb* oder *lboli mâñar)* wird erst kurz vor dem Gebrauch des Netzes festgebunden. Mit diesen Netzen fängt man nachts bei Fackelschein die fliegenden Fische *(mâñar)*.

---

[1] Sammlung Hamburg 5350.

[2] Sammlung Museum Hamburg 5351; vgl. dazu auch die Abb. 144/146 in Damm und Sarfert 1935, S. 66.

[3] Damm und Sarfert 1935, S. 51.

d) Fischdrachen *(djoligodjáuk)* zum Fang des *dâx* (He.) mit einem Köder von Fischfleisch (?) (Abb. 207)[1] an drei bis vier Meter langer Leine.

e) Schlingen *(núm)* zum Fang von Haien wie auf Polowat[2].

Vor jedem Fischfang wurde Ráigumeń (S. 143) angerufen, dazu wurden ihm Opfer gebracht[3].

Jagd spielte keine Rolle. Ratten soll es auf der Inselgruppe nicht geben, deshalb fehlt auch die karolinische Art der Rattenfalle *(dâwis)*, wenngleich ihr Name bekannt ist. — Vögel werden entweder mit dem *djóu*-Netz (S. 29), das dann keinen Querstab besitzt, oder mit Schlingen *(núm)* gefangen. Von letzteren hat man zwei Arten: a) auf einen Holzstab gereihte kleine Schlingen, — b) eine an einen Stab befestigte Zugschlinge[4]. In diesem Zusammenhang sei der Schildkrötenfang genannt. Kann man das Tier an Land fangen, so wird es auf den Rücken gedreht, im Wasser sucht man ihm eine Schlinge über die Vorderfüße zu stecken. Das Rückenschild wird mit Feuer abgelöst.

An Haustieren hatte man lediglich Hühner; Hunde und Schweine fehlten. Die Haltung von gezähmten Tieren schien sich jedoch großer Beliebtheit zu erfreuen; so beobachtete Sarfert, wie sich ein Reiherpaar und zwei Seeschwalben im Bootshaus aufhielten und sich durch die Menschen nicht stören ließen, eine andere Seeschwalbe sah Hellwig in einem Boot zwischen Geräten angebunden[5].

Die Nahrung wird über dem offenen Feuer *(jâf)*; Brennholz = *uês*, Rauch = *buldk*, Asche = *madjódj)* geröstet oder im Erdofen *(jeldń)* gedämpft. Die Feuererzeugung erfolgt auf zweierlei Art: 1. durch »Pflügen«: der liegende Stab heißt dann *sine lâulti*, der stehende *lâul*, der ganze Apparat wird *lâultí* genannt; — 2. durch »Bohren«: der liegende Stab führt die Bezeichnung *sîl lidk*, der stehende *lâul lidk*, beide zusammen heißen *lidk*. — Hellwig erwarb eine »Feuerholzbüchse *(xuluxûl)* für Raucher«; sie ist aus Bambusrohr und besitzt einen Holzdeckel *(pilepîl)*, der mit einer Schnur am Boden befestigt ist (Abb. 208); es ist wohl eine Zunderbüchse, wie wir sie auch von Polowat kennen[6]. An Feuerfächern (Kr.: *sâipa)* gibt es drei Formen (vergl. Taf. 9 obere Reihe).

Wie das Feuer zu den Menschen kam, erzählt die folgende Sage. Der Donner fiel auf einen Pandanusbaum, der auf der Insel Yap stand, und kam von diesem Baum nicht mehr los[7]. Er hatte sich in den Blättern verfangen und flatterte wie ein Huhn hin und her. Da kam die Frau

Abb. 208. Bambusbüchse (Hamburg 5330II, Länge 27 ½ cm); die Schnur verläuft an der linken Außenseite. Abb. 208.

[1] Nähere Bestimmung durch das Zoolog. Staatsinstitut Hamburg war leider nicht möglich (Bescheid v. 9. Mai 1935).

[3] Thilenius 1927, S. 245.
[4] Sarfert und Damm 1929, Abb. 98.
[5] Thilenius 1927, S. 247.
[6] Damm und Sarfert 1935, S. 63.
[7] Gemeint ist: Der Blitz schlug ein.

Medirâdi vorüber. Der Donner rief diese an und bat sie, ihn zu befreien. Doch die Frau weigerte sich aus Angst, sie könnte sich verbrennen. Der Donner versprach ihr, es nicht zu tun. Da befreite ihn die Frau. Der Donner sagte zu ihr: »Du verstehst ja gar nicht Feuer zu machen! Euer Essen schmeckt wirklich nicht gut!« So nahm er zwei Stöcke und zeigte ihr, wie man Feuer bohrt. Schließlich erklärte er ihr noch den Erdofen: sie solle ein Loch machen, das Feuer hinein- und das Essen darauf legen; nach einer gewissen Zeit werde dann das Essen gut sein. Wie der Donner das gesagt hatte, stieg er wieder in die Luft empor. Die Frau tat, wie ihr geheißen worden war, und erzählte auch den übrigen Menschen davon. Nun wußten sie alle, wie Feuer bereitet wird.

An Küchengerät hatte man zunächst den einfachen Handschaber (Kr.: *valegter)* aus Nautilus-Muschel (Abb. 209) und den dreibeinigen Kokosnußschaber (Ha.: *uəigánnu*, He.: *wáigaṅ*, Abb. 216). Hambruch notierte für die einzelnen Teile *perrák* = Muschel (He.: *pelig)*, *forrofor-* = Bindung, *uəigánnu* = Sitzbrett, *beramá* = Beine. Daneben gab es noch eine Art degenerierte Form, ein einfaches beinloses Sitzbrett mit angebundenem Hobeleisen.

Tarostampfer (He.: *faūrúpo)* aus Korallenstein (He.: *páraṅ)*, s. Abb. 211.

Kokosnußgefäße aus halben oder ganzen Früchten, dann mit und ohne Deckel *(bór*, He.: *pór)*, wurden viel benutzt vor allem für Wasser und Palmwein (Abb. 210).

Eßschüsseln (He.: *tapit*, Ha.: *tábbi)* aus *tralle*-Holz gibt es in verschiedener Form: a) einfach und bootförmig mit flachem Boden (Abb. 215) — b) durch Füße gehoben, mit »Nasen« versehen und teilweise stark ausgeweitet (Abb. 212—214).

An Körben zum Aufbewahren von Essen stellte Krämer folgende Arten fest:

a) *gádo* (Taf. 9 Abb. 5), ein hoher Henkelkorb,

b) *a borów*, ein länglicher Henkelkorb aus gewöhnlichem Geflecht,

c) *dágu* (He.: *tūx)*, ein hoher Korb (Taf. 9 Abb. 4) mit »Zopf« am Boden,

d) *a boláu*, ein im Längsschnitt trapezförmiger Korb, ohne Henkel,

e) *léipo*, muldenartiger, henkelloser Korb (Taf. 9 Abb. 6).

III. Technik.

A. Die Holzbearbeitung erfolgte im Groben mit der Axt, die eine feste, nicht drehbare Muschelklinge *(dâlâ berêī)* besaß. Die Einzelteile heißen: Stiel = *imêīm*, Muschelklinge = *berêī*, Umschnürung = *fófo*.

B. Eine große Rolle spielte die Muschel- und Kokos-Scheibenherstellung Die Insel ist nach Dr. Born ein berühmtes Fabrikationszentrum von Spondylus-Scheiben und -Plättchen gewesen[1] und versorgte mit ihren Erzeugnissen einen großen Teil der Karolinen. Die zunächst durch Zerschlagen der Muschel entstandenen eckigen Stückchen werden durchbohrt und zwar die Kokosscheibchen mit dem Stabbohrer *(wârrewurr*, Abb. 217) mit Haizahnspitze (He.: *nilibágo)* und die Muschelscheiben mit dem Drillbohrer *(walupâûp*, Abb. 218), der eine besondere Schwungscheibe aus Schildkrötenknochen (He.: *šû lûwón)* aufweist und früher eine Steinspitze hatte, die dagegen jetzt durch eine Drahtspitze ersetzt ist. Während der Drillbohrer in senkrechter Stellung in Tätigkeit gesetzt wird, dreht man den Stabbohrer so mit der Handfläche auf dem Schenkel, daß seine Spitze schräg nach oben steht. Das Kokosplättchen preßt man mit der freien Hand gegen die Spitze. Die durchbohrten Plättchen werden nun auf eine gespaltene Kokosblattrippe gefädelt. Das Schleifen erfolgt auf einem Brett mit einem Korallenstein *(ðâaū)* unter

öfterem Zugießen von Seewasser. Hellwig erwarb eine solche halbfertige Kette (Abb. 219) von dem elfjährigen Mädchen Maraŋ. Sie hatte der Schnur gerade den ersten Anschliff von etwa sechs Minuten Dauer gegeben, die beiden Enden wurden von ihr absichtlich unberührt gelassen.

C. An Flechtarbeiten wurden außer den bereits erwähnten Körben noch Täschchen (He.: *ɣapáč*) aus Pandanusstreifen geflochten[1] für Schmuck und dergl., vor allem wurden aber Matten angefertigt und zwar:

a) *ɣlagi*, aus schmalen Pandanusstreifen; doppelt gearbeitet, als Schlafmatten;

b) *glli* (Kr.: *gerri*, He.: *xedi*) aus den beiden Hälften eines Kokoswedels[2]; sie dienen als Schlaf- und Türmatten;

c) *tabachau* (Kr.), aus vier Wedelhälften doppelt gearbeitete Matte;

d) *jâs*, Dachmatten aus Kokoswedeln[3].

D. Die Weberei (weben = *dôdor*) spielte ehedem eine große Rolle als Hausgewerbe, heute ist diese Arbeit durch die Einführung europäischen Kattuns stark zurückgegangen. Das Material alter Zeit waren Bananen- (*ɣemies*) und Hibiscus-Fasern (*gulivâ*). Gewebe aus den erstgenannten sind besonders kostbar und genießen nicht zu Unrecht den Vorzug vor den gröberen Hibiscus-Geweben. Die Fasern werden mit einem Stock (Kr.: *bdüro*) geschabt, um sie geschmeidig zu machen (Abb. 220). Das Webmaterial wird in runden Körben (*gabâa*, He.: *xabâes*) aus Kokosblattstreifen aufbewahrt (Taf. 8).

Die Gewebe werden auf dem Horizontal-Webstuhl hergestellt, der den gleichen Spannkasten (Nr. 1—4 der Abb. 221) hat wie z. B. auf Satowal[4].

Abb. 220.

8.	Spanngürtel aus Kokosschnur *(xoloxále)*	*dále*	

Über die einzelnen Gewebe und ihre Muster s. S. 123.

IV. Handel und Schiffahrt.

Aurepik war ein wichtiger Handelsplatz für Spondylus-Schmuck (s. S. 128). Diese rote Muschel kommt hier so häufig vor, daß sie ein Haupthandelsartikel geworden ist und besonders stark von den Yap-Leuten angekauft wird, die dafür Gelbwurz zahlen. Rege Handelsbeziehungen bestehen aber auch nach Lamutrik, Ifaluk, Faraulip[1] und Polowat[2].

Die nautischen Kenntnisse der Aurepik-Leute standen nicht hinter denen anderer Karoliner etwa der Polowat-Insulaner zurück. Sarfert's Gewährsmann, der Kapitän Wasâu, hatte in seinem Eingeborenenboot alle Inseln zwischen Ngulu im Westen und Satowal im Osten besucht, desgleichen hatte er mit seinem Boot die Marianen-Inseln (Guam, Rota, Tinian und Saipan) angesteuert.

27.	Chatâu (wohl Kusai)	Miseliôl	15—1	20
28.	Lamutrik	Saipan	16—7	5[1]

Diese Segelkurse zeigen die weit gespannte Kenntnis der Aurepik-Kapitäne *(damôl tôtt)*. Sie reichte ostwärts bestimmt bis nach Kusae (einheimischer Name Chatâu) und nach Ponape, hier Wulebêt genannt, wenn nicht noch weiter, nordwärts bis zu den Marianen, westwärts bis zu den Philippinen (Dawogân). Nach Eingeborenenaussage liegt Dawogân südlich von Chatowei[2] und soll viel größer und höher als Truk, Yap und Palau sein. Wie weit die Kenntnis südwärts reichte, läßt sich nicht sicher nachweisen.

Von Verschlagungen und Antreibungen wußten die Eingeborenen nichts zu berichten. Dagegen ist der eine wie der andere Fall aus der Literatur bekannt. Der Missionar Snelling trieb von Piherar aus im Eingeborenenboot 93(!) Tage lang umher, bis er Aurepik erreichte, von hier aus fuhr er dann nach Olean[3]. — Über die Verschlagung eines Aurepik-Bootes nach Hok s. Damm und Sarfert 1935 S. 108.

Das Kanu *(ud)* ist ein Plankenboot von der typisch zentralkarolinischen Form. Die verschiedenen Bootarten haben besondere Namen, so fuhr Sarfert im *maiwôle* nach Uâu im Atoll. — Die Zahl der noch vorhandenen Boote ist jetzt sehr klein; auf der Hauptinsel waren drei große Segelboote und sieben kleine Kanus, auf der zweiten Insel befand sich ein kleines Boot. Lütke bzw. sein Begleiter v. Kittlitz beobachteten ehedem sviele Boote am Strand[4].

[1] Sarfert's Gewährsmann brauchte dazu wegen schlechter Windverhältnisse sogar 9 Tage.
[2] Es handelt sich hierbei wohl um Tobi, wie aus der Karte des Polowat-Kapitäns Igorâli zu ersehen ist (vgl. Damm und Sarfert 1935, Abb. 203).

hinteres Querholz *waadso*
(parallel dem vorigen auf der dem Kanu zugewandten Seite der inneren Gabeln festgebunden)
Auslegerstöcke *chêdr*
Ausleger-Plattform *fâdai*
Rand davon *wôeli fâai*
Bretterwand auf Kanurand aufgesetzt *bêrdjo*
Randleisten dazu *mâle mâiâr*
Öffnung *lawâo*

Plattform der auslegerfreien Seite *ebôbe*
(Nr. 1 der Abb. 224)
Längsträger (Nr. 4 der Abb. 224) *walemôli*
Querbalken (Nr. 2 der Abb. 224) *suud*
hohes Querholz darauf (Nr. 3 der Abb. 224) *chaligissâ*
Kanurand (Nr. 5 der Abb. 224) *mesâpe*
Segel *âe*
Segelrahmen *iralâe*
Tau zum Ausleger *jaŋeldb*
Tau zum Bug und Heck *danegâdj*
Tau zum Festhalten des Segels *môli*
Rolle, durch die das *môli* läuft *haligirlh*
Tau zum Segel-Aufziehen *ulâle*
Mast *chaûis*
Ruder *jadâle*.

V. Haus und Dorf.

Hausarten. A) *fm*: Wohnhaus der Familie. Es stand in der Regel auf einem Steinunterbau und besaß Bretterwände mit Türen; die vorgebauten Giebelwände bestanden aus Matten, das Dach aus Palmwedeln.[1] Durch diese Vorbauten ergab sich ein sechseckiger Grundriß. — Daneben wurden auch kleinere Hütten *(imomâti)* zu ebener Erde beobachtet[2], die nur mit Matten verkleidet waren und auch keinen Giebelvorbau besaßen, also einen viereckigen Grundriß hatten. Wie Sarfert's Dolmetscher sagt, sollen diese Hütten den jungen Mädchen als Aufenthaltsort dienen. Dem steht jedoch eine Beobachtung Sarfert's entgegen, der auf Ulâu eine solche Hütte von einem alten Mann und seiner Familie bewohnt fand.[3]

b) *malâm:* Kochhaus; es ist nach allen Seiten offen, das kleine Giebeldach ruht auf vier Pfählen.

c) *fanud:* Kanuhaus; es ist nach allen Seiten offen; die Pfähle tragen ein schweres Dach. Die Kanuhäuser sind der Aufenthaltsort der Männer, denn eigentliche Männerhäuser gibt es nicht. Hier schlafen sie auch sehr häufig, wenn sie nicht gerade mit ihren Frauen zusammen sein wollen. — An der Lagunenseite wurden jedoch noch zwei kleine Pfahlhütten festgestellt (s. Taf. 7), die ebenfalls als Schlafhütten dienten und zum Schutz gegen die Moskiten auf Pfähle gesetzt waren.

d) *imbribel:* Bluthaus; es wird von den Frauen während der Menstruation bewohnt. Der Platz, auf dem diese Hütte steht, heißt *bâl*. Den Schiffskapitänen war das Betreten des Platzes wie der Hütte streng tapu, während dies angeblich für die andern Männer nicht gelten soll.

e) Häuptlingshaus. Diese Häuser fallen durch ihren gewaltigen, bis zwei Meter hohen und treppenartig ersteigbaren Steinunterbau auf, der zumeist wie das Haus einen sechseckigen Grundriß hat, doch kommen auch rechteckige und weniger hohe Plattformen vor (s. Taf. 6). Das südlichste von den drei Häuptlingshäusern steht noch auf einem besonderen kleinen Unterbau.

f) Geisterhaus: Das Geisterhaus des Râgumeñ ist scheinbar nichts anderes als ein auf den Boden gestelltes Blätterdach. Es stand auf einem abseits liegenden sauber gehaltenen Platz. In seiner unmittelbaren Nähe befindet sich die Grabstelle des Râgumeñ (s. S. 143).

[1] Eine ganz allgemein gehaltene Schilderung bei Sievers 1910, Bd. II, S. 364.
[2] Thilenius 1927, S. 240. [3] Thilenius 1927, S. 246.

g) Hühnerstallungen fehlen, die Hühner schlafen im Freien.

Die Einzelteile eines Hauses sind:

Pfosten *sûre* (Nr. 1 der Abb. 225);

Mittelpfosten *naldwer* (Nr. 2), er trägt wie die zwei übrigen Mittelpfeiler den First, unterscheidet sich aber in nichts von ihnen;

Abb. 225. Grundriß eines Wohnhauses (nach Skizze Sarfert).

Abb. 226. Querschnitt durch einen Giebel (nach Skizze Sarfert). 1 = Firstbalken, 2 = letzter Mittelpfeiler, 3 = Wand, 4 = Gatterwerk.

Querbalken der Langseiten *darlelab* (Nr. 3), sie liegen auf den Pfosten auf;

Querbalken der Giebelwände *kôdom* (Nr. 4);

Auf den Querbalken der Langseite (Nr. 3) sind die dicken und im Querschnitt rechteckigen Dachträger festgebunden, auf diesen ruhen dünne, waagerechte Pfetten *(kabdnak)*, dünne senkrechte Dachsparren *(kâto)* und auf diesen liegen die Dachmatten *(jâso)*. Die Balkensetzung unterhalb der Wand (s. Taf. 6 unteres Bild) heißt *korddjo*.

Das Dach *(bōigilīm)* wird durch den Firstbalken *(dā)* gestützt. — Die Wände des viereckigen Hausinnern *(nīm)* sind senkrecht stehende Bretter, die einge-

Abb. 227.

Abb. 228.

Abb. 229. Siedlung auf Aurepik (nach Skizze Krämer).

spannt sind. Die Giebelwände sind ebenfalls aus Brettern und sind von der Dachhöhe ab nach außen zu geneigt, jedoch nur für einen kleinen Teil und verlaufen dann horizontal als eine Art Dach für die Veranda. Dieses horizontale

2: Damm et al. OR21 Woleai

Stück bildet einen tiefen Raum zur Aufbewahrung von Sachen, z. B. lag darunter in dem einen Haus ein Boot. Unter diesem Veranda-Dach aus Brettern ist ein Gatterwerk *(niblɨ̀)* zum Ablegen von Sachen (vgl. Abb. 226).

Unter dem Hausrat fielen ein Kinderhängestuhl (He.: *xûr:* s. Abb. 227) und eine Kinderwiege (He.: *ûlólɛ, ōlólɛ,* s. Abb. 228) mit Pandanusmatte *(xɛ̂age)* auf.

Siedlungen bestehen auf der Hauptinsel und auf Uâu. Auf Aurepik verteilt sich die Bevölkerung auf zwei »Gehöfte« (Valiâureg [Kr.] oder Waliâudriγ [He.] und Roñali [Kr.]), die von nur wenigen Hütten gebildet werden (s. Abb. 229). Auf Uâu wird die Siedlung von zwei größeren Hütten gebildet, die auf hohen Steinplattformen stehen. Außerdem fand Sarfert noch ein kleines, mit Kokosmatten verhängtes Häuschen, das von einem alten Mann bewohnt war. Diese kleine Siedlung wird nach Eingeborenen-Aussage nur zeitweilig bewohnt.

VI. Waffen.

Der Speer ist als Waffe unbekannt; man hat lediglich den Fischspeer (S. 124). Die Steinschleuder *(kâule)* fehlt ebenfalls, man kennt sie jedoch von Truk. Allgemein gebraucht wird der Schlagring *(raserds)* in der bekannten karolinischen Form.

Soziale Verhältnisse und Geisteskultur.

VII. Soziologie.

Über der engeren **Familie** stand die **Sippe.** Aufbau und Gliederung zeigten keinerlei nennenswerte Unterschiede hinsichtlich der Verhältnisse auf Polowat, so war z. B. die Sippe Wonĕī vertreten.[1]

Von den Verwandtschaftsbezeichnungen schrieb Sarfert folgende nieder:

Vater *domâl*

Mutter *sine (silĕī* = meine Mutter)

Bruder *wisîl*

Schwester *miandl* (bezeichnet das Verhältnis von Bruder zu Schwester und umgekehrt[2])

Gatte, Gattin *saligenĕī*

Sohn, Tochter *lĕī*

Vaterbruder *faduâl.*

Einehe ist die Regel. Vielehen sind selten; so fand Sarfert auf Uâu einen alten Mann, der mit zwei Frauen verheiratet war.

Bestattung. Der Tote wird in eine Matte eingewickelt und dann entweder in die Erde gebettet oder durch einen Stein beschwert ins Meer versenkt. Eine Beisetzung im Boot gibt es nicht! — Es gab besondere Begräbnisplätze.

Die **Geschichte** dieser Inselgruppe ist mit der Insel Yap aufs engste verknüpft. Wie Miklucho-Maclay erfuhr, »verdankt Aurepik einen großen Teil seiner Bewohner der Insel Japa[3]. Diese Tatsache ist auch in der Volksüberlieferung festgehalten worden, die berichtet, daß der Yap-Mann Chôiss nach Aurepik fuhr und dort aus der Spondylus-Muschel Menschen beiderlei Geschlechts schuf[4]. (Eine andere Version über die Menschwerdung s. S. 142.) Kann somit Chôiss (Chôs) als der erste Häuptling *(damôl)* angesehen werden, so ist sicher sein Sohn Râigumen, der heute göttliche Verehrung genießt (s. S. 143), sein Nachfolger gewesen. — Lütke nennt als Herrscher über Aurepik und einige ostwärts gelegene Inseln den Häuptling »Roouae[5].

Die Hamburger Südsee-Expedition konnte noch folgende Häuptlingsreihe ermitteln. Baluelap als Nachfolger des Ligowûw, des Mannes der Urmutter (s. Religion), dann Solâñ, Ellulué, Módj, Ârûdâl (Erídal); über sie alle wußten die Eingeborenen nichts Näheres anzugeben, dagegen ist der Sohn des Ârûdâl namens Jadóa (Jâdowuá) als Häuptling noch in bester Erinnerung, denn unter ihm jagte ein Taifun über die Insel, der so schwere Zerstörungen anrichtete, daß die überlebenden Eingeborenen, um einer Hungersnot zu entgehen, nach Oleai fuhren und hier etwa zehn Monate blieben. Als nach dieser Zeit die Aurepik-Leute unter Mañeluá wieder in ihre Heimat zurückfuhren, blieb Jadóa in Oleai und starb auch hier. Von den Heimkehrern wurde sein Sohn Fagíl Häuptling. Ihm folgte sein Sohn Medâk, der noch 1909 regierte (s. Taf. 5).

142

VIII. Religion.

Das **Weltgebäude** zerfällt nach Auffassung der Insulaner in drei Teile: den Himmel *(rân)*, die Erde *(selôb)* und die Unterwelt *(ilôl* oder *faliolôl)*.

Die **Götterwelt.** Als Schöpfer des Weltalls gilt Solál. Er errichtete einen Baumstamm, kletterte bis zur Mitte empor und schuf dort die Erde als Scheibe mit all ihren Inseln und Meeren. Dann kletterte er weiter und errichtete an der Spitze des Stammes horizontal zur Erde ausgerichtet den Himmel. Als er fertig war, hieß er seinen jüngeren Bruder Älülôb, der mit Nimogél verheiratet ist, zum Himmel hinaufgehen und dort König sein, während er selbst König der Unterwelt bleiben wollte. Hier wohnen viele Menschen und die Sonne scheint nachts. Solál ist aber auch der Gott des Meeres.

Älülôb übergab die Regierung schließlich seinem Sohn Lugelâṅ, der nunmehr der Himmelskönig ist. Seine Frau ist Idämälûl. Lugelâṅ arbeitet nicht, sondern schaut beständig nach den Menschen aus. Sieht er, daß ein Inselhäuptling nicht dafür sorgt, daß seine Leute gut sprechen und gut handeln, so zerstört er die Insel durch einen Taifun. — Sein Sohn Olofâd ist der Himmelsbote, er wandert stetig umher und sieht auf der Erde nach dem rechten. Er berichtet dann seinem Vater Lugelâṅ, der den Himmel nie verläßt.

Auch auf Aurepik herrscht die Vorstellung von einem großen Geist Yâṅelap, der in Kadjebâr[1] sein »Haus« hat. Ihm sind ein großer Teil der mikronesischen Inseln tributpflichtig z. B. Mogemog, Feis, Sorol, Oleai, Ifaluk, Faraulip, Lamutrik, Satowal, Polowat, Hok, Truk, Pingelap, Kâtau (= Kusai?), Imâl, Meseliól u. a. Inseln, denn er hat die Inseln bevölkert. So sagte er zu einer Frau: »Du gehst nach diesem Platz!«, und zu einer andern sprach er: »Du gehst nach jener Insel und zeugst Kinder!« So gingen die betreffenden Frauen mit ihrem Mann nach der bezeichneten Insel und bevölkerten sie. Die Urmutter von Aurepik hieß Ligowurieliél, ihr Mann war Ligowûw, die Namen ihrer Kinder sind unbekannt. — Einen andern Bericht über die Menschwerdung und Besiedlung von Aurepik gibt Hambruch auf S. 143.

Yâṅelap verläßt sein Haus nicht, doch steigt er von Zeit zu Zeit in die Höhe und schaut nach seinen Inseln aus. Sie alle bringen ihm Tribut in Form von Matten, Schüsseln und dgl. Die Fahrten wurden von den Oleai-, Ifaluk-, Faraulip-, Lamutrik-, Satowal- und Aurepik-Leuten gemeinsam unternommen und zwar

[1] Es ist Aṅebâr auf Yap (vgl. Damm und Sarfert 1935, S. 198).

von Oleai aus. Hier sammelten sich die Boote und fuhren dann über Feis—Mogemog nach Kadjebâr. Der »König« dieses Wallfahrtsortes bringt dann den Tribut ins Haus von Yâñelap, wo er unberührt liegen bleibt und verrottet. — Als die Hamburger Südsee-Expedition auf Aurepik weilte, war ein Teil der Insulaner nach Kadjebâr gefahren, doch hatte sie der König zur Arbeitsleistung nach Nauru geschickt, nur einer von ihnen war auf Yap geblieben.

Hambruch erfuhr auf Aurepik noch eine Sage, die auf Yâñelap Bezug nimmt und die Menschwerdung auf unserer Insel schildert, andererseits wirft sie ein interessantes Licht auf die Entstehung von Gottheiten. Yâñelap hieß den Yap-Mann Chôiss nach Aurepik fahren und dort aus einer Spondylus-Muschel Menschen erschaffen. Chôiss bekam selbst einen Sohn, den er Rãgumẽñ nannte. Dieser ist der eigentliche Gott der Seefahrer; er wird bei Antritt einer Seereise, bei Taifungefahr und vor Ausfahrt zum Fischfang angerufen. In seinem Haus hingen mancherlei Opfergaben (Kopfkränze, Matten, Kokosnüsse), in unmittelbarer Nähe der Hütte war seine Grabstätte, die mit Steinen eingefriedet war und sorgfältig betreut wurde.[1]

Das **Totenreich.** Die Toten schweifen unsichtbar als Geister *(âlläs)* umher, entweder halten sie sich auf der Erde auf oder sie fliegen durch die Lüfte wie der Wind. Andere Vorstellungen, wie sie auf Bur, Merir und Songosor bestehen, fehlen. König über Lebende wie Tote ist Lugelâñ.

IX. Verschiedenes.

Spielzeug und Spiele. a) *bagisöfisôf:* Spielbogen,
b) *ganíni*: Schwirrer aus einem zusammengebogenen Kokosblattstreifen,

Abb. 230. Schwirrer (nach Skizze Sarfert).

über den ein Bügel aus einer Kokosblattrippe gespannt ist (s. Abb. 230). — Das Schwirrholz ist unbekannt.

c) Außer Fadenspielen wurde auch ein Handklatschspiel beobachtet.

Zeiteinteilung. Das Jahr hat zwölf Monate, die sich auf die beiden Jahreszeiten *rák* (auch *ledják)* und *niłwän* verteilen. Die Monatsnamen sind:

rák	*niłwän*
1. *ál*	7. *dûmul*
2. *elûel*	8. *mädjîk*
3. *mál*	9. *mâlöb*
4. *łt*	10. *sôda*
5. *serewôl*	11. *nâke*
6. *eremâis*	12. *gûi*

Jeder Monat hat dreißig Tage:

1. *sigorû*
2. *elłîn*
3. *mädjälâne*
4. *mädjâle*
5. *mädjaſis*
6. *mädjaūâle*
7. *mädjadłu*
8. *jamedâle*
9. *jabêī*
10. *djławon*
11. *jârowugû*
12. *wolawûl*
13. *wolomâu*
14. *mâdj*
15. *ûre*
16. *nêdu*
17. *kilêī*

bearbeitet von Dr. Hans Damm.

(p. 150 is blank)

151

Faraulip.

Allgemeiner Teil.

I. Äußere Geschichte.

Die Zeit der Entdeckung dieser Inselgruppe liegt nicht sicher fest. Nach Krämer ist die von Francisco Lezcano 1686 gesichtete Insel, die dieser »Carolina« taufte und deren Lage auf der Kompaßkarte des Piloten Somera 1710 erstmalig festgehalten wurde, »wahrscheinlich Fároilap«, also unser Faraulip[1]. Er geht damit über Meinicke[2] hinaus, der die Entdeckung dem Spanier Rodriguez 1696 zubilligt. Sichere Kunde von dieser Inselgruppe brachten 1696 nach Guam verschlagene Fais-Leute, von denen Pater Clain unterm 10. 6. 1697 berichtet. Diese Eingeborenen kannten die Hauptinsel unter dem Namen »Piraulop« und eine zweite nordwestlich davon im Riffkranz gelegene als »Pic«[3].

1804 besuchte Luis de Torres[4] von den Marianen aus die Gruppe. Sie verschwand jedoch wieder aus dem Gesichtskreis der Entdecker und Lütke mußte regelrechte Nachforschungen nach ihr anstellen. So erklärt es sich, daß Lütke vielfach in späterer Literatur als der eigentliche Entdecker geführt wurde und auch heute noch geführt wird[5]. Am 28. März 1828 morgens fand Lütke das Atoll »Farrollap«, wie es ihm von den Eingeborenen bezeichnet wurde. Daneben gibt er noch »Fattoilap« an. Diese Schreibung geht wohl auf den Eingeborenen Kadu aus »Ulle« (wohl Oleai) gebürtig zurück; er schreibt Fatoilep[6]. Am 16. Dezember des gleichen Jahres besuchte er diese Inselgruppe zum zweitenmal, ohne jedoch

2: Damm et al. OR21 Woleai

irgendwelche völkerkundlichen Beobachtungen machen zu können, denn sein Gewährsmann Alberto (vgl. S. 192) vom ersten Besuch war nicht da[1].

Von den Teilnehmern der Hamburger Südsee-Expedition weilte Hambruch vom 4. bis 18. November 1909 auf der Insel.

Wann sich die ersten Händler auf der Insel niederließen, ist nicht bekannt. 1909 unterhielten japanische Koprahändler eine Station auf Pik und hatten auch einen Kutter im Bau.

---

[1] Lutké 1835, Vol. II, S. 130, 298; v. Kittlitz 1858, Bd. II, S. 151, 417. — Brigham (1900 S.64) gibt das Jahr der Entdeckung durch Lütke irrtümlich mit 1818 an. — Nach Meinicke (1888, Bd. II, S. 358) hat »ein neuerer Seefahrer« die Insel »Gardner« genannt; welcher damit gemeint ist, war nicht festzustellen.

153

II. Geographie.

Wie oben bereits erwähnt wurde, ist der **Name** der Insel in einheimischer Mundart dem Abendland bekannt geworden und zwar als »Piraulop«. v. Chamisso gibt nach Luis de Torres die Schreibung mit Farruelap und Faroilep, nach dem Eingeborenen Kadu (s. S. 151) mit Fatoilep an[1]. Auch Lütke bediente sich der Eingeborenenbezeichnung »Farroilap«. Finsch machte daraus Faraulap[2]. Faroilap findet sich auch bei Meinicke, der jedoch als Hauptstichwort seines Verzeichnisses Faraulep wählt[3]. Diese Schreibung hat sich damals stark eingebürgert[4] und veränderte sich schließlich zu Faraulip, wie der Inselname auch von den Teilnehmern der Südsee-Expedition zumeist gehört wurde[5], daneben wurden noch folgende Aussprachen notiert: Faráulop und Faróilap (He.), Farûilôp, Farôilep, Fa-tja-ü-napo und Fatjaunapo (Ha.) sowie Fadjáumaep (Kr.)[6].

Das erste **Kartenbild** dieser Inselgruppe stammt von Lütke (s. Abb. 231), es hat die Unterlage für alle späteren Inselkarten (Pacific Islands Pilot 1933, Japanische Regierungskarte 1925; vgl. Abb. 232) gebildet.

Lage und Größe. Die Längen- und Breitenangaben von Faraulip gehen aus der Zusammenstellung hervor:

	nördliche Breite	östliche Länge
v. Chamisso (in v. Kotzebue 1821 Bd. III S. 94)	8° 3′	144° 30′
Lütke (nach Karte)	8° 34′ 57″	215° 32′ 45″
Meinicke (1888 Bd. II S. 358)	8° 35′	144° 36′
Gulick (1862 S. 59)	8° 34′	144° 37′
Brigham (1900 S. 64)	8° 36′	144° 36′
Sievers (1900 Bd. II S. 364)	8° 40′	144° 35′
Kolonial-Lexikon (Bd. I S. 600; südlichste Insel)	8° 35′	144° 36′
Japanische Karte 1925	8° 35′ 45″	144° 33′ 16″

[1] v. Chamisso in v. Kotzebue 1821 Bd. III S. 94.
[2] Finsch 1914, S. 64. [3] Meinicke 1888, Bd. II, S. 358.
[4] Auch bei Gulick (Ms.); Brigham 1900, S. 64; Sievers 1910, Bd. II, S. 364; Pacific Islands Pilot 1933, S. 503; Japan. Regierungskarte 1925.
[5] So auch bei Sievers 1910, Bd. II, S. 364 und im Kolonial-Lexikon Bd. I, S. 600.
[6] Thilenius 1927, S. 258.

Abb. 231. Karte von Faraulip (nach Lütke 1828).

Abb. 232. Karte von Faraulip (Japan. Regierungskarte 1923).

Die **Gliederung der Inselgruppe** erkannte bereits Lütke als die eines typischen Korallenatolls von nicht mehr als 4 Meilen Umfang mit drei Inselchen[1]. Hellwig schildert sie in seinem Tagebuch sehr plastisch und mit der ihm eigenen Genauigkeit: »Das Atoll mit seinen drei länglichen, nach innen etwas ansteigenden, dicht bewaldeten Inseln, mit der in dunkelblau mit hell- und dunkelgrünen Streifen und ihren gelblich durchschimmernden Sandbänken und gelben Strandlinien leuchtenden Lagune endlich das Riff, außen scharf umzeichnet, von den gleißend weißen Schaumketten einer im Lee besonders mächtigen Brandung[2].« Bemerkenswert ist die Angabe, daß die Inseln nach innen etwas ansteigen, auf der Hauptinsel Faraulip erreicht diese Steigung 23,8 Meter[3]!

Das Atoll besteht aus drei Inseln: der Hauptinsel Faraulip und der nächstgrößten Pfx (Piko [Ha.], Pig [Marineamt], Pigue [Pacific Islands Pilot]), die beide bewohnt sind; die kleinste und südlichste Insel, Eád (Eatto [Ha.], Eat [Marineamt], Eate [Meinicke, Pacific Islands Pilot, Japanische Karte]) mit Namen, war nach Hambruch's Erkundungen ehedem ebenfalls bewohnt, ist aber nach den noch erkennbaren Verwüstungen eines früheren Taifuns nicht wieder besiedelt worden[4].

Drei schmale und nur für Boote befahrbare Passagen machen die Lagune von der Südseite her zugänglich[5].

Die Eingeborenen machten Hambruch folgende Angaben: a) Inseln: 1 = Faraulip, 2 = Pfx, 3 = Eád; b) Meere: 4 = lamm, 5 = nuguiborro; c) Riffe: 6 = madonnefjefan, 7 = fall lipig, 8 = furoú, 9 und 10 = pallepall, 11 = thawuorró, 12 = madonnefjóu; d) Passagen: 13 = tafualiáp, 14 = tafuleuleá, 15 = tafegiddegidd.

Abb. 233. Skizze des Atolls mit den von den Eingeborenen näher bezeichneten Teilen (die Ziffern sind im Text erläutert).

Die **Bevölkerungszahl** ist nie bedeutend gewesen, auf welche Angaben sich jedoch Gulick und Meinicke stützen, die die Inseln als unbewohnte angeben, ist unerfindlich[6]. In Wirklichkeit ist lediglich die kleinste Insel Eád unbewohnt

[1] Lutké 1835, Vol. II, S. 130. Von Brigham (1900, S. 64) und Sievers (1910, Bd. II S. 364) übernommen. – Meinicke (1888, Bd. II S. 358) gibt den Umfang mit nur einer Meile an.
[2] Bei Thilenius 1927, S. 249.
[3] Pacific Islands Pilot 1933, S. 503; vgl. auch Thilenius 1927, S. 259.
[4] Thilenius 1927, S. 259.
[5] Pacific Islands Pilot 1933, S. 503.
[6] Gulick (Ms.); Meinicke 1888, Bd. II, S. 358.

und vermutlich auch erst seit wenigen Jahren (s. S. 155). Es liegen folgende Zahlenangaben vor:

Jahr	Gesamt	Faraulip	Pfn	Bemerkungen	Quelle
1828	etwa 60				Lütke 1835, Vol. II, S. 326.
1903/4	121			1 eingeb. Händler	Sievers 1910, Bd. II, S. 347, 364; Finsch 1914, S. 64.
1909	155	96	59	davon 14 auf Yap	Hamburger Südsee-Expedition.
1912	80				Kolonial-Lexikon Bd. I, S. 600.
1930	145			dazu kommen 10 Japaner	Pacific Islands Pilot 1933, S. 503.

Auffällig ist der bald 50% betragende, starke Rückgang zwischen 1909 und 1912. Dieser Ausfall ist wohl kaum auf reiselustige Insulaner zurückzuführen, vielmehr scheint sich darin doch der fortschreitende Zerfall der Bevölkerung auszudrücken, auf den bereits Sievers[1] hinweist und der nach Hambruch in alter Zeit seinen eigentlichen Grund in fortwährenden einheimischen Kriegen hatte[2].

Wörterliste.

Himmel	*ūeneŋ*	Brecher	*lā*
Luft	*oiutjdr*	Sonne	*eāl*
Wolke	*raniñan*	Schatten	*χdlu*
Regen	*eborogorō*	Tag	*rāl*

Südwest-Dünung	*lāū mazerlχ*	Insel	*eroliđi*

Flora. Von dem malerischen Anblick, den das dicht bewaldete Faraulip auf den Reisenden macht, berichtete bereits Hellwig in beredten Worten[3], in der Tat

[1] Sievers 1910, Bd. II, S. 347. [2] Thilenius 1927, S. 260. [3] Thilenius 1927, S. 249.

ist die Flora an Arten reich vertreten. Sievers[1] zählt Kokospalmen, Brotfruchtbäume, Bananen, Cystosperma edule, Betelpalmen, Pandanusbäume auf.

Hambruch notierte folgende Pflanzennamen:

Pandanus	*fáð*	Wurzel	*χrapli*
Kokospalme	*nd*	Dorn	*χrágd*
Brotfruchtbaum	*mdi*	Samen	*tumdl*
Banane	*edð*	Schale	*fóid*
Sumpftaro	*udi*	Blüte	*uarðn*
Taro (Colocasia)	*fild*	Frucht	*fóid*
Pflanze	*ualiðr*	Strauch	*ualiðr*
Baum	*ualiðr en ár endp*	Kraut	*pfurðχ*
Blatt	*χrán*	Gras	*ejawds*
Ast	*rd*	Farnarten	*χamdraχ, χriχri*
Rinde	*χín*		

Fauna. Die Landtierwelt ist wie auf allen diesen niederen Koralleninseln spärlich genug. Hambruch stellte abgesehen von Haustieren nur wenige Vogelarten fest. Lästig sind die Moskiten, die besonders nach Regen stark auftreten.

Wörterliste.

Hund	*χerdiχ*	junges Tier	*man iamát*
Schwein	*tlido*	Fell	*χám*
Hahn	*koko* (sicher vom engl. cock abgeleitet)	Schwanz	*artarid*

158

III. Demographie.

Anthropologische Aufnahmen wurden nicht gemacht. Nach Sievers ähnelt die Bevölkerung der von Feis und Mogemog[1].

Krankheiten. Als Hambruch die Insel besuchte, litt die Bevölkerung unter einer heftigen Husten- und Schnupfen-Epidemie. Von sonstigen tropischen Krankheiten wurden Elefantiasis *(peverdup)*, Ringwurm *(genilewdk)*, Frambösie *(rdf)* und Syphilis *(kwdk)*, letztere zu einem hohen Prozentsatz, festgestellt.

160

Spezieller Teil.

I. Körperpflege und Tracht, Schmuck und Kleidung.

Körperpflege. Die Eingeborenen reiben ihren Körper mit *rên*-Farbe und Kokosöl ein. Außerdem schätzen sie wohlriechende Blumen und Pflanzen über alle Maßen und behängen sich deshalb sehr gern mit ihnen; es sind dies weißgrüne Blüten *(edro)* oder solche von Banian-Bäumen *(uûd)*, Geranium *(xerâx)*, eine Lilienart *(madagâu)*, Papaya *(bâbâ)* und Pfefferminz *(uanronâ)*.

Die **Haartracht** (s. Taf. 10) wurde nach Auffassung der Eingeborenen von Lugulân eingeführt. Die Männer trugen das Kopfhaar in Form einer dichten Perrücke, die mitunter vorn gescheitelt und am Hinterkopf durch einen Blattstreifen zu einem Schopf zusammengerafft war, (Abb. 234, 235) oder das Haar war vorn glatt nach hinten gekämmt und durch einen Blattstreifen zusammengebunden (s. Taf. 10 links). Die Frauen tragen das Haar gelockt, wie Hambruch treffend schreibt, als »Tituskopf« oder herabhängend und glatt abgeschnitten.

234. 235.

Abb. 234 und 235. Männerhaartracht (nach Skizze Hambruch).

Der **Bartwuchs** ist nicht übermäßig stark; außer Schnurrbart wird vielfach und zwar von älteren Männern Kinn- oder Backenbart getragen (s. Taf. 10).

Tatauierung haben beide Geschlechter, die Tatauierkunst wird in gleicher Weise von Frauen und Männern geübt. Zum Tatauieren *(mâk)* bedient man sich eines Tatauierkammes *(garîd)* und eines Hammers *(merâm)* von der in den Karolinen üblichen Form[1]. Die einzelnen Teile des Kammes heißen: Griff = *kod*, daran gebundenes Querstück = *xalenân*, das durch ein besonderes Stäbchen

[1] Museum Hamburg 302.

(tšrü) mit dem Stiel verbunden ist. Die Farbe *(lâm)* wird aus dem Ruß verbrannter Kokosfasern gewonnen.

Als **Haarschmuck** werden gern Blumen (s. oben) und Pandanusblattstreifen getragen (s. Taf. 10 links). Es fehlen schließlich nicht die für die Karolinen typischen **Kämme** *(rdua)* aus Holz oder Bambus mit mehreren Zinken oder solche aus einzelnen Stäbchen, die durch Holznägel zusammengehalten werden. In der Form glichen sie denen von Polowat und anderen karolinischen Inseln. Für die einzelnen Kammteile notierte Hambruch: Kopf = *ðumdi*, Zinken = *gaill*, Bindung = *eðr*, Nagel = *ðriſðna*.

Als **Ohrschmuck** *(tſuðru)* werden in den durchbohrten Ohrläppchen Kokos- *(tagdx)*, Schildpatt *(buðxs)*- oder Muschel *(mdtſi)*-Ringe einzeln oder in verschiedener Zusammenstellung getragen, wie wir dies auch von anderen mikronesischen Inseln kennen[1].

In das durchbohrte Septum werden als einziger **Nasenschmuck** wohlriechende Kräuter gesteckt.

An **Halsbändern** werden die verschiedensten Arten getragen:

a) aus Kokosringen oder Kokosscheibchen (wie z. B. auf Ifaluk vgl. Abb. 42, 43)[2].

b) wie a), aber mit dazwischen geschalteten weißen Muschelscheibchen (vgl. Ifaluk Abb. 44—47)[3].

c) aus roten Spondylus-Scheibchen mit dazwischen geschalteten weißen Muschel- und schwarzen Kokosscheibchen (vgl. Ifaluk Abb. 53)[4]; nicht selten sind sie mehrsträhnig. Eine dreisträhnige Kette dieser Art besitzt das Berliner Museum in der Sammlung Finsch (VI/6397).

Selten waren **Kettenanhänger**. Hambruch sammelte einen aus Kokosnuß geschnitzten (Abb. 236), der dem aus Tridacna geschliffenen von Hok formgleich ist.[5]

Abb. 236. Brusthänger aus Kokosnuß (Hamburg 298[II], Länge 10 cm). Abb. 236.

Es fehlten schließlich auch nicht die breiten **Halsbandkragen** *(tðo)*, wie sie bei Krämer (Inseln um Truk, 1. Hlbbd. 1935 Abb. 15) abgebildet sind.

Am beliebtesten waren **Armringe** aus gerilltem Schildpatt *(buðxs)* wie etwa auf Polowat[6], die von Truk eingehandelt werden, daneben gab es solche aus

[1] Einen *mdtſi* genannten Ohrhänger ähnlich Polowat (Damm und Sarfert 1935, Abb. 41) besitzt Hamburg 233.
[2] Museum Hamburg 229, 242.
[3] Museum Hamburg 246.
[4] Museum Hamburg 287, 288.
[5] Damm und Sarfert 1935, Abb. 95.
[6] Museum Hamburg 255; vgl. auch Damm und Sarfert 1935, Abb. 101.

Kokosnuß *(tagáx;* vgl. Ifaluk Abb. 59)[1] und aus Trochus *(lagaldx)*[2]. — **Fingerringe** aus Kokosnußschale kamen erst in neuerer Zeit auf.

Die eigentliche **Kleidung** ist nach Alter und Geschlecht des Trägers verschieden. Ihren Ursprung führen die Eingeborenen auf »Eluelap« zurück, der deshalb die Kleidung einführte, um Blutschande zu verhüten (s. Weberei). Es ist in der Tat so, daß ein Mann ohne Lendenschurz sich unmöglich macht. Das gilt jedoch nicht für die Knaben und Mädchen bis etwa zum 4. Jahr; sie gehen nackend. Die Mädchen legen dann einen Schamschurz *(ðiirtsl/)*[3] aus wohlriechenden Kräutern an, während die Knaben von diesem Zeitpunkt an bereits die gewebte Lendenbinde *(xariûr)* tragen. Die ebenfalls gewebte Frauenmatte *(bðix)* ist wesentlich breiter (s. Technik). — Während die Männer ihre Lendenbinde in der bekannten T-Form tragen, wird die Matte der Frauen von einer aus Haaren geflochtenen Schnur *(šrîm)*[4] gehalten, darüber wird zumeist noch ein aus 3—4 Kokosperlen-Strähnen verfertigter Gürtel *(mdramar)*, der durch Muschelstege in Felder geteilt ist, getragen[5]. Während dieser auf Faraulip hergestellt wird, trifft dies für den seltener vorkommenden, sehr breiten (bis achtsträhnigen) und ebenfalls durch Stege in Felder geteilten Gürtel *(xldi)* nicht zu; er wird von Aurepik eingehandelt.

Die Seeleute haben festere Kleidungsstücke: sie tragen aus Pandanusstreifen zusammengenähte spitze Hüte *(þdriñ)* und gegen die Unbill des Wetters Regenkappen *(þalân)*, Segeljacken *(nikôt)* und Kokoskleidmatten *(ua lulit)*.

163

II. Die Nahrungsquellen und ihre Ausnutzung.

Von den verschiedenen **Nährpflanzen** und **Fruchtbäumen** wurden folgende Arten angepflanzt bzw. ausgewertet:

Verschiedene Taro-Arten: *file e Ifaluk* (sehr klein), *file e kŏl, uŏt, momŏiga, marĺŋ*.

Colocasia: *lâk, pulâk*,

Süßkartoffel: *kamŏti*,

Sedum: *anûs, xŏp, eāugûle*,

Kürbis: *ewârs*

Zuckerrohr: *uwâu*,

Banane: *ulə*,

Terminabia: *fariŏp*,

Morinda citrifolia: *nâre*,

Pandanus: *fâə*,

Feige: *xoân*,

pfirsichähnliche Frucht mit vielen scheibenähnlichen Kernen: *xumâr*,

Brotfrucht: *mâī*; im Monat *uarĺx* setzt die Frucht an, im *mâtrĺx* beginnt sie zu reifen, im *mâllŏp* ist sie ausgereift; das dauert insgesamt sechs Monate. — Die Frucht liefert die Lieblingsspeise *mâra*, die auf dieselbe Art zubereitet wird, wie das *mâr* der Polowat-Leute[1].

Kokospalme: *nlu*. — Bezeichnungen zur Kokospalme:

Stamm	*χarâd*	alte Nuß	*âbf*
Wurzel	*χagrĺt*	Hülse	*χâus*
junges Blatt	*bagorifâ*	Schale	*pŏr*
altes Blatt	*âwud*	Fleisch	*tχrâ*
Blattscheide	*etenâ*	Kokoswasser	*rân*
rote Flechte am Stamm	*hudre e Olufaə*	Auge der Nuß	*metâd nugûd*
Blüte	*amiâm*	Keimloch	*pŏr*
junge Nuß	*χurâf e gûrub*	Keim	*tâmul*
Eßnuß	*sâu*	Keimblatt	*tχramĺn*

Die **Anpflanzung** geschieht ohne jede Ordnung. Bananen, Süßkartoffeln, Kokospalmen wachsen z. B. wild durcheinander, dagegen wird der Taro auf besonders hergerichteten Feldern angepflanzt. Es sind dies große viereckige Gruben

[1] Damm und Sarfert 1935, S. 68.

(poadé), die von einem Erdwall *(xatú)* — es handelt sich um ausgehobene Erde — umgeben sind (Abb. 237). Die Männer legen die Felder an, während die Frauen die eigentliche Landarbeit besorgen; für die Tarokultur benutzen sie einen Holzspaten *(xuotó*, s. Abb. 238; Griff = *erd*, Blatt = *xdroxdre)*. Die Männer kümmern sich um die Kokospalmen, die übrige Fruchtpflege obliegt den Frauen. Die Oberaufsicht über alle Feldarbeiten hat der Häuptling; er greift mit Strafen ein, wenn die Arbeiten nicht ordentlich erledigt sind. Ebenso verbietet er zu gewissen Zeiten durch Tabuzeichen das Betreten der unbewohnten Insel Eád, um die hier wachsenden Bestände an Kokospalmen und Tabakpflanzen zu schonen und um andererseits die hier zur Eiablage an Land kommenden Schildkröten nicht zu vertreiben.

Abb. 237.

Abb. 238.

Abb. 237. Querschnitt durch eine Tarogrube (poadé); nach Skizze Hambruch. — Abb. 238. Holzspaten (Hamburg 274II, Länge 85 cm).

Fischfang. Folgende Fischarten werden gefangen:

talaṅáp	*ejáu*	*daṅírd*
rél	*jáujáu*	*dát*
ajlnó	*homél*	*xarús*
sáux	*etám*	*moilú*
erón	*séra*	*táuk*
llt	*tšalálut*	*mogulm*
olovlli	*mótš*	*tagaludrs*
vóu	*uiplix*	*mánar* = fliegender Fisch (erscheint viermal im Jahr)
ulúl	*lérjó*	*takú'u.*

I. Die Angelfischerei (Angelrute = *báu*, umstrickter Griff = *tigóu*[1]) wird mit folgenden Fischhaken betrieben:

[1] Vgl. Damm und Sarfert 1935, Abb. 113.

a) *bâ* ist der zusammengesetzte Haken, dessen Blänker aus Meleagrina oder Spondylus und dessen Haken aus Schildpatt besteht; die »Fliege« ist aus gestutzten Fregattvogelfedern[1]. — Bezeichnungen für die einzelnen Teile: Angelschnur aus Hibiskusbast = *eôr* oder *eôl*, Blänker = *nâm*, Hakenspitze = *matâl*, Hakenbasis = *ramûm*, Fliege = *igûd*. — Diese Haken werden in Holzkisten *(sâup)* aufbewahrt (s. S. 168).

Abb. 239. Haihaken (Hamburg 270II, Länge des Hakens 15 cm).

b) *tlu* ist der einfache hölzerne Haken zum Haifang[2]. Ein seltenes Stück erwarb Hambruch; es war ein Doppelhaken aus einem Pteroceras-Muschelstück (s. Abb. 239).

c) *tarân* werden die neueren, aus einem Stück Eisendraht gebogenen Angelhaken genannt[3].

d) *porâli mâtš* ist ein einfacher Angelhaken aus Kokosnußschale, der an einer als Schwimmboje verwendeten Kokosnuß hängt (s. Abb. 240; über die Anwendung s. Damm und Sarfert 1935 S. 49). Diese Fangart wird heute nur noch wenig geübt.

Abb. 240. Schwimmer aus Kokosnuß mit Angelhaken (Hamburg 250II; ¼ nat. Gr.).

II. Die Netzfischerei wird auf dem Riff mit *etîn*-Netzen betrieben. Die Bezeichnungen zu den einzelnen Netzteilen sind (vgl. dazu die Abb. 241) *xoloxôl* (Nr. 1), *tanûapip* (Nr. 2), *edn* (Nr. 3), *bugebûx* (Nr. 4), *metât* (Nr. 5), Netzsenker = *fâu u lûm*, Netzschwimmer = *xuapês;* die letzteren sind nicht selten in Gestalt

Abb. 241. Teil eines Netzes (Bezeichnung der einzelnen Netzteile im Text); nach Skizze Hambruch.

von Fischen geschnitzt. — Das große Netz ist nicht Eigentum eines Einzelnen, sondern gehört dem Männerhaus.

[1] Museum Hamburg 227, 240.
[2] Museum Hamburg 231.
[3] Vgl. Sarfert und Damm 1929, Abb. 74.

III. Für die Reusenfischerei bedient man sich folgender Reusen:

a) eine aus Kokosschnüren fest gearbeitete Reuse *(ulipâm)* von gleicher Form wie Ifaluk (Taf. 3)[1]. Die einzelnen Bezeichnungen sind: Boden = *bŏxebox*, Hinterwand = *xaplt*, Seitenwand = *pẽigil*, Dach = *xuluxûl*, erhöhter spitzer Dachteil = *uñdl*.

b) Reuse *(ule mõurõuld)* mit tonnenförmigem Dach aus starken Kokosblattrippen (s. Taf. 11, Abb.5). Die Namen für die einzelnen Teile sind folgende: vorspringender Teil des Daches = *xromâre*, Decke = *uñdre*, Seitenwand = *xobâr*, Boden = *ird*, Tür in Rückenwand = *irlə*, Henkel = *tanln*.

c) wie b), aber von viereckiger Form (s. Taf. 11 Abb. 4).

IV. Zur Drachenfischerei wird ein Drachen *(kapẽs)* aus einem durch Kokosblattrippen versteiften Brotfruchtblatt verwendet. An der Schnur hängt ein *tarân*-Haken.

V. Schlingenfang mit einer am Holzstab befestigten Schlinge *(nõm)*; an einer weiteren kurzen Schnur hängt der Köder[2].

Besondere Sitten. Gemeinsame Fischzüge in großen Booten werden nur mit Erlaubnis des Häuptlings veranstaltet. Der »erste Rat« (s. Staat) hat die Aufsicht über Kanu und Fang, der Häuptling verteilt dann die Beute nach bestimmten Regeln. Lautes Rufen und Trompeten auf den Muschelhörnern rufen die Bevölkerung zusammen. Die Fische werden am Strand ausgeschüttet und sind bis zur Verteilung tabu. Hambruch erlebte eine Verteilung von 45 großen Fischen *(falufâu* und *takû'u)*: den größten *takû'u* erhielt eine alte kranke Frau, zwei *falufâu* Hambruch, fünf *takû'u* und zwei *falufâu* sieben Gäste aus Ifaluk, zwei *takû'u* der Häuptling, einen *takû'u* der »erste Rat«, einen *takû'u* der »zweite Rat«, einen *takû'u* der Oleai-Mann Olapfl, achtzehn *takû'u* die neun Häuser, zehn kleine Tinte die Kanubesatzung und der »erste Rat«, zwei *takû'u* und die kleinen Fische die Knaben.

Bei einem zweiten Fang, den Hambruch miterlebte, wurden elf große und 390 kleine Fische (hauptsächlich in Treibholzreusen) gefangen. Sie wurden folgendermaßen verteilt: zwei große Fische erhielt Hambruch, zwei weitere der Häuptling, einen der »erste Rat«, einen weiteren der »zweite Rat«, zwei große Fische und zehn kleine der Oleai-Mann Olapfl, drei große Fische und sechzehn kleine die sieben Ifaluk-Männer, 270 kleine Fische die neun Häuser (jedes 30), fünfzehn kleine Fische der Kanuaufseher, achtzig kleine Fische für die acht Häuser in Pix, fünfzehn kleine Fische für einen Mann, der seinerzeit beim Bau des Bootes mitgeholfen hatte. — Ist die Beute nicht in dem erwarteten Ausmaße ausgefallen, so geht der Fischer zum »großen Haus« oder zum Geisterhaus des Ponijõu, legt hier eine Opfergabe nieder und bittet um einen guten Fang (s. Sage S. 206).

[1] Museum Hamburg 281. [2] Sarfert und Damm, 1929, Bd. I, Abb. 98.

Die **Jagd** spielt überhaupt keine Rolle, denn die Landtierwelt ist arm an größeren eßbaren Tieren. — Ratten werden mit einer Falle *(tâwiš)*, die in der Form der auf Polowat ähnelt[1], gefangen, die Bezeichnungen für die einzelnen Teile s. Abb. 242. Auch Hunde werden gegessen.

Die **Zubereitung der Speisen** besorgen alle Frauen im Haus, lediglich im großen Haus kochen die Männer; die Kleinsten sind in allen Fällen immer die eifrigsten Helfer.

Zur **Feuererzeugung** (Feuer = *ijâ/*) bedient man sich des Feuerhobels *(noirlt;* der liegende Stab = *imôu*, der in einer Furche von diesem geführte Stab

Abb. 242. Rattenfalle (nach Skizze Hambruch). 1 = fâuida, 2 = tâurân, 3 = eôr, 4 = nemâr, 5 = puñedâ, 6 = todugân.

= *noirlt)* und des Feuerbohrers *(niâluk* oder *liâluk;* liegender Stab = *ilâ*, Bohrloch = *meddd* [»Auge«], senkrecht stehender Bohrstab = *noirlt)*. Zunder *(xabâd)* wird in einer Bambusbüchse aufbewahrt. Der geflochtene Feuerfächer *(sêipo)* hat länglich rechteckige Form.

An **Haushaltgeräten** sind zu nennen:

a) Messer *(sâr)*, früher aus Muschel, jetzt ein in ein Brett geklopfter und geschärfter Nagel,

b) Taroschaber aus Meleagrina-Muschel,[2]

c) Kokoskratzer *(uêigan)* auf einem Dreifuß ist eine kleine Muschel *(poritôx)* aufgebunden (s. Abb. 243)[3].

d) Löffel *(idît)* aus Muschelschale.

e) Stampfer *(faierâs)* aus Korallen-

Abb. 243. Kokoskratzer (Hamburg 277[II]), Länge 54 cm.

[1] Damm und Sarfert 1935, Abb. 126.
[2] Museum Hamburg 275.
[3] Ein weiteres Stück im Museum Hamburg 276, dessen Muschelbefestigung wie 277 (Faraulip) und Gestell wie 218 (Aurepik) ist.

stein *(ſdux)* in der Form wie auf Ifaluk[1] (stampfen = *zûs*, reiben = *egâx*, schlagen = *narûna)*.

f) Kokosnußgefäße *(tagax* = Kokosschale) als Wasserflaschen[2].

g) Holzkasten *(sâup)* mit Deckel wie auf Polowat[3], sie dienen zum Aufbewahren von Kleinigkeiten besonders von Fischhaken. Für die einzelnen Teile gibt Hambruch folgende Bezeichnungen: Deckel = *garâp*, Loch für Aufhängeschnur = *piapi* in einem angeschnitzten Ansatz (= *botil)* Unterteil = *xaloâl*, Boden = *pêigil*, Wand = *ni*, Falz für den Deckel = *pôra ni*.

h) Eßschüssel *(tâbbi)* mit Füßen von ähnlicher Form wie die *dôbi lemâbu* von Ifaluk (Abb. 119)[4]. Daneben finden sich auch von Truk eingeführte *täbbi*-Schüsseln mit dem für diese Inselgruppe typischen roten Anstrich[5]. (Boden = *ranôg*, Füße = *perêle*, Nasen = *madâl*.)

i) Körbe zum Aufbewahren von Essen, die größeren zum Transport von Feldfrüchten; erstere heißen *tûx*, letztere *hîx*. Besondere Formen sind *kâtôvas*[6] wie Taf. 1 oben (Ifaluk) und *paûtaû*[7], ein Tragkorb (s. Taf. 11 Abb. 2).

Abb. 244. Fischbrett (Hamburg 223II, Länge 66 cm).

k) Fischbrett *(bâp)* zum Zerteilen des Bonito (s. Abb. 244),

l) Besen *(nâux)* aus Kokosblattrippen[8],

m) Rattenhaken *(xôr)* zum Aufhängen von Speisebehältern ähnlich wie Abb. 126 in Sarfert und Damm 1929, S. 138.

Von geregelten **Mahlzeiten** in unserem Sinn kann man nicht sprechen. Kinder und Frauen essen fast fortwährend, die Männer morgens, mittags und abends. Die Familienmitglieder essen gemeinsam und nicht nach Geschlechtern getrennt. — Für die Frauen gelten einige Speiseverbote und zwar dürfen sie zu allen Zeiten folgende Fischarten nicht essen: *bûp, liwelû, fât, bâxo, nawût, môru, nôš, udi*. Schwangere Frauen dürfen überhaupt keine Fische essen und haben auch sonst noch Speiseverbote zu beachten. Erst fünf Monate nach der Geburt fallen diese; werden sie vorher schon nicht beachtet, so wird die Schuldige nach Eingeborenenansicht sehr krank.

An Genußmitteln hat man an erster Stelle Tabak *(tomâxo)*; den Eingeborenen kann er garnicht kräftig genug sein. Er wurde einst aus Guam eingeführt und wird jetzt auf der Insel selbst gezogen. Allerdings ist der amerikanische Stangen- und Plattentabak beliebter. Ferner genießt man sehr gern Palmwein (xarf). Die Zubereitung ist die gleiche wie auf Polowat[9].

167

III. Technik.

Die **Holzbearbeitung** lag in den Händen der Männer. Angefertigt wurden Eßschüsseln, Deckelkästen, Kokoskratzer, Kämme, Waffen, Kanus und Hüttenteile. Das wichtigste Werkzeug war ehedem die Muschelaxt *(ϑapâl)*, die 1909 bereits nicht mehr im Gebrauch war, lediglich »heilige Äxte« (Abb. 245) hatten die alte Form getreulich bewahrt. Muschelklinge aus Tridacna oder Cassis = *porugîl* bzw. *tarâ* (die Klinge wird mit einem Schleifstein [*udre*] scharf gehalten), Schneide = *metâd*, Oberseite = *lugûl*, Unterseite = *ndn*, Beilschaft = *im mê âm*, Umschnürung = *fôr-fôr*. Daneben gab es schließlich die Geräte für die feineren Arbeiten: Feile = *(vâm)* aus Korallenstein, Pfriemen *(etâu)*, Bohrer *(purepûr)*.

Abb. 245. Heilige Axt mit Muschelklinge (Hamburg 271 II, Gesamtlänge 46 cm, Länge der Klinge 17 cm).

Abb. 246. Bastklopfer (nach Skizze Hambruch).

Die **Herstellung von Kokosschnüren** *(mâtš)* geschah in dem allgemein üblichen Arbeitsgang: Wässern in Salzwasser = *ni pêli gôth*, Wässern im Süßwasser = *thâmu*, trocknen = *igapâl*, klopfen *(thâs)* mit einem schweren Holzklopfer *(pêreix;* s. Abb. 246) und schließlich drehen = *xôloxôl*. Kokosstrick = *tariklt*, Tau = *tât*.

Hibiskus-Schnüre *(giliſôſ)* für Fischleinen werden in der auf Polowat üblichen Art hergestellt[1].

Die **Weberei** ist, wie auf allen Karolinen-Inseln stark zurückgegangen, das ist um so bedauerlicher, als es der Frauenfleiß darin zu einer erstaunlichen Kunst-

[1] Damm und Sarfert 1935, S. 75.

fertigkeit gebracht hatte (s. Taf. 12). — Früher soll es nach Eingeborenenaussage keine gewebten Matten gegeben haben; man lief nackend umher. Damals waren Fälle von Blutschande nicht selten, weil die Männer ihre Geschwister, Kinder und Frauen nicht unterscheiden konnten. Da gab der Himmelsbewohner Lugulen der Aifáth den Auftrag, den Menschen den Webstuhl zu bringen, damit sie sich Matten weben und somit besser unterscheiden könnten[1].

Abb. 247. Teile des Kastens vom Webapparat (Hamburg 263II; ¾ nat. Gr.); die gestrichelten Teile sind rot, die schwarzen mit schwarzer Farbe bemalt.

Es wird Hibiscus-Bast und Bananenfaser verwebt, wobei letztere wegen ihrer Güte bevorzugt wird. Der Bananenbast wird geschält, im Seewasser zerfasert, getrocknet und dann gedreht. Das Webmaterial wird in einem runden Korb *(xápen)*[2] aufbewahrt, der die Form wie auf Aurepik (Taf. 8) hat (vgl. auch Taf. 13 unten rechts im Bild). Den Aufbau des Webstuhls zeigt Taf. 13, die Form des Holzgestells Abb. 247.

Die einzelnen Teile des Apparates heißen:

Vorderes und hinteres Spannbrett = *pâp*,
Schwert = *xabôp*
Litzenstab = *nân*
Schiffchen[3] = *thritôp*,
(mit dem von Aurepik [Abb. 221] formengleich)
Spanngürtel = *tâdi*
Kasten mit Spannbrett = *puijdlʃ*
Verzierung daran in Rot und Schwarz = *xaũ iêl idr*
Querstange über dem Spannbrett = *nugûd*
Balken zum Gegenstemmen für die Füße = *ʃaʃâ*.

Eine wahre Musterkarte der auf Faraulip üblichen Webmuster, dazu ein Meisterwerk einheimischer Handwerkskunst ist die »Königsmatte« (Taf. 13). Die einzelnen Muster (von links gezählt) heißen: 1. *šürûbu*, 2. *ʃoirimât*, 3. *puriiʃât*, 4. *bôirûd*, 5. *uvethitâlub*, 6. *pairimûru*, 10. *xolimdth*, 11. *pairônunũ*, 13. *mônda*, 16. *šib*, 17. *xôugôuthip*, 18. *toirudt*. Das Muster der Matte (Taf. 12, Nr. 244II) heißt *metarêl*; die Bezeichnungen für die einzelnen Elemente sind:

lugurêl = breite schwarze Streifen,
nigawôs = breite helle Felder zwischen den schwarzen Streifen,

[1] Es scheinen also die einzelnen Sippen bestimmte Webmuster gehabt zu haben.
[2] Museum Hamburg 279. [3] Museum Hamburg 241.

narłde = schmaler schwarzer Randstreifen,
thaū u wŏl = die beiden (schmaleren und breiteren) Querstreifen.

Der oberste Querstreifen im Muster der Matte Nr. 307 II (Taf. 12) heißt *taūb*, die über und unter diesem liegenden beiden schmalen Streifen heißen *pireplł*. — Die einzelnen Bestandteile des Querstreifens von Matte Nr. 308 II heißen *tanabó* = sanduhrförmiges, dunkles Muster, *taūf* = helles Rhombenmuster.

Für die **Färberei** gilt das für Polowat gesagte[1]. Als Farbtöpfe werden gleichfalls Meerpocken verwendet (Abb 248.), ebenso gibt es Farbschüsseln *(tăbbi endp)* von der Form wie Ifaluk (Abb. 125)[2]. Rote Farbe *(tšageŏx)* zum Streichen der Boote wird aus Yap eingehandelt. Als Pinsel dient ein beliebiges Stück Holz.

Abb. 248. Farbbehälter (Hamburg 245 II. 3/4 nat. Gr.).

[2] Museum Hamburg 238.

172

IV. Handel und Schiffahrt.

Der **Handel** war ein reiner Tauschhandel, die Stelle des »Kleingeldes« vertraten Kokosnüsse. So kostete ein kleines Boot drei gewebte Kleidmatten, eine solche Matte hundert Kokosnüsse. Nach Hambruch ist aber auch Palau-Perlengeld und zwar das *ā udôt* auf der Inselgruppe als *ujôd (āujôd)* im Kurs gewesen.

In alter Zeit suchten die Eingeborenen folgende Inseln auf, um mit ihnen einen ausgedehnten Handel zu treiben: Unaṅâi (Oleai), Auripík, Ifalûk, ðoról (Sorol), Uejêi (Fais), Magemûx (Mogemog), Yap, Nólu (Ngulu), Palau, Songosor, Pur, Merir, Lāmutšéx (Lamutrik), Setōuan (Satowal), Sóux (Hok), Unûon (Onon), Piserâs, Tšûk (Truk), Magur, Moirála (Murillo), Ratak, Magíl (Mokil), Ebon, Nutaû, Gâtšaûe (Kusai). Sehr rege waren auch die Beziehungen zu den Marianen (Guam, Saipan). Ferner wurden in alter Zeit noch folgende Inseln aufgesucht, die die heutige Generation jedoch nicht mehr bestimmen kann: Uaxû, Solnís, Bahaû, Ánelulu (Honolulu??). — Jetzt haben diese Großfahrten durch das Wegsterben der alten Kapitäne und die Interessenlosigkeit der Jugend aufgehört; es werden nur noch mit ganz wenigen Inseln in unmittelbarer Nähe Handelsbeziehungen gepflegt: von Lamutrik tauscht man *kamôs, reng*-Farbe, Schildpatt und aus Truk stammende Kleidmatten ein, von Aurepik *kamôs*, Spondylus-Halsketten, Tanzgürtel, *kid*, von Satowal *reng*-Farbe und Halsketten aus Truk, von Ifaluk und Oleai Tauwerk, Netze, gewebte Matten. Dagegen geben die Faraulip-Leute gewebte Matten eigener Arbeit, Tauwerk und Schlafmatten ab.

Über die **nautischen Kenntnisse** war mit Rücksicht auf die bereits oben angedeuteten Verhältnisse nur wenig Material zu heben. An Sternbildern (Stern = *fōn ð*) kannte man

Polarstern	= *olûol*	Adler	= *maûlop*
?	= *uolâgor*	drei Könige (im Orion)	= *öliöl*
?	= *ugeliga*	?	= *ðarawûon*
Procyon	*mâl*	Jungfrau	*tumur*
Plejaden	*maraegiri*	?	*metarû*
Aldebaran	*oûl*	?	*tubulûp*
?	*matjomaûdan*		

Krämer erwarb eine alte Schnurtasche[1] mit Schneckenschalen, die dem Oberhäuptling gehörte und als »heilig« galt. Sie hing am Firstbalken des Bootshauses und soll früher zu Lehrzwecken über Navigation benutzt worden sein, wobei die Schneckenschalen als Inseln (oder Sterne?) ausgelegt wurden.

Abb. 249. Strichrose (nach Skizze Hambruch).

Die Strichrose (Abb. 249) ist in der gleichen Weise zu verstehen wie auf Polowat[2]. Die Eingeborenen-Namen für die einzelnen Punkte sind:

1. *olûol el ijefaṅ*
2. *tagali mâlop*
3. *uolâgor*
4. *ugelîga*
5. *mâl*
6. *maraegiri*
7. *oûl*
8. *mâlop*
9. *öliöl*
10. *ðarawuon*
11. *tumur*
12. *metarû*
13. *tubulûp*
14. *matjomâidan*
15. *olûol le lûp*
16. *matjomâiað*
17. *taχalûp*
18. *taχal metarû*
19. *taχal tumur*
20. *taχal ðarawuon*
21. *taχal öliöl*
22. *tubul mâlop*
23. *tubul oûl*
24. *tubul u maraegiri*
25. *tubul ule mâl*
26. *tubul ugeligâ*
27. *tubul uolâgor*
28. *tubul e mâlop baliefaṅ*

[1] Museum Hamburg 3171.
[2] Damm und Sarfert 1935, S. 89.

Die Windrichtungen sind:

etôk e lap	Wind aus Westen	*xotôu a ʃdṅ*	Wind aus Nordosten
xotôn e mâl	Wind aus Osten	*netô a ʃdṅ*	Wind aus Nordwesten
eâlr u lâp	Wind aus Süden	*xotôu eâlr*	Wind aus Südosten
eʃdṅ e lâp	Wind aus Norden	*netô eâlr*	Wind aus Südwesten

Die See von Osten und Westen heißt *la e lapaldp*, von Süden *la e l'eâlr*, von Norden *la el'eʃdṅ*.

Das Beispiel eines Schiffskurses gibt Abb. 250 wieder. Er führt von Faraulip nach Oleai und zwar erst zwei Meilen Kurs 3 zu 16, dann eine Meile 4 zu 18 und

Abb. 250. Schiffskurs Faraulip — Oleai (nach Skizze Hambruch).

schließlich 3 Meilen 3 zu 17. Die Namen der betreffenden Sternbilder sind aus der Tabelle S. 173 zu ersehen.

Die zwischen den einzelnen Inselgruppen liegenden Meeresteile führen besondere Namen, die ebenfalls die Orientierung erleichtern: es heißen das Meer zwischen:

Mogemog—Yap	*mateuari ruepâne*	Lamutrik—Satowal	*uôi rêki*
Faraulip—Oleai	*ʃanihe matôuru*	Satowal—Elato	
Lamutrik—Ifaluk	*kapinapi nipu*	Satowal—Polowat	*kapina nêi*
Faraulip—Ifaluk	*metâue pânaki*	Polowat—Truk	*eruâni*
Oleai—Ifaluk	*ʃani aroma*	Fais—Mogemog	*metâue mare vâtje*
Oleai—Aurepik	*metâue ni polu*	Yap—Ngulu	
Oleai—Sorol	*metâue ni kini mâre*	Yap—Palau	*metâue u male*
		Polowat—Hok	*metâue pânaki*
Oleai—Fais	*kapini ma kano*		

Von Antreibungen brachte Hambruch nur eine in Erfahrung; es handelt sich um ein unbemanntes Boot, das vor etwa fünf Jahren (also um 1904) aus Pur antrieb. — Verschlagungen kamen sicher vor, wenn auch Hambruch keine in Erfahrung bringen konnte. Kadu, der Gewährsmann von Chamisso, berichtet von einem Faraulip-Häuptling, der nach Guam segeln wollte, aber nach Mogemog verschlagen wurde; er kehrte von hier wieder heim[1].

An **Kanu**-Arten gab es kleine *uá ju mẽn* und große *uá ju lấp*; im Bau zeigten sie keine nennenswerten Unterschiede von denen der zentralkarolinischen Boote (s. Taf. 14).

Abb. 252. Ruder (nach Skizze Hambruch). — Abb. 251. Steuer (nach Skizze Hambruch).

252. 251.

Die wichtigsten Bootsteile und Bootsgeräte heißen:

Boot	*uá, auch χrá*	Stab zum Staken	*fấl*
Bug	*imốu*	Ruder (s. Abb 252)	*faχíl*
Heck	*imấli*	Stiel	*erấn*, auch *erá*

auf den Ausleger treten	*etâlu*
der Ausleger kommt aus dem Wasser	*ilχ*
kentern	*χrâp*
auf Grund stoßen	*eaχódo*
Schiffbruch	*etods*
vollschlagen	*mâs*

Kanubau. Die großen Hochseeboote werden auf Befehl des Häuptlings gebaut und geweiht der Öffentlichkeit. — Wie die Kenntnis vom Bootbau zu den Menschen kam, erzählt folgende Sage: Thelán baute einstens auf Geheiß des Eluelap ein Boot auf der Insel Ponape für den Verkehr zwischen den einzelnen Inseln. Ein Mann namens Matáh half ihm bei der Arbeit, so daß dieser genaue Kenntnis über den Kanubau erhielt. Das Boot wurde aus Brotfruchtholz gearbeitet und zwar lediglich mit Muscheläxten, nachdem vorher der Stamm fast ganz mit Feuer ausgehöhlt worden war. Die Kiellänge wurde mit einer Meßleine *(tás)* von

6½ Faden Länge *(oulâṅ ṅâf ma kopôe)* festgelegt, d. i. die Kiellänge eines Reisebootes. Diese Meßleine ist dem Thelâṅ geweiht (S. 197) und hat an den beiden Enden Kokosfiederblätter *(tjâtš)*. Die Kalfatermasse bestand wie auch heute noch aus Brotfruchtbaumharz und jungen Kokosblättern. Das Boot war in drei Monaten fertig. Thelâṅ nannte es *uâ*. — Heute erstreckt sich die Arbeitsdauer

Abb. 259. Wetterzauber (Hamburg 31701I, Länge ohne Blattstreifen 36 cm). — Abb. 260. Doppelköpfiger Griff eines solchen Wetterzaubers (Hamburg 22611, Höhe 33 cm); b = Seitenansicht.

auf über zwei bis drei Monate; die hauptsächlichsten Arbeiten wurden bereits in sechs Tagen erledigt. Das ganze Dorf hilft dabei mit. Die Arbeit leitet ein Baumeister *(šînap)*. Die Werkzeuge wurden bereits oben bzw. unter Technik genannt. Die Verpflegung der Arbeiter obliegt in dieser Zeit den am Bau nicht mitschaffenden Menschen. Die Arbeit wird oft unterbrochen, damit das Holz nachtrocknen kann, und die freie Zeit durch festliche Schmausereien von jeweils sechstägiger Dauer ausgefüllt.

Als **Reiseproviant** wurden für eine fünfköpfige Besatzung zweihundert Kokosnüsse und fünfzig Kokosflaschen mit Wasser angegeben; verfehlt man das Ziel, so müssen Fische, aufgefangenes Regenwasser und im Notfall Seewasser genügen. Gekocht wird in einem kleinen Sandkasten *(fenâṅ)*.

Über Kanuhäuser s. S. 183.

Von den **religiösen Gebräuchen** ist der auf den Karolinen allbekannte Wetterzauber (Abb. 259, 260) mit holzgeschnitzten und mit Rochenstacheln (Stachel = *perạ*, Rochen = *ʃdix)* bewehrten Figuren *(xɔ̃s)* üblich, teilweise sind sie mit mehreren Kokosblattknoten *(ɑ̃wud)* und mit Seepocken für Farbe zum Bemalen der Figur behangen. Sie werden in der gleichen Weise wie auf Polowat gehandhabt[1]. — Dieser Wetterzauber wurde durch den vielgereisten Mann Buimẽn erst auf Faraulip eingeführt.

Vor Antritt der großen Fahrten wird noch folgender Zauber für Thelấn gemacht: es wird eine Tritonsmuschel geblasen, die nach Rückkehr im großen Haus aufgehängt wird. Als Opfer für Alülue werden auf dem Ausleger Matten und Kokosnüsse niedergelegt. — Beim Heraufziehen eines Reisebootes auf den Strand wird ein längeres Lied *(bɑ̃ne)* gesungen, das wohl mehr den Charakter eines Arbeitsgesanges hat.

Thibɑ̃e karehitšẽ	Es läuft von außen in die Passage ein,
Mẽthẽ Inarüdlu	In den Einlaß von Inarüalu.
Muirišõ u merẽ	Es steuert richtig und es fährt schnell
Puẽlẽ mailɑ̃p e lanĩkapi	Es sieht den Mailap, den Lanikapi
Urupu. Thibɑ̃e tẽe rivɑ̃tẽ	Und den Urupu. Sie sehen jetzt das Ziel.
Ta u mẽnu kamenai	Viele Vögel, viele große und kleine
Rẽ fiti mẽ korükakɑ̃	Sind nun in seiner Nähe,
Bue ire manü fẽ ki	Sie flattern auf das Kanu,
Re roupe uẽ ni matẽ,	Sie setzten sich auf Aufsatz und Ausleger,
Mẽ išerõu uẽ ni mate ŋaru	Sie setzten sich auf den weichen Fang,
Bue ire manü fẽ ki	Sie flattern auf das Kanu,
Re roupe uẽ ni matẽ ŋarɑ̃.	Sie setzten sich auf den weichen Fang.

/81/

V. Haus und Dorf.

Hausarten. a) Die Wohnhäuser *(ĺm)* zeigen hinsichtlich der Giebelseiten Unterschiede, als neben der glatten Giebelseite hier und da noch ein von Stangen getragener Giebelvorbau angebracht ist (s. Taf. 15). Die Hütten stehen auf einer größeren rechteckigen Erdplattform, die von großen Kopfsteinen begrenzt ist, und haben Balkenlage sowie Bretterwände mit vier Türöffnungen. Das Dach *(eáu er ĺm)* hat die für die Westkarolinen typische Form mit dem weit überragenden Firstbalken. Dachmatten = *ás.* — Zu den verschiedenen Skizzen seien die einzelnen Bezeichnungen angeführt.

ofen *(tâm)* in der Mitte ist und die andere Seite für Küchenabfälle bestimmt ist (Abb. 270).

e) Niederkunftshütten und Bluthäuser *(tm malipâr)* sind nichts anderes als Wohnhütten, nur in roherer Ausführung und in kleinerem Maßstabe (s. Taf. 15).

Zum Inventar gehören außer Waffen und den auf S. 167 genannten Haushaltgeräten noch Kopfstützen *(elüdü)*, Wiegen *(ülo̊ila)* aus einem viereckigen Rahmen *(ealo̊)*, der mit einem Schnurnetzwerk *(metâd)* bespannt ist, sowie Schlafmatten *(χidgi;* Schlafstelle = *nanle)*.

Der Hausbau ist Sache von Fachleuten *(šînaṗ)*, in deren Händen auch die Kanuherstellung liegt. Auf Faraulip gab es 1909 noch drei derartige Handwerker. Als Honorar wird das gezahlt, was sie fordern, zumeist ist es Essen. Bei der Arbeit helfen alle Dorfbewohner mit; in ½ bis 1 Monat ist sie geleistet. Als Material wird Brotfruchtholz genommen. — Das »große Haus« wird auf Geheiß des Oberhäuptlings erbaut; es ist wie die großen Boote, die ja auch ein Ergebnis von Gemeinschaftsarbeit sind, gemeinsamer Besitz.

Siedlungen bestehen auf der Hauptinsel Faraulip und auf Pix; dagegen fand Hambruch die dritte Insel Ead unbewohnt und nur von Gestrüpp überwucherte Steinpostamente und verwilderte Tarofelder zeigten eine frühere Besiedlung an.[1] Die vorhandenen Niederlassungen unterstehen einem Häuptling und zwei Unterhäuptlingen. Auf *Faraulip* stehen 18 Wohnhäuser, 4 Bluthäuser und ein Geisterhaus. Die Hausaufnahme durch Hambruch ergab folgendes Bild:

Zahl der Gebäude	Name des Gebäudes	Zahl der Bewohner	Bemerkungen
1. u. 2.	*galîne e pix*	der Häuptling und seine zwei Schwestern, sein Sohn sowie zwei Mädchen und ein Knabe	Häuptlingshaus
3. u. 4.	*malûm*		Kochhaus
5.	*šepâl*		es ist kein Kanu mehr vorhanden; das Haus wurde sieben Gästen aus Ifaluk zur Verfügung gestellt.
6.	*gatimo̊x*		großes Kanu- und Männerhaus
7.	*banerdn̊*		kleines Kanuhaus mit 7 Booten, davon sind drei noch im Bau.
8.	*šordî*	ein Mann, eine Frau, zwei Knaben, ein Mädchen	

[1] Thilenius 1927, S. 258.

Zahl der Gebäude	Name des Gebäudes	Zahl der Bewohner	Bemerkungen
9.	*šomât*	drei Männer, fünf Frauen, zwei Mädchen	
10.	*šepâl*		kleines Kanuhaus
11.	*nîmmaū*	drei Männer, drei Frauen, zwei Knaben, ein Mädchen	
12. u. 13.	*lagôi ijâ*	vier Männer, fünf Frauen, fünf Knaben	
14.	*jalinîx*	ein Mann, eine Frau, zwei Knaben, ein Mädchen	
15.	*gajeldn*	drei Männer, drei Frauen, zwei Mädchen	
16.	*galineldx*	zwei Männer, drei Frauen, zwei Knaben, ein Mädchen	
17. u. 18.	*îm malipâr*		Bluthaus
19.	*jarijôu*	drei Männer, drei Frauen, drei Knaben, ein Mädchen	Haus des Saūeru
20.	*banijôu*		Geisterhaus
21.	*pegejân*	zwei Frauen, ein Knabe	»Prostituiertenhaus«
22. u. 23.	*îm malipâr*		Bluthäuser

In dieser Siedlung lebten also 22 Männer, 28 Frauen, 17 Knaben, 11 Mädchen, zusammen 78 Individuen, dazu kommen noch 14 Leute, die sich damals gerade auf Yap befanden. Die Bevölkerungszahl betrug also 92.

Auf Pix wurden 17 Wohnhäuser, 14 Kochhütten und zwei Geisterhäuser (ein Beispiel von der Verzierung der Stützpfeiler s. Abb. 271) gezählt, mit 15 Männern, 24 Frauen, 10 Mädchen, 13 Knaben, zusammen 62 Menschen. Ferner fand sich hier die verlassene Station des japanischen Händlers. Die Aufnahme durch Hambruch ergab folgendes Bild:

Abb. 271. Verzierung der Stützpfeiler im Geisterhaus (nach Skizze Hambruch).

1. u. 2.	oue e rûx	vier Männer, fünf Frauen, ein Mädchen, ein Knabe
3.	nanûefat	ein Mann, zwei Frauen, ein Mädchen, zwei Knaben
4.	matereměijûr	drei Männer, vier Frauen, zwei Mädchen, drei Knaben (hier waren die Hausplanken mit einem Tau »vernäht«)

5.	fareiåñ	ein Mann, vier Frauen, zwei Knaben
6.	orifåra	zwei Männer, zwei Frauen, zwei Mädchen, zwei Knaben
7.	oripéi	ein Mann, zwei Frauen, ein Knabe
8.	xateubůr	zwei Männer, zwei Frauen, zwei Mädchen, ein Knabe
9.	ralůñ	ein Mann, drei Frauen, zwei Mädchen, ein Knabe.

VI. Krieg und Waffen.

Kriege *(fitɛ̊x)* waren in alten Zeiten nicht selten[1], jetzt werden Streitigkeiten mit Speeren, Stöcken und Haizahnschlagringen *(rajarås)* ausgetragen. — Steine werden mit der Hand geschleudert. — Bogen und Pfeile sind nicht vorhanden. Der Sieger gebietet dem Kampf Einhalt. — Kriegserklärung = *maůd*, Friedensschluß = *eiamɛ̊le maůd*.

[1] Thilenius 1927, S. 259.

155

Soziale Verhältnisse und Geisteskultur.

VII. Zur Soziologie.

An **Verwandtschaftsbezeichnungen** stellte Hambruch folgende fest:
Großvater (väterlicherseits) *pulje tamâ*
Großmutter (väterlicherseits) *tjîn i tamâ*
Großvater (mütterlicherseits) *tematemâχ puljetjîn*
Großmutter (mütterlicherseits) *pulje tjîn temai tjînē*
Vater *temâ, tamâ*
Mutter *iîn, tjîn*
Bruder *mâneanâ*
jüngerer Bruder *puljî*
älterer Bruder *mâr'npêi*
Schwester *eïetogovêi*
ältere Schwester *maneâ* (ist wohl identisch mit dem Polowat-Begriff *moněâl;* vgl. dazu Damm und Sarfert 1935 S. 143)
Gatte *tšoglnidne*
Gattin *eutâχ*
Sohn *šâri*
Tochter *nigâu*
Vaterbruder *marinepâ e tamâ*
Mutterbruder *puljid*
Sohn des Sohnes *lân în mân*
Tochter des Sohnes *lân în rawût*
Sohn der Tochter *naūîn*
Tochter der Tochter *naūîn rawût*

Als **Altersbezeichnungen** wurden dagegen genannt:

Mann	*mân*
Frau	*rawût, jāîfîn*
Greis	*itagîl e mân*
Greisin	*itagîl e medâ e jâ.*

Namen für die Altersabschnitte der Jugend finden sich bei Hambruch nicht angegeben!

Ehe. Die Regel ist Einehe, doch kann ein Mann auch mehrere Frauen haben, so hatte der Häuptling z. B. vier Frauen. — Will ein Mann heiraten und zwar kann er das, wenn er fischen, segeln, rudern, Palmwein bereiten, kurz wenn er eine Frau ernähren kann — so fragt er sein Mädchen, ob sie wohl die Seine werden wolle. Das Mädchen gibt nicht sogleich Antwort, sondern will ihren Zukünftigen erst einmal näher kennen lernen. Die Liebenden stecken sich gegenseitig allerlei zu: der Mann bringt der Frau Nüsse, Fische, Schmuck und dergleichen, die Frau versorgt den Mann mit Matten, Essen, Taro und dergleichen. Ist man sich schließlich einig geworden, so geht der Mann zum Vater des Mädchens und holt sich dessen Zustimmung, zugleich bringt er Matten, Fische und dergleichen mit. Wird dem Werber das Mädchen versagt, so kommt es mitunter vor, daß das Mädchen doch auf ihren Willen besteht und die Heirat auch gegen den Willen des Vaters durchsetzt. Die Hochzeit wird durch ein großes Essen gefeiert, das die Verwandten des jungen Paares anrichten; das ganze Dorf feiert mit. Als Mitgift werden der Frau Taropatschen, zwei bis drei Brotfruchtbäume und einige Kokospalmen mitgegeben, der Mann bezahlt dagegen an den Schwiegervater 30 bis 200 Kokosnüsse, 3—10 Brotfrüchte und einige Taroschüsseln.

Der Ehemann zieht in das Haus seiner Frau und leistet dort Arbeit; doch geht er auch ab und zu in das eigene Elternhaus. Die Frau kümmert sich zunächst wenig um den Haushalt, vorerst besorgen die Eltern alles für die junge Ehe, bis dann später auch die Arbeit von der verheirateten Tochter mit erledigt wird. Die junge Frau kümmert sich um das Haus der Schwiegereltern in keiner Weise; sie sucht es höchstens auf, wenn es dort etwas zu essen gibt.

Geschlechtsverkehr soll vor der Ehe nicht geübt werden, doch wird es jetzt zumindest nicht sehr genau damit genommen. Das Coitieren (*ria* = Vagina, *ɔunum* = Clitoris) wird beiden Geschlechtern von den alten Leuten systematisch gelehrt. Über die Entstehung des Coitus s. Sage S. 207. Dicke Leute üben meist den Cunnilingus aus und zwar drei bis viermal im Monat. Die Schamlippen (*/lx*) werden künstlich verlängert.

Prostitution ist bekannt; die Prostituierten liefern den Liebeslohn ihrer Mutter ab. Einen besonderen Namen gibt es für Dirnen nicht.

Geburt. Den Eintritt der Schwangerschaft erkennt die Frau an dem Wegbleiben der Mensis. Kurz vor der Geburt sucht die Schwangere das Bluthaus (S. 184) auf und bleibt hier etwa zwei Monate lang, dann geht sie wieder in ihr Haus. Erst fünf bis sechs Monate nach der Geburt darf der Verkehr wieder gepflegt werden, geschieht es eher, so stirbt nach Auffassung der Insulaner das Kind. — Über Mehrgeburten war nichts zu erfahren. — Bei der Geburt des ersten Kindes entrichtet der Vater des Mannes an den Schwiegervater große Zahlungen an Fischen, Nüssen und Brotfrüchten.

Ehebruch wird durch Zahlung von Wertsachen gesühnt.

Der persönliche **Besitz** verteilt sich auf beide Geschlechter; es gehören:

dem Manne	der Frau
Wohnhaus	Taroplätze
Kokospalmen	Küchengerät
Handwerkszeug	mitunter auch ein Boot.
Fischereigerät	

Beiden gemeinsam gehören Bananen und Brotfruchtbäume, während die großen Boote und das große Kanuhaus Dorfeigentum sind. Der Häuptling hat für die Instandhaltung zu sorgen; dazu stehen ihm die Dorfbewohner zur Verfügung.

Stirbt der Mann, so verbleiben der Frau die Tarofelder, während das Haus auf den nächstältesten Bruder des Verstorbenen übergeht. Dieser heiratet zumeist auch die Witwe und nimmt damit gleichzeitig die Kinder in seine Obhut. Mit seinem Ableben übernimmt das älteste Kind die Verpflichtung für die Mutter und Geschwister zu sorgen.

Die **Arbeit** verteilt sich auf die beiden Geschlechter in folgender Weise; es entfällt auf

den Mann	die Frau
Buschrodung	Tarokultur
Anlage der Brotfruchtpflanzungen	Süßkartoffelanbau
Kochen im Kanuhaus	Nahrungszubereitung
Tauanfertigung	Weberei
Kanubau	
Hausbau	

Tod *(emêia)* und **Bestattung** *(iragegêrigi)*. Ist der Kranke trotz sorgfältiger Pflege von seiten der Eltern, Geschwister und Verwandten gestorben, so wird sein Gesicht sorgfältig mit gelber Farbe *(rân)*, der übrige Körper jedoch nur wenig damit bemalt. Schließlich wird der Tote völlig in Kleidmatten eingewickelt. Männer und Frauen stimmen Totengesänge an und tragen die Leiche noch am gleichen Tag auf ein großes Boot, das nach Osten zu liegt, so daß also auch der Tote, ganz wie es einst Eluelap bestimmt hat, in dieser Richtung zu liegen kommt. Man bringt die Leiche dann außerhalb des Riffkranzes, legt sie in ein mit Steinen beschwertes Netz *(šrôu)* und versenkt sie im Meer *(gaterôuldûx)*. Die Toten werden von Fischen gefressen und die Gebeine nimmt der Meeresgrund auf. Nach 4—5 Wochen findet ein großer Totenschmaus statt *(eâxi giri mêxa)*, der gleichsam die Bezahlung für die gelieferten Totenmatten ist. Witwe und Witwer *(niptth)* dürfen drei Monate nicht ihr Haar schneiden.

Früher sollen die Toten begraben worden sein und auf ihren Gräbern soll man kleine Steinsetzungen errichtet haben *(šêtje)*. Erst auf Betreiben der Yap-Leute, die damit einen Wunsch des Gottes Yônelaf verwirklichten, haben dann die

Bewohner von Oleai, Ifaluk, Aurepik und Faraulip die Meeresbestattung übernommen. — Diese Angabe Hambruch's ist außerordentlich bemerkenswert, denn damit sind die beiden Bestattungsarten in ihrem Alter zueinander festgelegt und andererseits ist die Verknüpfung der Totenversenkung mit der Yŏñelaf-Verehrung sicher. Bedenken wir, daß auf Grund der *ánaṅ*-Verbreitung über die Karolinen ein Wanderstrom von Osten und einer von Westen als sicher anzunehmen sind[1], so zeigt sich durch Hambruch's Angabe das Bild der aus Westen vorgedrungenen Kulturwelle bereits sehr klar in seinen wesentlichsten Elementen.

Neben der eigentlichen Familie gab es die **Sippe**, wie sie von Polowat ausführlich beschrieben ist. Es gab die Sippen Wolél, deren *moṅánaṅ* 1909 Ligilak war, ferner Ellaṅáidjáu, Sáuwól, Sáufalášik und Moṅólifer[2].

Die Bevölkerung gliederte sich in folgende **Standesgruppen**:

a) Oberhäuptling *(tamól, e pi móón)* und seine Familie,

b) drei Unterhäuptlinge *(poirlm, áuelíg* und *mánu)* und ihre Familien,

c) das übrige Volk.

Die Würde des Oberhäuptlings ist erblich und geht bis auf die ersten Siedler zurück. So gab es in alter Zeit einen *tamól* auf Faraulip, auf Pix und auf Ead und zwar hatte die letztgenannte Insel den ersten *tamól*. Der Oberhäuptling kümmert sich um das »große« Haus, ordnet die öffentlichen Arbeiten an, überwacht den Grund und Boden sowie den Fischfang, spricht Recht und sorgt für den Frieden innerhalb seiner Gemeinde. Versagt jemand den Gehorsam, so wird sein Feld enteignet. Stirbt der Oberhäuptling, so werden seine Brüder der Reihe nach Oberhäuptling und dann erst die Söhne des Verstorbenen. Frauen können nie die Herrschaft übernehmen, fehlen doch einmal die direkten männlichen Nachkommen, so werden die männlichen Kinder der Oberhäuptlingsfamilie Oberhäuptling.

Im Fall der Minderjährigkeit eines Oberhäuptlings führt der *poirlm* die Geschäfte bis zur Großjährigkeit (d. h. bis zum Pubertätsalter). Stirbt er, so tritt der *poirlm* Nr. 2 an seine Stelle, falls nicht Söhne des *poirlm* Nr. 1 vorhanden sind. Stirbt der minderjährige Oberhäuptling, so wird der *poirlm* Nr. 1 Oberhäuptling.

Die Unterhäuptlinge sind die Sprecher: sie überbringen die Befehle des Oberhäuptlings und sorgen dafür, daß sie ausgeführt werden.

In Ratsversammlungen *(xopái)*, die im »großen« Haus stattfinden, werden Großfahrten beschlossen, Arbeiten beraten, wird Recht gesprochen.

Der Eigentumsbesitz verteilte sich auf diese beiden Standesgruppen etwa folgendermaßen: der Oberhäuptling hatte 24 Plätze, dazu die Inseln Ead und

[1] Damm und Sarfert 1935, S. 158.

[2] Vgl. Damm und Sarfert 1935, S. 155ff. und Tafel bei S. 160.

Pix [das Betreten dieses Besitzes verbot er zu Zeiten durch Tabus[1]], der *poirlm* 17 Plätze, der *ãuelig* 20 und der *mânu* 13 Plätze. Ihren Besitz lassen sie von Dorfbewohnern bearbeiten, die sie dann mit Kokosnüssen bezahlen.

Die Namen der Häuptlinge vom Jahre 1909 an rückwärts sind Sãuerû, Gavûs, (um 1885) Parôa, Mareróiisãû, Néipôl (um 1804; er ist der historische Alberto, vgl. S. 194), Ragetéx, Thamolrâs[2]. — Die beiden Unterhäuptlinge zu Zeiten der Hamburger Südsee-Expedition hießen Šãûwul und Mâroijam.

Recht. Der Oberhäuptling ist der oberste Richter. Stiehlt jemand Nüsse, so wird das ganze Dorf im »großen« Haus zusammengerufen, dieses wird dann mit einem Tau abgesperrt und der Dieb wird dann nicht eher wieder eingelassen, als bis er dem Häuptling eine Buße entrichtet hat. Ist der Dieb nicht zu fassen, so geht man in das Haus des Betreffenden und eignet sich hier an, was man will.

Schimpfworte wie *manu butšo* = vermaledeiter Kerl, *go tẽ pird manemu edi* = stiehl mir nur nichts! oder *xo na fẽe manemu mondanum* = gebrauche Deine Schwester! führen nicht selten zu Tätlichkeiten. Doch verprügeln bzw. duellieren sich die streitenden Parteien meist so, daß selten jemand dabei ernstlich zu Schaden kommt und stirbt. In diesem Fall tritt der Bruder des Erschlagenen für diesen ein und stellt Sühneforderungen, letztere sind sonst nicht nötig.

Ehebruch wird durch Barzahlung gesühnt. — Brandstiftung ist ein großes Verbrechen und wird mit dem Tod bestraft, außerdem wird das Haus des Täters niedergebrannt. Wer es wagt, das »große« Haus anzuzünden, wird vom ganzen Dorf zu Tode geprügelt.

Sind Schulden nicht beizutreiben, so nimmt der Gläubiger dem Schuldner Dinge im gleichen Wert fort, doch muß der Häuptling vorher davon unterrichtet werden.

---

[1] Vgl. Thilenius 1927, S. 259.

[2] Lütke (1835, Vol. II, S. 344) berichtet weiterhin, daß ein gewisser Kafalu Häuptling über Ifaluk und Faraulip sei; dieser läßt sich weder in der Häuptlingsreihe von Ifaluk noch in der von Faraulip eingliedern. Es ist nicht ausgeschlossen, daß es sich dabei um einen *moñaiñan* handelt.

193

VIII. Zur inneren Geschichte.

Über die Geschichte der ersten Besiedlung dieser Inselgruppe sind wir gar nicht unterrichtet. Wir wissen lediglich, daß die Inselbewohner sehr kriegerisch waren und sich in fortwährenden Kämpfen selbst vernichteten und daß eine neue Besiedlung in späterer Zeit von Ifaluk aus erfolgte.[1] Dies ist zur Zeit des Oberhäuptlings Thamolrâs gewesen, der deshalb auch in der Erinnerung der Bevölkerung als der erste Häuptling gilt. Über seine Zeit unterrichtet die folgende Geschichte:

Krieg zwischen Faraulip und Pix.

Ein Mann aus Pix namens Nargetumâr hatte mit langen Schimpfreden die Leute von Faraulip beleidigt. Diese hatten ihm fürchterliche Drohungen nachgerufen, als er Faraulip verließ. Daheim sagte er zu seinen Leuten: »Macht Euch fertig! Morgen kommen die Leute von Faraulip und werden mit uns kämpfen!« So machten sich die Pix-Leute Speere und auch die Faraulip-Leute rüsteten sich, aber keine Partei hatte den Mut, den Krieg zu beginnen. — Eines Nachts gingen die Faraulip-Leute fischen und nur wenige blieben mit den Frauen und Kindern im Dorf zurück. Diese wurden plötzlich von den Pix-Leuten überfallen und eine große Zahl von ihnen wurde getötet. Mit Sonnenaufgang kamen die Boote vom Fischen zurück und sahen das Blutbad. Da wurden plötzlich auch die wehrlosen Fischer in den Booten überfallen und niedergemetzelt, nur ein kleiner Teil konnte aufs Meer oder in den Busch flüchten. Die Leute von Pix blieben noch eine Zeit auf Faraulip, zogen aber dann ab.

Damals weilte ein Yap-Mann auf Faraulip, zu diesem gingen die wenigen Überlebenden und fragten ihn, ob er ihnen nicht gegen Pix helfen wolle. Er sagte zu und machte einen Zauber: da kam eine große See (wohl Taifun) und zerstörte viele Häuser auf Pix, dabei kamen zahlreiche Menschen um, nur 20 blieben etwa übrig. Aber auch der Insel Faraulip setzte die See böse zu, alle Bewohner bis auf einen, der sich in den Busch gerettet hatte, kamen um. Der Yap-Mann war kurz nach dem Zauber gestorben.

Dieser Faraulip-Überlebende namens Uerlipâr ging nun aufs Riff, fing in Körben 20 *oméi*-Fische, legte sie in einen *âx*-Korb und fuhr damit nach Pix. Zuerst rief er nach dem Häuptling. Da kam ein alter Mann an Stöcken herbeigekrochen. »Hier, willst Du den Fisch haben? Komm hole ihn Dir!« Der Alte

[1] Vgl. Thilenius 1927, S. 239, 260.

kam, da zog ihn der Fischer ins Boot und zertrümmerte ihm mit der Fischkeule den Schädel. So rief er der Reihe nach alle Leute herbei und tötete sie. Nun war er allein, das behagte ihm auch nicht und so fuhr er nach Unaneń (= Oleai) und heiratete hier, dann kehrte er mit seiner Frau nach Faraulip zurück. Als er ankam, fand er jedoch ein Boot aus Ifaluk vor, dessen Insassen von der Insel Besitz ergriffen hatten und ihm verboten, die Insel zu betreten. So fuhr er nach Pix und blieb dort. So sind viele Kulturgüter, die sich auf Faraulip finden, nicht ursprünglich, sondern stammen aus Ifaluk!

Unter dem Häuptling Ragetéx kam ein großer Taifun über Faraulip, der auf dieser Insel besonders großen Schaden anrichtete, Oleai und Aurepik dagegen weniger heimsuchte. Dieses Unwetter vernichtete viele Menschen und alle Palmen, so daß Hungersnot drohte. Glücklicherweise erschien bald ein Boot aus Oleai, das die Überlebenden mit nach ihrer Insel brachte und ihnen über die ärgste Notzeit hinweghalf. Als dann alles einigermaßen wieder angewachsen war, kehrten die Leute in ihre Heimat zurück. — Wenige Zeit später ging noch ein zweiter Taifun über die Insel, der zwar die Hütten vernichtete und einige Palmen umbrach, aber keinen größeren Schaden anrichtete.

Der Häuptling Néipôl ist der historische Alberto, den Lütke und v. Kittlitz 1828 kennen lernten und der ihnen durch seine europäischen Manieren und spanischen Sprachkenntnisse auffiel; er hatte zwei Jahre auf den Marianen zugebracht[1].

Wie Hambruch von den Eingeborenen erfuhr, kamen in dieser Zeit die ersten Weißen und zwar sollen es Spanier gewesen sein, die jedoch nicht landeten, sondern nur in der Lagune blieben. Möglicherweise ist damit Luis de Torres gemeint, der 1804 die Gruppe besuchte. Die Eingeborenen brachten ihnen Kokosnüsse und was sie sonst hatten und erhielten dafür von den Spaniern europäische Dinge. Das Eisen *(pardń)*[2] war ihnen damals schon bekannt und zwar hatte man es auf Lamutrik kennen gelernt, wo man es aus Guam einführte, gelegentlich waren auch Faraulip-Leute selbst nach Guam gefahren.

Unter Marerôi isáu wurden große Fischzüge ausgeführt und zwar in einem Ausmaße, wie es seitdem nicht wieder geschehen ist. Es erschienen auch unter seiner Regierung zweimal Walfänger (Wal = *rás)* und zwar waren es amerikanische Dreimaster. Für die Festlegung dieser Regierungszeit ist die Tatsache wichtig, daß zu jener Zeit ein deutscher Händler zum erstenmal nach Oleai kam.

Unter der Regierung des Häuptlings Gavûs strandete einmal nachts ein deutsches Schiff »Karerêin« (wohl »Kathrine«) in der Passage; sein Kapitän hieß

[1] Lutké 1835, Vol. II, S. 130; v. Kittlitz 1858, II. Bd., S. 151.

[2] Dieses Wort gibt hinreichend Aufschluß über die Herkunft dieses neuartigen Materiales, denn *pardá* ist das malaiische Wort für Buschmesser oder für ein Schwert mit gerader Klinge.

Becker. Er und seine Leute (zwei Weiße, das übrige waren Sandwich-Leute und ein Samoaner) blieben 1½ Jahr auf der Insel. Becker war dem Rum sehr zugetan und es wurde das Schiffsunglück seiner Trunkenheit zugeschrieben, er wurde später nach Ponape gebracht. Der eine von den beiden Weißen hat hier einen Sohn, der 1909 etwa 25 Jahre alt war; das Unglück muß sich also 1885 zugetragen haben.

Der 1909 regierende Häuptling Säberü war ein viel gereister und zuvorkommender Mann. Unter ihm siedelten sich der Händler O'Keefe und Japaner an, von letzteren ist einer auf Faraulip gestorben. Als Hambruch auf der Insel weilte, lag er grippekrank in seinem Haus; durch einen Zauberer hoffte er wieder gesund zu werden; der Zauberer half nicht, wohl aber das Chinin Hambruch's.

176

IX. Zur Religion.

Über die **Entstehung der Welt** erzählen die Eingeborenen folgendes. Tief unter der Erde liegt das Urriff *(olethapathâp*, s. Abb. 272, a); es brachte Solâl (δ) Alüeläp (ɔ) und Eoitâân (♀) hervor. Solâl pflanzte nun in das Urriff einen Stab, der rasch emporwuchs. Alüeläp nahm ein wenig Erde und stieg an diesem Stab (Abb. h) empor. Als er auf halber Höhe war, streute er etwas Erde aus und

Abb. 272. Schematische Darstellung des Weltbildes (nach Skizze Hambruch).

schuf so die Erde (d), über die er seine Schwester Eoitâân, ein menschenähnliches Wesen, als Häuptling einsetzte. Er stieg dann noch höher bis in den Himmel *(lân*, Abb. f) und bezog hier das große Haus *(falûmâl*, Abb. g). Für die Erde schuf er die ersten Menschen, eine Frau namens Legobú und einen Mann Nigoburonialüâl. Beide wohnten im Osten, vielleicht auf Ponape, doch wissen es die Eingeborenen nicht genau. Auf Geheiß des Gottes Alüeläp zeugten sie viele Knaben

2: Damm et al. ORZI Woleai

und Mädchen, dann fuhren sie von Insel zu Insel und überall setzten sie einen Jüngling und ein Mädchen ab, damit sie die Inseln bevölkern sollten. Sie zogen dann weiter nach Westen, wo sie andere (!) Menschen antrafen. — Eine andere Version sagt, daß von diesem ersten Menschenpaar die gesamte Menschheit, Kanaker und Weiße, abstammen!

Die Unterwelt *(ilálo)* wird von Solál (Thaûulál, Thâûlalû), einem Wesen halb Mensch halb Fisch, beherrscht. Er schuf die Tiere des Meeres und setzte über jede Insel einen »Verwalter«, der den Eingeborenen eine reiche Beute zu sichern hatte. Im Reich der Unterwelt scheint die Sonne, wenn es auf der Erde nachtet. Der Eingeborene stellt sich dieses Land üppiger als die Erde etwa wie ein Schlaraffenland vor. Hier ist auch das Urriff (s. oben). Solal muß auf Geheiß des Alüelâp das Meer erregen, so daß Taifune entstehen und die Menschen sterben.

Im Himmel *(lâs)* befindet sich ein sehr großes Haus *(fatîumâl)*, in dem Alüelâp (auch Eluelâp), ein Wesen halb Mensch halb Fisch, haust und in dem auch alle guten Menschen Aufnahme finden (s. Totenreich). Alüelâp schuf die Welt, er machte die Sonne, die am Tag über der Erde scheint und des Nachts ihr Licht in der Unterwelt erstrahlen läßt. Ebenso schuf er den Blitz *(worowôr)* und Donner *(bâtî)*, beides benutzt er um böse Menschen zu töten. Alüelâp achtet sorgsam darauf, daß alles auf der Erde wie überhaupt im gesamten Weltall seine Ordnung hat.

Alüelâp hat eine Frau, deren Namen unbekannt ist, beider Kinder sind Nimegêt (?), die den Menschen die Kokosnuß gab (s. Sage S. 205) und Lugêilen (♂), doch gibt es über die Abstammung des letzteren noch eine andere Version (s. Sage S. 204). Lugêilen gilt genau wie bei den Polowat-Leuten als der Vertraute des Himmelsgottes[1]. Er hatte zwei Frauen und zwar eine im Himmel namens Lâmelâl (Ilamalûl), und eine auf Erden, Tâûrôx genannt, von dieser hatte er den Knaben Olufâth, während die Ehe mit der erstgenannten kinderlos war. Über die Taten dieser allbekannten karolinischen Göttergestalt berichtet die Sage S. 202.

Alüelâp hatte aber der Sage (S. 205) nach noch Adoptivkinder, von denen Thelân und Paluelâp für die Insulaner besondere Bedeutung haben. Ersterer ist der Erfinder des Bootbaues (s. S. 178), ihm sind die Meßschnur, an deren Enden zwei Kokosfiederblätter *(tjâtî)* hängen und die Kanuaxt (Abb. 245) besonders geweiht. Letzterer hat das Segel erfunden und kennt die Wege auf dem Meer. Deshalb legen die Kapitäne, wenn sie ihr Reiseziel sicher und bei ruhiger See erreichen wollen, im Boothaus eine Kokosnuß und eine Matte als Opfergabe für Paluelâp nieder. Sein Sohn Elülûe ist ihm Helfer in allen Dingen.

Im Himmel lebt weiterhin die gute Frau Marâm (= Mond). Sie möchte, daß alle Menschen leben, und läßt die Kinder zur Welt kommen. Das Gegenteil von ihr ist die Frau Nigesegés, die ebenfalls im Himmel haust. Sie ist nicht gut und

[1] Damm und Sarfert 1935, S. 191.

läßt die Menschen sterben. Wenn auf der Erde jemand Böses getan hat, so gibt Alüeläp der Nigesegés den Auftrag, diesen Menschen sterben zu lassen. Marám wehrt sich dann dagegen und sagt wohl: »Sé má! (= Stirb nicht!) Die Menschen sterben dann wohl, werden aber alle zu kleinen Kindern, wachsen wieder heran und sterben so doch nicht. (Es scheint hier der Glaube an eine Unsterblichkeit vorzuliegen!) — Ehedem starben die Menschen überhaupt nicht. Als aber Alüeläp sah, wie viele Dinge sie seit der Zeit ihrer Erschaffung bereits erworben hatten, die er nicht einmal im Himmel besaß, befahl er Nigesegés, die Menschen sterben zu lassen.

Der Beherrscher der Luft *(oistjár;* das Blaue des Himmels = *li ma rahurah)* ist Thaúdr, ein Bruder des Solál (s. oben); er ist der Vermittler zwischen Himmel und Unterwelt und läßt den Menschen die Wünsche des Alüeläp wie des Solál wissen. Er kümmert sich um das Gedeihen der Brotfrucht, des Taro, der Bataten und was sonst an Eßbarem vorhanden ist.

Yoneláf

wird mehr als eine Art Dämon angesehen. Da er Taifun bringt, wird er auf den niederen Koralleninseln sehr gefürchtet. Wie Yoneláf auf den Inseln bekannt wurde, geschah folgendermaßen:

Einst wollten die Yap-Leute nach Palau fahren. Da kam ein starker Wind und verschlug sie nach Oleai. Hier berichteten sie den Bewohnern, daß in Yap ein großer König Yoneláf herrsche, dem alle Inseln bis Taróa (= Tarawa der Gilbert-Inseln) gehörten. Wenn sie nicht von einem Taifun heimgesucht werden wollten, sollten sie ihm bald Geschenke bringen. Obgleich die Oleai-Leute nicht recht an diese Erzählung glaubten, bekamen sie es doch mit der Angst zu tun und opferten seither regelmäßig Yoneláf. Von Oleai nahm dieser Kult seinen Weg weiter ostwärts.

Hambruch notierte noch den Namen eines Fabellandes Matán, das im Osten liegen soll und sicher mit dem Mehán von Polowat[1] identisch ist.

Mächtige Leute wie z. B. Ponijóu, der durch seinen Fischzauber berühmt wurde, sind nach Hambruch zu »Lokalgottheiten« erhoben worden und es wurden ihnen in kleinen Geisterhütten (s. Taf. 15) Opfer dargebracht (s. Sage S. 206).

Totenreich und Seelenvorstellung. Die Totenseelen *(faga bdobu)* gehen zu Alüeläp in den Himmel; die der guten Menschen kommen in das *fatfumál*, die der schlechten ins Feuer *(iáf)*[2], das weit vom Hause des Alüeläp entfernt brennt. Nach zwei Monaten werden diese aus dem Feuer entlassen und zur Erde geschickt, wo sie als Geister in der Luft herumschwirren, die Riffe, das Meer und den Busch

[1] Damm und Sarfert 1933, S. 197.
[2] Wörtlich: all some calabus.

beunruhigen. (Guter Geist = *eahatjá*, böser Geist = *candné*). Dabei erscheinen sie bald dem einen, bald dem andern Menschen als Traumgesicht und bringen bald böse, bald gute Nachrichten. Zumeist erscheinen sie dem Häuptling, der dann die Anordnungen des Verstorbenen ausführen läßt. Nicht selten fährt der Geist auch in einen gewöhnlichen Menschen, der dann eine Art Prophetismus (*hiffui*) betreibt. 1909 gab es solche Leute bereits nicht mehr, da mit dem Letzten die Kenntnis des entsprechenden Zaubers verloren gegangen war. — Über eine Unsterblichkeitsvorstellung s. S. 198.

Zauber kann nur von einem Wissenden (*tálo báneban*) gemacht werden. Seine Ausrüstung besteht in folgenden Dingen:

a) *tárapó*: um das rechte Handgelenk gebundene junge Kokosblattfieder,

b) *tejapetáx*: um den Hals gebundene junge Kokosblattfieder mit dem charakteristischen Knoten (*buzubáx*),

c) *ówád tábi'ip*: junge Kokosblattfiederstreifen, mit denen der Kranke unter Beschwörungen bestrichen wird; die Streifen werden dann am Kanumast für Alúlue aufgehängt,

d) *xárup*: mit Kokoswasser angerührte »Medizin«, die vom Kranken getrunken wird,

e) *xudli ówád*: Blattfiedern (*ilagli*) des Kokoswedels, wird wie c) benutzt und dann im Kanu niedergelegt,

f) *popów*: großer Palmenwedel, mit dem der Krankheitsdämon aus dem Haus getrieben wird,

g) *tídél*: der von Polowat[1] bekannte Medizinbeutel aus Kokosbastblattscheide (Blattzierstreifen = *edm*, Bastbeutel = *ád*, Medizin = *lífe*).

Hambruch konnte eine Krankheitsbeschwörung miterleben: der Häuptling war an Influenza erkrankt und so wurde der *tálo bánebau* gerufen, der mit dem Kranken folgende Rede und Gegenrede führte.

»Warum bist Du jetzt krank?« —

»Ach alles ist bei mir krank, Kopf, Arme, Beine, Bauch!« —

»Bist Du ein guter Mensch?« —

»Ja, ich bin gut!« —

»Das glaube ich nicht!« —

»Nein, ich bin gut!« —

»Wenn Du gut wärest, hätte Alúelóp Dich nicht krank gemacht. Ich glaube Du hast Leute beschimpft oder gestohlen. Ja, jetzt magst Du gut sein, denn Du kannst nichts Schlechtes tun, weil Du krank bist! — Jetzt will ich Dich besser und gesund machen. Ich werde zaubern, daß Du aufstehen kannst, und wenn Du nicht stirbst, wirst Du ein guter Mensch werden. Stirbst Du aber, dann bist Du ein schlechter Mensch! Sieh, Alúelóp gebot, Du sollst nicht töten, Du sollst nicht

[1] Damm und Sarfert 1935, Taf. 29, Abb. 1.

stehlen, Du sollst nicht schimpfen, nichts sollst Du nehmen, was nicht Dein Eigen ist. Tust Du dies aber doch, dann wirst Du bald sterben!«

Daraufhin trug der Medizinmann seine Krankenbeschwörung *(palupōl)* in monotoner Weise psalmierend vor.

Thālę mēiroñ, thāle māle fāl elāl	Sorget Euch, kümmert Euch!
Thāle mēiroñ thāle māle fāl elāub	Sorget Euch, macht Alles gut!
Elūlemāth le fāl lōwāx ko Elūlūe ko ll	Elülemath im großen Haus, Elülüe schau mich an!
Le ittox ko ol pi tomā uexelāhm	Komm herbei und sieh den Kranken an!
Ibue tlli riāl	Laßt die Krankheit vorüber gehen
Ko botli e tll	Macht ihn gesund!
Ko botll āñ riāth	Wehrt die Krankheit von ihm ab!
Lāuām, tarlser, xolomāri	Du, Junge, schön ist das Wetter, sieh doch
Fagli, mā u rūx, elāi, eāi	Wie schön, ich bin gesund mein Junge, mein
Aiūlāp, urisiā, falāi	Alüelap, wir singen in unserem großen Haus
Moxrōlaxrō, uāl.	Den Sitztanz.
Nalūda Alūlue, thoulde, voputōx, vapūleta lāñ.	Schlafe Alülue, geh an einen andern Platz, steig wieder in den Himmel.
Reā lāni tharāta, lm e ho xēlū	Der Himmel ist klar, es fällt ein wenig Regen.
Elāgelap, Elūlūmēi, Tebiōua[1]	Alüelap, Alülümei, Tebioua[1]
Thorōu logilorlti logilorōta	Seid gegrüßt, steigt herab, steigt hinauf!
Eān laximōt thorōulifel e vāūiōx	Seht Euch um, fertigt an die Medizin,
Uiserāx fāliſā thamōl ā	Bringt sie herab zum Häuptling!
Mailōp gerātax ūtā	Es ist gut, über dem Riff geht soeben auf der *mailōp*.
Falāi ūtā ourūna	Der Zauber ist gut.
Palde xōubogo narbiu	Palue, alle Leute bringen Dir Essen,
Tebiōua ilaiā tirorōle	Tebioua Dir auch und ebenso
Elūlemath erāti Thalāāx beigāua	Elülemath, kommt her zu meinem Kranken!
Ovilisōu sōu ull le mēiāli	Geht wieder zurück und nehmt den Weg über das Riff!
Alūlue xolouilōx, xolouilāx	Alülue, Komm herbei, steig wieder in den Himmel!
Udm Ualuā lā u xathavothovōā a le matāli	Alülue bleib wieder hinterm Riff im Wasser!

Ein anderer wichtiger Zauber ist der *mailumāti*, der Wetterzauber. Diesen gibt es in zweierlei Form: a) Wenn längere Zeit Regen ausbleibt, defäziert der Häuptling in eine Segelbahn *(gīri)* und hängt diese im großen Haus *(fāl)* auf. —

[1] Tebioua = Regengott, von Elūelap eingesetzt.

Um Regen zu machen, wird mitunter auch das Muschelhorn geblasen. — b) Über den Wetterzauber des Seemannes s. S. 180.

Eine Art Feldzauber ist das Schwimmenlassen von Spielbooten (s. Abb. 273) durch Kinder[1]. Er gilt der Brotfrucht, dem wichtigsten Nahrungsmittel der Insulaner, denn aus ihm stellt man eine Konserve her, die über die Notzeit hinweghilft. Wenn nun die Reifezeit beginnt — Wachstum und Reife dauern sechs Monate — fertigt jeder Knabe ein Spielboot *(uárlíš)* an und läßt es schwimmen, um die Brotfrucht zu begrüßen. Auf Geheiß des Älüelâp hat Thâûûr den Menschen die Kenntnis dieser Spielboote übermittelt.

Verbotsvorschriften *(etâb:* polynesisch tapu) werden bei bestimmten Gelegenheiten ausgesprochen; so verbot der Häuptling durch Tapuzeichen das Betreten seines Besitzes. Weitere Tapus s. S. 168.

X. Sagen und Märchen.

Die Taten des Olufâth.

Tâlâûóx war von Lugéileń schwanger. Sie lebte auf einer Insel (Name unbekannt), wo bei der Geburt eines Kindes der Frau der Leib aufgeschnitten wurde, da anders die Kinder nicht geboren werden konnten. Lugéileń sagte zu seiner Frau: »Wenn die Wehen kommen, so seufze gehörig, zieh die Bauchdecke ein und dann wird das Kind kommen!« Als es soweit war, kam Olufâth aus dem Kopfe (Bregma) der Tâlâûóx. Gleich nach der Geburt lief er nach einer Palme. Die Mutter sagte ihm: »Warte, Du bist ganz mit Blut bedeckt, laß Dich waschen!« — »Oh, ich kann mich allein waschen!« — Und er wischte das Blut an den Palmstämmen ab, die daher rot sind. Er wuchs rasch heran. Tâlâûóx sagte: »Komm, ich will Dir die Nabelschnur abschneiden!« — »Oh, das kann ich auch!« Und er schnitt sie ab. Er blieb auf der Erde und spielte mit andern Kindern. Eines Tages fing er Streit an. Da sagten die Kinder: »Geh zu Deinem Vater!« — »Ich habe keinen; ach, der ist im Himmel!« — Und Olufâth lief zu seiner Mutter. Diese fing auf seine Fragen nach dem Vater zu klagen an und sagte ihm nichts.

Eines Nachts dürstete Olufâth. Wie andere Knaben auch hatte er die Kokosnuß bisher nicht selbst aufgeschlagen und an den Mund gesetzt, sondern auf Geheiß des Vaters hatte ihm seine Mutter den Inhalt der Trinknuß stets in eine Schale gegossen und ihn daraus trinken lassen. Jetzt schlug Olufâth aber selbst eine Nuß auf und setzte sie an den Mund, da sah er seinen Vater. — »Ich will zu meinem Vater! Wie kann ich zu ihm kommen, sag' es mir!« — »Du sollst gar bald zu ihm gehen«, sagte da seine Mutter. Und Lugeiléń sagte zu Tâlâûóx: »Wenn mein Junge zu mir kommen will, zünde ihm ein Feuer an und lege viel Holz hinein, daß es Rauch gibt.« Tâlâûóx tat es. Olufâth setzte sich auf den Rauch und wurde in den Himmel emporgetragen. Als er dort ankam, sah er viele Knaben, die mit kleinen Booten spielten. »Kommt und leiht mir ein Boot!« — »Was will denn der? Woher kommt der fremde Junge? Wir geben Dir keins!« — Und sie spielten weiter. Nur ein Knabe gab Olufâth ein Boot zum Spielen. Olufâth spielte damit, gab es dann dem Knaben wieder und ging fort. Den anderen Knaben aber schwammen die Boote weg, nur dem einen nicht.

An einer anderen Stelle spielten Knaben mit Haifischen, die damals zahm waren. »Laßt mich mitspielen und leiht mir einen Fisch!« — »Was will denn der? Woher kommt denn nur der fremde Junge?« Und sie spielten weiter, nur ein

Knabe lieh Olufáth einen Fisch. Nachdem er damit gespielt hatte, gab er ihn wieder zurück. Als die anderen Knaben wieder mit ihren Fischen spielen wollten, hatten diese große Zähne bekommen und bissen die Knaben, nur den einen nicht. Dasselbe Spiel wiederholte sich bei dem kleinen Fisch *nɨx* (Hornhecht?).

Olufáth ging auf einen Berg und sah wie die Leute Palmblätter abschlugen, um damit das Haus des Eluelâp neu zu decken. »Gebt mir einmal das Messer, ich will auch Blätter schneiden!« — »Dummes Zeug! Wer kennt den Knaben?« — Nur einer gab ihm das Messer. Olufáth schnitt damit Palmwedel ab. Da kam die Nacht. Als am andern Morgen die Leute weiter arbeiten wollten, klebten ihnen die Hände am Arbeitsgerät fest, andere, die gerade die Palmstämme oder Wedel anfaßten, blieben daran hängen. So erging es allen, nur dem einen nicht.

An der Palme führte ein Weg vorüber, darauf urinierte Olufáth und hockte dann im Busch nieder. Bald darauf kam Lugeilêñ. Er trat in die Pfütze, schalt tüchtig, wußte aber nicht, wer es getan hatte. Olufáth saß im Busch und machte wie ein Vogel: »Hi, hi!« Lugeilêñ ging weiter und kam an den Platz, wo die Arbeiter an den Bäumen klebten. Da merkte er, daß Olufáth gekommen war, freute sich und befreite die Männer. Er ging dann in das große Haus. Bald darauf kam Olufáth, aber nicht als Mensch, er sah vielmehr aus wie der Vogel *golúñ*. Lugeilêñ sagte: »Komm!« Doch Olufáth lief fort. Nun rief Lugeilêñ: »Geh fort!« Da kam Olufáth herzu. Jetzt hatte er jedoch nicht mehr Vogelgestalt, sondern lag als ein Haufen Kot vor dem Vater. »Komm heraus!«, sagte da Lugeilêñ und da trat Olufáth in Menschengestalt hervor.

Die Leute im großen Haus sagten: »Ein Balken ist morsch geworden, morgen wollen wir einen anderen holen.« Alle gingen dann schlafen, auch Olufáth. Als die Sonne aufging, eilten die Leute in den Busch, schlugen einen Pfeiler, brachten ihn in das Haus und wollten ihn gegen den morschen auswechseln. Dazu mußten sie zuerst ein Loch graben. Sie sagten es Olufáth. Der nahm eine Palmblattrippe und ein Blättchen, steckte sie in seinen Lendengürtel und grub dann das Loch aus. Kaum war er fertig, als die Leute den Pfeiler nahmen und ihn durch Olufáth's Leib in die Grube rammten. Sie glaubten, daß er nun tot sei, das war jedoch nicht der Fall. Nachts nahm er die Kokosrippe, bohrte damit den Pfeiler aus und kletterte in ihm in die Höhe. Er setzte sich auf den Firstbalken und schaute zu, wie die andern Kokosnüsse aßen und sich dabei vom Tod des Olufáth erzählten. Da nahm er das einzige winzige Kokosblattstückchen, das er am Tage vorher beim Graben der Grube eingesteckt hatte, zauberte und aus dem Blattstückchen wurde eine Nuß, die größer und immer größer wurde. Er nahm sie und warf sie zwischen die Leute. »Seht, ich bin gar nicht tot!« Da merkten sie, daß Olufáth oben auf dem Firstbalken saß. Nun machten die Leute im großen Haus eine Fischreuse. Sie war nicht ganz fertig, im Innern mußte noch einiges gemacht werden, das sollte Olufáth tun. Er holte aus dem Busch Holz, nahm eine Pflanze

in den Mund und kroch in die Reuse. Schnell schlossen die Leute die Reuse, setzten sie auf ein Boot und fuhren damit vor das Riff. Hier warfen sie die Reuse in tiefes Wasser und glaubten nun, Olufáth sei endlich tot. Doch die Pflanze im Mund hielt ihn oben; es gelang ihm sogar aus der Reuse herauszukommen; dann fing er viele Fische und steckte sie in die Reuse. Er selber gab sich das Aussehen eines Ringwurmkranken und war schließlich noch eher an Land, als die Leute, die ihn töten wollten. Die Reuse lag aber schon gefüllt am Strand. Bald darauf kam Lugeilén. So waren die beiden Männer im großen Haus, ehe die anderen kamen. Als diese nun das Haus betraten, meinten sie, daß der Mann im Haus Lugeilén wäre. »Nein, so sieht er nicht aus! Ob es vielleicht Olufáth ist?« — »Oh, der liegt im tiefen Wasser vor dem Riff!« Als sie aber ins Haus eintraten, da sahen sie, daß es doch Olufáth war. Dieser erzählte ihnen nun von der gefüllten Fischreuse am Strand. Die Männer holten sie sofort herzu, sie war vollkommen gefüllt. Olufáth nahm einen Fisch und ging damit in das Haus des Donners, nahm dessen Frau, gab ihr den Fisch und schlief mit ihr. Da kam der Donner und sah, was Olufáth begangen hatte. Als er ihn fangen wollte, lief dieser jedoch ins große Haus. So machte es Olufáth auch mit der Frau des Blitzes und mit der des Mannes Pofs. Stets merkten es die hintergangenen Ehemänner, doch niemals konnten sie den flinken Olufáth fangen. Beim letzten wäre es Olufáth beinahe schlecht ergangen. Pofs war ein großer starker Mann und Olufáth hatte Angst. Er nahm deshalb einen Stein, warf ihn Pofs ins Auge und lief fort ins große Haus. Dann nahm er wieder einen Fisch und lief damit nach dem Haus des Féla. Dieser befand sich im Busch, so machte er es mit dessen Frau wie mit den andern auch. Als er fortgehen wollte, kam Féla. Sofort lief Olufáth weg, doch Féla hatte eine Fischleine. Mit dem Haken fing er Olufáth am Ohr, zog ihn zu sich heran und verprügelte ihn dermaßen, daß er wie tot liegen blieb. Féla stach ihm noch beide Augen aus und vergrub sie bei seinem Haus.

Da kam Lugeilén und hielt nach seinem Sohn Ausschau. Er spürte den Verwesungsgeruch, ging ihm nach und sah, daß Olufáth tot war. Schnell machte er einen Zauber und Olufáth wurde wieder lebendig. Er sollte nun mit Lugeilén gehen, doch wollte er nicht. Zuerst sollte Féla getötet werden. Er ging ins Haus, tötete ihn, schlug ihm die Zähne aus und warf sie ins Meer. Dann ging er zu seinen Eltern in den Himmel; er liebt Tanz und Gesang und leitet diese auf den Plätzen im Himmel und auf der Erde.

Lugeilen.

Zwei Frauen, Wavú und Pugelú, wohnten auf der Erde. Jede von ihnen bekam ein Mädchen und jedes von diesen hatte einen Apfelsinenbaum (von Europäern eingeführt). Doch waren beide nicht gleich; der eine Baum hatte bessere Früchte wie der andere. Da stahl das eine Mädchen dem andern eine Apfelsine.

Diese merkte es und verprügelte ihre Schwester. Schließlich fingen beide mit Sonnenaufgang an, eine Kleidmatte zu weben. Um die Mittagszeit hörte jedoch die eine damit auf, denn die andere, die schwächere Frau, hatte einen Zauber gemacht und machte ihre Kleidmatte fertig.

Da kam ein Mann Nisaréla; er fing sich die Frau, die ihre Matte fertig hatte und stieg mit ihr in den Himmel. Hier wohnte im Osten des Himmels ein kleiner König Mesenieńótu, der nahm sich diese Frau zur Gattin. Sie bekam bald einen Knaben, der erhielt jedoch keinen Namen; er war ein guter, lieber Mensch. Elueláp hatte ihn sehr gern, nahm ihn zu sich und nannte ihn Lugeiléń. Er machte ihn zu einem großen König im Himmel.

Wie Nimégei den Menschen die Kokosnuß gab.

Früher gab es wohl Palmen, aber keine Nüsse. Da bekam Elueláp eine Tochter Nimegéi. Nimegéi wurde schwanger, doch gebar sie kein Kind, sondern eine Kokosnuß kam heraus. Diese Nuß füllte sie mit Erde und ließ sie liegen. Nach zehn Tagen keimte sie. Nimegéi wußte nicht, was es war; das Ding wuchs rasch empor, es war eine Palme, an der viele, viele Nüsse hingen. Da sagte Elueláp zu vier Männern: »Paßt auf, daß niemand die Nüsse vom Baum stiehlt oder die abgefallenen wegnimmt!« Doch Lugeiléń nahm heimlich eine davon, ging damit nach Mogemog und pflanzte sie dort ein. Schnell wuchs sie empor und bekam viele Nüsse. Da machten sich alle Leute in ihren Booten nach Mogemog auf und holten sich Nüsse. So kam die Kokosnuß auf die Inseln.

Die Abstammung des Theláń und seiner Brüder.

Elueláp hat drei weitere Söhne Theláń und Alülemáth. Diese waren Zimmerleute. Theláń ging zu den farbigen, Alülemáth zu den weißen Menschen und zeigte ihnen den Schiffbau. Theláń baute in Málip auf Ponape das Kanu, das sich von dort aus weiter nach dem Westen verbreitete, er baute auch die Häuser, aber er war auf das Praktische bedacht. Alülemáth ging zu den Weißen, unterrichtete sie in den Wissenschaften, zeigte ihnen, wie Schiffe gebaut wurden und machte sie klug.

Eine andere Version lautet: Zwei Männer, Theláń und Themarûx, sind Brüder des Alülemáth. Die beiden ersteren halten sich bei den Eingeborenen auf, Alülemáth bei den Weißen. Alle drei sind nicht die rechtmäßigen Kinder des Elueláp. Sie stammen vielmehr von der Frau Legobú und dem Mann Nigoburonialüal ab, die sich beide von der Frau Eőitsán herleiten. Das Ehepaar bekam die genannten drei Söhne, die sehr klug waren und die Elueláp deshalb so gern hatte, daß er sie zu sich nahm, ihnen ihre Namen gab und sie adoptierte. Ein weiterer Sohn (dieses Paares?) ist Palûelap, der einen Sohn Elûlûe hat.

Eluelâp sprach zu seiner Schwester Eōitsân: »Schaffe Menschen!« Eōitsân gab es weiter an Legobû. Diese tat es, aber hatte kein Essen. Als sie morgens aufwachte, fand sie viel Essen vor, weil sie davon geträumt hatte. Wenn sie aber träumte, sie bekäme kein Essen, so war auch am andern Morgen keins da. Eluelâp ließ sie stets so träumen, wie es für ihr Leben notwendig war. Themarûx baute das Haus, Thelân das Boot. Palûelap ist der Wegweiser auf Reisen und hat das Segel erfunden. Sein Sohn Elülûe hilft ihm.

Die Frauen Nagé.

Zwei Freundinnen lebten in Ifaluk: Nagéibiorû (1) und Nagéirifan (2). Als sie einmal nach Ifaluk kamen, gerieten sie heftig in Streit. Da nahm Nagé 2 eine Kokosschale, füllte sie mit Sand und ging auf das Meer hinaus. Sie schüttete den Sand ins Wasser und eine Insel kam hervor; es war Fāliéu. Nur niedriger Busch wuchs hier, Palmen gab es nicht, kurz niemand konnte darauf leben. Diese Frau bekam einen Knaben Fagém e tāū und ein Mädchen Lewāūuót, letzteres starb jedoch. Als der Knabe herangewachsen war, sagte er zu seiner Mutter: »Mach mir ein Boot!« Die Mutter machte ihm ein Spielkanu. »Wenn Dir dieses Boot einmal wegschwimmt, dann steig hinauf!« Einmal schwamm das Kanu fort, da schwamm der Knabe hinterher und stieg in das Boot. Es brachte ihn nach Ifaluk. Da sah er viele Knaben und er zeigte ihnen, wie man Spielboote macht. Nagé 1 war in Ifaluk geblieben. Eines Tages sagte ein Knabe: »Woher kommt dieser Knabe, den haben wir früher nicht gesehen?« Das hörte Nagé 1. Da Fagém e tāū seiner Mutter sehr ähnelte, fragte sie ihn, woher er denn käme. Er sagte es ihr und berichtete auch von seiner Mutter. Da nahm ihn Nagé 1 in ihr Haus und er blieb bei ihr.

Ponijoû.

Ponijoû war ein Mann, der vor kurzer Zeit starb. Zu Lebzeiten war er wegen wirksamer Fischzauber sehr berühmt, besonders gut war sein Zauber für fliegende Fische. Da nun nach seinem Tod niemand den Zauber kennt, baute man ihm ein Geisterhäuschen. — Schläft Sāūerû, so erscheint ihm zuweilen Ponijoû und sagt ihm, daß die Leute einen guten Fischfang tun können. Fällt der Fang nicht gut aus, so geht ein Fischer zum Haus des Ponijoû und stiftet irgendein Geschenk. — Ponijoû befiehlt und verbietet das Fischefangen der; Häuptling ist in allen Fällen Vermittler.

Wie die Menschen zum Feuer kamen.

Eluelâp machte das Feuer und gab es Olufâth, der es heimlich in einem Bambus verbarg und es den Menschen brachte. Er zeigte ihnen, wie sie mit Hilfe von Hölzern das Feuer bohren konnten.

Wie Lugeilẽñ den Menschen den Coitus lehrte.

Früher hatten die Frauen keine Scham und die Menschen kannten den Coitus nicht, sie konnten nur essen und trinken. Da kam Lugeilẽñ, den Eluelâp zur Erde geschickt hatte, zum Mann Niparâra und zur Frau Temoñemõñ und sagte zur letzteren: »Hast Du keinen Mann?« Die Frau sagte: »Doch!« — »Wo ist er denn?« — »Er fängt Fische.« — »Mehr versteht Ihr nicht? Kennt Ihr nichts Anderes?« Bei diesen Worten nahm Lugeilẽñ der Frau die Kleidmatte fort und sah, daß sie keine Scham hatte. Da machte er eine, steckte zwei Finger hinein und gestaltete die Geschlechtsteile. Dann gebrauchte er sie und ging schließlich fort. Da kam der Mann nach Hause und sagte: »Hier bringe ich Fische, geh und mach das Boot gut fest!« — »Ach was, Boot!« Und das Boot blieb halb auf den Strand gezogen liegen. Die Frau sagte weiter: »Ich will Dir aber was Schönes zeigen, das wurde mich soeben gelehrt. Ich kannte es noch nicht, niemand hier kennt es. Komm, steig über mich hinweg!« Er tat es, aber sein Glied wollte nicht steif werden, da rieb sie den Penis und so koitierten sie. Und alle Leute kamen herbei und sahen zu. Da sagte die Frau: »Sieh nach Deinem Boot!« — »Ach was, Boot! Dies ist schön!« Und so koitierten sie den ganzen Tag.

Der Vogel Bâth.

Früher gab es einen Vogel Bâth, der mit seinem Ruf »Bri-bri« immer großen Lärm machte. In der Luft sah er bald weiß, bald rot, bald schwarz aus. Alle Menschen hatten große Angst vor ihm, denn viele, die ihn sahen, starben. Da beklagten sich die Überlebenden bei Olufâth. Dieser nahm nun einen jungen *bâth*-Vogel, setzte ihn auf die Erde und sagte ihm, er solle klein bleiben und nicht mehr solchen Lärm machen. Als das Tier auf der Erde seine Stimme ertönen ließ, kam nur ein »kikeriki« und »gakgak« heraus. Es soll ein sehr großer Vogel gewesen sein. (Damit kann wohl nur das Huhn gemeint sein?) Einmal bemerkten ihn zwei Yap-Leute, als sie fischten. Sie machten einen Zauber, um ihn zu fangen, doch der Vogel stieß auf den einen von ihnen los und tötete ihn, den anderen verwundete er. Der Vogel soll dann nach Palau gelangt und dort gestorben sein.

XI. Musik, Tanz und Spiel.

Von Musikinstrumenten ist einzig und allein die Muscheltrompete *(tâûi;* Mundstück = *eoâl*, Schalloch = *nân*, blasen = *xâ̈num)* zu nennen, die aber mehr zu Signalen und religiösen Anrufen (s. S. 180) als zur musikalischen Erbauung dient. — Schwirrer und Blattpfeife sind als Kinderspielzeug bekannt (s. S. 210).

An Tänzen *(ûru)* kennen die Männer den unter den Karolinern allgemein üblichen Stabtanz *(nôn ûra)* und den Handtanz *(huaſûrux)*. Die Frauen haben einen Sitztanz *(apſtax)*; die einzelnen Phasen sind nach Hambruch:

1. langsame, choralartige Einleitung, Handbewegungen: Schließen, Öffnen und Drehen taktmäßig im Rhythmus der Begleitmusik (gesungen), $^3/_4$ Takt, zum Schluß Beschleunigung, plötzliches Abbrechen,
2. Schnelleres Tempo und Gestenspiel zu lebhaftem Gesang,
3. Wie 1.,
4. Klatschen der Hände,
5. Kopfwenden und Drehen, gegen Schluß Handbewegungen.
6. Aufstehen, Ordnen der Reihen, Klopfen des rechten Oberschenkels, Aufheben des Beines, Treten auf der Stelle, Drehen und Wenden nach den Seiten und zurück, Bauchtanz (in drei verschiedenen Weisen zur Schau gestellt, stark erotisch),
7. Auflösen in Reigentanz, ballettartig,
8. Bauchtanz, Hüftendrehen, Treten auf der Stelle, dann Handbewegungen gegen Ende langsamer,
9. Coitustanz, Nachahmen der Hingabe,
10. wie 6.,
11. Klatschen mit hohler Hand auf Bauch, Brust, dann lebhafter Gesang, Coitustanz, Ballett,
12. wie 11.,
13. Klatschen, eine Vorsängerin singt Solo, weiter wie 11.
14. Vorwärts- und Rückwärtsschreiten, weiter wie 6., dazu Rufen: »*Hôka, ſetâi ûra tipêi.*«
15. Coitustanz, Herausforderung, Klopfen der Oberschenkel, Spreizen der Oberschenkel, Schlagen auf die Vulva.

Das Tanzkleid *(śrûp)* besteht aus einem Schurz von langen Kokosfiedern, die Männer tragen zudem noch im Haar mit Federn geschmückte Kämme und

2: Damm et al. OR21 Woleai

Blattbinden um den Haarschopf (s. Taf. 16). Die Tanzstäbe der Männer sind einfache Stöcke oder Rippen eines Kokoswedels.

An Spielzeug beobachtete Hambruch:

a) Spielboote *(maravâl)* mit einem Segel aus einem Taroblatt. Auf die religiöse Bedeutung wurde bereits S. 201 hingewiesen (Abb. 273).

b) Fadenspiele *(xatôte)*, einzeln oder zu zweien gespielt, dabei meist zehn Manipulationen zu einer Figur.

c) Schwirrer *(xânum)* von gleicher Form wie der *gañfni* von Aurepik (s. Abb. 274).

d) Windrädchen *(nigaferên)* aus Palmblattstreifen von derselben Form wie auf Ifaluk.

e) Ball *(garofâ)* von der bekannten karolinischen Form.

f) verschiedene Flechtarbeiten als Spielzeug: Vogel *(gatâf)* aus Blattstreifen geflochten (Abb. 275), kopulierendes Ehepaar (Abb. 276), Pfeife *(atîgetix)*, Täschchen(?) (Abb. 277).

211

XII. Verschiedenes.

Medizinische Kenntnisse sind nicht unbekannt. Zur Heilung der Elefantiasis wird die *kowddewad*-Pflanze in das Feuer geworfen, an dem der Kranke sich wärmt. Gegen Frambösie wendet man als Heilpflanze *tšêl* an, während man bei Syphilis die Geschwüre aufsticht. Bei Armbrüchen werden Stäbchenverbände angelegt (s. Abb. 278).

Abb. 278. Stäbchenverband (nach Skizze Krämer).

Zeiteinteilung. Das Jahr zerfällt in zwei Abschnitte, ähnlich unseren Jahreszeiten: *Thāū e ſâṅ* und *thāū e râx*. Die einzelnen Monate *(marâm)* sind nach Sternbildern benannt und verteilen sich folgendermaßen:

thāū e ſâṅ	*thāū e râx*
ülüâl = November	*māūirâx* = Mai
malâ = Dezember	*māūilôp* = Juni
ith = Januar	*thadâ* = Juli
thârebol = Februar	*nâx* = August
eremâūi = März	*xûe* = September
tumâlü = April	*uûl* = Oktober

Jeder Monat hat 29 Tage *(râl)* oder richtiger Nächte *(pôṅi)*, die nach den einzelnen Mondphasen bestimmt werden. Die Namen sind: (mit Neumond beginnend):

šegōrû	*epêïi*	*xerâṅ*
elïṅ	*olabuê*	*kerelieverâx*
mederïṅ	*olomâï*	*thapâs merioumûr*
mejân	*mâxth*	*komâla*
mejaſtïh	*ourâ*	*komalaſâṅ*
mexuân	*natiouâ*	*eroſû*
mejatûi	*kirêi*	*žeü*
emetatï	*kaneuâ*	*eſâïṅ*
šruobôṅ	*thapâs*	*ĕrâp/*
arabogû	*ewerâx*	

Den Tag teilte man in einzelne Abschnitte ein:

Morgen, Sonnenaufgang	*nī thorū*
Mittag	*nuēl*
Abend, Sonnenuntergang	*nifigāfi*
Nachteinbruch	*niga pūn*
Mitternacht	*nūk i ni pūn*
Nachtende	*pūn e nilō.*

Die Faraulip-Leute wenden eine eigene **Schrift** an (Abb. 279, 280), die viel Ähn-

XIII. Zur Sprache.

Der Wortschatz hat mit Satowal viel Gemeinsames. Artikel gibt es nicht.

Personalpronomen:

ich	*χ̊ɔn*	wir (inkl. = ich und du)	*χ̊ɔn ema χ̊ɛl*
du	*χ̊ɛl*	wir (exkl. = ich und er)	*χ̊ɔn ema mɛ̀*
er	*χ̊i*	wir (drei)	*χ̊ɔn mɛ̀n ma jɛ̀li me mɛ̀n*
		wir alle (der Angeredete eingerechnet)	*χ̊illgimɛ̀n*
		wir alle (der Angeredete ausgeschlossen)	*χ̊ɛ̀mi*
		wir	*illgez*
		ihr	*ilegemɛ̀n*
		sie	*ilagɛ̀da*

Possessivpronomen (von Hambruch unvollständig aufgenommen):

mein	*im-mɛ̀i*	sein	*im-ameremɛ̀tera*
dein	*im-mɛ̀m*	unser	*im-mumɛ̀m*

Vom Demonstrativpronomen gibt Hambruch nur eine Form: *mɛ̀ne* = dieser.

Zahlworte s. S. 213ff.

Die Längenmaße werden dem menschlichen Körper entnommen:

eine Spannweite (= Länge der ausgestreckten Arme und Brust) *ɔandɛ̀l*
eine halbe Spanne *ɔaterɔ́ɔp*
ein Arm *ɔepɔ̀k*
ein halber Arm (= Unterarm) *ɔemɔ́rɔ̀*
Mittelfinger und Daumen *ɔɛ̀ɛn*
Mittelfinger bis Knöchel *ɔɛɔɛlipotlɔ̀*
eine Zeigefingerlänge *ɔerɔ̀i*
eine halbe Zeigefingerlänge *marɔ̀lɔ́p*
ein Fingerglied *marɔ̀i i rɔ̀χ*.

Adjektiva.

Sorol.

Nach den Aufzeichnungen von Dr. E. Sarfert bearbeitet
von Dr. Hans Damm

221
(p 232 : blank)

2: Damm et al. OR21 Woleai

Sorol.

Allgemeiner Teil.

I. Äußere Geschichte.

Die **Entdeckungsgeschichte** der Karolinen wurde bereits von Krämer in seinem Palau-Werk in großen Umrissen festgelegt. Nach ihm haben bereits Alonso de Arellano und sein Pilot Lope Martin, nachdem sie sich mit der »San Lucas« von der Expedition des Miguel Lopez de Legazpi (1564) getrennt hatten, die Inselgruppe Sorol entdeckt[1]. Es ist auch nicht ausgeschlossen, daß Francis Drake, der am 13. Oktober 1588 die Marianen erreichte, auf unsern Archipel traf[2]. Ist somit für das 16. Jahrhundert die Kenntnis von Sorol sehr fraglich, so wurde es jedoch dem Abendland mit Bestimmtheit durch den Brief des Pater Clain (vom 10. Juni 1697) bekannt, der aus dem Mund von angetriebenen Feis-Leuten u. a. den Namen einer Insel »Saraone« erfuhr, die mit Sorol identisch ist. Auf der seinem Bericht an den Generalpater Gonzalez beigegebenen Karte ist sie als »Sarol« angegeben[3]. Auf einer späteren, durch ihre völkerkundlichen Bilder interessanten Karte des Piloten Somera (1710) findet sie sich als »Saraol« wieder[4].

Die erste einwandfreie Nachricht von Sorol erhalten wir von Hunter, der am 14. Juli 1791 zwei Inseln etwa fünf Meilen voneinander entfernt unter 8° 6′ n. Br. und 140° 3′ ö. Länge sichtete und sie »Philipps-Inseln« nannte[5]. In der Zwischenzeit wird die Insel nicht weniger oft von Walfängern und Händlern angelaufen worden sein wie die übrigen Karolinen auch. 1883/84 besuchte Kubary das Atoll[6]. Vom 4.—21. Oktober 1909 weilte Sarfert als Mitglied der Hamburger Südsee-Expedition auf der Gruppe.

[6] Krämer 1917 Bd. I, S. 148.

II. Geographie.

Der Name der Gruppe ist auf den alten Karten mit »Saraone«, »Saraole«, »Sarole« angegeben. Hunter legte ihr als Entdecker den Namen »Philipps Inseln« zu, den sie noch bis zu Zeiten Cheyne's behielt. Cheyne führt sie in seiner Arbeit noch unter diesem Namen[1].

Das **Kartenbild** war bis in die neueste Zeit noch recht unklar; erst auf den Admiralstabskarten schält sich die Form des Atolls immer klarer heraus. Sarfert

Abb. 281. Plan von Sorol.
(Aufnahme des ersten Offiziers Lorenzen).

nahm die größten Inseln der Gruppe Bigelimôl und Bigeliwôl auf[2], während der 1. Offizier des »Peiho« Vermessungsarbeiten in der Lagune vornahm (Abb. 281). Das neueste Kartenbild (Abb. 282) von der Gruppe zeigt die japanische Regierungskarte von 1925 (No. 772).

Lage und Größe. Die Entfernung von Sorol zu den nächsten Inseln ist bis Feis 95 Sm und bis Aurepik 50 Sm.[3] — Die folgende Zusammenstellung zeigt, wie lange sich die Angaben von Hunter und Raper in der späteren Literatur gehalten haben.

[1] Cheyne 1852, S. 139, 145.
[2] Siehe Skizzenbuch (Museumsarchiv Hamburg Sa. 11).

Brigham (1900, S. 148)	8° 6′	140° 53′
Sievers (1910, Bd. II, S. 367)	8° 5′ bis 8° 10′	140° 15′ bis 140° 25′
Kolonial Lexikon (Bd. III, S. 376)	8° 10′	140° 17′
japan. Regierungskarte v. 1925	8° 8′	140° 24′ 30″

Nach Hunter liegen die beiden größten Inseln (Sorol und Bigelimôl) etwa fünf Meilen voneinander; diese Angabe ist auch von Cheyne und Brigham übernommen worden. Meinicke gibt die beiderseitige Entfernung mit nur einer Meile an[1].

Die **Gliederung der Insel** ist die eines typischen Korallenatolls. Auf einem niedrigen langgestreckten Riffkranz, dessen nordwestlichen und südöstlichen Teile spitz zulaufen, liegen 13 Inseln und Inselchen und zwar sind sie alle auf die Nordostseite verteilt[2]. Davon sind sechs mehr oder weniger mit Vegetation bestanden[3], die übrigen sind Sandbänke. Die Namen der Inseln sind von SO nach NW folgende:

Bigolór (auch Bigelór), mit wenig Baumbestand.

Belemán, Sandbank.

Soról, Hauptinsel, ist als einzige bewohnt; auf der Nordseite fehlt der Sandstrand, dagegen wird er im Osten an einer Stelle sehr breit, die Südspitze ist unbewachsen.

Belalâi (auch Bilalâi), mit Bäumen bewachsen, mit ausgedehntem Sandstrand im SW und NW.

Abidadogoriât, Sandinsel ohne Baumbestand.

Biedóni, Sandinsel.

Falewâldjfdj (auch Falewôidfd), kleine Insel mit wenig Baumbestand.

Chaugulebí, Insel ohne Baumbestand.

Bigeliwôl (auch Bigoliwol), Insel mit wenig Bäumen, Schildkröteninsel.

Falefât, Sandinsel ohne Bäume.

Buguwâidjdfj, Sandinsel.

Bigelimôl, Insel mit wenig Bäumen, Vogelinsel.

Biesâre, Sandinsel.

Von den Inseln ist nur die größte, Sorol, bewohnt, die anderen waren nie besiedelt; es wäre dies auch lediglich auf Bigelimôl möglich gewesen, die anderen

[1] Hunter 1794 Bd. I. S. 418. Ebenso Cheyne 1852, S. 143, Brigham 1900, S. 148, Meinicke 1888, Bd. II, S. 359.
[2] Cheyne 1852, S. 139. [3] Sievers gibt deshalb für das Atoll auch nur diese Zahl an (1910, Bd. II, S. 367).

sind viel zu klein. Die Inseln liegen so auf dem Riff, daß man bei großem Niedrigwasser von der südöstlichen Insel zur nordwestlichen zu Fuß (!) gehen kann, bei gewöhnlichem Niedrigwasser kann man nur bis Falewâdjfdj gehen.

Weitere **geographische Einzelheiten** von mehr maritimen Interesse bringt die letzterschienene Ausgabe des Pacific Islands Pilot 1933 S. 500.

Taifune haben die Inselgruppe nicht verschont, vielmehr wurde sie, wie die Geschichte erweist, vor fünf Generationen von einem Taifun so schwer betroffen, daß die Bevölkerung bis auf zwei Frauen umkam[1]. Auch später noch, so 1905 und am 27./28. März 1907 richteten derartige Unwetter schwere Verwüstungen an.[2]

Wörterliste.

Himmel	*ldn*	Meer	*ddd*
Luft, Wind	*jdin*	Wasser	*dâl*

Tag	*râl*	Blatt	*dâl*
Morgen	*limalll*	Wurzel	*warachal*
Nacht	*sawôn*	Stamm	*rarâl*

Flora. Die Angaben über die Vegetation sind von allen Besuchern der Inselgruppe immer sehr allgemein gehalten und widersprechen sich vielfach: Sievers nennt den Bestand an Kokospalmen üppig und auch der Pacific Islands Pilot spricht von »well wooded«, dagegen konnte Sarfert die Vegetation nur als spärlich bezeichnen und auch Meinicke äußert sich sehr zurückhaltend.[3]

Sarfert stellte u. a. folgende Pflanzen fest:

Kokospalme *lâ*, *lâto* (Kokoswedel = *balâ*, Blattrippe = *sfal*, ungeschälte Nuß = *tô*, geschälte Nuß = *lût*)

Pandanus *fât*

Brotfruchtbaum *mâi* (Brotfrucht *mâr*)

Banane *ualûdj*, *ûdj*

Es fehlen fliegender Hund und Fledermaus. Haustiere s. S. 241.

Die **Bevölkerung** ist, wie bereits erwähnt wurde, vor einigen Generationen durch eine Naturkatastrophe so dezimiert worden, daß sich eine völlige Neubesiedelung notwendig machte (s. S. 269). So mag es kommen, daß hin und wieder die Inselgruppe als »unbewohnt« angegeben wird[1], ja selbst der neueste Pacific Islands Pilot (1933 S. 500) tut dies noch. Die Kopfzahl stellt sich für die einzelnen Jahre wie folgt:

Jahr	Kopfzahl	Quelle
1862	20	Gulick 1862, S. 60
1900	20	Brigham 1900, S. 148
1903	72	Sievers 1910, Bd. II, S. 347, 367[2]
1909	156	Hamburger Südsee-Expedition

[1] Najmcke 1888, Bd. II, S. 359.

[2] Finsch 1914, S. 64) spricht von etwa 75, er hat wohl die gleiche Quelle wie Sievers benutzt.

234

III. Demographie.

Anthropologisches. Die Sorol-Leute sind im Durchschnitt größer als die westlicher wohnenden Stammesgenossen: die Größen wurden bei 6 Individuen mit 170, 166, 170, 170, 163, 163 cm gemessen. Dabei erscheinen sie noch stattlicher durch die ihnen eigene Wohlgenährtheit. Junge Frauen tragen oft recht männliche Züge. — Die Zähne sehen gesund und weiß aus, denn die Sitte des Betelkauens ist unbekannt.

Krankheiten hat Sarfert an keinem Insulaner bemerken können, obgleich er alle zu Gesicht bekommen hat. Wie äußerlich ihr Körper gesund und von Wohlergehen strotzend aussieht, so scheinen sie auch so gut wie von keiner Krankheit geplagt zu sein. Ihrer Aussage nach war zur Zeit Sarfert's niemand krank, auch nicht geschlechtskrank. Nur über Kopfschmerzen klagten sie von Zeit zu Zeit. Ringwurm *(gilsewó)* soll früher vorhanden gewesen sein, 1909 war diese Hautkrankheit nicht zu beobachten. Geschlechtskrankheiten *(damálŏ)* sind nur dem Namen nach bekannt.

Wörterliste.

Mensch	*fromät*	Backen- und Kinnbart	*elŏs*
Zunge	*lŏmodj*	Wange	*lŏmod tobŏt*

Bauch	*sât*	Kot	*bâak*
Nabel	*uoôt*	Atem	*jañli uôt*

Psychologisches. Die Insulaner sind sehr träge[1] und langsam in ihren Bewegungen, dagegen lachen sie gern und viel. Ihr Lachen ist dem unseren ähnlich, während nach Sarfert — soweit er das beobachten konnte — die Papuas im Fistelton lachen. Auch beim Tanz können die Sorol-Leute sehr lebhaft werden. — Eine eigentümliche, von Sarfert mehrfach beobachtete Sitte ist das Schlafen mit nur halbgeschlossenen Augen. Der Gewährsmann aus Yap bestätigte es auch für seine Heimatinsel. — Ihr Denken ist äußerst langsam, nur einer zeichnete sich durch geistige Gewandtheit und Verständnis aus. — Was Sarfert den Eingeborenen an Speisen, Getränken und anderen Dingen gab, alles wurde genau berochen und ging von einer Nase zur andern. Meist lehnten sie die fremden Dinge ab, nur den Reis schätzten sie. — Beim Sprechen werden häufig die Arme mit verwendet, z. B. wird bei »Das weiß ich nicht« eine Hand oder es werden beide Hände vorwärts geschwungen.

[1] Vgl. dazu auch Thilenius 1917, S. 241/242.

Spezieller Teil.

I. Tracht, Schmuck und Kleidung.

Körpertracht. Man trägt das Haar kurz oder lang und dann auf dem Scheitel zu einem Knoten gebunden. Der Bartwuchs ist spärlich. Schnurrbart *(koroliwát)* ist hier im Gegensatz zu den südwestlichen Karolinen Bur, Merir, Songosor und manchen zentralkarolinischen Gruppen wenig beliebt; man reißt die Haare aus. Sarfert beobachtete diese Barttracht nur bei wenigen Männern. Dagegen ist der Vollbart *(elús)* der Stolz des Mannes, er wird von besonders angesehenen Personen getragen und zwar als Spitzbart oder Fräse (s. Taf. 17).

Die **Tatauierung** *(mák;* tatauieren = *fáfufer)* soll früher den Sorol-Leuten unbekannt gewesen sein. Ein Mogemog-Mann, namens Mudjuwulúl, der hier blieb, führte diese Sitte ein und lehrte sie einem Mann, der noch 1909 alle Männer tatauierte. Von den Frauen versteht keine diese Kunst. Sie tragen nur wenige Muster und zwar werden ihnen die Oberschenkel und Hände und, wenn es gewünscht wird, auch die Scham tatauiert. Beim Mann bedeckt das Muster einen großen Teil des Körpers. Das Tatauieren ist sehr schmerzhaft und dauert beim Mann, sofern er es aushält, zwei bis drei Monate. — Die zu dieser Operation benötigten Instrumente sind der Tatauierkamm *(kállis;* Abb. 283) und der Tatauierhammer *(káfo)*, die beide in Holzkästen (s. Abb. 321) aufbewahrt werden. Die benötigte Farbe stellt man folgendermaßen her: es wird das Harz *(wulús)* des *fúfu*-Baumes im Feuer verbrannt, der Rauch in einer Kokosschale aufgefangen, so daß sich der Ruß absetzt, dieser wird dann mit Kokosöl angerührt.

Abb. 282. Tatauierkamm und verschiedene Kammformen. Stammung in [illegible] gehörig. [illegible] der Ge[illegible]

Die Tatauierung der Männer besteht aus folgenden Mustern (in den Abb. 284, 285 nummeriert):

1. chádau
2. dúgaranúb
3. marúl
4. dolúbanu
5. faresár
6. roród
7. sebalúá
8. danelúch
9. chal
10. fad
11. chúb
12. búlebil
13. lugulúi
14. chauiót
15. fálodóbl
16. uás
17. lugulúbóu
18. wól

284a 284b 285a 285b

Abb. 284a. Tatauierung des Mannes Dèidjók (nach Skizze Sarfert). — Abb. 285a, b. Tatauierung des Mannes Dèlinan (nach Skizze Sarfert).
Die Ziffern sind im Text erläutert.

Hand-, Arm- und Beintatauierung von Frauen s. Abb. 286—290.

286. 287. 288. 289. 290.

Abb. 286—290. Tatauiermuster bei Frauen (nach Skizze Sarfert). — Abb. 286—288. Handmuster djôu; Abb. 289. Armmuster rôros; Abb. 290. Beinmuster bagêli bêdâ.

Schmuckgegenstände. 1. Im Haar werden — jedoch nicht allgemein — Holzkämme *(makâl)* verschiedener Form getragen (s. Abb. 291—294); sie bestehen aus einzelnen Stäben, die entweder zusammengepflockt oder gebunden sind. Zum Tanz bindet man dem Kamm Federschmuck an, besondere Tanzkämme gibt es nicht.

2. Blütenkränze *(maremâr)* im Haar wurden nur vereinzelt getragen.

291. 292. 293. 294. 295. 296. 297.

Abb. 291—294. Holzkämme (Hamburg 1680II, 1685II, 1690II, 1688II; Länge 23 ½, 23, 24, 24 ½ cm). — Abb. 295—297. Ohrschmuck (Hamburg 1682II, 5300II, 18.94:2; ⅓, ⅓, ⅓ nat. Gr.).

3. Als Ohrschmuck trugen Frauen wie Männer gewöhnlich mehrere Ringe aus Muschel- und Kokosnuß an einem kleinen Schildpattring im durchbohrten Ohrläppchen (Abb. 295)[1]. Diesen Schmuck nennt Sarfert *mddj*; nach Hellwig, der solchen Zierrat von Sorol-Leuten aus einem längsseits der »Peihoe liegenden Boot erhandelte, ist dies der Name für die Muschelringe. Solche aus Kokosnuß heißen nach ihm *dâxax*, während ihm der Muschelschmuck als *duodâ* bezeichnet wurde. — Eine andere Form des Ohrschmuckes erwarb Hellwig unter dem gleichen Namen (Abb. 296), er bestand aus abwechselnd übereinander gelegten Platten von dunkler Kokosnußschale und weißer Muschel; er wurde mit einem Schildpatthaken ins Ohr gehängt; ein ähnliches Stück mit europäischen Glasperlen s. Abb. 297. — Junge Leute stecken sich dagegen gern Blätter und Blüten in die Ohrdurchbohrung.

4. Nasen- und Lippenschmuck ist nicht üblich; es ist auch die Durchbohrung der Lippen und des Septums unbekannt.

5. Als Hälsschmuck *(maremâr*, He.: *marremârr)* dienen Ketten aus dicken Kokosperlen (Abb. 298) oder aus kleinen Kokosscheiben (Abb. 299), zwischen die sehr gern in bestimmten Abständen weiße Muschelscheibchen (Abb. 300) gefädelt werden.[2]

298.

299.

300.

301.

302.

Abb. 298—300. Halsketten (Hamburg 1673II, 1671II, 1662II; Länge 71, 64, 68 cm). — Abb. 301—302. Hüftketten (Hamburg 1669II, 1670II; Länge 68 und 62 cm).

6. Dieser eben genannte Schmuck wird von den Frauen über der Lendenmatte auch als Hüftkette *(daredâr)* getragen; am wertvollsten sind jedoch die mehrsträhnigen durch Schildpattstege zusammengehaltenen Ketten *(kll*, He.: *klm;* Abb. 301, 302). Daneben sind auch Gürtel aus Menschenhaar (He.: *târre-târre, tâge-tâge)*[3] üblich. Ferner findet sich, wenn auch selten[4] die sonst auf Ifaluk übliche Kokoskettenart.

7. Armringe *(lakaldk)* und Fingerringe (Name fehlt) werden nicht getragen; früher wurden mitunter Schildpattarmringe von Mogemog-Leuten gekauft.

[2] Museum Hamburg 5303, 5304, 5315, 1661—1668.
[3] Museum Hamburg 1676.
[4] Museum Hamburg 1674.

8. Frauen und Männer tragen gewebte **Lendenschurze** *(bălebal)* und zwar erstere rockartig, letztere als Binde um den Leib und dann zwischen den Schenkeln durchgezogen. Gewöhnlich sind die Schurze gemustert, entweder einfach durch schwarze Streifen (Taf. 22 untere Reihe Mitte [1699^{II}]) oder sie wechseln mit roten Streifen ab und geben dann der Tracht eine besonders lebhafte Note (Taf. 22 obere Reihe, Mitte [1700^{II}]); die Streifen können schmal oder breit sein. Mitunter sind die schwarzen Bänder durch zierliche Muster aufgelockert (Taf. 22 obere Reihe rechts [5307^{II}]) oder es wird noch eine malerische Steigerung dadurch erzielt, daß in diese Streifen feine rote Fäden eingewebt werden (Taf. 22 obere und untere Reihe links [1697^{II}, 1701^{II}]).

Abb 303 Hut (Hamburg 1725^{II}; Höhe 22 cm).

Segeljacken *(ligŏu)* wie auf Yap und Trauerjacken sind unbekannt.

Hüte *(bŏrŏn)* aus Pandanusblatt-Streifen genäht (wie auf Ifaluk) werden auf dem Meer getragen (Abb. 303).

II. Die Nahrungsquellen und ihre Ausnutzung.

Landbau. An Nährpflanzen und Fruchtbäumen haben die Eingeborenen Taroarten (solche mit großen Knollen = *filâ*, Sumpftaro = *wuldk*), eine wildwachsende Knollenfrucht *(wugll)*, eine Crataeva-Art *(ăwât)*[1], *koll*, *lümesâ*, Kokospalmen *(lâ)*, Brotfruchtbäume *(mâi)*, Pandanus *(fât)*, Bananen *(âdj)*. — An Feldern *(gli)* sind nur Taropatschen vorhanden. Diese sind in tiefen Löchern (etwa 1—1½ m tief), die in alter Zeit ausgehoben worden sind. Der ausgeworfene Sand ist noch jetzt um den Feldern als eine Art Wall zu erkennen. Diese Felder sind vollkommen unregelmäßig über die Insel verstreut. Außerdem stehen noch Taropflanzen im Dorf und zwar meist zwischen den Häusern. Die Grenzen *(kôjeu)* zwischen den einzelnen »Grundstücken« sind entweder durch einen Baumstamm, durch angepflanzte Bäume oder auch gar nicht besonders gekennzeichnet.

Die Pflege dieser Anlagen ist Frauensache. Zum Graben verwenden sie einen langen Stock *(kôdj)*; Düngung *(wâl)* erfolgt wie auf Yap und Palau mit Blättern. Neben den Feldern stehen Unterkunftshütten *(imelîgel)*, ebenso gibt es hier Wasserlöcher *(dalâl)*, die das Regenwasser auffangen.

Fischfang. Die Zahl der eßbaren Fische ist sehr groß. Sarfert konnte zu der Sorol-Bezeichnung die entsprechende von Yap angeben, was eine Artenbestimmung erleichtern wird.

I. Zur Angelfischerei mit Angelstab und Schnur benutzt man verschiedene Haken: a) *kowŏdj:* Schildpatthaken (Abb. 304, 305); sie wurden von Mogemog-Leuten gekauft. 1909 gab es nur wenige derartige Haken. — b) *dardk:* Haken aus Kokosnußschale zum Fang des fliegenden Fisches wurden in früherer Zeit wie der *gŏni* auf Polowat benutzt.[1] — c) *meddīgo:* hölzerner Haken zum Haifang, an seine Stelle sind große Eisenhaken getreten (Abb. 306, 307). Die Haischlinge ist auf Sorol unbekannt. — d) *bd* ist der übliche zusammengesetzte Haken aus Meleagrina- oder Cassis rufus-Muschel und Schildpatt (Abb. 308, 309). Diese Haken werden auf rechteckige Holzrahmen *(lenlāwŏd)* aufgespannt, die für gewöhnlich im Bootshaus hängen und mit aufs Kanu genommen werden. Seitdem unter der Regierung des Lemadjāl ein Segler auf dem Riff strandete, verfertigen die Eingeborenen ihre Angelhaken aus Eisen.

304. 305. 308. 309. 306. 307.

Abb. 304—309. Angelhaken (Hamburg: 304 = 1748[II], Länge 4 ⅛ cm; 305 = 1749, Länge 5⅜ cm; 306 = 1750[II], Länge 62 cm; 307 = 1751, Länge 51 cm; 308 = 1743[II], Länge 6 ⅛ cm; 309 = 1744[II], Länge 4 cm).

II. Die Netzfischerei gebraucht folgende Netze: a) *wŏli mānar* für den Fang des fliegenden Fisches *(mānar)* nachts im Schein der Kokosblattfackeln. Der Rahmen ist in seinem oberen Teil nach unten geknickt (Taf. 20). Der Griffteil heißt *kabŏr*, der obere Teil des Rahmens *kŏdj* und das eigentliche Netz *ŏk*.

b) *wulimŏdj* ist ein Netz wie a), jedoch ohne Knickung des Rahmens; diese Form ist vor allem für den Fang innerhalb des Riffes.[2]

c) *ŏdjiñ:* langes, schmales Netz mit Senkern und Schwimmern *(uabŏs)* zum Fang von vielen Fischen innerhalb des Riffes. Die Fische werden in einen Netzkreis eingeschlossen und dann mit dem *wulimŏdj* gefangen.

d) *fŏl:* das runde Senknetz[3] ist hier unbekannt, dagegen benutzen es die Mogemog-Leute.

III. Speerfischerei mit dem *soresŏr*-Speer betreibt man auf große Fische innerhalb wie außerhalb des Riffes.[4]

[1] Damm und Sarfert 1935, S. 49.
[2] Museum Hamburg 1752, 1753.
[3] Vgl. Damm und Sarfert 1935, Taf. 14, Abb. 1.
[4] Museum Hamburg 1760—1763.

IV. Zur Reusenfischerei benutzt man die *merowōl*-Reuse (Taf. 20). Die Benutzung ist die gleiche wie auf Polowat.[1] Der Reusenbau soll in alter Zeit unbekannt gewesen und erst durch die Ifaluk-Leute eingeführt worden sein.

V. Fischfang mit Drachen. Der Fischdrachen besteht aus einem Brotfruchtblatt, das mit Kokosblattrippen versteift wird: die Blattrippe bleibt oben, das Gatterwerk von Rippen und die Achse (aus mehreren Rippen) liegt unten. Die Schnur ist am Boot befestigt und läuft von da zur Mitte der Drachenachse, von da zum Schwanz und dann ins Wasser. Als Köder benutzt man *kaūlāl*, das Hautgewebe des Haifisches, das im Wasser aufweicht und sich dann in den Zähnen der Beute verfängt.

VI. Fischfang mit Gift (Name unbekannt) wird nicht geübt.

VII. Haifischfang mit Schlinge *(lōm)* ist nie üblich gewesen; man benutzte dazu große Holzhaken (s. S. 239). Haigesänge wie auf Yap waren beim Fang nie üblich.

VIII. Schildkrötenfang. Man fängt die Schildkröte an Land. Die Männer verstecken sich mit Stangen im Busch und stoßen, sobald sich das Tier ein Loch zur Eiablage gegraben hat, ihm die Stange vor den Kopf, so daß es sich nach der andern Seite zur Flucht wendet; inzwischen greifen es die andern mit den Händen. — Auch vom Boot aus fängt man Schildkröten und zwar zur Zeit der Begattung. Gewöhnlich springen zwei Männer mit einer Schlinge am Arm ins Wasser und suchen sie dem Tier über den Fuß zu stecken, um es dann aus dem Wasser zu ziehen.

Nach dem Fang der Schildkröten stimmen Männer und Frauen unter Händeklatschen einen Schildkrötengesang an. Bei jedem Takt wird zweimal unter leichtem Schwingen der Arme in die Hände geklatscht. Der Text lautet:

Emēle ffle ffāluk
Gowāligīda kābedje

Mallwol lā komākāmu
Liwōlitō kemālei.

[1] Vgl. Damm und Sarfert 1935, S. 54.

Dem **Vogelfang** wurde mit Netzen und Schlingen nachgegangen. Die Netze[1] *(wulimál)* wurden vom Baum aus gehandhabt; sie waren dem zum Fischen benutzten *wulimddj*-Netz ähnlich, nur größer. Zum Schlingenfang benutzte man bis 5 m lange Stangen[2], an deren Spitze vorn eine Schlinge *(lóm)* festgebunden ist. Das freie Ende der Stange hält der Eingeborene in der Hand, streift die Schlinge dem Vogel über den Kopf und zieht zu. — Einen andern Schlingenfang wie z. B. auf den südlichen Inseln, wo die Schlingen an einen Zaun festgemacht werden, ist nicht üblich.

Ratten werden entweder mit einem Stock erschlagen oder in der bekannten Bambusrohrfalle *(ddfit)*[3] gefangen.

Haustiere sind lediglich Hühner *(malúk)*; Schweine *(bdwi)* und Hunde fehlen, sind aber bekannt.

Feuererzeugung. Das Feuer *(jáf)* wurde früher mit dem Feuerquirl *(liág)* erbohrt, jetzt benutzt man Schlageisen und Zunder, der in einem Bambusrohr aufbewahrt wird. — Woher die Menschheit die Kenntnis vom Feuer erhielt, darüber wußte man nichts. Sarfert hat die Eingeborenen durch seinen Yap-Mann wissen lassen, daß der weiße Mann diese Art der Feuererzeugung bereits viel früher anwendete. — Zum Anfachen des Feuerbrandes dient ein geflochtener Fächer *(sabó)*. — Über das Kochen s. Kochhaus.

Küchengeräte. a) Schaber, Kratzer, Reiber: 1. *nodofdr* ist ein Stück des Cassis rufus-Schneckengehäuses zum Schaben von Taro und Brotfrucht (Abb. 315). — 2. *wánek* ist der bekannte Kokosnußkratzer (Abb. 319).

b) Fruchtöffner. Zum Schälen und Aufschlagen der Kokosnüsse bedient man sich eines zugespitzten Stück Holzes (Abb. 312), das man vor sich in die Erde steckt. Jetzt sind derartige Öffner gewöhnlich aus Eisen.

c) Messer: 1. Die gebräuchlichsten Messer *(sár)* waren Muschelschalen; — 2. *tilewál* ist ein Messer aus Schildkrot zum Ausschneiden der Kokosnuß (Abb. 310, 311).

d) Löffel *(dárak)* waren Cymbium-Muschel (Abb. 316) oder aus Kokosnußschale in Palauform geschnitzt (Abb. 317, 318).

e) Stampfer *(fasifis)* aus Korallenkalk zum Zerquetschen des Taro (Abb. 313—314). — Als Mörser dienen Holzschüsseln.

f) Gefäße aus der Cassis rufus-Schneckenschale *(mafál)* dienen zum Aufbewahren der Pandanusfrüchte und als Eßschalen. Sie werden in Mengen aufbewahrt und an den Hausständern aufgehängt (Taf. 18).

g) Schüsseln *(dóbi)* aus Brotfruchtholz zum Herrichten der Speisen sind in der Regel rund, haben einen flachen, mitunter auch kielförmigen Boden[4], nicht selten

[1] Museum Hamburg 1756, 1757. [2] Museum Hamburg 1758, 1759.

333. 334. 335. 336. 337.

338. 339. 340. 341. 342.

Abb. 333—342. Henkelformen von den Holzschüsseln (sämtlich im Museum Hamburg) 1634II, 5312II, 1631II, 5074II, 5313II, 5073II, 5072II, 1635II, 1632II, 1630II (alle ¼ nat. Gr.).

h) Deckelkästen aus Brotfruchtholz mit abnehmbarem Deckel, in dessen »Rippe« eine Öse für die Aufhängeschnur angebracht ist (*soub* genannt, Abb. 320) und solche mit Schiebedeckel, *giuar* mit Namen (Abb. 321), dienen mehr zur Aufnahme von Kleinigkeiten (Tatauiergerät, Angelhaken, Schmuck).

Abb. 343. Drillbohrer (Hamburg 1767II, Höhe 42 cm).

Unter den **Speisen** spielt wie auch anderwärts die Brotfrucht eine wichtige Rolle, denn sie läßt sich konservieren und hilft so, Notzeiten überstehen. Die Früchte werden erst einen Tag und eine Nacht in den *tôu*-Netztaschen ins Meerwasser gelegt. Dann wurden Strunk und Kerne entfernt, die Früchte zerdrückt und in Gruben aufbewahrt. Das Ganze wurde mit Blättern zugedeckt und mit Steinen beschwert genau wie auf Polowat.[1] Solche Vorratsgruben finden sich öfters im Busch, wenn man auch leicht achtlos daran vorübergeht.

Neuerdings haben sich die Eingeborenen auch an Reis gewöhnt.

245

III. Technik.

Holztechnik. Männer stellen Schüsseln, Kästen, Kokoskratzer, Waffen, Kanu- und Hüttenplanken her, doch ist ihre Anfertigung nicht jedermanns Sache, es verstehen sich nur einzelne Männer darauf. Zur Holzbearbeitung bedienen sie sich folgender Werkzeuge:

1. Äxte *(ddlai)* mit gerader oder gekrümmter Muschelklinge *(gł)*, um welche Muschelart es sich dabei handelte, erfuhr Sarfert nicht, da keine alte Axt bzw. Klinge mehr vorhanden war. — Äxte mit drehbarer Klinge waren angeblich unbekannt. Beilschaft = *mâul*, Umschnürung = *ſôſo*.

2. Bohrer *(wulewûr)* ist entweder ein einfacher Stab mit einem Haizahn als Spitze oder der bekannte Drillbohrer mit Schwungscheibe (Abb. 343). Auf Yap ist nach Angabe von Sarfert's Gewährsmann der Querstab mit einem Loch versehen, in dem die Achse läuft.

3. Zirkel fehlt.

4. Feilen *(ſât)* zum Glätten des Holzes sind Korallenkalkstücke oder die Haut vom Rochen.

Schildpattechnik. Das Schildpatt wird vom Rücken der Schildkröte durch einen glühenden Holzstab losgelöst. Das Schildpatt wird mit heiß gemachten Haizähnen *(nilibâro)* geschnitten und mit einem Stück Rochenhaut, die man um einen Stab wickelt, abgefeilt.

Die **Anfertigung von Kokosperlen** ist wie die von Muschelscheiben eine Sache der beiden Geschlechter. Die Bearbeitung beider Materialien ist fast gleich. Während die Kokosringe aus der Schale geschnitten werden, schlägt man den Muscheln mit einem Stück Eisen die Spitze ab. Dann werden beide auf einem Reibstein dünn geschliffen, schließlich mit dem Bohrer durchbohrt und alle Muscheln wie Kokosschalen werden auf eine Schnur gereiht. Das eine Ende davon wird auf einem Stück Holz befestigt. Dann wird die ganze Reihe mit einem Stück angeschwemmten Bimssteines glatt geschliffen.[1] Diese Technik ist auf Sorol sehr hoch entwickelt, die Insulaner stehen seit alters in dem Ruf, die schönsten, mehrsträhnigen Gürtel der Karolinen anzufertigen, die sie im Tausch weithin nach Osten verhandeln.[2]

[1] Vgl. die Taf. 27 in Sarfert und Damm 1929 Bd. I.
[2] Finsch 1914, S. 155.

2: Damm et al. OR21 Woleai

Schnurherstellung. 1. Kokosschnüre fertigt man folgendermaßen an: Die Kokosnüsse werden lange Zeit in Wasser gelegt. Sarfert beobachtete eine ganze Reihe von Wasserlöchern *(semäligôt)*, die mit Kokosschalen gefüllt waren. Nach einer gewissen Zeit werden sie herausgenommen und mit einem Stück Holz geklopft, bis die Faser leicht herauszuziehen ist. Sie wird auf dem Bein zu dünner Bindeschnur *(kolekôl)* gedreht, die dann zu dickeren Seilen *(tâl)* für Segelboote und dergleichen weiter verarbeitet wird. Es geschieht dies nicht mit den in den Karolinen so häufig dazu benutzten Stöcken, sondern in einer Art, die bereits auf Polowat als die ältere Arbeitsmethode gekennzeichnet war[1]. Drei Männer sind dabei tätig: der eine hält das über einen horizontal liegenden Hausbalken gelegte Seil, die zwei andern drehen es zusammen, indem sie die beiden Enden sich immerfort im Kreise zureichen.

2. Bastschnüre werden aus dem weichen Holz des *eremâ*- und *liliſô*-Baumes gewonnen. Man legt die Stöcke vier Tage lang ins Wasser, dann ist das Fleisch des Holzes leicht in Fasern lösbar. Daraus werden auf dem Schenkel Fäden gedreht, die dann mit dem bekannten kreuzförmigen Apparat *bîlebil*[2] zu Fischleinen *(jâu)* weiter verarbeitet werden.

Die **Flechterei** ist Frauenarbeit. 1. Pandanusmatten: a) *gîaki* aus etwa 1,7 cm breiten Streifen in einfachem Geflecht dienen als Schlaf- und Totenmatte[3]. — b) *tôb* ist eine in einfachem Geflecht aus etwa ½ cm breiten Streifen doppelt gearbeitete Matte.

2. Kokosmatten: a) *daborô* ist aus einem ganzen Kokoswedel geflochten und dient als Schlafmatte oder als Decke für den Fußboden. — b) *jâso* ist in einfachem Geflecht aus einem halben Wedel gearbeitet und wird als Dachmatte benutzt.

3. Taschen verschiedenster Form und Größe. a) *sirâra* (He.: *serâra* oder *sigerâra*[4]): kleines Täschchen von viereckigem oder rundem Querschnitt mit aufstülpbarem Deckel aus Pandanusstreifen in einfachem Geflecht; sie dienen zum Aufbewahren kleiner Gegenstände, die man in der Tragtasche mit sich führt, z. B. Tabak (Taf. 21 Abb. 3 und 4). — b) *rârêt*: Tasche mit Henkel aus schmalen Pandanusstreifen in einfacher Technik gearbeitet; es ist die Handtasche der Männer und Frauen (s. Taf. 21 Abb. 2). — c) *wôdâū*: Es ist die gewöhnliche Gebrauchstasche beider Geschlechter. Sie wird aus verschieden breiten Kokosblattstreifen in verschiedener Technik gearbeitet (s. Taf. 21 Abb. 1, 5 und 6).

Strickarbeiten sind nicht häufig. Die Männer verstehen große Netztaschen *(tôu)* anzufertigen, in denen die Brotfrucht gewässert wird.[5]

2	Spanngurt	*dâl*
3	Schwert	*kabôb*
4	Litzenstab	*dîb*
5	—	*ṅâṅ*
6	—	*dâbaṅ*
7	—	*olât*
8	—	*dîwo*
9	Schiffchen	*kasâb*
10	Faden	*ligâbat*

[1] Museum Hamburg 1704, 1705.

Über die Muster s. S. 236. Weiße Streifen heißen *ligabôt*, schwarze *ligodôl*, Rand der schwarzen Streifen *kaût*. Die andern Muster tragen keine Namen.

Die **Färberei** ist Frauenarbeit. a) Die gelblichbraune Farbe *(rân)* zur Körperbemalung wird aus Gelbwurz gewonnen. — b) Die rote Farbe erhielten die Sorol-Leute von den Weißen auf dem Umweg über Mogemog und diese Eingeborenen kauften sie von Yap. Früher gab es keine rote Farbe. — c) Die schwarze Farbe wird durch Abreiben eines alten Stückes rostigen Eisens gewonnen, das man mit einem Stein in eine mit wenig Wasser gefüllte Holzschüssel abkratzt. — Über Tatauierfarbe s. S. 232.

249

IV. Handel und Schiffahrt.

Wie auf allen Karolinen-Inseln, so ist auch auf Sorol der **Handel** mit den Nachbarinseln mehr und mehr zurückgegangen. Nicht allein, weil die Jugend sich nicht mehr für die alten Seefahrtskenntnisse interessierte, wohl eher, weil der Weiße mit seinen Waren ganz neue Wünsche wach werden ließ, zu deren Befriedigung Reisen nicht mehr notwendig waren, er brachte ja seine schönen Sachen selbst ins Land. — So ist es gekommen, daß die groß angelegten Tributfahrten nach Yap, die auch Lütke erwähnt,[1] ganz der Geschichte angehören. Dennoch betrachten die Sorol-Leute noch jetzt den Häuptling von Katschebar auf Yap als ihren Oberhäuptling und selbst unter dem 1909 herrschenden Häuptling fuhr ein Mann namens Ligedjisŏk mit Tributgaben (Matten, Holzschüsseln, Muscheln, Seilen usw.) dorthin. Ein Mogemog-Boot holte ihn ab und fuhr mit dem Passatwind zunächst nach Feis, wo es einige Tage blieb, dann weiter nach Mogemog, wo ebenfalls ein kurzer Aufenthalt genommen wurde, und schließlich nach Katschebar. Hier blieb dieses Boot solange, bis der Monsun die Heimfahrt ermöglichte. Der genannte Sorol-Mann kam auf der letzten Heimreise ums Leben. — Auch in früheren Zeiten waren die Mogemog-Leute die Vermittler dieser Tributzahlungen; sie holten die Sorol-Leute ab und brachten sie auch wieder zurück, da diese schon frühzeitig ihre Segelkenntnis verloren hatten. Den Grund für diese Tributzahlungen wußten die Sorol-Leute nicht anzugeben.[2]

Andererseits statteten einst Mogemog- und Feis-Boote[3] den Sorol-Leuten Handelsbesuche ab, um gegen gelbe Farbe und Töpfe, Ruder, Schüsseln und Schnüre zu erhandeln. Zu häufigen Besuchern zählten auch Yap- und Oleai-Leute[4], von denen gerade die letzteren sehr begierig die schönen Muschelgürtel verlangten[5], in deren Anfertigung ja die Sorol-Leute Meister waren. Von Gebrauchsgütern waren noch Matten, Schurze, Schüsseln, Seile, Boote begehrt.

---

[1] Lutké 1835, Vol. II, S. 306.

[2] Nach Aussage von Sarfert's Yap-Mann kamen früher nach Katschebar die Leute von Feis, Mogemog, Sorol, Aurepik, Oleai, Lamutrik, Faraulip, Ălădj, Satowan, Ifaluk, Truk, Polowat, Saipan und zahlten an den Häuptling von Katschebar ihren Tribut. Dieser betrachtete diese Inselleute alle als seine Untergebenen!

[3] Ehemals kamen Mogemog-Boote nicht nur des Handels wegen, sondern auch zum Schildkrötenfang hierher. Die Sorol-Leute wollen früher die Schildkröten nicht gegessen haben, angeblich lernten es ihnen die Mogemog-Leute.

[4] Vgl. auch Cheyne 1852, S. 139.

[5] Finsch 1914, S. 155.

Über die **Nautik** sind, wie bereits oben bemerkt wurde, schon seit langer, langer Zeit keine Einzelheiten mehr bekannt. So weiß man von den Sternbildern gerade noch die, deren Namen in den Monatsbezeichnungen bewahrt wurden. Man kennt auch ihre Stellung am Himmel (s. Abb. 345); aber nur von zweien *(mâlôb* und *elâel)* weiß man die Zahl der dazu gehörigen Sterne. Die Eingeborenen können auch nicht sagen, in welchem Sternbild jeweils Mond oder Sonne aufgehen. Die Namen der Sternbilder sind:

Abb. 345. Stellung der Sternbilder zueinander (nach Skizze Sarfert).

Nummer im Abb.	Sorol	Deutsch[1])
1.	*môl*	Großer Hund
2.	*lâke*	Pegasus
3.	*gûi*	Delphin
4.	*mâleg*	Plejaden
5.	*mâlôb*	Oststern
6.	*elâel*	Aldebaran
7.	*sêrewol*	Orion
8.	*dûmul*	Großer Bär
9.	*mâl*	Procyon
10.	*sôda*	Equuleus
11.	*eremôi*	?
12.	*tt*	?

Boot. In alter Zeit sollen die Sorol-Leute keine Boote gekannt, sondern nur Flöße *(ʃâʃad)* benutzt haben. Erst durch den Mogemog-Mann Mâlemuk, der in einem kleinen Segelboot ankam und noch der alten Geschichte Sorols angehört — die Ifaluk-Leute kamen erst viel später — lernten sie den Bootbau. Flöße sind der heutigen Bevölkerung unbekannt.

Die Bootform ist aus der Abb. 346 und aus der Taf. 19 ersichtlich; sie unterscheidet sich kaum von der sonstiger zentral-karolinischer Boote. Die Ruderform (Ruder = *ʃâdjul)* zeigt Abb. 348,[2] die des Steuers *(ʃadelâlû)* Abb. 347.

Die Bezeichnungen für die einzelnen Bootsteile gibt folgende Liste (vgl. dazu Abb. 346).

1. Ausleger dâm
2. Auslegergabel jâm
3. wâliſn
4. chſa

[1] Die deutschen Bezeichnungen wurden nach der Liste in Damm und Sarfert 1935, S. 88 und 273 bestimmt.

Der Bau von Booten *(oâ)* geschieht nur mit Erlaubnis des Häuptlings; außer ihm verstanden sich 1909 nur noch vier Männer auf diese Kunst. Die Bäume werden aus den Stämmen von *mâ-* und *ſldou*-Bäumen gefertigt, die bereits im Walde roh zugehauen und dann zur Küste gezogen werden. Irgendwelche Arbeitslieder oder Verse zum gemeinsamen Anziehen des Stammes, wie sie anderwärts bekannt sind, hatte man nicht. Die Eingeborenen baten Sarfert's Yap-Leute darum, ihnen einen solchen Vers vorzusingen. Auch während des weiteren Arbeitsganges gibt es keine Gesänge; erst wenn das Boot fertig ist und zu Wasser gebracht werden soll, stellt sich der Eigentümer mit den bekannten Kokosblattknoten vor das Boot und singt:

Sibôu, sibôu, sâbo, sâbo[1]
Sibôu, sâlok maddwudal äwälawâile
Dailîabel äwälawîle sîbo, sâbo!

Dieses Lied wird verschiedene Male wiederholt. Ist das Boot zu Wasser gebracht worden, so stellt sich der Eigentümer wieder an den Bug mit einem Doppelknoten[2] und während er damit klatscht, wird ein anderer Vers hergesagt. Darauf wird der Knoten an den Bug des Bootes gehängt und nunmehr ein halber Kokoswedel hin und her bewegt und dazu ein dritter Vers gesagt. Diese beiden letzten Verse konnte Sarfert zunächst nicht niederschreiben, weil sie tapu waren, man sagte sie ihm wohl im üblichen Redefluß her, aber der Mann war nicht zu bewegen, die Verse nochmals langsam für die Nachschrift zu wiederholen. Wenn er dies tun würde, wäre Krankheit und gar Tod für ihn die Folge gewesen. Nach langen Verhandlungen, die mit dem Vertrauensmann allein geführt wurden und bei denen er

[1] Entsprechende Verse von Yap enthalten ebenfalls diese Wiederholung *sibôu, sâbou*. Sarfert's Yap-Dolmetscher weigerte sich, den entsprechenden Yap-Text herzusagen, da er sonst erkranken würde.
[2] In der gleichen Form wie Abb. 261 bei Damm und Sarfert 1935, S. 150.

immer wieder seine große Angst beteuerte, erklärte er sich schließlich gegen Zahlung von einem Lendenschurz und drei Tabakstangen bereit. Der zweite Vers lautet:

Limôlo / limôlo / sûsûmêija /
Sûsûmeluwôlobol ʃâlû Sorôlo /
Sâi rilâdo / elewûôʀ / mellineraû dâraí /
Lâdibâr / damôniʃeliť / mamâniʃeliťi /
Linâri / linâri liwôl / sereneri /
Sereneriilimeli mareneńâr /
Iganeréńâr / igadoâdok / wâ lidmel /
Maroldmel / roróra / waualla /
Lauaigo / ʃalewûdok gôʀ /
Falewûdok gâlai / sûsû neliť /
Elewuôʀ / ralêi!

Der letzte Vers hieß:

Lâreʃldi / môdemêi lâlomâi / mêlera rlliwar /
Mêile mêile / mêile golalimâʀ / mêile mêile /
Mêile golaloʃldi ʃid / iʃididîbum wajêl /
Mamâi doróri / wâimêi!

Abb. 349. Wohnhaus (nach Skizze Sarfert).

255

V. Haus und Dorf.

In alter, alter Zeit kannten die Sorol-Leute keine Hütten; sie schliefen unter Pandanus-Bäumen. Die Kunst des Hausbaues lernten sie erst durch den Mogemog-Mann Mâlemuk.

Es gibt folgende **Hausarten**: a) *fm*: Wohnhaus der Familie (vgl. Abb. 349. 350). Grundriß und Form sind verschieden und zwar richten sich diese nach der Größe der Hütten. Manche sind zehn Meter und länger und dabei bis über drei Meter hoch, wobei auf die Wandhöhe allein $^1/_3$ entfällt. Der Grundriß bei umfangreicheren Bauten ist eigentlich viereckig und erhält erst durch besondere Giebelvorbauten eine sechseckige Gestalt, die bei den kleineren Wohnhütten bereits im Grundriß vorhanden ist. — Der viereckige Raum eines größeren Wohnhauses besteht in seinem Grundriß aus starken, vierkantigen Balken, die an den Ecken ineinander greifen. In diesen Balken sind wieder an den Ecken senkrechte, vierkantige Pfosten eingelassen, desgleichen Türpfosten. Zwischen diesen senkrechten Pfosten stehen dicke Wandplanken; die zu oberst liegenden fassen in die beiden

351.

352.

353.

Abb. 351. Querschnitt durch die Längsbalken: 1 = Auflage für die Dachträger, 2 = Außenseite, 3 = Wandplanke (nach Skizze Sarfert). — Abb. 352. Dach mit Vorbau (nach Skizze Sarfert), 1 = First, 2 = Gatterwerk, 3 = Giebelvorbau. — Abb. 353. Querschnitt durch Türverschluß (nach Skizze Sarfert).

Längsbalken, die auf den Eckpfosten eingelassen sind. Diese Längsbalken haben nicht nur einen Falz für die Wandplanken, sondern auch eine feste Auflage für die kräftigen, im 45 Grad-Winkel aufliegenden Dachträger (vgl. Abb. 351), auf denen dann das Gatterwerk der Sparren liegt. Dieses überragt die Hüttenwand, so daß das Dach übersteht. — Auf jedem Querbalken der Giebelwände steht ein Stützpfosten, der den Firstbalken trägt. Dieser überragt die Giebelwand, so daß das Gatterwerk, das auf dem Querbalken aufliegt, nach außen geneigt ist.

Die Giebelwände haben einen gesondert gebauten eckigen Vorbau, dessen Gatterwerk an das des Daches anlehnt und angebunden ist, andererseits sitzt es auf zwei horizontalen Stangen auf, die von wenigen, einfachen runden Stützpfosten getragen werden.

Die horizontalen Dachsparren dieses Vorbaues sind meist einfach rund gebogen, seine Wände bestehen einfach aus Matten. Auch sein Dach ist so dicht mit Matten belegt, daß man von außen nur die Fransen sieht. Dieser Vorbau mag entstanden sein, um einen Raum mit mehr Luft und Licht für die tätigen Frauen zu haben. Sarfert sah verschiedentlich Frauen unter diesem Vorbau arbeiten.

Das Dach wird außerdem innen an jeder Langseite meist noch durch einen schräg liegenden Balken oder eine Stange *(ßlowöt)* gestützt, dem *idubut* auf Polowat oder dem *lari Orofad* der kleinen südlichen Inseln ähnlich.[1]

Türen *(katám)* finden sich an jeder Langseite zwei und an jeder Giebelseite je eine, doch sind immer mehrere von ihnen geschlossen. Der Verschluß ist eigenartig genug. In dem Grundrißbalken ist ein Stück Holz im Querschnitt von Abb. 353 eingelassen, durch das Loch wird ein Brett geschoben. Da nur wenig Türen in den Häusern offen sind und das Dach sehr tief bis zur Erde reicht, ist es meist in ihnen sehr finster.

Auf den Bau dieser Hütten verstehen sich nur besondere Familien. Man ruft sie und ihre Helfer herbei und bezahlt sie während der Bauzeit mit Essen und Geld. Gewöhnlich bauen sich erwachsene und verheiratete Kinder ein Haus für sich. Durch eine Balkenlage wurde das Haus, wenn auch vielfach unvollkommen von anderen abgegrenzt. — Mitunter ist an das Wohnhaus noch ein kleines Schlafhaus *(ruterán)* für das Ehepaar angebaut.

Abb. 354. Grundriß eines Bootshauses (nach Skizze Sarfert).

b) *falod*: Kanuhaus (s. Taf. 18). Die Bootshäuser stehen am Strand und wirken in ihrem Äußeren massiger, behäbiger als die Wohnhütten, zeigen aber auf den ersten Blick manche Ähnlichkeit mit ihnen. Die vier Stützpfosten (Nr. 1 der Abb. 354) sind derbe Baumstümpfe, in deren Gabeln die beiden Längsbalken (Nr. 2) liegen, auf diesen ruhen die kürzeren Querbalken (Nr. 3). Eigentliche Wände *(rarardk)* gibt es nicht, das *falod* ist nach allen Seiten offen; nur der obere Teil der Giebelwand ist geschlossen und zwar durch einen halbrunden (nicht eckigen) Vorbau, der aber nicht wie beim Wohnhaus durch Stützpfeiler getragen wird, sondern dessen Last einzig und allein auf zwei Stangen (Nr. 4) ruht, die auf

[1] Vgl. Damm und Sarfert 1935, S. 118; Eilers 1935, S. 129.

dem Giebelquerbalken befestigt sind. Die Dachkonstruktion ist die gleiche wie beim Männerhaus. Sarfert fand in einem Bootshaus einen Dachträger beschnitzt und bemalt.

c) *falarîdr:* Männerhaus[1]. Es ist der Aufenthaltsort für die Männer, aber nur tagsüber, und gleichzeitig ihr Tanzhaus. Den Frauen ist der Zutritt verboten; diese tanzen auch nicht. Der Fußboden *(lôfal)* ist mit Sand bestreut, auf dem

355.

356.

Abb. 355. Grundriß des Männerhauses (nach Skizze Sarfert). — Abb. 356. Längsschnitt durch das Männerhaus (nach Skizze Sarfert).

z. T. Kokosblattmatten liegen. Balken dienen als Kopfstützen. Der Bau des Männerhauses, an dem alle mithelfen, ist nicht mit Gesang und Tanz verbunden, auch seine Fertigstellung nicht. — Das einzige noch vorhandene Männerhaus, das Sarfert seinerzeit als Wohnung diente, war etwa 12 Meter lang und etwa 4 Meter breit. Sein Grundriß war rechteckig, auf jeder Langseite standen drei, etwa ein Meter hohe Stützpfosten *(sâre,* Nr. 1 der Abb. 355) von rundem oder viereckigen Querschnitt. Die in der Abb. viereckig eingetragenen (in Abb. 356

[1] Hambruch spricht in seinen Aufzeichnungen von einem „Geisterhaus" auf Sorol, das dem Yoneláf geweiht sei; hier sollen sich einfache Spielboote befinden, die vor der Brotfruchtreife angefertigt werden und mit denen die Knaben spielen. — Sarfert erwähnt ein „Geisterhaus" nicht; möglicherweise ist es mit dem Männerhaus identisch.

angekreuzten) sind beschnitzt und schwarz und weiß bemalt (Taf. 18 und Abb. 357—363). Der First wird von zwei viereckigen und beschnitzten Stützpfosten *(sūrōō*, Nr. 4) getragen, diese sind etwa drei Meter hoch gewesen. Die Trägerbalken für das Dach *(darielōb*, Nr. 2) und der First *(ōō*, Nr. 5) ruhen in Kerben auf den Stützpfosten. Wände gibt es nicht, nur die Windseite ist mit Kokosblattmatten verhangen; es ist dies stets eine Langseite oder eine halbe Giebelwand.

Auf dem Längsbalken ruhen dicke Pfosten *(wōō*, Nr. 6 der Abb. 356), die oben auf dem First aufliegen und von denen die angekreuzten verziert sind (Abb. 363). Auf diesem liegen wiederum horizontale *(kabuūk*, Nr. 7) wie vertikale *(tolewūt*, Nr. 8) Sparren. Diese letzteren ruhen auf dem Firstbalken *(ōō*, Nr. 5) und werden von einem zweiten längeren, jedoch dünneren (Nr. 5a) gehalten. — Die Giebelwände liegen innerhalb des nach vorn überhängenden Giebeldaches und haben nur eine leichte Balkenunterlage, die ohne jeden Stützpfosten von den Längsbalken getragen wird (s. Nr. 3 in Abb. 355). Das Sparrenwerk ist auch hier horizontal und vertikal angeordnet und mit dem des Giebeldaches verbunden.

a b c

357.

Die Musterung der einzelnen Stützpfosten und Dachträger (sind in Abb. 355als Viereck eingetragen und in Abb. 356 angekreuzt) zeigen die Abb. 357—363. Die weiß gebliebenen Flächen in der Abb. sind weiß bemalt und vertieft, die schwarzen dagegen erhaben und schwarz bemalt. Nur von wenigen Ornamenten konnten die Eingeborenen Namen angeben (z. B. Abb. 363b Nr. 1 = Penis, 2 = Vogel, 3 = Sonne).

a b c d a b a b c

358. 359. 360.

Abb. 357—360. Muster von den einzelnen Seiten der Stützpfeiler des Männerhauses (in Abb. 355 Nr. 1); nach Skinner Sariert.

Das Dach *(jaleflt)* ist ganz dicht mit Kokosblattmatten *(jāa)* belegt, die dachziegelartig übereinander liegen und zwar so, daß die Ränder der Matten (das sind die gespaltenen Kokoswedelstiele) in ganz geringem Abstand voneinander angeordnet sind und nur die losen Fransen nach außen kommen. Das

Abb. 361—362. Muster von den einzelnen Seiten der Firststützpfosten (in Abb. 335 Nr. 4); nach Skizze Sarfert.

eigentliche Geflecht kann man nur im Innern sehen (s. Abb. auf Taf. 18). — Als Bindematerial für Balken und Sparren dient *fdfa* - Schnur.

d) *fan melidi:* Kochhaus (Abb. 364); etwa 2½ m lang, 1—2 m breit, über 2 m hoch. Es mutet zunächst wie ein einfaches, auf Pfosten gesetztes Satteldach an, das aber bei genauerem Zusehen in der sorgfältigen Bearbeitung der Hölzer, der sauberen Verschnürung nicht den Eindruck einer flüchtig errichteten Hütte macht. — Der Grundriß (Abb. 365) ist rechteckig. Auf den vier Stützpfosten (Nr. 1) liegen

Abb. 363. Verzierte Dachträger (in Abb. 356 Nr. 6): a, b, c, d die verzierten Träger der einen, e, f, g die der andern Seite (nach Skizze Sarfert).

zwei Längsbalken (Nr. 2) und auf diesen zwei Querbalken (Nr. 3). Auf den Längsbalken liegen die Dachsparren, die nach dem First zu laufen und hier mit einem ganz leichten Firstbalken verbunden sind, der lediglich durch diese Bindung gehalten wird, denn besondere Stützpfosten sind für ihn nicht da. Über diesem Firstbalken liegt noch eine leichte Stange, so daß sich hier das gleiche Bild eines Doppelfirstes ergibt wie beim Männerhaus. Das Dach ist auch in der gleichen Art gedeckt, selbst die runden Giebelvorbauten fehlen nicht. Wände sind nicht vorhanden.

Gekocht wird in Löchern *(kaŭjó)*, in denen die Speisen liegen. Oben unterhält man ein Feuer. So hat man bei diesem langsamen Rösten stets warmes frisches Essen, ohne doch jeden Tag kochen zu müssen.

Abb. 364. Kochhaus (nach Skizze Sarfert).

Abb. 365. Grundriß eines Kochhauses (nach Skizze Sarfert).

Das *fm melidt* ist aber nicht allein Kochhaus, sondern anscheinend auch Vorratshaus, denn es findet sich darin unterm Dach ein größeres Hängegestell (Abb. 366) zum Ablegen von Speisen und Geräten und dergleichen. Von jedem der beiden Querbalken Nr. 3 (s. Abb. 365) hängt ein Holz herunter, in dem unten in einer Kerbe ein zweites horizontales liegt, dessen freies Ende an einem Stützpfosten festgebunden ist. Auf diesen beiden horizontalen Hölzern liegen dann Bretter zur Ablage für allerlei Dinge. Dieses Gestell wird auch einfacher dadurch erreicht, daß man die Querhölzer für die Bretter

Abb. 366. Hängegestell im Kochhaus (nach Skizze Sarfert).

gleich an die Stützpfosten bindet. — Dienen die *fm melidt* nur zur Aufbewahrung von Vorräten, sowie für Körbe, Schalen und dergleichen, so errichtet man sie mitunter nur auf zwei Baumstämmen (s. Abb. 367) oder macht um einen Baumstamm lediglich eine Plattform.

e) *fm oltôb*: Arbeitshütte und

f) *fâfi*: Holzschuppen sind einfache kleine und niedrige Hütten von rechteckigem Grundriß mit Mattenwänden und Giebeldach, der Vorbau fehlt bei e und f.

Abb. 367. Vorratshaus (nach Skizze Sarfert).

g) *bâl*: Bluthaus; es hat etwa die Form eines Bootshauses und ist mit Matten dicht verschlossen. Es liegt etwa drei bis vier Minuten vom Dorf entfernt mitten auf einem runden, mit weißem Sand bestreuten Platz. Um diesen herum stehen dicht gedrängt etwa 10—15 Schutzdächer ähnlich wie die *fm melidt*; es sind dies die Unterkunftshütten für die Männer, die ihren Frauen Essen bringen, denn dem männlichen Geschlecht ist das Betreten des Platzes wie des Hauses untersagt, sie würden sonst krank werden. — Die Frauen suchen diese Hütte auf, sobald die Mensis einsetzt; sie verlassen diese Hütte aber auch ebenso schnell wieder, wenn die Blutung wegbleibt.

Abb. 368. Bettartige Lagerstätt (nach Skizze Sarfert).

h) *meltgel*: Unterkunftshütten auf den Feldern.

i) *fm olimoldk*: Hühnerställe kennen sie nur dem Namen nach; die Tiere wohnen auf Bäumen.

Das **Inventar** eines Hauses bilden Wirtschaftsgeräte (S. 241) und Waffen (S. 265). Pandanusmatten (S. 246; *gfaki)* dienen als Lager; man hat neuerdings europäischen Vorbildern entsprechend bettartige Lagerstätten eingerichtet (Abb. 368).

Das **Dorf** *(olefiliði)* liegt auf der Westseite der Hauptinsel und macht einen schmutzigen, vernachlässigten Eindruck auf den Besucher[1]. Es zerfällt in vier einzelne Distrikte (über ihre Entstehung s. Sippe und Geschichte), die durch Balken abgegrenzt und sehr dicht mit Hütten verschiedener Bestimmung bestanden sind. Die Distrikte führen folgende Namen (vgl. Abb. 369):

Nr. 1 *kadlebi* Nr. 3 *lugaldb*
Nr. 2 *medâirdb* Nr. 4 *faligil.*

Abb. 369. Plan des Dorfes auf Sorol (nach einer Aufnahme von Sarfert).

[1] Sievers 1910, Bd. II, S. 367.

In jedem dieser Distrikte wohnt eine Großfamilie, die sich in ihren Einzelfamilien auf die verschiedenen Wohnhütten verteilt. Es entfallen:

	auf den Distrikt	Kanuhäuser		große Boote	Wohnhütten
		Zahl	Namen		
1	*kadṭebi*	2	*faleaṅoṅ*	1	3(?)
			faledjabḍaṅ		
2	*meddṛrḍb*	3	*faleledemadṓlok*		
			faleldt	4	5
			falibolṓ		
3	*lugaldb*	4	*kadṭefḍr*		
			faleäfḍṅ		
			uleliḍk	2	7(?)
			ubelifḍl		
4	*faligll*	1	*faledalemḍr*	2	4

Trinkwasser entnimmt man aus Wasserlöchern *(dalṓl)*, die man neben dem Feld bisweilen in den Korallenboden gegraben hat und in denen sich das Regenwasser sammelt.

265

VI. Waffen und Krieg.

Waffen sind unbekannt. Speere *(sorosôk)* wurden nur zum Fischfang verwendet. Die von Sarfert vorgezeigte Haizahnwaffe wurde bewundert und lebhaft besprochen. Schleuder, Bogen und Pfeile sind vollständig unbekannt und nicht einmal als Kinderspielzeug vorhanden. — Kriege *(fiâjêk)* scheint es kaum gegeben zu haben, denn in der Geschichte lebt keine Erinnerung an sie weiter.

206

Soziale Verhältnisse und Geisteskultur.

VII. Zur Soziologie.

Über der eigentlichen **Familie** *(lâodj)* steht die Sippe. Der Umfang beider läßt sich aus den Verwandtschaftsbezeichnungen erschließen.

Folgende Verwandtschaftsbezeichnungen konnte Sarfert feststellen:

Großvater (väterlicherseits) *damadjdamâdj*
Großmutter (väterlicherseits) *sildamâdj*
Großvater (mütterlicherseits) *damadjsll*
Großmutter (mütterlicherseits) *silesll*
Vater *damâdj*
Mutter *silâdj*
Bruder *wisldj mal*
Schwester *wisldj fâfil*
Gatte, Gattin *rll*
Sohn, Tochter *lêï*
Vaterbruder *wisidjdamâdj*
Vaterschwester *midwaldamâdj*
Mutterbruder *mâlelebêï*
Mutterschwester *wisisll*
Sohn des Sohnes, Tochter des Sohnes, Sohn der Tochter, Tochter der Tochter *laulêï*
Vater der Ehefrau *damalimeleroärll*
Mutter der Ehefrau *silêï*
Bruder der Ehefrau *kâûdomêï*
Schwester der Ehefrau *wisilerll*
Gatte der Schwester der Ehefrau *wîsi*
Vater des Ehemannes *damâï*
Mutter des Ehemannes *silêï*
Bruder des Ehemannes *kâûdôle wîsi*
Schwester des Ehemannes *kôsêï*
Gatte der Schwester des Vaters *rllimiawalidamêï*

Frau des Bruders des Vaters *rlliwisidamẽi*
Gatte der Schwester der Mutter *rlliwisisilẽi*
Sohn des Vaterbruders, Sohn der Vaterschwester, Sohn des Mutterbruders, Sohn der Mutterschwester *wisi*, auch *wisidj*
Tochter des Vaterbruders, Tochter der Vaterschwester, Tochter des Mutterbruders, Tochter der Mutterschwester *miandi*, auch *miandi*

Über das Verhältnis zwischen Bruder und Schwester vgl. das über Polowat Gesagte (Damm und Sarfert, 1935 S. 143).

Ehe. Es herrscht nur Einehe, Polygamie ist unbekannt. Heiratsfähig ist der Mann, sobald der Bart zu wachsen beginnt; beim Mädchen ist die Mensis das Zeichen der Reife. Geheiratet wird nur zwischen den Dorfteilen, also den Sippen; es besteht also Exogamie (s. unten). — Die Frau wird gekauft gegen Zahlung von Kanus und Gegenständen aller Art an die Eltern des Mädchens, selbst Grundeigentum wird mitunter vom Distriktältesten des heiratslustigen Burschen gegeben. Eine Gegenleistung von Seiten der Eltern des Mädchens gibt es nur insofern, als das junge Ehepaar Tag für Tag zu ihnen geht und sich von ihnen mit Essen versorgen läßt. Bleiben sie einmal aus, so wird ihnen das Essen nicht zugeschickt. Mitunter schläft das junge Paar auch hier. Doch zieht mit dem Tag der Eheschließung die Frau in das Elternhaus ihres Mannes. — Vor der Ehe besteht freier Verkehr zwischen den Unverheirateten.

Der **Geschlechtsverkehr** wird in der Form geübt, daß der Mann zwischen den Beinen der liegenden Frau kniet. Die Frau als incubus kennt man ebensowenig wie den seitlichen oder normalen Coitus. — Geschlechtliche Anormalitäten wie Cunnilingus (auf Yap zwischen Mann und Frau) oder Conträrsexualität (auf Palau zwischen Männern) kennt man nicht. — Ehebruch soll angeblich unbekannt sein.

Schwangerschaft und **Geburt.** Die Frauen sind im allgemeinen sehr fruchtbar, sie gebären im Durchschnitt etwa 4—5 Kinder. Zwillingsgeburten sind bekannt, aber selten; Drillinge sind nicht zur Welt gebracht worden. Die Geburt erfolgt im Wohnhaus, doch auch in der *bâl*-Hütte. Während des Geburtsaktes sitzt die Frau mit angezogenen und gespreizten Beinen, eine andere massiert sie, indem sie die Gebärende von hinten umfaßt. In dieser Hütte bleibt die Mutter mit dem Neugeborenen etwa 11 Tage. Eine Festlichkeit gibt es bei der Geburt nicht. Nach beendigter *bâl*-Zeit wiegen Vater und Mutter das Kind unter Gesang im Arm. Der Geschlechtsverkehr unter den Eltern ist solange tapu, bis das Kind laufen kann, das tritt etwa mit zehn Monaten ein. Über diese Zeit hinaus werden die Kinder noch gestillt, angeblich bis zu 20 Monaten. — Die Namengebung erfolgt sehr frühzeitig, etwa wenn das Kind anfängt herumzukrabbeln. Den Namen geben die Eltern. Im Alter von etwa sechs Jahren erhält dann das Kind den Schurz.

Menstruation. Die Frau geht während dieser Zeit in das Bluthaus (S. 262) und hält sich hier solange auf, bis die Menses aufgehört hat. Während dieser Zeit darf kein Geschlechtsverkehr geübt werden. Wenn die Frau wieder ins Haus zu ihrem Mann zurückkehrt, nennen sich beide Gatten *wuṅdôro* (auf Yap *medjillb)*, es besteht dann noch eine Tapu-Frist von vier Tagen. Speiseverbote bestehen nicht.

Altersbezeichnungen in dem Maße wie auf Bur hat man auf Sorol nicht.

Kind	*ellułt*
Junge	*daremdl*
Mädchen	*ddre ʃāʃidj*
Mann	*mdl*
Frau	*ʃāʃidj*
alter Mann, alte Frau	*dûʃeĭ*
Greis, Greisin	*môus*

Über Kindesadoption s. S. 269.

Tod und Begräbnis. Der Tote wird im Hause mit dem Kopf nach Norden aufgebahrt. Ist der Verstorbene ein Mann, so werden Totenlieder *(kadjiedjł)* angestimmt, die von den Angehörigen gedichtet worden sind. Der Tote bleibt einen Tag im Haus und wird nachmittags gegen vier Uhr beigesetzt und zwar wie bei der Aufbahrung mit dem Kopf nach Norden. — Es gibt Erdbegräbnis und Wasserbestattung; letztere besteht darin, daß man den Toten in ein Boot legt und forttreiben läßt. Die Art der Bestattung bestimmt der Betreffende vor seinem Tode, das gilt auch für die Frauen. Für die Kinder wählt die Mutter die Bestattungsart. Anscheinend sind beide Arten gleichwertig, die Vorliebe des Sterbenden für diese oder jene Art ist ausschlaggebend.

Die Gräber *(sialiwd)* liegen nicht auf einem Platz zusammen, sondern einzeln und verstreut, denn die Beerdigung erfolgt auf einem der Grundstücke, dem der Verstorbene zugehört. Der Tote liegt mit dem Kopf nach Norden; an den vier Ecken des Grabes, das weder durch einen Hügel, noch durch eine Steinsetzung kenntlich ist, werden Kokospalmen gepflanzt. Wer deshalb in der Nähe eines Grabes Kokosnüsse pflückt, legt stets für den Toten aufs Grab eine ungeschälte Nuß, die an einer Seite geöffnet ist.

Die Angehörigen des Verstorbenen bleiben im Haus des Toten zwei Monate lang ohne irgendeinen Handgriff zu tun. Die Witwe bleibt auch weiterhin im Haus ihres verstorbenen Mannes, sofern sie nicht heiratet; dieses darf sie — und das Gleiche gilt für den Witwer — erst nach neun Monaten.

Über die **Sippengliederung** war bei der Unkenntnis der Sorol-Leute in soziologischen wie in religiösen Fragen nichts zu erfahren, meinte doch selbst der Häuptling: »Wir Sorol-Leute wissen nichts, wir sind dumm wie die Schweine und Hunde, uns hat niemand etwas gesagt!« Hierin kommt ganz offensichtlich das

Fehlen jeglicher Tradition zum Ausdruck, was sich durch die vor kaum fünf Generationen erfolgte Neubesiedlung der Insel durch Ifaluk-Leute erklärt. Ein großer Taifun hatte nämlich die gesamte Inselbevölkerung bis auf zwei Frauen vernichtet, eine von ihnen gebar einen Sohn. Zu diesen drei Überlebenden kamen von Ifaluk fünf Männer und fünf Frauen, die schon damals die heute bestehende Dorfeinteilung vornahmen und von denen sich die heutigen Sorol-Leute herleiten. Da auf Ifaluk die Sippengliederung seit alters besteht, werden die neuen Siedler zweifellos die ihnen so wohlbekannte Einrichtung weiter erhalten haben.

Und in der Tat zeigt die Gliederung eines jeden der vier Dorfdistrikte und ihr Verhältnis zueinander das gleiche Bild wie auf den Zentral-Karolinen. So ist die Ehe zwischen den Mitgliedern des gleichen Dorfteiles untersagt, es besteht also Exogamie. Eine strenge Abgeschlossenheit zwischen den einzelnen Distrikten herrscht jedoch keineswegs, denn der Mann schläft einmal im elterlichen Haus, also in seinem Dorfdistrikt, dann wieder einmal bei seiner Frau, die einen anderen bewohnt. Die Kinder gehören aber stets dem Platz des Vaters an! Eine Kindesadoption kann auch nur aus einem anderen Dorfteil erfolgen. Der Adoptierte geht nie in das Haus seiner eigentlichen Eltern zurück.

Jeder dieser Dorfdistrikte untersteht einem älteren Mann, offenbar dem ältesten Vertreter der dort ansässigen Familien; er bestimmt, wann gefischt werden soll, und verteilt die Beute, desgleichen beaufsichtigt er die Arbeiten auf den Feldern seines Distriktes, deren Erträgnisse auch allen Sippengenossen zur freien Verfügung stehen. An allen Arbeiten beteiligt sich dieser Älteste selbst mit. Die Namen dieser Ältesten und Distriktsvorsteher waren für

den Distrikt	1909	zur Zeit der Ifaluk-Besiedlung
Kadiebi	Lugusemâl	Karañôt
Medairäb	Walekéda	Melâimlû
Lugalab	Filärôñ	Fereliwâ
Faligil	Medâlemâñ	Dalûdj

Filärôñ ist zugleich **Häuptling** *(domôl)*, die übrigen gelten jedoch nicht als Unterhäuptlinge! Die Vorgänger des jetzigen Häuptlings waren (rückwärts) Lamadâï, Kakilâ (seine Frau hieß Melolfal) und Merällím. Die Vererbung der Würde geschah bisher vom Vater auf den Sohn; auch Frauen übernahmen, wie die Geschichte lehrt, diese Würde. Die Nachfolgefrage nach dem Ableben des jetzigen Häuptlings Filärôñ wird insofern schwierig, weil seine beiden Söhne früh starben und seine Schwester mit ihrem Sohn bei einem Versuch ihre einstige Heimatinsel Ifaluk zu erreichen, ums Leben kam. So hat Filärôñ keine Familie mehr. Nach Aussage der Sorol-Leute kann nach seinem Tod Häuptling werden, wer will.

Recht. a) Besitzrecht. Grundeigentümer sind auf der Hauptinsel Sorol außer dem Häuptling auch die Ältesten der einzelnen Dorfdistrikte. So besaß

der Älteste	vom Distrikt	Nr. in Abb. 369	Zahl der Grundstücke	Namen	Nr. in Abb. 370
Lugusemál	Kadiebi	1	6	Dawôt	22
				Rielôṅ	16
				Mālôdo	18
				Sedeårāṅ	23
				Daboloåtaṅ	17
				Falåres	19
Walekéda	Medairäb	2	4	Luguliôludj	10
				Medaleôl	21
				Walibilimådo	20
				Lugulifålar	11
Filärôṅ	Lugalab	3	8	Bogelûk	2
				Domelilêi	3
				Falelimåṅar	4
				Dalâlok	5
				Lugulumâu	6
				Lugûlo	7
				Djimåfāṅ	8
				Bädît	9
Medālemāṅ	Faligil	4	4	Adåaṅ	12
				Wanimâ	13
				Manewôi	14
				Biedû	15

Von den übrigen Inseln des Atolls ist nur noch Bigelimel aufgeteilt und zwar in Faluwûe, Atidiué, Lalimadolôe, Laṅowâidît. Doch waren sie wie die übrigen fast unbewachsenen Inseln und gar die Sandbänke, die nicht aufgeteilt waren, Gemeingut, d. h. man konnte hier mit Erlaubnis des Häuptlings Nahrung holen.

Häuser, kleine Boote, Angelhaken, Schüsseln und sonstiges Gerät sind persönliches Eigentum, doch gehören die großen Reiseboote und Kanuhütten, also Geräte bzw. Einrichtungen, die in gemeinsamer Arbeit geschaffen wurden, dem Dorfdistrikt, während die beiden riesigen *ädjdṅ*-Netze gar Eigentum der ganzen Siedlung waren.

Besitz vererbte sich immer vom Vater auf den ältesten Sohn.

b) Ein Strafrecht wollen die Eingeborenen nicht haben, da angeblich Körperverletzungen und Schlägereien nicht unter ihnen vorkommen, ebenso soll Diebstahl *(modjŏk)* fremd sein.

Abb. 370. Die Lage der Grundstücke auf der Insel Sorol (nach Skizze Sarfert).

370.

222

VIII. Zur inneren Geschichte.

Die geschichtliche Erinnerung der Sorol-Leute reichte kaum fünf Generationen zurück, das fand seine Erklärung darin, daß durch eine Taifun-Katastrophe die alteingesessene Bevölkerung der Insel bis auf zwei Frauen, von denen eine, Mogorâń mit Namen, später noch einen Knaben zur Welt brachte, getötet wurde und erst von Ifaluk her eine Neubesiedlung durch fünf Männer mit ihren fünf Frauen erfolgte (vgl. auch unter Sippe). Die Einwanderer waren Fereliwâ und seine Frau Lelimâk, Karańôt und Läalûel, Dalûdj und Liliffdj, Tilfb und Kariesédj, Mosûräk und Ladokerâń.

Von anderen Inseln, die mit Sorol Handel pflegten wie z. B. Yap, Mogemog, Feis, ist keine Besiedlung erfolgt. Häuptling wurde damals Merälllm, der einzige der Abstammung nach männliche Sorol-Abkömmling.

Von den vor der Katastrophe lebenden Sorol-Leuten lebt lediglich noch der Name Mâlemuk in der Erinnerung fort. Es handelt sich dabei um einen Mogemog-Mann, der einst in einem kleinen Segelboot ankam, den Eingeborenen die Kenntnis des Haus- und Bootbaues übermittelte und Tanz und Gesang lehrte, um dann wieder in seine Heimat zurückzukehren.[1]

Kakilâ war mit einer Frau namens Melolfal verheiratet. Über seine Regierungszeit ist nichts bekannt. — Als Lamadâî herrschte, besuchten zwei Segelschiffe die Insel, eines davon strandete auf dem Riff und ist den Insulanern eine unergründliche Fundgrube des ihnen so wertvollen Eisens. Menschen kamen bei dieser Schiffskatastrophe nicht ums Leben, die Besatzung wurde vom Begleitschiff übernommen. Noch 1909 lag von diesem Unglück her ein großer Eisenblock vor dem Häuptlingshaus. — Der Sohn des Lamadâî, namens Filärôń, war 1909 Oberhäuptling; er war ein »fetter, fauler, dabei dummschlauer Mann«, der keinen guten Einfluß auf die Bevölkerung ausübte.[2]

---

[1] Von der Geschichte Sorols, wie sie Chamisso darstellt, ist nichts bekannt. Lugulôt ist nur dem Namen nach bekannt. Von einer Besiedlung der Insel von Mogemok aus ist nichts bekannt, ebenso von einer politischen Abhängigkeit in dieser Richtung.

[2] Thilenius 1927, S. 241/242.

IX. Zur Religion.

Von der alten Religion, die in den Zentralkarolinen z. B. auf Polowat noch so lebendig ist, wissen die Sorol-Leute — Sarfert hatte die ältesten Eingeborenen vor sich — nichts mehr. Das gilt auch für die Vorstellungen über die Totenwelt, für Zauber und Sagen. Der Grund dafür ist in erster Linie die bereits erwähnte Naturkatastrophe vor 5 Generationen, doch hätten andererseits die religiösen Anschauungen der Ifaluk-Einwanderer noch lebendig sein müssen. Daß auch dies nicht der Fall war, liegt daran, daß seinerzeit alte Männer aus Ifaluk nicht mit nach Sorol fuhren und in den jungen damals die geistige Kultur ihrer Heimat noch nicht oder schon nicht mehr Wurzel gefaßt hatte. Eine Religion konnte sich auch nicht herausbilden, da das Leben auf Sorol »durch eine erhebliche Abgeschlossenheit von der übrigen Eingeborenenwelt« dahinglitt und Reisen, die eine geistige Anregung vermittelt hätten, nicht mehr unternommen wurden.[1]

Von den Himmelsgottheiten kennt man wohl die Namen Lugélaṅ und Ellefádj; erster gilt auf Polowat als Sohn des obersten Himmelsgottes Áluelöb, letzterer ist identisch mit Olifád.[2] Als Sarfert ihnen erzählte, daß Lugélaṅ den Menschen, wenn sie böse sind, Tod und Taifun bringt, waren sie sehr erstaunt und frugen immer wieder, ob das tatsächlich wahr sei. Über Gestirne und Naturerscheinungen (Regenbogen usw.) hatten sie keinerlei Vorstellung.

Abb. 371. Fregattvogel aus Holz (Hamburg 2396[II], Länge des Rumpfes 31, Flügelbreite 44 cm).

Sarfert erwarb auf Sorol die Darstellung eines Fregattvogels (Abb. 371), zu der die Eingeborenen keine näheren Angaben machen konnten. Es ist aber wohl die Annahme berechtigt, daß dieser Vogel einst auch auf Sorol religiöse Wertschätzung genossen hat wie z. B. auf Polowat als Götterbote (vgl. Damm und Sarfert 1935 S. 193, 217).

Es besteht auch noch ein Geisterglauben und zwar sind die »Seelen« *(samedóh)* der Toten derartige Geister (ob böse oder gute, sie heißen stets *éllüs)*. Kurz nach dem Tod irrt nämlich die Seele nachts ruhelos umher, die Eingeborenen

[1] Vgl. auch Thilenius 1927, S. 241/242.
[2] Damm und Sarfert 1935, S. 191, 193.

hocken dann zusammen und fürchten sich vor ihr. Worin ihr böser Sinn besteht, was sie den Menschen antun, ist ebenso unbekannt wie die Vorstellung von einem Totenreich oder irgendeinem Aufenthaltsort der Seelen. Als Sarfert den Sorol-Leuten die Ansicht der Pur-Leute erzählte, erwiderte der Sorol-Häuptling trocken: Der Tote wird ja zu Erde! — Vom Geist Besessene gibt es auf Sorol nicht.

Zauberei *(wânewân)* spielt bei der Krankenheilung eine große Rolle. Bei kranken Frauen benutzt der Wissende Kokosblattknoten (Abb. 372); er setzt sich damit an das Krankenlager, wedelt mit den Knoten hin und her und spricht dazu: »*Älemerâ mälemält Dôlor* (= Sarfert gemeint) *wä mälemält fâfît, wä mälemält mal, fâflte wä mâl, wägêr remâle remâl, remâle fadefâdo.*«

372.

373.

Abb. 372. Bindestadien (1—3) des Zauberknotens (nach Skizze Sarfert). — Abb. 373. Brett zur Heilung kranker Männer (Hamburg 1742[II], Länge 67 cm).

Zur Heilung der Männer wird ein Brett (Abb. 373) gebraucht, das viele kleine Löcher aufweist, deren Zweck unbekannt ist. Das Brett führt keine besondere Bezeichnung. Diese Methode stammt von Mogemog; ein Mogemog-Mann lehrte sie einem alten Sorol-Mann: das Holz wird unter Hersagen eines Verses gegen die Stirn des Kranken geschlagen. Über medizinische Mittel zur Krankenheilung s. S. 277.

Zeremonien zur Zeit der Brotfruchtreife gibt es nach Sarfert nicht; Hambruch behauptet dagegen, daß zu dieser Zeit einfache Spielboote angefertigt werden, mit denen die Knaben dann spielen.

Tabu *(etâb*, das Gegenteil davon ist *dâtôb)* besteht in folgenden Fällen: 1. Zur Fangzeit der Hochseefische *malidâdj, dagû, kalanâb, fafâ, manâr*, dann dürfen die Fischer nicht ins Wohnhaus gehen, sondern müssen im Männerhaus schlafen. — Während des Fanges ist jedes Essen tabu; es ist erst an Land im Männerhaus gestattet. Von den Fischen sind seit alters folgende tapu: *borô* (Hai), *soröfân, fâ* (Rochen), *lôt, belibêl* (Yap: *lugûl)*; der Grund ist unbekannt. — 2. Während des Kanubaues ist der Mann tapu. — 3. Tapu nach der Geburt eines Kindes s. S. 267. — 4. Tapu während der Menstruation s. S. 268. — 5. Das Betreten des Männerhauses ist tapu (s. S. 257).

295

X. Musik, Tanz und Spiel.

Musikinstrumente gibt es nicht; die Begleitung zu den Tänzen erfolgt durch Händeklatschen und eintönigen Gesang, der eigentlich nur aus drei Tönen besteht: Grundton, ½ Ton, Terz!

Den Tanz mit dazugehörigen Liedern lernten die Sorol-Leute von dem Mogemog-Mann Mâlemuk (s. S. 272). Man kennt nur einen einzigen, aber sehr ausgedehnten Tanz *(wâruk)*, der aus fünf Teilen, die nicht besonders benannt werden, besteht und den nur die Männer pflegen; die Frauen tanzen nicht. Der Häuptling ordnet nach Belieben Tanzaufführungen an.

Das gesamte Tanzkostüm besteht aus jungen Kokosblättern:

a) *mêrimal:* Kopfring, dessen Knoten vorn über der Stirn liegt.
b) *mâremar:* Halsring; er ist vorn und hinten geknotet,
c) *silibôt:* Oberarmring und Unterarmring,
d) *gamâdjo:* Gürtel,
e) *dâbeddb:* Schurz aus einem halben Kokoswedel,
f) *silibeddt:* Beinringe, sie werden über dem Knöchel und über der Wade getragen.

Inmitten der in einer Reihe aufgestellten Tänzer ist ein Vorsänger, der den Beginn der Veranstaltung verkündet. Der einleitende Teil ist sehr getragen und besteht aus langsamen Arm- und Handbewegungen. Der Vorsänger singt besonders am Anfang und Ende dieser Tour etwas vor und der Chor stimmt dann mit ein. — Der zweite Teil hat etwa zwölf Touren. Die erste davon wird mit Händeklatschen auf Waden, Armbewegungen und leichtes Hin- und Herwiegen des Körpers eingeleitet. Das Tempo wird dann rascher und rascher und gewinnt durch abwechselndes Stampfen mit den Füßen etwas Wildes, Urwüchsiges. Die Tanzstellung ist eine halbtiefe Kniebeuge (nach vorn) mit leicht vorgeneigtem Oberkörper. Etwa in der achten Tour spaltet sich die Reihe der Tänzer, die durch Halbrechts- bzw. Halblinkswendung innerhalb der beiden Hälften hintereinander stehen und einander zugekehrt sind. Bei der neunten Tour knieen die Tänzer nieder, wobei der Vorsänger zur andern Partei hinüberwechselt. Die folgenden Touren sind lebhafter als die vorhergehenden. Die zehnte beginnt mit Vorwärts- und Rückwärtsschreiten verbunden mit einem seitlichen Drehen des Körpers. Mitten in der Tour setzt dann bei lebhafter werdendem Vorwärts- und Rückwärts-

schreiten abwechselnd der Gesang aus, bis ein Schlußruf die Tour beendet. Bei der elften Tour treten die Tänzer in Doppelreihe und zwar Rücken an Rücken gekehrt an. Die Reihen bewegen sich in lebhaftem Tempo vor- und rückwärts und durchschreiten schließlich die Gegenreihe. Auch hierbei fällt der Gesang verschiedentlich aus; auf die Rufe des Vortänzers antworten die übrigen. Bei der zwölften Tour sind die Tänzer wieder in Doppelreihe aufgestellt und zwar so, daß die Paare abwechselnd mit entgegengesetzten Fronten stehen. Sie tanzen unter Klatschen gegeneinander bald nach links und rechts. Auch bei dieser Tour setzt der Gesang wiederholt aus. Das Tempo steigert sich nach dem Schluß zu. — Der dritte Teil besteht aus Sitztänzen; es handelt sich dabei um ein Hocken auf den Waden. Eine der Touren besteht fast ausschließlich aus Deklamationen in einer leicht hockenden Stellung. — Der vierte Teil gleicht mit seinen langsamen Tanzbewegungen und seinem getragenen Gesang ganz dem ersten und zweiten Teil, ja die fünfte Tour hat das gleiche Bild wie die achte Tour vom zweiten Teil. Bei der sechsten Tour knieen die Tänzer in der gleichen Anordnung wie vorher, die beiden Hälften sind also einander zugekehrt und stehen in Einerreihe, mitten im Tanz erheben sie sich. — Die Touren des fünften und letzten Teiles kennzeichnet Sarfert in folgender Reihenfolge: Sitztanz, lebhafte Stehtänze teilweise mit Coitusbewegungen und zum Schluß Stabtänze, der Stab wird über dem Kopf geschwungen, dann wieder vorgehalten usw.

Lieder s. Fischfang.

Spiele *(gogôm)* kennen die Erwachsenen nicht, umso lauter geben sich die Kinder damit ab (Kopfstand, Spielboote s. S. 274); Einzelheiten gibt Sarfert nicht an.

Die Blattpfeife *(kanîni)* ist nur dem Namen nach bekannt; das Schwirrholz fehlt.

277

XI. Verschiedenes.

Krankheiten werden nicht allein mit *wdńewaṅ*-Zauber (s. S. 274) behandelt, man verfügt auch über **medizinische Kenntnisse,** die bei bestimmten Erkrankungen angewendet werden.

a) *fieſt* = Massieren der Arme und Beine; damit behandelten die Eingeborenen z. B. einen Influenzakranken namens Moṓn.

b) *ddſēt* = ein Aufguß von zerstampften Blättern und Blüten alter Bäume mit der Milch dreier Kokosnüsse.

c) *kosṓs:* es wird in einem Topf junge Kokosmilch gekocht, in die der Saft bestimmter Bäume hineingedrückt wird; der Dampf wird inhaliert.

d) *kṓlob:* es werden bestimmte Blätter heiß gemacht und der Kranke legt sich darauf.

In der Nennung von **Namen** gibt es keine Einschränkung wie auf Merir, Songosor, Bur und Palau, es ist auch die Anrede der Personen anders, man nennt alle, auch den Häuptling beim Namen und nimmt keinerlei Rücksicht auf Namen von Verstorbenen.

Grußformen. Das Grußwort, das unserem »guten Tag« entspricht, ist *kawṓṅ;* man wendet es auch bei längerem Abschied an, so grüßen die Angehörigen einen Verstorbenen mit dem Ruf: »*kawṓṅ!*« Zwischen den nächsten Familienangehörigen ist der Nasenkuß *(fāsṓṅ)* üblich, dagegen führt man bei der Begrüßung von Fernstehenden die Hand des andern an die Nase[1]. — Der »Zungenkuß« ist auf Sorol nicht üblich.

Die **Zeiteinteilung** in zwei Jahreszeiten und in Monate ist dieselbe wie auf Polowat[2]. Der Tag wird in folgende Abschnitte eingeteilt:

Morgendämmerung	*limaltl*	etwa 13 Uhr	*sadjfk mä ilódo*
Sonnenaufgang	*satirat jāl*	etwa 14 Uhr	*sabāl mä ilódo*
(etwa 6 Uhr)		etwa 15 Uhr	*djälewāṅ*
etwa 7 Uhr	*dämālūk*	etwa 16 Uhr	*doligōt*
etwa 8 Uhr	*efälēri mālūk*	etwa 18 Uhr	*sādjub*
etwa 9 Uhr	*sabólo mogodjī*	abends	*liwarāf*
etwa 10 Uhr	*djāddūk mogodjī*	nachts	*sāwon'*
etwa 11 Uhr	*efälēri mogodjī*	Mitternacht	*lugoliwṓṅ*
etwa 12 Uhr	*sāūwōl*		

[1] Bei Behandlung dieser Sache schämten sich die Leute und der Mogemog-Mann lief lachend weg.
[2] Damm und Sarfert 1935, S. 273.

208

XII. Zur Sprache.

Die Sorol-Sprache ist dem Yap sehr fremd, steht dagegen dem Mogemog näher. Die Ähnlichkeit des Sprachschatzes ist jedoch nicht sehr groß, denn der Mogemog sprechende Yap-Mann, den Sarfert als Dolmetscher benutzte, konnte sich nur schwer mit den Sorol-Leuten verständigen.

Artikel gibt es nicht.

Demonstrativpronomen. Dieser Mann = *ārimātalā*, jener Mann = *ārimātalāī*; dieser Vogel = *malilā*, jener Vogel = *malilāī*; dieser Fisch = *thelā*, jener Fisch = *thelāī*; diese Nuß = *lüelā*, jene Nuß = *lüelāī*.

Personalpronomen.

ich *ńdń*	wir (exkl.) *kāmem*
du *kēl*	ihr *kāmi*
er *tje*	sie *tge*
wir (inkl. = ich und du) *ktt*	

Possessivpronomen. Für Sorol gilt dazu das Gleiche wie für Polowat (vgl. Damm und Sarfert 1935, S. 279). — a) Für Personen- und Verwandtschaftsbezeichnungen hat man nachgestellte (suffigierte) Pronomina:

mein Vater	*damāī*
dein Vater	*damōm*
sein Vater	*damāl*
unser Vater	*damādj*
euer Vater	*damāmi*
ihr Vater	*damāre*

b) Bei allen lebendigen Wesen (Tieren usw.) werden dagegen zusammengesetzte und vorangestellte Pronomina angewendet:

mein Huhn	*lāī malūk*
dein Huhn	*lālum malūk*
sein Huhn	*lālule malūk*
unser Huhn	*lālat malūk*
euer Huhn	*lālumi malūk*
ihr Huhn	*lāūāre malūk*

c) Bei Bäumen und Pflanzen wird das Pronomen vorangestellt.

meine Nuß	*kalô tô*
deine Nuß	*kaldmu tô*
seine Nuß	*kâle tô*
unsere Nuß	*kalât tô*
euere Nuß	*kalâmi tô*
ihre Nuß	*kaldre tô*

d) Für leblose Dinge gelten Formen ähnlich wie unter a).

mein Boot	*odî*
dein Boot	*odm*
sein Boot	*odî*
unser Boot	*oddj*
euer Boot	*odmi*
ihr Boot	*odre*

Zahlworte.

1	*sâu*	600	*olowâgi*

Verbum. Von den Verbalformen erfuhr Sarfert stets nur Präsens und Futur.

Präsens:		Futur:	
ich gehe	*ifildlok*	ich werde gehen	*osdlok*
du gehst	*kofildlok*	du wirst gehen	*kosdlok*
er geht	*ifildlok*	er wird gehen	*dsdlok*
wir gehen	*sifildlok*	wir werden gehen	*sidlok*
ihr geht	*gäfildlok*	ihr werdet gehen	*gäsdlok*
sie gehen	*räfildlok*	sie werden gehen	*räsdlok*

Vom Verbum »kommen« wurde Sarfert auch das Imperfekt genannt.

Präsens:			
ich komme	*iwowdjo*	er kam	*milawddjok*
du kommst	*kowowddjok*	wir kamen	*milawddjok*
er kommt	*dubuddjok*	ihr kamt / sie kamen	*melowowddjok*
wir kommen (inkl.)	*siwowddjok*		
wir kommen (exkl.)	*kawowddjok*	Futur:	
ihr kommt	*gäwddjok*	ich werde kommen	*oswddjok*
sie kommen	*kawddjok*	du wirst kommen	*koswddjok*
Imperfekt:		er wird kommen	*äswddjok*
		wir werden kommen	*siwddjok*
ich kam (gestern)	*milawddjok*	ihr werdet kommen	*gäswddjok*
du kamst	*melowowddjok*	sie werden kommen	*räswddjok*

Imperativ:

komme	*wddjok*
kommt	*kawddjok*

Die **Längenmaße** werden dem menschlichen Körper entnommen.

ein Faden (= Länge der ausgestreckten Arme und Brustbreite)	*sandf*	sechs F.	*olandf*
zwei F.	*rindf*	sieben F.	*fisindf*
drei F.	*selindf*	acht F.	*walindf*
vier F.	*fandf*	neun F.	*duandf*
fünf F.	*limandf*	zehn F.	*sdk*

Kürzere Längen wurden mit dem einen Arm auf dem andern bzw. auf der Brust abgegriffen.

eine Armlänge vom Schulteransatz an = *sebŏl*
Unterarm vom Ellenbogen bis Fingerspitze = *samall*
von der Handwurzel bis zur Fingerspitze = *sugumăl*
von dem Ansatz der einen Schulter bis Ende des andern Armes = *sălăr*
vom Ellenbogen bis zu den Fingerspitzen des andern Armes = *kobŏl*
von der Handwurzel bis zum Ende des andern Armes = *dŏko sănaf*

Adjektiva.

Mogemog.

Nach den Aufzeichnungen von Prof. Dr. Hambruch bearbeitet
von Dr. Hans Damm.

(p 284 is blank)

Mogemog.

285

Allgemeiner Teil.

I. Äußere Geschichte.

In seiner Entdeckungsgeschichte der Karolinen hat sich Krämer nächst Palau mit besonderer Ausführlichkeit der Inselgruppe Mogemog gewidmet, die bei dem starken nach Osten gerichteten Vorwärtsdrängen spanischer Kolonisatoren und Missionare von den Philippinen her rasch bevorzugtes Interesse fand. Wann jedoch das Auge eines Europäers diesen großen Inselarchipel erstmalig sichtete, ist nicht mit Sicherheit ausgemacht. So hält es Krämer für ziemlich sicher, daß Ruy Gomez de Villalobos am 23. Januar 1543 in der von ihm »Arrecifes« (Inseln der Riffe) genannten Gruppe Mogemog vor sich hatte,[1] während eine frühere Entdeckung (1. Oktober 1525) durch Diego de Rocha und seinem Piloten Gomez de Sequeira weniger wahrscheinlich ist[2]! Unsicher ist nach wie vor, ob die durch Meuterei führerlos gewordene »San Gironimo«, die am 1. Mai 1566 Acapulco westwärts verließ, Mogemog gesichtet hat.[3]

Sicheren Bescheid von der Gruppe erhielt Pater Clain[4] durch einige im Jahre 1696 angetriebene Feis-Leute, von denen einer namens Olit genauere Angaben machen konnte. Er selbst besuchte die Insel nicht. Es vergingen etwa 150 Jahre, bis wieder und zwar am 6. Februar 1712 ein europäisches Schiff, die »Santo Domingo«, unter dem Kommando des Don Bernardo de Egui y Zabalaga die Inseln sichtete und einen Bericht mit ethnographischen Einzelheiten der Nachwelt hinterließ[5]. Mogemog war nunmehr so stark in den europäischen Interessenkreis d. h. Spaniens getreten, daß es nur eines Anstoßes bedurfte, um auf der Inselgruppe eine europäische Niederlassung zu gründen. Dieses Ereignis trat gar bald ein, nur nahm es einen tragischen Ausgang. Am 19. und 21. Juni 1721

[1] Krämer 1917, Bd. I, S. 2/3.
[2] Krämer 1917 Bd. I, S. 4. — Die entdeckungsgeschichtlichen Angaben von Meinicke (1888 Bd. II, S. 359), auf die auch Sievers (1910 Bd. II, S. 303) sich zu stützen scheint, sind damit endgültig erledigt.
[3] Krämer 1917 Bd. II, S. 8/9.
[4] Krämer 1917, Bd. II, S. 15.
[5] Krämer 1917, Bd. II, S. 75ff. — Auch Lütke (1835, Vol. II, S. 317) berichtet kurz darüber. — Egui kann also kaum als »Entdecker« gewertet werden, wenn er auch stets als solcher genannt wird (Grück, Ms.).

trieben an der Ostküste von Guam zwei Mogemog-Boote mit 29 Insassen an und mit einem Teil dieser Schiffbrüchigen fuhr im Mai 1722 Pater Juan Antonio Cantova mit dem Ziel Mogemog los. Sein Schiff strandet jedoch auf einer der Philippinen-Inseln, Cantova wird als Einziger gerettet. Am 11. Februar 1731 fährt er zusammen mit Pater Viktor Walter und einem der noch auf Guam weilenden Mogemog-Leute ein zweitesmal nach jenen Inseln, die er glücklich am 2. März 1731 erreicht und »Los Dolores« nennt, die Hauptinsel erhält von ihm den Namen »Isla de los Garbanzos«. Auf Falalap wurde eine Niederlassung gegründet und die äußeren Erfolge der Missionsarbeit zeigten sich gar bald in 127 getauften Kindern. Als nach drei Monaten die Lebensmittel ausgingen, segelte Pater Walter nach den Marianen, wurde aber nach den Philippinen verschlagen; am 12. November fuhr er weiter, sein Schiff ging vor den Marianen unter, mit knapper Mühe und Not konnte sich Walter retten. Am 31. Mai 1733 trat er die Rückreise in Begleitung von Pater Schrevel und 44 Soldaten an. Als man nach 9 Tagen am Ziel war, fand man ein zerstörtes Missionshaus aber keine Weißen mehr vor. Pater Cantova, 8 Spanier, 4 Filipinos und ein Sklave waren niedergemetzelt worden. Damit fanden Missionierung und auch jedwede Zivilisationsbestrebung ein rasches Ende.[1]

Die Inselgruppe ist seit dieser Zeit lange gemieden worden. Erst Lütke suchte sie wieder auf; am 21. Dezember 1828 fand er sie, nachdem sie bereits 1823 von dem Engländer Mackenzie gesehen worden war.[2] In den folgenden Jahren wurde sie vielfach von Händlern und Walfängern besucht, was nicht immer friedlich abging[3]; von ihnen muß u. a. Tetens, der 1865/68 die Insel verschiedentlich besuchte, lobend genannt werden[4], denn er brachte dem Volkstum dieser Insulaner größtes Verständnis entgegen und hat mancherlei beobachtet. Am 27. März 1876 nimmt Miklucho-Maklai kurzen Aufenthalt auf einer der vielen Inseln[5]; er ist für die völkerkundliche Erschließung ebenso belanglos wie die kurzen Besuche vom Bezirksamtmann Senfft am 11. Mai 1901 oder von SMS. »Planet« am 15. April 1907, denn hierbei handelte es sich um ein Studium der Verwüstungen des Taifuns zwecks Hilfeleistung.[6]

Die Hamburger Südsee-Expedition landete am 2. Oktober 1910 Hambruch auf Mogemog, der bis zum 17. Oktober hier blieb, am 13. Oktober besuchten dann noch Sarfert, Hellwig und der 1. Offizier Lorenzen Falalap, wenn auch nur für drei Tage.

II. Geographie.

Name. Wie bereits oben gesagt wurde, ist vermutlich der erste Name, der dieser Inselgruppe von den Weißen zugelegt wurde, »Arrecifes« (s. S. 285) gewesen.[1] Die einheimische Benennung erfuhr das Abendland durch den bereits erwähnten Brief des Pater Clain (1697) mit seinem Bericht über die Antreibung von Feis-Leuten, die u. a. auch die Insel »Lamululutup« (in einem ausführlichen Einzelbericht von einem dieser Insulaner nur »Ulutup« genannt) aufzählten.[2] Bereits wenige Jahre später (1712) finden sich in einigen Reisebeschreibungen der Fahrt des Don Bernardo de Egui y Zabalaga[3] eine ganze Reihe einheimischer Namen einzelner Inseln dieses Atolls aufgezählt, die dann auf Cantova's Karte (1721) in anderer Schreibung wiederkehren (vgl. S. 288[4]). Diese Eingeborenennamen fanden aber noch keinen Anklang, Cantova belegte vielmehr auf seiner Missionsfahrt die als Mogmog bekannte Insel mit dem Namen »Los Dolores« (Namenstag), während die Hauptinsel der Gruppe von ihm den Namen »Isla de los Garbanzos« (Kichererbsen-Insel) erhielt.[5] Später wurde sie nach dem Engländer »Mackenzie« benannt.[6] Alle diese Namen hatten aber nur eine kurze Lebensdauer, erst durch Lütke (1828) wird in den Namenwirrwarr Ordnung gebracht, denn er stellte fest, daß der Archipel Mogemog sei und von den Eingeborenen Ouluthy (th = engl. th) genannt werde.[7] Diese Namen haben sich nun sehr rasch eingebürgert, wenn auch — besonders was den letzteren angeht — in den verschiedensten Schreibungen: Ulithi und Mogmog bei v. Miklucho-Maklay[8], Uli 9i und Uluthy bei Meinicke[9], Uliti, Uluti, Ulussi bei Finsch[10], diese Formen finden

[1] Da die von Meinicke (1888, Bd. II, S. 359/60) dem Spanier Saavedra zugeschriebene Entdeckung von Mogemog zu Unrecht besteht (s. S. 285 Anm. 2), ist oben die Bezeichnung Los Reyes nicht mit aufgeführt worden.

[2] Krämer 1917, S. 15, 27.

[3] Krämer 1917, S. 78, Anm. 2.

[4] Chamisso (bei Kotzebue 1821, III. Bd. S. 102) gibt die Namen des Cantova z. T. in anderer Schreibung wieder; bemerkenswert sind noch die von ihm aufgeführten Inselnamen des Mogemog-Archipels, die er aus dem Munde des Oleai-Mannes Kadu erfuhr.

[5] Krämer 1917 S. 105 und S. 78 Anm. 2. Nach Meinicke ist der Archipel das »Egoy bzw. Garbanzos früherer spanischer Seefahrer« (1888, Bd. II, S. 359/60); diese Angaben hat er wohl Chamisso (bei Kotzebue 1821, III. Bd., S. 102) entnommen.

[6] Meinicke 1888 Bd. II, S. 359/60.

[7] Lutké 1835, Vol. II, S. 306, 308.

[8] v. Miklucho-Maklai 1877, S. 296.

Regierungskarte findet sich dagegen Mogamog. Kubary[1] deutete dieses Wort mit »Pfeilwurz *(arrowroot)*«, einer wichtigen Nährpflanze, die hier besonders reichlich gedeiht. Hambruch erhielt dies von Eingeborenen bestätigt.[2]

[1] Kubary 1895, S. 109.
[2] Thilenius usw. 1927, S. 229.

Karthographie. Der Archipel taucht schon früh auf den Karten auf (Ortelius 1579 und 1589)[1]. Die dem Brief des Pater Cantova beigegebene Karte zeigt bereits eine ganze Reihe von Inseln dieses Archipels[2], eine genauere Aufnahme

Abb. 374. Japanische Regierungskarte des Mogemog-Archipels.

erfolgte aber erst in jüngster Zeit durch die Kolonialmächte (japanische Regierungskarte v. 1925 [s. Abb. 374], Pacific Islands Pilot 1933). Die deutsche Regierung hat sich die Verbesserung der Karte sehr angelegen sein lassen[3]; die Offiziere vom »Peiho«, besonders der 1. Offizier Lorenzen, haben dann den Archipel genau vermessen (Abb. 375).

[1] Krämer 1917, Bd. I, S. 7; vgl. auch S. 3, Anm. 1.
[2] Krämer 1917, Bd. I, Abb. 7.
[3] Vgl. Senfft 1901, S. 826.

Lage und Größe des Archipels ergeben sich aus den folgenden Breiten und Längenangaben:

Quelle	nördl. Breite	östliche Länge
Egui (bei Krämer 1917 Bd. I S. 93)	9° 32′ — 10° 10′	14° — 13° 15′
Lütke (nach Gulick 1862 S. 60) »östl.-Atoll«	10° 6′	139° 47′
d'Urville (nach Gulick 1862 S. 60)		
»Südpunkt der Westgruppe«	9° 47′	139° 35′
»Nordpunkt«	10° 6′	139° 46′
Meinicke (1888 Bd. II S. 359/60) »für Falalap«	10° 2′	139° 50′
Brigham (1900 S. 106, 161)		
»für Mogemog«	10° 6′	139° 45′ 30″
»für Uluthi«	9° 56′	139° 50′
Sievers (1910 Bd. II S. 367) (Die Inseln »freilich nur bis 139° 57′ das Riff aber bis über 140«.)	9° 47′ — 10° 7′	139° 37′ — 140° 4′
Japanische Regierungskarte		
Mogemog	10° 5′	139° 43′
Falalap	10° 1′ 30″	139° 48′

Die **Gliederung** dieser für die Westkarolinen größten Inselgruppe ist durch die vielen flachen Inseln und Inselchen, deren Egui bereits 28 zählte[1] und die langgestreckte gebrochene Form nicht übersichtlich. Dieser ebengenannte spanische Entdecker erfaßt in seinem Diario trotzdem und mit wenigen Worten richtig die eigentümliche, von Sievers[2] treffend mit einem Hammer verglichene Gestalt[3], doch erkannte er nicht, daß der gesamte Archipel aus zwei Atollen, streng genommen sogar aus drei nebeneinander liegenden besteht.[4] Das östlichste Atoll besteht aus dem langgestreckten Riff Zohhoiiyorut und trägt die Inseln Gielap und Jar, während das mittlere kleiner ist, aber drei Inseln Bulubul, Pau und Losiep trägt; beide sind wirtschaftlich ohne jede Bedeutung. Am größten — die Lagune hat in der NS-Richtung eine Länge von »über 30 km«[5] — und unter dem Namen Mogemog bzw. Uluti auch allgemein verstanden ist das westlichste

[3] Krämer 1917, S. 91.
[4] Vgl. Meinicke (1888 Bd. II, S. 359/60), dessen Angaben z. T. auf Tetens und Kubary (1873, S. 56) zurückgehen, ferner Sievers 1910, Bd. II, S. 367.
[5] Sievers 1910, Bd. II, S. 367.

Riff mit etwa 30 Inseln, von denen die japanische Karte die meisten anführte (s. Tabelle). Unter ihnen befinden sich auch die am dichtesten bevölkerten Inseln Mogemog und Falalap, beide sollen nach Meinicke[1] etwa ½ Meile lang sein. Sie haben im Innern sumpfige, dicht mit Gestrüpp bestandene Senkungen, während für die gesamte Insel Falalap ein durchschnittlich 10—12 m hochansteigendes Ufer kennzeichnend ist.[2]

Passagen für größere Schiffe soll es nach Tetens nicht geben, so daß die Fahrzeuge vor dem »brandungsumtosten« Riff ankern oder treiben müssen[3]. Der Pacific Islands Pilot (S. 499/500) nennt jedoch einige gute Passagen: so hat die an der NO-Seite der Mangejang-Insel 9 m Tiefe, ferner führt im SW von Asor der Dowarugui-Kanal und ein weiterer zwischen Eau und Ealil am SW-Teil des Atolls zu guten Ankerplätzen. Der »Peiho« ankerte in der Lagune vor der Piras-Insel bei 34 m Wassertiefe[4]. — Die Namen der Passagen gibt der oben bereits angeführte Mogemog-Kapitän, wie folgt an:

[4] Thilenius 1927, S. 238.

Abb. 375. Nördlicher Teil des Mogemog-Archipels (nach Aufnahme der Offiziere des Expeditionsschiffes „Peiho").

a) (in Abb. 376) Thāuelik
b) Thāū e P'taneras
c) M'thāū
d) Thāū e thūgethik
e) Lügütherōi
f) Thāū i lierō
g) Thāū i liāū.

Taifune haben die Inselgruppe mehrfach (etwa 1869[1]), 10./11. November 1898[2], 1904, 27./28. März 1907[3]) schwer heimgesucht. Die dabei angerichteten Verwüstungen der Palmbestände und die dadurch zu erwartende Knappheit an Nahrung veranlaßte die deutsche Kolonialregierung sogar zur Verpflanzung eines Teiles der Bevölkerung nach anderen Karolineninseln.[4]

Abb. 376. Karte eines Mogemog-Kapitäns von seinem Inselarchipel. (Die in der Karte angegebenen Namen sind Riff-Namen, die Inselnamen s. Liste S. 290, die Buchstaben sind Passagen (s. oben).

Die **Flora** ist im Vergleich zu andern Karolineninseln reichhaltig. Es wurden von Hambruch und Hellwig festgestellt.

magemâg = Manihot utilissima, gedeiht üppig und hat der Inselgruppe den Namen gegeben (s. oben);
komōtiχ o totâl = Süßkartoffel;
eōz = Sumpftaro;
wuldχ = Taroart;
fîle = Taroart;
mâṅ = Brotfruchtbaum;
þâ = Arekapalme;
Pandanus;
eowâdj (He.: *jawât*) = Gurkenbaum mit grüner, weiß gesprenkelter und gerieften Frucht;
lôl = Morinda citrifolia;

[4] Sievers 1910, Bd. II, S. 348.

ittš = Banane;
udwđ (He.: *wdwđ*) = Papaya;
χaūel (He.: *χaūwal*) = strauchartige Bananenart mit birnenartigen, gelbroten Früchten;
dχuss = kleines gelbblühendes Crassulaceenartiges Gewächs;
widewid = Betelpfefferstrauch;
kalavas = Kürbis, wurde vor vielen Jahren aus Yap eingeführt;
(He.) *jiji* = Farnart;
kamardk = Farnart;
Zuckerrohr
lđ = Kokospalme;
Teile der Kokospalme:

Nuß	*lđ*
Rispe	*emiđm*

Fauna. Hambruch gibt folgende Tierarten an:
the i all = fliegender Hund;
labāth = Eidechse;
galūf = Varan;
uđl = Schildkröte; Lütke und v. Kittlitz[1] nennen zwei Arten der Gattung Caretta, eine größere „*oul*", und eine kleinere „*kaf*".
liflf = Schmetterling;
revōl = Fühler;
temdl = Kopf;

poón = Flügel;
χoloχól = Leib;
ldń = Fliege;
thoń = Moskito;
le metherńda = Spinne;
χalép = Krebs;
ńr = Tridacna;
mál = Vogel;
tiirtiir = Ei;
igúl = Schnabel;
pál = Feder;
bothel e mál = Kralle;
úkúr = Schwanz;
pá'ul = Flügel;
tg, td = Fisch;
haraṅap = Schuppen;
tśiltg = Gräte;
tjel = Kiemen;
botól = Schwanzflosse;
ratól = Bauchflosse;
iṅtll = Rückenflosse;
húi = Delphin;
baró = Hai.

Die **Bevölkerung** sitzt nach Tetens[1] auf den Inseln »Mogemog, Falalap, Assur, Fandree, Mongine«. Nach Aussage des oben genannten Kapitäns sind jedoch weit mehr Inseln besiedelt; außer den von Tetens genannten Falalup, Ešur, Mogemog und Mańáń, sind es Lamm, Sorolóń, Tukelüli, Wätavoll, Lothóp und Wasaru. Die größte Bewohnerzahl hat Falalap.

Jahr	Gesamt	Falalap	Mogemog	Quelle

1903	797	?	?	Sievers 1910 Bd. II S. 347.
1914	etwa 700			Finsch 1914 S. 432.
1909	200 Männer 329 Frauen 268 Kinder			
	797		über 100	Hamburger Südsee-Expedition.

Das Überwiegen der Frauen wird nach Sievers auf die Verluste von Männern durch Verschlagungen usw. zurückgeführt.[2]

Eine Verminderung der Kopfzahl trat einmal 1906 ein, als die deutsche Regierung »mehrere hundert Eingeborene« der übervölkerten Inseln Mogemog, Bur, Merir, Sonsol nach Palau und Saipan verpflanzte, und schließlich 1907 durch die Taifunkatastrophe, die den betroffenen Inseln (darunter auch Mogemog) etwa 230 Todesopfer kostete und die zu einer nochmaligen, wenn auch nur vorüber-

[1] Tetens-Steinberg 1889, S. 321.
[2] Sievers 1910, Bd. II, S. 367.

gehenden Verbringung von Insulanern nach Yap führte.[1] Andere Gründe für die Entvölkerung erfährt Hellwig durch eine Frau Sulivên, die in europäischen Diensten weit herumgekommen war und deren Auskunft als zuverlässig gelten kann. Sie gab als Ursachen an: »das Aussterben ganzer Häuser durch eine vor Jahren umgehende Seuche (Husten, Gliederschmerzen, Atemnot, blutige Entleerung, nach 3—4 Tagen tot!), zweitens: die Arbeiteranwerbung, durch die manche nicht wiedergekommen seien und drittens: der Verlust vieler Reisekanus auf See. Es gäbe eine große Zahl männerloser Weiber und viele Kinder ohne Eltern. Die bei richtiger Bewirtschaftung sehr reichlichen Nahrungsmittel der Insel verkamen z. T. durch überwachsenden Busch und die Trägheit der Eingeborenen. Felder von Abwesenden dürften nicht angerührt werden, denn man wisse nicht, ob die Besitzer wieder kämen, und um Felder von Verstorbenen kümmere man sich nicht, weil jedes Haus genügend mit dem Instandhalten der eigenen Pflanzungen zu tun habe.«[2]

III. Demographie.

Anthropologisches (vgl. Taf. 23, 24). Dem Brief des Don Bernardo de Egui y Zabalaga[1] war ein Bericht beigegeben mit einer treffenden Beschreibung der Eingeborenen: »Sie sind von gutem Körperbau, im allgemeinen hochgewachsen, und von starken Leibesumfang[2]; einige haben ein Haar wie Mulatten, andere langes und schlichtes Haar wie Juden.« Diese Angaben werden von Lütke[3] ergänzt, dem der Unterschied »einiger Physiognomien« mit denen von Oleai-Leuten auffiel, sie hatten große und gestülpte *(retroussés)* Nasen und dickere Lippen. Die Hautfarbe fand Tetens der von Yap-Leuten ähnlich, aber »etwas dunkler«.[4] Die Ähnlichkeit mit den Bewohnern von Yap betont auch Miklucho-Maclay.[5]

An **Krankheiten** sind bekannt Frambösie *(ijeldh)*, die sehr verbreitet und sehr ansteckend ist, Rheumatismus *(ddth)*, Influenza *(misiliplg)*, die durch Schiffe eingeschleppt wird, Ringwurm *(faguthlr)*, Schwären *(marägäs)*, Pocken *(methindh)*, Pusteln *(rüb)*, Schuppenringwurm *(gilthebö)*, Dysenterie *(pogothä)* wurde von Yap eingeschleppt, Auszehrung (Tuberkulose?, *thli'omerlü)*, Elephantiasis *(methulöp)*, Durchfall *(thär)*, Verstopfung *(pildd)*, Schnupfen *(manerö th)*, Augenentzündung *(djodjll i matäl)*, Zahnschmerz *(uarex e ni)*.

Psychologisches. Die Eingeborenen fielen dem ersten Entdecker Egui durch ihre Lebensfreude auf[1] und auch auf Lütke machten sie einen liebenswürdigen und anständigen Eindruck[2]: jeder Eingeborene suchte sich aus dem Kreis der

[1] Nach Krämer 1917, S. 79.
[2] Lutké 1835, Vol. II, S. 309.

Europäer seinen besonderen Freund und schloß diesen Freundesbund durch Ineinanderfassen seiner Hände mit denen des Weißen. Das gleiche Urteil gewannen hundert Jahre später auch die Mitglieder der Hamburger Südsee-Expedition[1]. — Wie ganz anders schildert dagegen Tetens die Leute, einmal als »kriegerisch gesinnte, hinterlistige Menschen«, das andere Mal als »wohl friedfertige, aber sehr falsche Menschen«[2]. Dieses Urteil ist zu subjektiv und erklärt sich wohl aus der Behandlung, die der von Tetens eingesetzte Händler auf der Gruppe erfahren hatte.

An Fleiß und Intelligenz werden sie von den Yap-Leuten übertroffen[3], Hellwig fand sie faul, Hambruch ist in seinem Urteil vorsichtiger; er hatte den Eindruck, daß den Eingeborenen Essen, Trinken, Schlafen sehr am Herzen liegt und sie für die Arbeit nur schwer zu haben sind. Selbst zu den kleinsten Handreichungen bedurfte es wiederholter Aufmunterung. Nur wenn ihnen ein nach ihrer Auffassung großes Geschenk winkte, beeilten sie sich und gehorchten sogleich. Sie scheuten selbst regelmäßige körperliche Arbeiten für sich selbst. Die Männer machten gelegentlich Flickarbeiten am Haus und Boot; die Frauen sorgten für die Küche oder bereiteten Hibiscus- oder Bananenbast zum Weben vor oder webten gar, wenn sie nicht gerade Neigung zu einer Siesta hatten.

Von Wahrheitsliebe sind sie nicht durchdrungen, wiederholt konnte Hambruch feststellen, daß sie Dinge ableugneten, die sie später, nach Kreuzfragen überführt, doch zugaben. Ein verlegenes Lächeln diente dann als Entschuldigung.

Für manche Dinge hatten sie keine Begriffsordnung. Der Zweck von Übersetzungen, die Angabe von Namen wollte ihnen nicht einleuchten. Vor dem weißen Mann, namentlich vor der regierenden Gewalt (Amtmann in Yāp) hatten sie große Angst. Anordnungen des Amtmannes wurden strikt befolgt, da sie glaubten, daß er sie von Yap aus kontrollieren könne. Die Mitglieder der Expedition galten gleichfalls als Respektspersonen. Jeder Wunsch wurde ausgeführt, nur durfte man nicht allzusehr auf Schnelligkeit der Ausführung dringen. — Gegen völlig fremde Dinge (Phonograph) verhielten sie sich entgegenkommend. Gern lauschten sie den *sloköm e djérmanə* (Tänze der Deutschen) und konnten sich nicht genug daran tun, immer wieder in den Phonographen hineinzusingen und das Gesungene wiederzuhören. Die Militärmusik interessierte sie wenig, die menschliche Stimme, der Gesang, zog sie an. Unbändiges Gelächter erscholl, wenn der Refrain eines erotischen Liedes mit großer Deutlichkeit aus der Maschine wiederhallte. Geheimnisvoll war es ihnen, als sie die Stimme des seit Jahren abwesenden Rúx e liól aus Falalap hörten. Den Phonographen hielten sie für einen großen Zauber.

---

2: Damm et al. OR21 Woleai

Für das Photographieren waren sie sehr zu haben; sie hielten trefflich still und zeigten nicht die geringste Angst. Eine Ausnahme machten die Frauen, die infolge übler Erfahrungen mit den Weißen zurückhaltender waren. Was sie den Weißen erläutern konnten, taten sie gern zumal die Knaben, die schon rege beim Fischfang, Sammeln von Muscheln und Schnecken und dergleichen mithalfen.

Als die Eingeborenen den Zweck der Expedition begriffen hatten, stellten sie sich von selber ein. Der alte Ufr und die Häuptlingsstellvertreterin Xáthàc kamen als ständige Gäste bereits morgens um 9 Uhr und blieben bis ½13 Uhr, um sich dann um 14 Uhr wieder einzufinden und bis 18 Uhr auszuharren. Alles, was Hambruch wissen wollte, mußte einzeln erfragt werden; unaufgefordert teilte niemand etwas mit. Um die kleinsten Dinge befragte man sich gegenseitig, um auf jeden Fall die richtige Auskunft zu geben. Häufig genug wichen sie dabei vom Thema ab und berichteten plötzlich über eine ganz andere Sache. — Alte Erzählungen zu erfahren, war ganz unmöglich. Die beiden Gewährsleute waren zu alt: »Wir haben zuviel im Kopf und wissen es nicht mehr! Die Leute in Yap wissen alles!« bekam Hambruch immer wieder zu hören. Hambruch glaubt wohl nicht mit Unrecht, daß die Mitwirkung des Yap-Mannes als Dolmetscher hinderlich war; die Leute wagten in seiner Gegenwart einfach nicht, aus sich herauszugehen. Die jungen Leute wußten gar nichts, hörten aber gern den Berichten der Alten zu.

Eine gewisse Lernbegier kann man der Jugend nicht absprechen. Die beiden Männer Oliefén und Elañumár kamen häufig und ließen sich deutsche Wörter sagen, letzterer wäre am liebsten mit nach Deutschland gegangen. Ein anderer Eingeborener namens Sebón von Falalap fuhr, nachdem er einmal begriffen hatte, was Hambruch wollte, in der Gruppe umher und brachte die Ethnologika zusammen. Bei diesem Wissensdurst war die Jugend nach unseren Begriffen oft reichlich zudringlich und unverschämt. Hambruch's Essen wurde eingehend geprüft, berochen; die leeren Konservendosen, Flaschen usw. auf ihren Inhalt hin untersucht, gern sahen sie sich Bilder aus Deutschland an, zumal Häuser und Schiffe. Alles, was der Weiße hatte, galt als *mámáß* = gut, schön, während sie von ihrem Eigenbesitz (Haus, Nahrung usw.) behaupteten, er sei *tánhŏf* = schlecht. Ob das eine Art Höflichkeit war, konnte Hambruch nicht feststellen.

Die Eltern sind gegen die Kinder sehr streng; sie verlangen unbedingten Gehorsam. Die Kinder zeigen auch große Ehrfurcht den Erwachsenen gegenüber. Trotzdem ist das Erinnerungsvermögen der Insulaner nicht besonders groß, sie können sich nur auf die dritte bzw. vierte Familiengeneration besinnen.

Was an Überlieferungen vorhanden ist, wird von Mund zu Mund weitergetragen, ohne Bild, ohne irgendwelche Anhaltspunkte. Im übrigen bildeten das Männerhaus und die Bluthäuser die Klatschbörse. Abends machte man sich gegenseitig Besuche. Nach dem Essen, das kurz nach Sonnenuntergang eingenommen wurde, legte man sich ein wenig schlafen und begab sich darauf zum

Tanz nach Fariöu. Dort hielt man bis 2 Uhr morgens aus und legte sich erst dann endgültig schlafen. Um 9 Uhr standen die ersten auf, doch lag nicht selten noch um 12 Uhr eine große Anzahl von Erwachsenen im Männerhaus oder in den Familienhäusern im tiefsten Schlummer.

Groß ist die Liebe zur Heimat und die Anhänglichkeit zueinander. Wie oft fragten die Leute in Palau nach unserm Abfahrtstermin (um dann doch in Yap bleiben zu müssen), wie oft mußte Hambruch in Mogemog von den in Yap angetriebenen Landsleuten berichten.

In manchen Benennungen von Pflanzenteilen sind sie arm; das meiste hat den gleichen oder keinen Namen.

Schamgefühl ist den Eingeborenen nicht abzusprechen. Ist man in geschlechtlichen Dingen auch wenig zurückhaltend, so wird man doch nie im Gespräch die Namen der Geschlechtsteile nennen, das geschieht nur im Flüsterton. Ist ein Vertreter des andern Geschlechts anwesend, so spricht man überhaupt nicht davon. — Diebstahl gibt es nicht, Hambruch konnte alles offen und ohne Aufsicht herumliegen lassen, es wurde nicht das Geringste weggenommen.

Unternehmungsgeist ist vorhanden und entspringt in der Hauptsache religiösen und kultischen Beweggründen; dagegen fehlt Mut und Tapferkeit.

302

Spezieller Teil.

I. Körperpflege und Tracht, Schmuck und Kleidung.

Körperpflege. Die Eingeborenen sehen auf Reinlichkeit und baden sich täglich. Auch bei der Verrichtung ihrer Notdurft sind sie sehr sauber; sie suchen zu diesem Zweck den Lagunenstrand auf.

Das Haar tragen Männer und Frauen gewöhnlich lang, vereinzelt haben es die Männer auch in einen Knoten gebunden, wie das bereits de Egui beschreibt.[1] Lütke bestätigt dies, sah aber auch Eingeborene mit zwei Büscheln an den Seiten.[2] Die Seltenheit dieser Haartracht deutet darauf hin, daß sie jetzt nicht mehr so beliebt wie früher ist. Das gleiche scheint für die Barttracht zuzutreffen, nach de Egui trugen sie den Bart »sehr lang und dicht«[3], was nach den Abb. der Taf. 23 nicht gesagt werden kann.

Rote Gesichtsbemalung war nicht selten.[4]

Die **Tatauierung** (*/ällu* = tatauieren) der Insulaner wird von den ersten Reisenden zwar erwähnt, aber nicht in ihrer Reichhaltigkeit erkannt[5]. Lütke meint,[6] die Tatauierung von Mogemog sei die gleiche wie auf Oleai.

Einzelne Muster hat Krämer bereits bei einem früheren Aufenthalt auf der Gruppe 1906 festgehalten. Der Halskragen ist in der Anordnung der Muster wie beim Sorol-Mann Deidock, ja einzelne Elemente kehren darin wieder:

Mogemog	Sorol
valetõl	*falodõl*
volumäravat	
valudz	*udz.*

Ebenso findet sich das breite Rückenmuster (auf Sorol wõl genannt) als *dlep* wieder, das auch auf den Oberschenkeln wiederkehrt (Sorol: *kdb*). Das eigentümlich lang gezackte Ornament an Brust und Seiten treffen wir gleichfalls bei

[1] Bei Krämer 1917, S. 79.
[2] Bei Krämer 1917, S. 79.
[3] Totens-Steinberg 1889, S. 321.
[4] Lutké 1835, Vol. II, S. 310; vgl. auch Atlas Taf. 25.
[5] Thilenius 1927, S. 237.
[6] Lutké 1835, Vol. II, S. 310.

Männern an. Bei Frauen skizzierte A. Kr. eine Tatauierung des Unterschenkels und Unterarmes, die dem *bagelibdā* von Sorol ähnelt. Der Oberschenkel war durch Fischmuster (Kr.: *fāfil*) verziert (Abb. 377). Bemerkenswert ist ferner, daß am Oberarm der Männer das gleiche Kreuzmuster *(laŋasīse)* auftritt wie auf Oleai.

Nach Hambruch's Feststellungen stammen die Muster der Frauentatauierung von Feis und die der Männer aus den Yap-Dörfern Nûlu, Gatšepâr, Oneân, Rikên, Lên, Livinâu, Têb, Mêrur. Der Mogemog-Mann Rathêl brachte diese Kunst in alter Zeit aus Yap mit. Die Mogemog-Tatauierer verstanden ihr Handwerk so gut, daß sich selbst die Yap-Häuptlinge von ihnen tatauieren ließen.[1] — 1909 wurde die Tatauierung noch von dem Mann Moxalôel auf Falalap ausgeführt, desgleichen von Têso, dem besten Künstler auf Yap. Die Frauen werden von einer Frau gemustert.

377

380

378

379

Abb. 377. Frauen-Tatauierung (nach Skizze Krämer). — Abb. 378 und 379. Tatauierkämme (Hamburg 611 bzw. 3275[II], ½ nat. Gr.). — Abb. 380. Tatauierhammer (Hamburg 3293[II], Lge. 30 cm).

Tatauieren lassen kann sich jeder, wenn er nur in der Lage ist, das Honorar zu bezahlen. Jedes Muster hat seinen bestimmten Preis, gezahlt wird in *rêi-*

[1] Krämer 1908, S. 174.

Abb. 381. Ohrschmuck (Hamburg 5233II; 1/2 nat. Gr.). — Abb. 382. Halskette aus Kokosperlen (Hamburg 5294II; Lge. 70 cm). — Abb. 383. Halskette aus Schildpatt-, Kokos- und Spondylusscheiben (Hamburg 5169II, Lge. 46 cm). — Abb. 384, 385. Halsschmuck mit Flossenknochen des Tümmler (Hamburg 5120II, 5136II, 1/4 nat. Gr.). — Abb. 386. Halskette mit Fischhaken (Hamburg 5166II, Lge. 45 cm). — Abb. 387. Armring aus Schildpatt (Hamburg 5180II, Durchm. 5 1/2 cm). — Abb. 388. Armring aus Kokosnuß (Hamburg 5090II, 1/2 nat. Gr.). — Abb. 389—391. Verschiedene Herstellungsstadien eines Schurzes (Hamburg 52708, 5270, 5279, 1/4 nat. Gr.). — Abb. 392. Gürtel aus Kokos- und Conus-Scheiben (Hamburg 5236II, Lge. 30 cm).

Farbe, Kleidmatten, Armringen, Frauengürteln u. a. Da jede Zeichnung dreimal(!) geklopft werden muß, benötigt der Künstler für ein vollständiges Muster etwa ein bis drei Monate, nur sehr kräftige Personen können diese Operation in kürzerer Zeit überstehen. — Der Tatauierkamm *(thallt*, He.: *alkd)* ist aus einem Fregattvogelflügel-Knochen und vier- bis sechszackig, der Hammer ist aus *xâni*-Holz (Abb. 378—380)[1]. Die Farbe *(wölloth)* wird in Kokosschalen aus dem Ruß verbrannter Calophyllum-Nüsse gewonnen und in Kokosschalen angerührt.

Schmuckgegenstände gab es nicht in der reichen Auswahl wie auf den Zentral-Karolinen; viel soll von Yap eingeführt sein. Beliebt waren dagegen Blumenschmuck[2] und Bänder aus mit Curcuma gefärbten Blattstreifen[3]. — Haarschmuck. Kämme (He.: *makdl)* aus zusammengebundenen Kokosfiederrippen (He.: *loχ)* sind häufig[4], doch kommen auch die bekannten gepflockten Holzkämme vor (s. Taf. 23). — Jüngere Männer und Frauen tragen im Haar gern Kränze[5] (He.: *uliaĕ)* von einem eispflanzenähnlichen Unkraut *(dkuxuss)* oder eingeknotete Bänder *(mâr el ue tšêm)* aus jungen Kokosblattfiedern (s. Taf. 23, 24).

Ohrschmuck (He.: *fufu)* gibt es in verschiedener Form: a) *čle talinâ* ist das bekannte Ohrgehänge aus Schildpatt *(wodtsch)* und Muschelringen *(falêrpe)*[6]. — b) aus einem Schildpattring mit Muschel- und Kokosscheibenkettchen, daran Anhängsel von roter Spondylus *(felêrpök)*[7] — c) dasselbe, jedoch als Anhänger Stücke der perlmutterähnlichen glänzenden *sârr*-Muschel (Abb. 381).

Halsschmuck. a) *mârremarr:* Kette aus großen Kokosscheibchen[8]. — b) *mârre dâxax:* Kette aus großen Kokosperlen[9] (Abb. 382). — c) *mârrelt:* Kette aus weißen Konusscheiben *(rassêlesâl)* und schwarzen Kokosscheiben *(daxâx)* wie auf Ifaluk. — d) *lamulâx:* Faserschnur mit roten Spondylusscheibchen, wird nach Hellwig von Oleai eingehandelt. — e) *mârreč:* Kette aus Schildpatt- und Kokosscheibchen, dazwischen Spondylusscheiben und zwei Blänker als Verschlußstück (Abb. 383). — f) *roropôk* ist ein eigentümlicher Hals- und Rückenschmuck aus den Flossenknochen des Tümmler (He.: *čile hâi)*, an jedem Knochen sind zwei Blattknoten angebracht. Der Schmuck wird so getragen, daß ein Knochen auf der Brust und einer auf dem Rücken hängt (Abb. 384); eine davon abweichende Form zeigt Abb. 385.

Abb. 393. Brustschmuck (Hamburg 5106II, 1/3 nat. Gr.).

Brustschmuck. a) *marêm:* Brustschmuck aus Schildpatt *(wodt*, Abb. 393). — b) *lâgeldge:* Brustschmuck in Form eines breiten Schildpattringes[10]. — c) Ungewöhnlich

[10] Museum Hamburg 5078, 5104, 5105, 5121.

ist ein Brustschmuck aus Schildpatthaken an einer Kokosscheiben-Kette, der angeblich aus Yap stammen soll (Abb. 386).[1]

Armringe *(lagél, lagáč)*: a) aus Schildpatt, hoch und gerippt[2] oder flach (Abb. 387); — b) aus Kokosschale (Abb. 388)[3] glatt und auch gerillt[4]; — c) aus Trochus *(oxôx)*[5]; — d) aus jungen Kokosblattfiedern.

Abb. 394. Beinring aus einem Kokosblattstreifen (Hamburg 5248[11], 1/2 nat. Gr.).

Fingerringe *(milaxât daxâx)* aus Kokosschale.[6]

Beinschmuck sind mit *rên* gefärbte junge Kokosblattfiedern *(moâd)*, die um Waden und Fußgelenk gebunden (Abb. 394) und *potštš* genannt werden; selten sind sie aus gezwirntem Männerhaar (s. Taf. 24).[7]

Kleidung. Männer und Frauen sind bekleidet, nur die kleinen Kinder laufen nackend umher. Das männliche Geschlecht trägt eine aus feiner Bananenfaser gewebte Matte in der bekannten T-Form um die Lenden gebunden. Die Matte wird zu diesem Zweck schmal zusammengelegt, so daß die oft in Zierknoten verschlungenen Fransen vorn herabhängen (Taf. 24). Diese Lendenmatte wird *gultš* genannt und den Knaben angelegt, sobald sie Palmen erklettern können. Dieses Ereignis wird durch ein besonderes Essen gefeiert.

Das weibliche Geschlecht ist in den ersten Lebensjahren unbekleidet, erhält aber gar bald einen Schurz *(šš/*, He.: *šire šir*[8], Abb. 389—391 zeigen verschiedene Herstellungsstadien, vgl. auch Taf. 32) aus getrockneten, fein geschlitzten Fiedern des Kokoswedels, die zu einem langen unteren und einem kürzeren oberen Fransenbehang angeordnet sind. Mit Eintritt der ersten Mensis legen die Mädchen die breite, zumeist aus Hibiscusbast gewebte und gemusterte Matte *(bêgi)* an[9]. Dieser Tag *išêdjix* genannt, wird durch ein besonderes Essen (Fisch, Kokosnuß, auch Brotfrucht und Papaya), das kräftigen soll, im Kreise der engeren Familie feierlich begangen. Die Matte wird so getragen, daß die Zierstreifen horizontal liegen. Eine Kokosschnur *(xoroxôr)* hält das Kleid fest (vgl. Taf. 24).

Außer dieser bereits genannten Kokosschnur werden über der Kleidmatte mitunter noch Ziergürtel getragen: a) häufig ist ein solcher, *teretlr* genannt, aus jungen Kokosblattfiedern, — b) *wšl*[10] wie Sorol Abb. 302, — c) *tarrâc*, auch *dardâ*: aus Menschenhaar *(čêm)* gezwirnt (wie auf Ifaluk[11]) oder aus Bananenfasern

gedreht[1], — d) *fil:* mehrsträhnige Ketten aus Kokos- und Conusscheiben mit Schildpattstegen (Abb. 390) sind jetzt selten[2], obgleich Mogemog als Fabrikationszentrum ehedem eine Rolle spielte[3]. Nach Angaben der Frau Sulivên, die Hellwig's »Mittelsmann« war, besitzt jetzt jede Frau einen solchen Gürtel, die zumeist aus Ngulu stammen.[4] Sie wurden bereits von de Egui erwähnt.[5] — e) sehr breite Gürtel aus Kokosperlen von über zwanzig Strähnen mit doppelten Holzstegen wahrscheinlich aus Truk stammend.[6]

Auf dem Meer wird der runde Spitzhut[7] *(parên, parropârr)* aus zusammengenähten Pandanusblattstreifen getragen; er ist teilweise durch aufgeheftete Schildpattplättchen verziert und mit einem Halteband *(eôl)* aus Kokosschnur versehen. — Der sonst gebräuchliche Umhang aus Hibiscusfasern *(ricôt)* ist unbekannt. — Bei Hitze fächelt man sich mit einem geflochtenen Fächer Kühlung zu und um vertreibt damit die lästigen Fliegen.

308

II. Die Nahrungsquellen und ihre Ausnutzung.

Landbau. Die Anlage der Pflanzungen geschieht ohne bestimmte Ordnung. Hellwig schreibt darüber[1]: ».... das Innere der Insel, welches aus einer hier und da sumpfigen Senkung besteht, deren Busch überall mit kleinen, unregelmäßigen Pflanzungen von Sumpftaro, Bananen, Süßkartoffeln und Zuckerrohr durchsetzt eines gewissen landschaftlichen Reizes nicht entbehrt. Dazwischen stehen die Kokospalmen verschiedensten Alters zahlreich, viele mit vollem Behang von kleinen, runden Nüssen und eine .....Art mit länglichen.« — Zum Feldbau der wichtigsten Früchte macht Hambruch folgende Angaben:

1. Süßkartoffeln *(kamôti)*. Der Yap-Mann Gilemoon aus Gatschebar brachte diese Frucht nach Mogemog. — Die Frucht wird von der Frau, mitunter auch vom Mann (wenn er Lust dazu hat), in Stecklingen *(rôl e kamôti)* ausgepflanzt, wozu eine »Schildkrothacke« (Abb. 395) benutzt worden sein soll. Die Auspflanzung erfolgt zwar wahllos in Beeten *(matôli e kamôti)*, doch liegen diese ihrerseits in regelmäßig angeordneten Feldern. Der Steckling wird in seinem unteren Ende zusammengerollt, dann in das vorbereitete Pflanzloch *(lûuʃ)* gelegt und mit Erde bedeckt *(theuêle vâ)*; dann überläßt man die Pflanze sich selbst. Nach drei Monaten kann man bereits ernten. Zum Ausgraben der Knollen benutzt man ein spatenähnliches Holz *(ʃathêl*, s. Abb. 396). Diese Feldfrucht ist sehr geschätzt, denn sie reift nicht nur rasch, sondern läßt sich auch zu jeder Zeit pflanzen.

2. Taro; es gibt zwei Sorten, den Sumpftaro *(eôtš)* und den Bergtaro *(ʃile)*; letzterer ist das Hauptnahrungsmittel. — a) Den Sumpftaro brachte vor etwa 70 Jahren (von 1909 an zurückgerechnet) ein Mann namens Mâuêl aus Umun. Die Pflanze kann nur dort gedeihen, wo genug Brakwasser vorhanden ist, wie z. B. in den sumpfigen Senkungen im Inselinnern. Das erklärt auch die unregelmäßige Anpflanzung. Nicht jeder Eingeborene besitzt Sumpftaro-Pflanzungen. Um den Anbau dieser Feldfrucht kümmern sich neben den Frauen auch alte Männer. Das Pflanzen der Stecklinge (abschneiden = *udre)* erfolgt am frühen Morgen. Frauen, die vorher geschlechtlichen Verkehr gehabt haben, können dabei nicht mithelfen, da sonst der Taro nicht gedeihen würde. Gedüngt wird mit frischen und verwelkten Blättern. Nach drei Monaten ist die Knolle des Stecklings so groß wie

[1] Thilenius 1927, S. 237.

ein Fingernagel, nach etwa 8 Monaten kann geerntet werden. Das Stechen *(kothôu)* erfolgt mit einem zugespitzten Holz, dem Grabstock *(chôth*, Abb. 397).

b) Vom Bergtaro kennt man drei Arten: *moldi, pâdle, file e Aurepik*. Während letzterer vor etwa 50 Jahren (von 1909 an zurückgerechnet) von dem Mann Logalâisâm aus Feis in Mogemog eingeführt wurde, sind die beiden anderen Sorten alteinheimisch. — Für den Bergtaro sorgen Männer und Frauen in gleicher Weise. Die Anpflanzung geschieht wahllos, die Behandlung ist die gleiche wie beim Sumpftaro. Allerdings gedeiht der *file* wesentlich langsamer, wenn seine Knollen auch bereits mit fünf Monaten genießbar sind, so läßt man ihn doch gern jahrelang (!) wachsen, um möglichst große Knollen zu erzielen. Zu den Tanzfesten ist der *file* als Festspeise sehr begehrt.

Von einer geregelten Pflege der Pflanzungen kann nicht gesprochen werden. Felder von Abwesenden dürfen überhaupt nicht angerührt werden und um solche von Verstorbenen kümmert man sich gar nicht. Die Witwen müssen die Kokosnüsse auflesen, da die jungen Männer keine für sie herunterholen.[1]

397. 395a. 395. 396.

Abb. 395. Schildkrot-Hacke (Hamburg 5234II, ¼ nat. Gr.); a = Hackenblatt von vorn gesehen. — Abb. 396. Holzspaten (Hamburg 5151II, Lge. 83 ½ cm). — Abb. 397. Grabstock (Hamburg 159II, Lge. 109 cm).

Landbesitz. Das Land ist in kleine Hufen *(a watšlîš e thêu)*, meist Tarofelder, und in große Hufen *(a pallû e thêu)*, die mit Palmen und Papaya durchsetzt sind, eingeteilt. Die Kinder erhalten die Plätze (Hufen) der Eltern zugewiesen und zwar entsprechend der Fürsorge, die sie den Eltern zuteil werden ließen. Wer seine Eltern gut versorgt, erhält auch viel Land, die andern wenig oder gar keines. Die Mädchen erhalten die Plätze der Mutter; sind keine männlichen Anverwandten da, so erhält der Bruder das Land.

[1] Thilenius usw. 1927, S. 236.

Besondere Merkzeichen gibt es für die einzelnen Landstücke nicht; jeder kennt sich darin aus. — Bei der Heirat wird den Ehepartnern Land von den Eltern überwiesen.

Die Verteilung des Landes auf Mogemog war nach Hambruch folgende:

Besitzer	Namen der kleinen Plätze	Namen der großen Plätze
Thāūulū (ein Knabe)	*haōelēdṅ, djdlemār, lūg e lümelūe, u'tēitēi, malagdle fāth*	*luōl*
Tahilumār (ein Mann)	*alithēū*	—
Tahilumār[1] (ein Knabe)	*mdth e gilufēi u mdṅ, mdth e gīl e to fāth, fōge fdṅ, tuōt, fāthirūi*	*djdl ü lūl, lūg e luōl,*
Ejóṅumār (ein Mann)	*rōt, pdiid, molōχ*	zwei *fdl e udl*
Xaūí (ein Mann)	*taūōt, limdt, apelilm*	*fariōu*
Falüerü (ein Knabe)	zwei *lug e luōl, limdt, ta boχdb*	zwei *theleudl*
Ulumódj (ein Mann)	*olumórtš, fāthürūlüs, e pāiilm, luōl,*	*pale e pardṅ, ta boχdb*
Ufr (ein Mann)	*lug e luōl, ta vurdb*	*ulm e lūχ, fdli e lūχ*
Xathāχ (Häuptlingstochter)	*le bāth, udle uōl, djōlu mūl*	*ta bordχ, fdl ū mēi, fdl i logdūēl, hapelilm*
Lāūb (eine Frau)	*taboχdb, lūg e luōl*	*hapelilm*
Oliefēṅ (ein Mann)	*fdl u rdl, uliesōr, magelitūr,* zwei *lūg e luōl, thaludl*	*tha pēuūl, ulewuṅewūṅ*
Talfṅ (ein Mann)	*fdl u lūwe, molōχ, fdl u dl, thūlūs, ūll methdχ, watšltš, mdl a qūl e to fāth, le mūt, to bordχ*	*ull methdχ palfṅ, mār o χōia*
Eāṅ (ein Mann)	*ulumótš, fāthürūlüs, baiejēṅ, luōl*	*alü e pardṅ, ta bordχ*
Tarātš	*fdl i lūe, ta bordχ, ta buōt, lorit,*	*fdl i lo χaūēl*

[1] Sein Besitz wurde Hambruch durch Erwachsene bezeichnet.

Besitzer	Namen der kleinen Plätze	Namen der großen Plätze
(ein Mann)	*elolâl, fâthürâlüs, mallñeltuwôl, odjêl, χapilzûñ, le pâth, lurôr*	
Pôl e mêi (ein Knabe)	*ull le metâχ, ullindt, siloudl, ta borâχ, elolâl, fariôu.*	*fâthînеχ*

Den **Fischfang** lernten die Eingeborenen von Yoñelâp (s. Religion). Das trug sich folgendermaßen zu: Der Mogemog-Mann Thâûumâl schlief im großen Haus, da schickte Yoñelâp den Geist Xâûk zu ihm, der sagte: »Ich will Dir sagen, wie man einen Fischhaken anfertigt und damit einen Fisch fängt. Wenn Du es nicht tust, kommt ein Taifun und zerstört alles, wenn Du aber tust, was ich Dir sage, dann wirst Du viele Fische fangen und Mogemog wird ein berühmter Platz werden!« Thâûumâl gab die Kenntnis seinen Leuten weiter, die nun Boote bauten und Fischhaken machten.

Abb. 398. Angelhaken aus Schildpatt (Hamburg 5205[II], ½ nat. Gr.).

Von den Fischen werden vorwiegend Hornhecht *(thâk)*, Bonito *(edl)*, fliegender Fisch *(mañâr)* und *ethâl* gefangen, der Hai *(bâxo)* wird seltener gefangen. Von Muscheln wird die *thâth* genannte Art (Barbatia fusca)[1] gegessen. — Zum Anlocken der Fische wird zerkaute Kokosnuß genommen.

a) Fang mit Speeren, die zumeist aus Yap stammen sollen, ist üblich.[2]

b) Angelfang (Angel[3] = *bâlu*, Bambusstock = *bâlu* [bis 4 m lang]). — 1. mit flachen Schildpatthaken *(kâûulâl*, He.: *zawûth*, Abb. 398[4]), wird für jeden Fisch gebraucht. Diese Haken sind heute selten und durch zurecht geklopfte und gefeilte Eisendrahthaken ersetzt worden. Die Anfertigung eines solchen beschreibt Hellwig anschaulich im Schiffstagebuch;[5] — 2. mit zusammengesetzten Haken *(pâ)*[6] von der bekannten Form (wie Ifaluk Abb. 92); die Einzelteile heißen:

Hibiscusschnur = *ôll e pâ* (He.: *ôllewâu*)
Blänker aus Meleagrina = *pâ* (He.: *bâ, poâ*)
Haken aus Schildpatt = *matal e pâ*
Fliege aus Fregattvogelfedern = *botjêl e poâ* (He.: *uxûl e pâ*).

Diese Haken werden nicht mehr gebraucht, alte Blänker werden als Schmuckstücke getragen; — 3. *kâi* ist ein einfacher Haken, der früher aus Holz gefertigt

[1] Nach Bestimmung durch das Zoologische Staatsinstitut in Hamburg.

2: Damm et al. OR21 Woleai

wurde, jetzt aus einem gebogenen Stück Eisen[1] besteht; an der Bindestelle der Angelschnur sind Kokosblattfiedern befestigt (Abb. 399); er wurde zum Fang vor dem Riff für Hai und einen *eḍḍ* genannten Fisch genommen.

c) Fang mit Netzen: 1. *ʃâl*: Senknetz in der gleichen Form wie auf den SW.-Karolinen.[2] Der Bügel *(châthêl e ʃâl)* besteht an dem von Hambruch gesammelten Stück bereits aus Eisendraht, darüber ist eine Schnur mit Schlinge für den Köderfisch gespannt. Das Netz *(ʃâl)* ist aus Kokosschnur, der Senker *(vâs)* ist ein Korallenstein; — 2. *ârrom*: Dieser Käscher (vgl. Taf. 20)[3]. wird zum Fang des fliegenden Fisches verwendet (Rahmen = *xapêr*, Griff = *capilapêr)*. Der Fang wird vom großen Boot *(uothêl)* aus getätigt und zwar in jedem Monat einmal. Es werden dann aus trockenen Palmblattwedeln etwa 50 Fackeln *(thâl)* gemacht. Mit Sonnenuntergang gehen die Boote in die Passage, dann werden die Fackeln angezündet und zwar stets drei, eine für vorn, achtern und mittschiffs. Die auf das Licht zufliegenden Fische werden mit dem Netz gehascht. Auf diese Weise werden mitunter bis zu 200 Fische bei einer Ausfahrt gefangen; — 3. *âg:* großes Schleppnetz.

Abb. 399. Haihaken (nach Skizze Hambruch).

d) Fang mit Reusen 1. *ûlâm*[4] für kleine *mečâl*-Fische. Eine gute Abb. befindet sich bei Damm und Sarfert 1935 Taf. 14 Abb. 3; — 2. große Reuse wie auf Polowat (s. auch Taf. 20).[5]

Zeremonielle Handlungen sind in Verbindung mit dem Fischen selten geworden. Es werden beim Erscheinen von Fischschwärmen Tänze veranstaltet und Zaubersprüche an Yoneláp, dem Herrn der Fische, gerichtet. Männer und Frauen schmücken sich mit Bändern von jungen Kokosblattfiedern und sagen den folgenden Spruch her:

Thimelê elâth thewarêtharûi	Komm hierher, wir rufen Dich!
Thewêragûm marêl	Wir winden die Blütenkränze für Dein Haupt.
Â ʃethîjagêr thalâp	Komm und schau Dir Dein Land an!
Thâmelijelî elôx	Alle freuen sich, daß die Fische wieder erscheinen
Ajelü pethî pamêm	Wir freuen uns sehr darüber (wörtlich: unsere Magen sind gut)
Ija šoûr!	Hier ist ein guter Platz!

[4] Museum Hamburg 5122, 5250.
[5] Damm und Sarfert 1935, Abb. 120, S. 53.

Die Zubereitung der Nahrung ist Sache der Frauen, auch während der Schwangerschaft. Im Kochhaus sind die **Herdstellen:** entweder wird über dem offenen Feuer in irdenen Töpfen *(rāūā)*, die aus Yap (Gitâm) eingeführt werden oder in Cassis-Schneckengehäusen *(mêâl)* gekocht, während zum Dünsten der Speisen der Erdofen *(âm)* dient. Es wird eine Grube *(liâp)* ausgehoben und mit Brennholz angefüllt. Dieses wird angezündet und in diesem Feuer werden Kochsteine *(fath el âm)* erhitzt. Auf die auseinander geharkten heißen Steine kommt eine Blattlage *(âf)* und auf diese das in Blätter eingeschlagene Essen. Darauf werden Blätter und Matten gelegt und das Ganze wird noch mit Steinen beschwert.

Das **Feuer** *(jâf)* wird gebohrt. Der Feuerbohrer heißt *pâṅal*; Bohrstab = *uâl*, der liegende Stab = *ithlth*, das Bohrloch = *lâl*. Man kniet auf der Unterlage. Das Feuerschlagen *(talôdji)* lernte man auf Yap kennen. Feuerstein = *patšš*, Feuerstahl = *parâṅ*, Rauch = *wurâx*, Asche = *palaṅôl*, Flamme = *thawuôl*. Feuerholzbüchsen *(xūluxûl)* sind aus Bambus[1]; geflochtene Feuerfächer[2] *(rūpô)* sind im Gebrauch.

Küchengeräte. a) Schaber, Kratzer, Reiber: 1. *jârr:* Schaber aus Meleagrina, zum Ausschaben der Kokosnüsse;[3] — 2. *kâth:* Taroschaber in Gestalt einer Hacke mit Schildkrotblatt *(čilôl)*;[4] — 3. *uathiṅâk:* Kokosnußkratzer mit angebundener *gurugûr*-Muschel; gewöhnlich mit Füßen *(bodjêl;* s. Abb. 400, 401), neuerdings werden als Kratzer auch Wrakteile benutzt (s. Abb. 402 aus Messing).

b) *kôth:* Kokosnußöffner in Form eines beiderseitig flach zugeschärften Palmholzes.

c) Messer: 1. *str:* Bambussplitter sind noch heute bei dem Mangel an eisernen Messern in Gebrauch;[5] — 2. *thewethšf* (Ha.: *tjlluol):* Schildkrotmesser zum Ausschneiden der Kokosnuß (Abb. 403, 404).

d) Löffel *(tolôṅ lâle uēī;* He.: *gurugûr a lamm)* aus Schalenstücken der Kokosnuß oder aus Cardium-Muschel (Abb. 405); — 2. Sieblöffel *(taxâx)* aus Kokosschale mit Holzstiel (Abb. 406); er dient beim Fischkochen zum Durchseihen der Brühe.

e) Tarostampfer *(jâl)* aus *lewôs*-Holz (Abb. 407)[6], auch dazu werden mitunter Schiffsteile (Abb. 408, ein Marlspiker) verwendet.

f) Kokosnußgefäße. 1. *takôg* (Ha.: *ithithll tjdl):* Trinkschale aus halbierter Nuß[7]; — 2. *kogillâ atjl* (Ha.: *xaūēlh):* ausgehöhlte Nuß, dient als Flasche für Wasser und Palmwein[8].

Muschellöffel (Hamburg 168^{II}, $^{1}/_{3}$ nat. Gr.). — Abb. 406. Sieblöffel aus Kokosschale (Hamburg 5144^{II}; $^{1}/_{6}$ nat. Gr.). a = Seitenansicht des Löffels. — Abb. 407 und 408. Stampfer aus Holz (Hamburg 5261^{II} bzw. 196^{II}; ¼ nat. Gr.). — Abb. 409 und 410. Aufhängehaken aus Holz (Hamburg 5093^{II} bzw. 184^{II}; $^{1}/_{6}$ nat. Gr.). — Abb. 411. Hänger für Flaschen, aus Muschel (Hamburg 5218^{II}; ¼ nat. Gr.).

g) Holzgefäße. 1. *tōvitōf* (He.: *davidēf*): Deckelkästen aus Brotfruchtholz *(mâ)* mit flachem Deckel (Abb. 412) mit mehreren Abteilungen zum Aufbewahren von Utensilien. Unterer Kastenteil = *kolonelâ* (He.: *kolonâl*), Deckel = *atjopâl* (He.: *japâl*), Griff = *tāūōl* (He.: *tawōl*), Falz = *badjōl* (He.: *potâl*), abgeteilte Innenfächer = *tobolâ*.[1] — Die Schüsseln zeigen verschiedenste Form, ohne daß damit immer ein besonderer Zweck verbunden wäre. a) *tâpi lamdlâ*: gewöhnliche Speiseschüsseln aus *âit (âθ)*-Holz mit nasenartigen Griffen *(matâl)*[2], sie sollen in Sorol gearbeitet sein (Abb. 413); — b) *tâpi lo wōl*: große Schüssel für Schildkrötenfleisch, nach Eingeborenenangabe von Lamutrik erhandelt, stammt aber wohl von Truk. — c) *tâpi el tk*: Fischschüssel in eigenartig verzerrter Form mit Füßen (Abb. 414)[3]. —

d) Schüssel in Fregattvogelform (Abb. 415); sie soll einheimische Arbeit sein, während die gleiche Schüssel ohne Füße aus Sorol stammt.[4]

e) flache tellerartige Schüsseln mit Stiel zählen auch als *tâpi*; sie dienen zum Stampfen von Essen (Abb. 416, 417).

f) Gefäße *(lâmm)*: Große Cassis rufus-Schneckengehäuse (Abb. 418) werden seit alters zum Kochen verwendet.

g) Büchsen *(kiâar)*: 1. aus Bambus *(gâl*, Abb. 419, 420) mit Holzdeckel und Holzboden, für Kalk und Tabak; sie sind z. T. verziert; — 2. aus einer Zwillingsnuß *(xôat)* mit natürlicher Zwischenwand (Abb. 421) mit Holzdeckel *(pelitâl)* für Tabak u. ä.

h) Taschen bzw. Körbe zum Aufbewahren von Essen, größere für Feldfrüchte,
α) geflochten: 1. *wōtâū*: aus Kokosblattstreifen, teilweise mit Haarschnurhenkel; einheimische Arbeit (Taf. 31, Abb. 3)[5]. Die besser angefertigten (Taf. 31, Abb. 5) sind aus Yap. Diese *wōtâū* werden gewöhnlich unter den Arm geklemmt; — 2. *tâñerex*:[6] große derbe Taschen mit »Zopf« (Taf. 31, Abb. 4); — 3. *xabâss* (He.: *xobâs*): runder henkelloser Korb (Taf. 31, Abb. 2) für Webutensilien; — 4. *kâθ*: runder Korb aus Pandanusstreifen mit Schnurhenkel[7]. — 5. *hâgits*, auch *ägâtč*: zweiteilige, zusammensteckbare, kleine Tasche aus Pandanusstreifen.[8]

β) aus Kokosschnur geknüpft *(tschô)*: dicht oder weit gearbeitete Tasche mit Ösen zum Durchstecken von Tragstangen[9]; der Rand ist durch Blattrippen versteift (Taf. 31, Abb. 1), derartige Taschen stammen aus Yap.

i) Haken *(tjañillmorôt*, He.: *mädâxôt)* zum Aufhängen von Körben, Taschen und Flaschen: 1. aus Palmfiederschlingen; — 2. aus Holz (Abb. 409, 410); — 3. aus einem Stück Cassis-Muschel (Abb. 411).

k) Betelmörser *(mâ)* aus *xôrox*-Holz (Abb. 422) stammen aus Yap.

Die Speisen und ihre Zubereitung. Die vorhandene Flora und Fauna setzt dem Speisezettel gewisse Grenzen. Wenn auch keine paradiesischen Zustände bestehen — die Nüsse fallen nur klein aus, Brotfrucht, Bananen und Taro gibt es nur wenig — so ist doch bei der geringen Volkszahl genug Essen vorhanden, das den Eingeborenen unmittelbar in den Mund wächst. Es kann aber von unseren Insulanern nicht gesagt werden, daß ihre Kochkunst besonders vielseitig in der Herstellung verschiedener Gerichte wäre. Die Zubereitung der einzelnen Speisen ist folgende:

a) Süßkartoffeln: Sie werden gereinigt *(djlri)*, in den Topf getan *(lololôn)* und in Wasser gekocht *(i thagemanâ)*. Sobald sie gar sind, wird das Wasser abgegossen, und die Kartoffeln werden zu Brei zerstampft *(xobôla)*. Nun schabt man Kokosnüsse und mengt das Geschabsel *(thia ge rât eagerâ)* über den Brei, der so genußfertig ist.

b) Sumpftaro: Die Knollen werden geschabt und dann wie die Süßkartoffeln behandelt, jedoch ohne Zusatz von Kokosnuß. Die Taroblätter *(limellm)* werden als Gemüse dazu genossen.

c) Die Früchte des Gurkenbaumes *(eowûdj)* werden halbreif abgenommen und dann entweder wie Süßkartoffeln zubereitet, oder man läßt sie drei Tage lang auf dem Erdboden liegen, damit sie ausreifen. Den Reifezustand erkennt man durch Anritzen mit dem Fingernagel. Die Früchte werden geschabt genossen.

d) Die kleinen Feigen einer Banianart *(xâûdl*, He.: *xâûwdl)* werden entweder gleich aus der Schale in den Mund gequetscht oder im Topf gekocht und mit geschabter Kokosnuß vermischt; das Ganze wird dann durchgerührt und gegessen.

e) Die Früchte der Morinda citrifolia *(lôl)* werden gewaschen und roh verzehrt.

f) Die großen Blätter der Süßkartoffel und die kleinen einer Sedum-Art werden zusammen gekocht und mit Kokosnußgeschabsel oder Palmwein vermischt genossen.

g) Bananen werden roh verzehrt.

h) Brotfrucht wird geröstet oder gekocht.

i) Die Maniok-Knollen[1] werden zunächst geputzt und dann mit dem Kokoskratzer über einer Kokosschale geraspelt. Das Geschabsel wird in Salzwasser getan und unter häufigem Wechseln des Wassers umgerührt. Der Bodensatz wird dann getrocknet und abgeschmeckt. Ist er nicht mehr bitter, dann wird das Mehl mit Kokoswasser gekocht und genossen.

Als Getränke kennt man neben Süßwasser *(tjâl)* den Fruchtsaft der Kokosnüsse und den Palmwein *(atjî)*[2].

An Genußmitteln hat man Tabak *(tomâxo)*, der in Rollenform von Feis

[1] Von Lütke (1836 Vol. III, S. 232) als Tacca pinantifida (= *moggemog*) bezeichnet, er weist dabei auf den gleichlautenden Inselnamen hin und vermutet, daß sich dieser von der Pflanze herleitet.

[2] Die Gewinnung ist die gleiche wie auf Polowat (vgl. Damm und Sarfert 1935, S. 46).

2: Damm et al. OR21 Woleai

eingehandelt wird; für eine Rolle bezahlt man einen Kegel der bekannten *rdh*-Farbe. — Bereits Lütke wurde von den Eingeborenen mit dem Verlangen *stamakhos* überrascht, und er fragt sich deshalb, ob die Insulaner diese Pflanze etwa seit der Mission Cantova's kennen und dann an die anderen Karoliner weitergegeben haben.[1] — Betel hat von Yap aus Eingang gefunden, spielt aber keine große Rolle.

Die Mahlzeiten werden gemeinsam, meist aus einem Gefäß eingenommen. Die jüngeren Frauen haben für die Alten zu sorgen und sie unter Umständen auch zu füttern. Gegessen wird eigentlich immer zur Zeit des Palmweinschneidens: morgens, mittags und abends.

317

III. Technik.

Zur Anfertigung von **Holzarbeiten** (Kästen, Schüsseln, Waffen, Hütten, Booten) benutzen die Insulaner:

a) Äxte (He.: *dallá*, Ham.: *ṗatjugál);* α) mit Tridacna-Klinge *(hl, xf*; Abb. 423, 424)[1]; — β) mit Terebra-Klinge *(lḗn*; Abb. 425); — γ) mit Cassis rufus-Klinge (Abb. 426, 427)[2]. — Hambruch konnte noch eine alte Axt erwerben, die er neu schäften ließ (Abb. 428), die einzelnen Teile wurden genannt: Klinge = *ṗatjugál*, Schneide = *matál* (He.: *naṫḗl)*, Lager = *imá umál* (He.: *nuṫḗl)*, Bindung = *faṗḗl* (He.: *vdvṓl)*, Stiel (Abb 429) = *mál* (He.: *mḗl)*. Jetzt verwendet man statt der Muschelklingen europäische Hobeleisen[3].

b) Bohrer *(burubúr;* He.: *wurewúr):* α) einfacher Stab *(ṫetá)* mit Haizahn-Spitze (Abb. 430)[4]. — β) Drillbohrer (Abb. 431), Stab = *uál*, Querstab *(ṗoṓm)* mit Drillschnur *(eṓl)*, Schwungscheibe = *legatagál*, Spitze *(matál)* früher aus Stein[5], jetzt ein Nagel.

c) Feilen *(ṫa elacáuáχ)* zum Glätten von Holz sind aus einem Stück Rochenhaut[6]; das Polieren erfolgt mit einem Stück *wa*-Muschel[7].

d) Zum Verkitten gesprungener Holzarbeiten wird eine Harzart *(uhál)* genommen.[8]

In der **Herstellung von Muschelgürteln** genoß Mogemog einen guten Ruf, besonders was die mehrsträhnigen *ṗile*-Gürtel angeht; die Muschelscheibchen wurden nicht auf der Insel selbst angefertigt, sondern fertig bearbeitet eingehandelt.[9]

Die **Schildpattarbeiten** kommen mehr und mehr in Vergessenheit, da die Angelhaken aus Eisendraht gefertigt werden.[10]

Die **Kokosschnurherstellung** erfolgt nach dem Klopfen der Faser mit einem Holzschlägel (*eawdi lilogôtj*; He.: *susûloxôt*; Abb. 432) auf zweierlei Art: a) Die Fasern werden quer über den Oberschenkel gelegt und durch gleichmäßige

Abb. 423 und 424. Beil-Klingen aus Tridacna-Muschel (Hamburg 5227II bzw. 5178II; ⅓ bzw. ¹/₉ nat. Gr.). a = Seitenansicht. — Abb. 425. Beilklinge aus Terebra-Schnecke (Hamburg 5226II; ¹/₉ nat. Gr.). — Abb. 426 und 427. Beilklingen aus Cassis-Schnecke (Hamburg 5231II bzw. 5228II; ¹/₉ nat. Gr.). — Abb. 428. Beil mit Tridacna-Klinge (Hamburg 5203II; ¹/₉ nat. Gr.). — Abb. 429. Stiel zu einem Beil (Hamburg 3865II, ¹/₃ nat. Gr.). — Abb. 430 und 431. Bohrer (Hamburg 205II bzw. 161II; ⅙ bzw. ¹/₄ nat. Gr.). — Abb. 432. Bastklopfer (Hamburg 5080II; ¹/₄ nat. Gr.). — Abb. 433. Flechtnadel (Hamburg 5096II ⅙ nat. Gr.).

Reibung mit der Handfläche zusammengedreht[1], — b) für stärkere Fäden und Taue benutzt man das bekannte Seilergerät wie auf Tobi, Songosor, Yap und andern Inseln. Dazu gehören drei gleiche Stabkreuze (*udth*; He.: *wdth*) von der

[1] Vgl. Thilenius usw. 1927, S. 237.

gleichen Art wie auf Polowat)[1]. Die einzelnen Teile heißen *tawŏl* = senkrechter Stab, *pdi* = Querstab, *bŭbăl* = Bambushülse, verdicktes Stabende = *xapăl*.

Flechtarbeiten aus Kokoswedeln und Pandanusblättern wurden von Frauen gemacht. Sie bedienten sich dazu einer Flechtnadel *(ĕl)* aus dem Schulterstück einer Schildkröte (Abb. 433). Geflochten wurden Taschen (s. S. 315), sowie große und kleine Schlafmatten *(ŏŏho)* aus Pandanusgeflecht für Erwachsene und für Kinder.[2]

Webearbeiten fielen bereits den Europäern auf, die als Erste die Inselgruppe anliefen[3], auch später noch wird die Inselgruppe als »bedeutende Webereizentrale« gerühmt.[4] Die Erzeugnisse der Weberei sind Lendenkleider für Männer und Frauen, die aus Hibiscus- oder Bananenfaser erstellt und farbig gemustert werden. Die Muster stimmen z. T. völlig mit denen überein, die auf Ngulu üblich sind.[5] Die häufigsten Matten sind solche mit breiten schwarzen oder roten Streifen (Taf. 32, Abb. 1)[6]; ihr Geldwert ist ein Schwein[7]. Rote und schwarze Streifen können auch zusammen in wechselnder Folge auftreten[8]. Besonders kostbar sind Matten mit breiter Querborte (Taf. 32, Abb. 2)[9]. Für die Muster zu Nr. 5164 (Taf. 32, Abb. 3) erhielt Hellwig folgende Namen (von oben nach unten): 1. *baŋ*, 2. *malesŏll* (Zickzacklinie), 3. *luγu ŏumăl*, 4. *mathŏn*, 5. *lothăl*, 6. *terrăja* (Dreieck), 7. *učalălan*, 8. *illigăl dăoŏ* (Rhombenmuster), von nun an wiederholen sich die Muster in umgekehrter Reihenfolge also 9 wie 7, 10 wie 6 usw.

Das Weben ist Frauenarbeit[10]; dazu wird gern trockenes Wetter bevorzugt, denn die Fasern saugen Feuchtigkeit ungleichmäßig auf, was die Arbeit erschweren würde[11]. Das Weben einer Matte soll nach Born[12] etwa einen Monat dauern. Im Gebrauch ist der bekannte Horizontalwebstuhl *(buosŏl; He.: dörr)*[13]. Das Webmaterial wird in einem runden Korb aus Kokosblattstreifen (*xobăs*, Taf. 31, Abb. 2) aufbewahrt. Hellwig erwarb einen solchen mit Inhalt, es befanden sich darin Bananenbast *(gululălj)* in allen Arbeitsstadien, roh, geschabt, fein gespalten und schließlich fertig zu Webfäden verknüpft, ferner Hibiscusbast *(gulivŏl)* in gleicher Art z. T. mit europäischem oder japanischem Rot oder Grün[14], andere nach

2: Damm et al. ORZI Woleai

alter Art mit Pflanzensaft (s. unten) schwarz gefärbt. Zum Spalten der Fasern lag eine Muschel bei. Die Namen für die einzelnen Webstuhlteile sind:

Deutsch	nach Hellwig	nach Parkinson[1]	nach Krämer (Diar)
Gürtel zum Festhalten	*dál le dörr*	*tal*	*tadl*
Spannhölzer	*ülth, ilöth*	*ulut*	*eilith*
Knüppel zum Trennen der Fäden	*tapaŋ*	*tapang*	
Schlingstab	*ŋúŋ*	*ngung*	*ngung*
Schwert	*xaupöp, a pöp*	*aupop*	*oböp*
Schiffchen	*xas*	*sap*	
Längsfäden		*ther*	
Durchschlagfaden		*inach*	
Gewebe		*a ther*	
Gestell	*wüsál*		*vithol*
Leib- und Fußbrett	*páp*		

Zum **Färben** *(ligapodx)* benutzt man vorwiegend das gelbe bis zinnoberrote *rán*. Man gewinnt es nach Hellwig aus den Wurzeln einer Ingwerart, die auf einem Stein zerrieben werden. Das feuchte Reibenehl wird in eine sauber ausgekratzte Kokosnuß, die in ihrer Längsachse gespalten ist, gedrückt. Man fügt beide Hälften wieder genau zusammen, umbindet sie und hängt sie in einer frischen Blattumhüllung zum Trocknen übers Feuer. Nach einer gewissen Zeit kann man aus der Gußform einen einzigen Farbkegel herausnehmen, der mit Baststreifen umwickelt wird, damit er nicht zerbricht, denn diese Farbkegel sind Handelsware. Nach Hellwig scheint es davon fünf Größen zu geben[2]:

a) eine große, konische Form in armlangen Holzkapseln = *rán elehlki*
b) größte runde Nuß = *rán bulák* (Wert: zwei kleine Schweine)
c) große runde Nuß } = *rán során* (Wert zweier derartiger Kegel ein
d) mittlere längliche Nuß } mittleres Schwein oder zwei gewebte Hüftmatten)
e) kleine längliche Nuß = *rán ile palák* (soll nichts mit der gleichnamigen Insel zu tun haben).

Die Farben werden in geteilten Holztöpfen *(tapi e lap*, Abb. 416) oder Meerpocken *(tjageök)* aufbewahrt[3].

Zum Schwarzfärben der Hibiskusfaser dienen die Blätter einer Ficus-Art. Sie werden zerstampft und mit dem Saft junger Kokosfasern zu einem Brei verrührt, den man kocht und dann vier Tage stehen läßt. Die gewonnene Farbe wird *podx* genannt.

IV. Handel und Schiffahrt.

Der **Handel** war ein Warenaustausch, bei dem die Mogemog-Leute mit *rêñ*-Farbe, Schlafmatten, Schildpattringen und gewebten Matten zahlten. Auf der Inselgruppe gab man für ein Boot etwa zehn Schildpattringe, für zwei Segel hundert Faden Tau oder zwanzig Kleidmatten. — Viele Schmucksachen aus Conus und Spondylus wurden aus Yap eingeführt, wohin man das Rohmaterial dazu verhandelte. Dieser Tauschverkehr mit Yap wurde — ganz abgesehen von den Tributlieferungen — besonders gern gepflegt[1]. Andere Dinge wie große Kokosscheiben wurden z. T. aus Oleai eingeführt, die schönen Leibgürtel zumeist aus Ngulu[2], doch werden sie auch auf der Insel Mogemog selbst angefertigt und gelangen von hier bis nach Oleai. In Schmucksachen besteht ein besonders lebhafter Zwischenhandel von Insel zu Insel.[3]

Wie auf allen westlichen Karolinen standen auch hier die Tributfahrten nach Yap für Yoñelâp im Mittelpunkt des öffentlichen Interesses. Sie finden einmal im Jahr statt und zwar im Monat *thâmur*. Wenn der NO-Wind *(matarâl)* weht, machen sich die Boote (etwa 10—20) fertig. Die Boote sammeln sich am Ausgang der Lagune bei Fatharêl; hier übernahmen (dies gilt für das Jahr 1909) die Kapitäne Pôl und Rumeniâr aus Falalap, nachdem sie vorher einen Zauber gemacht haben, die Leitung über die gesamte Flotte. Die Beobachtungen des Sonnenaufganges und Wellenganges bestimmen den Abfahrtstermin. Während den Seeleuten vorher keinerlei Speiseverbote auferlegt sind, dürfen bei Antritt der Ausreise keine Bananen, kein Seehecht *(dâk)* und *lowâi* gegessen werden, da sie dem Yoñelâp gehörene. Dieses Verbot gilt bis fünf Monate nach der Rückkehr von Yap. Frauen, die keine Kinder haben, dürfen eine solche Fahrt überhaupt nicht mitmachen.

Das Reiseziel ist Gatjapâr (Kr.: Gadjebar) in der Landschaft Gagil im Norden von Yap; hier lebte 1906 noch der alte Oberpriester Bogilrâu. Jede der einzelnen Inselgruppen hat hier etwas Land, wo sie während ihrer Anwesenheit wohnt; nicht selten bauten sich die Mogemog-Leute hier auch neue Boote.[4] Nach der Ankunft bleiben die Boote aber erst vier Tage in Gatjepâr in Clausur[5], erst dann

2: Damm et al. OR21 Woleai

dürfen sie den Mast niederlegen, d. h. endgültig landen. Ein Mann aus Rfken macht auch sofort einen Zauber *(mattemdtš)*: er nimmt einen Palmwedel und beklopft damit jedes Boot, dann nimmt er eine halbe Kokosschale, füllt sie mit Wasser und zerschlagt sie am Mast. Nun erst dürfen vier Leute den Mast niederlegen und es erfolgt die Verteilung der mitgebrachten Gaben. Dem Gott Yoñelâp liefert jedes Boot als Tribut eine Lendenmatte und eine Flasche Öl ab, der Häuptling erhält 10—20 Lendenschurze, die Gastgeber 20—30 Flaschen Öl. Dieser Tag wird mit einem großen Tanz beschlossen. Solange die Mogemog-Leute auf Yap weilen, werden sie von den Ansässigen verpflegt. Die Boote fahren auch keinesfalls leer nach Hause, sondern nehmen Lebensmittel (Taro, Yams u. a.) mit. Treffen sie auf See ein Yap-Boot, so hat jedes Mogemog-Boot etwas von seiner Ladung abzugeben. — Mit aufkommendem SW-Wind *(melthâl)*, das ist in etwa 3—4 Monaten nach der Ankunft, tritt man die Rückreise an.

Über die **nautischen Kenntnisse** der Karoliner ist bereits im Band Polowat[1] und in den kleineren Arbeiten von Sarfert und Hambruch ausführlich berichtet worden.[2] Was dort gesagt wurde, trifft auch für die Mogemog-Leute zu. Es war jedenfalls nicht so, wie Lütke sagt[3], daß die Mogemog-Leute in der Navigation unerfahren gewesen wären, nur weil ihre Bootsmanöver ungeschickt ausgesehen hätten. An anderer Stelle muß Lütke selbst ihre Kenntnis der Insellage bewundernd zugestehen.[4] Dafür sind die weit ausgedehnten Handels- und Besuchsfahrten das beste Zeugnis. Heute gilt das nicht mehr, es fehlen nicht nur die Mannschaften, sondern es ist bereits seit Jahren keine Seemannstradition mehr gepflegt worden. Auch die deutsche Kolonialregierung hat den alten »Wikingergeist« eindämmen müssen; sie verbot die Fahrten von Mogemog nach Yap (etwa 200 km = Entfernung Hamburg—Leipzig), weil viele Boote aus-

Bei schlechtem Wetter werden die Segel herabgenommen und die Dünungen genau beachtet, dabei ist die starke Ost-Dünung an erster Stelle maßgebend. — Senfft[3] erfuhr auf Yap von angetriebenen Mogemog-Leuten, daß die Schiffskapitäne bereits als Kinder in der Navigation unterrichtet werden, später Probefahrten unter Beteiligung Kundiger zu machen haben und erst, wenn sie diese Prüfung bestehen, ein eigenes Kommando erhalten.

Die Himmelsrichtungen heißen:

Die Mogemog-Leute unternehmen noch heute folgende Fahrten:

nach	Monat der Abfahrt	Monat der Heimfahrt	Fahrtdauer
Yap	*eremōth* Wind: *eothō a ſdn*	*mādīx* Wind: *loothī ūr*	2 Tage
Feis	bei gutem Wetter und Wind, ohne an eine bestimmte Zeit gebunden zu sein.	zurück mit *eothō a ſdn*	1 Tag
Oleai	Wird von Yap aus bei günstigem Winde (SW = *djödjō le mīl o thalu*) unternommen		verschieden

Außerdem segelten sie nach Lamutrik, Elato, Sorol, Ngulu, Palau.

Verschlagungen waren nicht selten und kamen bis in die jüngste Zeit hinein vor, so fischte selbst die Hamburger Südsee-Expedition ein Boot mit Besatzung auf. In zeitlicher Reihenfolge sind folgende Verschlagungen bekannt:

a) die älteste Kunde findet sich in einem Brief des Pater Cantova, wonach am 19. und 21. Juni 1721 mit Mogemog-Leuten bemannte Boote auf Guam einliefen. Sie waren mit anderen von Faraulip mit Ziel Oleai abgefahren und 20 Tage umhergeirrt[1].

b) Erstaunlich ist die folgende »Odyssee«, von der Senfft 1899 berichtet[2]. Der Taifun am 10./11. November 1898 überraschte Mogemog-Boote, die nach Feis segelten. Die Flotte wurde in alle Richtungen zerstreut, fünf Boote fanden sich in die Heimat zurück. Bald darauf fuhren sieben Mogemog-Boote mit 30 Leuten nach Feis, um die noch verschollenen (etwa 120 Personen) ausfindig zu machen. Widrige Winde ließen sie weder ans Ziel kommen noch ihre Heimat erreichen, ebenso versuchten sie vergeblich Yap oder Palau anzusegeln. Als die Nahrung ausging, fuhr man westwärts, um zu den Philippinen zu gelangen. Vier Boote erreichten eine angeblich zu den Visayas gehörige Insel Kiuvan[3]. Zunächst wollte man bessere Windverhältnisse abwarten, als aber zwei Todesfälle eintraten, fuhren die Bootsleute trotz schlechten Windes ab. Dreißig Tage lang sind sie umhergekreuzt, ohne Land zu sehen. Der Proviant war verzehrt, man lebte von Regenwasser, Fischen und einem Brei aus Rēñ-Farbe und Wasser. Nach neunzehn weiteren Tagen erreichten sie Yap, teilweise direkt, teilweise über Ngulu. Ihr

[1] Bei Krämer 1917, Bd. I, S. 103, 105.
[2] Senfft 1901, S. 41 ff.
[3] Ist Samar der Philippinen; Verschlagungen nach den Philippinen waren nicht selten wie u. a. das Erlebnis der Hamburger Südsee-Expedition v. 26. 8. 1909 lehrt (vgl. Thilenius usw. 1927, S. 186).

Unternehmungsgeist war noch so stark, daß sie sogleich in ihre Heimat weiter segeln wollten. Der Bezirksamtmann verbot es jedoch.

c) Hambruch erfährt noch von folgenden Verschlagungen: Sieben Boote von Mogemog, Ethór, Falalap und Fatherēi fuhren nach Yap. Es kam schlechtes Wetter auf, man ließ die Segel herunter und die Boote fünf Tage lang mit der Strömung treiben. Sie kamen nicht nach Yap, sondern trieben noch weitere zehn Tage umher. Bei Nacht schlossen sich alle Boote dicht zusammen, während man bei Tag weit auseinander rückte. Der Führer der Flotte, der »große Kapitän«, gab dazu Signale mit dem Muschelhorn. Schließlich war aller Proviant verzehrt, man hielt sich mit wenig Regenwasser und dem an den Booten angewachsenen Tang bei Kräften. Endlich kam man nach Kiuvan (= Samar, Philippinen) und blieb drei Monate hier. Die Mannschaft baute sich Häuser und wurde von den Tagalen gut verpflegt. Das Anerbieten der amerikanischen Beamten, sie mit einem Dampfer in ihre Heimat zu bringen, lehnten sie ab, sie wollten trotz aller Warnung selbst fahren. Sie steuerten Palau an, um Proviant zu fassen. Als sie Delphine sahen, wußten sie, daß sie unweit von Land waren, denn diese Tiere halten sich nur in Landnähe auf. Bei Babeltaob hatten sie noch ein »Abenteuer« mit einem Wal, bei Ngaremlungui liefen sie in die Passage ein. Zehn Tage waren vergangen, als sie Palau erreichten. Hier fand sie die Hamburger Südsee-Expedition im August 1909.

d) Das Expeditionsschiff der Hamburger Südsee-Expedition traf dann wenige Tage später am 25. August 1909 selbst ein verschlagenes Mogemog-Boot, dessen beide Kapitäne Pól und Reféll bereits mehrere Verschlagungen erlebt hatten.

Die Bootsinsassen waren:

Pól, erster Kapitän, etwa 35 Jahre alt;
Reféll, zweiter Kapitän, 55 Jahre alt,
Thfl, 20 Jahre,
Uil e palfñ, 23 Jahre
Uil e watšſtš, 20 Jahre } Söhne des Reféll,
Mālemír, 18 Jahre
Lorés, 45 Jahre, Frau des Reféll,
Alīnamár, 20 Jahre, Frau des Thfl,
Ruót, 10 Jahre
Xāilumár, 10 Jahre } Söhne des Thfl.

Sie waren auf einer Tributfahrt nach Yap unterwegs gewesen und nach Samar (Philippinen) verschlagen worden; von hier hatten sie vergeblich Palau zu erreichen versucht. (Die anderen Boote hatten Palau erreicht, es handelt sich um die Verschlagung c.) Ihr Vorrat war bis auf drei Kokosnüsse und eine Dose Fleisch zusammengeschmolzen. Seit zwanzig Tagen hatten sie Salzwasser trinken müssen.

Die Leute waren seit fünfeinhalb Monaten unterwegs und hatten die letzten 36 Tage kein Land gesichtet; trotzdem waren sie auf richtigem Kurs![1]

e) Der Mogemog-Häuptling Aûlemâi wurde auf einer Reise nach Truk verschlagen.[2]

f) Eine andere Verschlagung, die Pôl und Refêll miteinander erlebten, liegt mehrere Jahre zurück (etwa 1903). Die Boote dieser Kapitäne waren durch einen Taifun auseinander getrieben worden. Schließlich fand Refêll das beschädigte Boot Pôl's zwischen Feis und Mogemog auf. Sie verloren dann beide die Richtung, trieben zwei Monate umher; von den dreizehn Mann Besatzung starben sieben. Schließlich wurden sie von einem spanischen Kriegsschiff aufgenommen und nach Manila gebracht. Hier blieben sie einen halben Monat. Refêll wurde mit Pôl und den vier übrigen Bootsinsassen auf einem deutschen Dampfer nach Singapore gebracht. Hier blieben sie einen halben Monat auf dem deutschen Konsulat, bis sie ein deutsches Schiff über Batavia, Makassar nach Matupi brachte, hier starben noch zwei der Kameraden. Nach sieben Monaten gelangten die übrigen endlich wieder auf einem deutschen Dampfer nach Yap und von da in einem Eingeborenenboot in ihre Heimat.

Von **Antreibungen** nach Mogemog ist eine aus Faraulip bekannt.[3]

Das **Kanu.** Wie das erste Boot entstand, beschreibt folgende Sage: Das erste Boot wurde von dem Himmelsgott Thelâñ gebaut. Er schlug mit seinen Schwestern Falüipaláp und Faroawâi einen */etôñ* (Calophyllum)-Baum um. Thelâñ haute dann mit einem Muschelbeil das Boot auf einem Platz zwischen Himmel und Erde *(imôl)* zurecht. Er brauchte dazu sieben Tage. Das Boot war sieben Faden lang, anderthalb Faden breit (mit dem Ausleger 4 Faden), zwei Faden tief und mit Mast fünf Faden hoch. Thelâñ bestieg mit seinen Schwestern das Kanu, nahm Taro und Kokosnüsse mit und segelte in ein Land, das keinerlei Baumwuchs hatte und nur aus Sand bestand. Es liegt im Südosten von Mogemog und wird vom Geist Elûlûê bewohnt, der vier Augen hat, aber gut ist. Kein Kanu kann dort hinfahren, weil der Geist dort wohnt.

Die älteste Beschreibung eines Mogemog-Bootes findet sich im Tagebuch des de Egui[4]. »Diese Barken (mit Segel) sind nach Art derjenigen der Marianen, mit geringem Unterschiede. Lütke[5] stellte bereits zwei Arten von Booten fest, die einen fand er denen von Oleai vollkommen ähnlich, — sie waren wahrscheinlich dort hergestellt worden,[6] — die anderen waren viel grober gearbeitet und Bug und Heck ragten in die Luft (les extrémités tournées en l'air). — Nun, die Bootstypen sind

Die einzelnen Teile des Mastes heißen (vgl. dazu die Nummern der Abb. 436):

1 = sól
2 = χós
3 = ülüol a χós
4 = Bindestelle vafél o χós (vgl. dazu Abb. 436a)
5 = Tau dál
6 = ár rigerſk
7 = tšíretšir

Die Boote werden in Kanuhäusern untergebracht S. 332).

[1] Vgl. Damm und Sarfert 1935, S. 108ff.; Senfft (1901 S. 825) fühlte sich an die Boote von Yap erinnert, die ja den gleichen Aufbau wie in den Zentralkarolinen zeigen.

[2] Vgl. Thilenius usw. 1927, S. 238.

[3] Die von Hambruch angefertigte Skizze ist leider so unklar, daß sie nicht wiedergegeben werden konnte. Die der folgenden Wortliste beigegebenen Ziffern beziehen sich auf die Original-Skizze Hambruch ein Skizzenbuch Mogemog.

Religiöse Zeremonien. a) Bei den Fahrten nach Yap wird ein Geist Falûth angerufen und folgende Handlung vorgenommen. Eine junge Kokosnuß wird geöffnet und auf den Ausleger mit den Worten niedergelegt: »Falûth trink die Nuß und mache unser Kanu gut, beschirme es, wenn wir auf der Fahrt nach Yap sind und gib uns glückliche Heimkehr, Du Geist!«

a

Abb. 437. Wetterzauber (Hamburg 2993[II]; 1/3 nat. Gr.), a = Seitenansicht.

b) Kommt schlechtes Wetter (Regen, Sturm) auf, so faßt man eine janusartige, mit Rochenstacheln bewehrte Holzfigur (gôs; Abb. 437)[1], hält sie gegen den Wind und spricht zu Falûth, doch war der Sinn der Worte den Eingeborenen nicht mehr verständlich.

»Ibuthelethôx thamôl ililuûl opiriêi lañêt metharêithêi
lañêt eûi thawuothôl,
Maluf eûi malugûru upôl eomâ tharûl wogêl uâ ôll,
Euîk bogêl mâl xobolôthîk xobolaipâr a pareparêl,
Thamôl iltulût ilôf thofôth ilôf thilêth ruñdl mâl thîli,
Orôf thebethapôr thouwelôx thouwethôx ithîr fâlegothô,
Ithîr irithû thîkô eolopôf eolopôm orthû,
Eothôu nethôu xolôx i le methâu.«

Ist das Unwetter vorüber, dann legt man die Figur wieder in ihr kleines Häuschen *(barôñ)*, das auf dem Ausleger angebracht ist. Diese Figur ist Eigentum der ganzen Flotte, der Kanuführer hat sie in Verwahrung; ebenso befand sich in dem auf Pfählen stehenden Geisterhäusern ein solches Gerät.

Bestimmte Meidungen der Seeleute wurden bereits auf S. 323 genannt. Hinzu kommt noch, daß auf See der Mann nicht mit der Frau schlafen darf, geschieht es doch, so sterben beide noch während der Fahrt.

[1] Vgl. Thilenius usw. 1927, S. 195.

331

V. Haus und Dorf.

Die ersten näheren Angaben über die Wohnweise der Mogemog-Insulaner finden sich bei Tetens. Als Mitarbeiter des Hamburger Handelshauses Godeffroy teilte er dessen Museumsbeamten mit, daß die Hütten wohl »klein und armselig, aber reinlich und wegen ihrer Rohrgeflechtwände, die den Wind durchlassen, kühl und angenehm sind.« Er besuchte das Gemeindehaus mit dem großen, von Palmen umrahmten Versammlungsplatz und sah auch ein großes Kanuhaus[1]. Der in den Karolinen viel gereiste Bezirksamtmann Senfft[2] stellt bereits die Ähnlichkeit, aber auch die Unterschiede zu den entsprechenden Bauten auf Yap fest, die wenige Jahre später von Krämer bestätigt werden.[3] »Wohn-, Boots- und Kochhäuser ähneln denen von Yap, den ersteren mangelt der solide Unterbau gänzlich (im Vergleich zu denen von Yap), sie sind auch viel flüchtiger gebaut; die Umgebung wird aber sehr sauber gehalten[4], sie ist mit kleinen weißen Steinen bedeckt, die auch als Boden in den Wohnhäusern verwendet werden.«[5]

Hausarten. a) *im* (He.: *jim):* Wohnhaus der Familie[6]. Die Bauausführung ist auf den Inseln des Archipels sehr unterschiedlich. So hat Falalap bedeutend größere und besser gebaute Häuser als Mogemog. — Fremdartig mutete ein Pfahlbau auf einer Steinplattform an; eine Veranda führte um das Haus und gab ihm den Charakter eines Bungalow.[7]

Im allgemeinen ist der Baukörper viereckig und erhält nur durch die beiden vorspringenden und überdachten Giebel, die gleichsam in die Grundbalken projiziert werden, einen sechseckigen Grundriß (vgl. Taf. 25, 26). Die gewöhnlichen Maße sind: Länge 6 bzw. mit Giebelvorbau 10 m, Breite 3½ m. Das Haus steht auf einem viereckigen, flachen Steinsockel. Die Wände sind aus starken, viereckig länglichen Platten, die zwischen den Fuß- und Dachbalken stehen; einzelne von ihnen lassen sich herausnehmen, so daß sich leicht Tür- und Fensteröffnungen schaffen lassen. Gewöhnlich liegen die Türen an den beiden Giebelwänden, nicht selten auch an den Seitenwänden. Sie können durch Gitter aus Holzstäben und

Bambus (Abb. 438) geschlossen werden und wahren trotzdem die Luftigkeit des Raumes.

Die Bezeichnungen der einzelnen Teile entsprechen denen des »großen Hauses«.

Hausbau. Will jemand ein Haus bauen — Häuser sind ja nicht käuflich — so schlägt er Brotfruchtbäume, Kokospalmen und Calophyllum-Bäume um. Während man heute dazu eiserne Äxte braucht, geschah das in alter Zeit mit Muschelbeilen und Feuer. Es werden dann alle Hölzer zurecht geschnitten (schneiden = *to p̄as)*. Die Wandplanken werden mit Vorliebe aus Brotfruchtholz und Treibholz angefertigt; dann erst wird das Fundament, die Plattform *(thalʃ)* aus Korallensteinen, errichtet. Das Decken des Daches *(olʼim)* beginnt von unten (!) her. — Das Haus, wird unter Mithilfe aller Familienangehörigen, die es später bewohnen werden, gebaut, die Frauen stellen die Haus- und Dachmatten her. Können die Angehörigen einzelne Arbeiten nicht verrichten, so beauftragt das Familienhaupt jemanden damit und zahlt dafür *rēn*-Farbe, Kleidmatten in größerer Menge u. a. Die einzelnen Familienmitglieder erhalten vom Hausherrn für ihre Mitarbeit je eine Kleidmatte. Ist der Bau fertig, so wird ein großes Essen veranstaltet, an dem das ganze Dorf teilnehmen kann. Dabei wird ein Zauber gemacht, um die bösen Dämonen zu vertreiben. Oberarme und Knöchel der Beteiligten sind mit Kokosblattstreifen umbunden. Mit einem Palmwedel, der nur junge Fiederblätter *(popēi)* haben darf, und an dem einige Blattknoten befestigt sind, wird das Haus geschlagen und dazu folgender Spruch aufgesagt:

Abb. 438. Gittertür (Hamburg 5224[II]; 1/10 nat. Gr.).

I ʃīl Buūlethī ni ʃilemaāu	Buūlethī bleib nicht im Haus, überlaß es uns!
Ni ʃile maā thūr Lugelēn	Lugelēn verweile nicht!
Ni pāb Tjalthathagiāl	Tjalthathagiāl bleib nicht im Hause!
Eōr sū eōr sū	Bleibet nicht, bleibet nicht!
Xatamōl a xatamōl	Geht fort, *geht fort!*
Thūth a rīa	Böse Geister macht Euch fort!
Palōx a rīa!	Damit wir nicht krank werden!

b) *fagīl:* Kanuhaus[1]; es ist gleichzeitig das Schlafhaus für die Männer, hier halten sich auch die Wächter für die am Strande liegenden Boote auf (s. Taf. 27).

[1] Modell im Museum Hamburg 211.

439.

439b.

440.

439a.

441.

Abb. 439. Geisterhaus (nach einer Zeichnung von E. Krämer); a = Muster der vorderen Giebelseite, b = Muster der hinteren Giebelseite (nach Skizze Hambruch). — Abb. 440. Beschnitzter Balkenkopf (nach Skizze Hambruch). — Abb. 441. Balkenverzierung im großen Haus (nach Skizze Hambruch).

Das Innere beschreibt Hellwig in seinem Tagebuch sehr anschaulich: »Die Mattensegel liegen auf dem Querbalken des Hauses und an den Wänden hängen Senknetze, Fischspeere und Körbe, Boden mit Schlafmattfetzen und Kokosblattmatten bedeckt, dazu Palmstammabschnitte als Kopfstützen.«[1]

c) Geisterhaus (s. Taf. 28). Das Haus — es hat sehr unter dem Taifun von 1905 gelitten — wurde einst von Ulurâñ gebaut, der ein großer Zauberer war. Seine Kunst ging auf Talñ über, dieser kann durch Zauber Krankheit und Tod schicken, aber auch das Leben erhalten. In diesem Haus werden die Opfergaben für Yonelap niedergelegt. Das Haus muß dauernd in gutem Zustand sein, sonst werden die Bewohner der Insel krank.

Das Haus ist an den Wänden reich verziert, d. h. die Bretter sind beschnitzt, schwarz und weiß bemalt (vgl. auch dazu Abb. 439). Die Bedeutung der einzelnen Muster ist folgende; Abb. 439a: 1 = pegêl (Muster auf Taf. 28 deutlich erkennbar), 2 = mâr (kein Muster, sondern ausgestellte Opferkränze), 3 = djâl (Sonne), 4 = nôl, 5 = liôš, 6 = aufgehängte Wetterzauberfigur. — Abb. 439b: 1 = liôš, 2 und 3 = djâl (Sonne).

d) *fdl:* »Großes Haus«[2]; es ist etwa 15 m lang, 4 m hoch und 5 m breit. Über die Anlage s. Abb. 442, 443 und Taf. 27. — Die Balken bzw. ihre Kopfenden sind nicht selten verziert (s. Abb. 440, 441).

Zum Grundriß des »Großen« Hauses (Abb. 443); die einzelnen Teile bzw. Räume führen folgende Namen:

1. *thugellñ utjîg*
2. *thurelil tjotjôl*
3. *uâligetam*
4. *thâres thaoä*
5. *thurîligelok*
6. *fâthilium*
7. *hâujôl*
8. *thuritopâl*
9. *kallokdtam*
10. *fdllañ* (Herdstelle)
11. *thurôñ*
12. *thûrôl thavâ*

Die im Längsschnitt (Abb. 442) sichtbaren Teile heißen:

1. *wâm*
2. *ûduo*
3. *irapañdk*
4. *jafên*
5. *thafêl*
6. *lugilôk*
7. *chdtam* (Tür)

e) *malâm:* Koch- und Vorratshaus ist ein einfaches, auf einigen Holzpfählen stehendes Dach.

f) Bluthaus: Auf Falalap stand ehedem ein großes Bluthaus, das vom letzten Taifun zerstört wurde; man errichtete dafür kleinere Hütten dieser Art.

g) *djumôl:* Schweinestall; Schweine gibt es zur Zeit nicht.

[1] Thilenius usw. 1927, S. 228.
[2] Modell im Museum Hamburg 213.

442.

443.

Abb. 442. Längsschnitt durch das „Große Haus" (nach Skizze Hambruch). — Abb. 443. Grundriß des „Großen Hauses" (nach Skizze Hambruch).

Zum **Hausrat** gehören außer den Wirtschaftsgeräten (S. 313) und Waffen (S. 339) noch Schlafmatten *(trobôi)*, Kopfstützen *(uliu'ûr)* in Form von groben Stammstücken und »Betten« *(thidm me thûr)*.

Regelrechte **Dorfanlagen** *(êra ma têli fêli ufâ)* finden sich eigentlich nur auf Mogemog und Falalap, während einige weitere Inseln nur Weiler tragen (s. S. 295).

Mogemog. Hambruch hat eine Siedlungsaufnahme gemacht, leider ist ihm der dazugehörige Plan während eines Sturmes verloren gegangen. Zeit zur Neuanfertigung fehlte wegen bevorstehender Abreise des »Peiho«.

Platznamen	darauf Gebäude	Bewohner
Limat	Wohnhaus, 2 Kochhäuser, leerer Schweinestall	Häuptling, Frau Lâûb.
Fathü'ulûs	Wohnhaus und Begräbnisplatz	Frau Uérü
Uule'uñebûñ	Wohnhaus und ein Kochhaus	Frau Goliefâñ, die Mutter des Thfl, der z. Zt. als Verschlagener in Yap weilt (s. Schifffahrt), ferner seine Schwestern Xúth und Uthûlumarel
Lugefalû	Geisterhaus und ein Vorratshaus für Kokosnüsse	
Fathü'ulûs	Wohnhaus	Wurde vom Häuptling Uulemén erbaut, der der Bruder des Besitzers ist. In dieses Haus heiratete die Frau Marethál. Die Kinder aus dieser Ehe sind die Töchter Léira, Lemáñ, Thumár und die Söhne Jolóx und der verstorbene Ithupél.
?	Wohnhaus	Der Mann Uâru und die Frau Mañilumár mit einem adoptierten Waisenkind
?	Wohnhaus	Die Frau Farôî i thál und der Knabe Erethiitâx
Fáñ ülü 'elûs	Zauberplatz für Marêthüpâs (s. Religion)	
Fathü'ulûs	Wohnhaus	Mann Ijóñ und Frau Eañîle mit ihrem kleinen Sohn Epoñôithél;

Platznamen	darauf Gebäude	Bewohner
Ga fél eáñ	Männerhaus	
?	Wohnhaus und Kochhaus	Der Häuptling Uér und der Mann Falíñ
?	verfallenes Haus	
Xamageráñ	Wohnhaus	Besitzer ist der Knabe Palüerû; es wohnten hier seine Mutter Láthóp und seine Brüder Thogelû und Erumár
Fál éi gilifóñ	Wohnhaus (»Haus im Hibiskusbusch«)	die Frauen Lemaréteñ und Ethepérûp
Lamethâx	Wohnhaus	die Frauen Lethól und Xarûs
Fál i gelañ	Häuptlingshaus, 2 Vorratshäuser, 1 Opferhütte	die alte Frau Xathâx und ihr Enkel, der spätere Häuptling Tarétš
Waría	Wohnhaus	die Frauen Gathogothéi und Rolüméi
Pilím	Wohnhaus	der Häuptling Râûe und die Frau Solumár
La methâx	Wohnhaus	der Witwer Gíf und seine Kinder Elóa und Tsím
La methâx	Wohnhaus	die Frau Lameliûl, ihr Mann Taliñumár weilte zur Zeit in Lamm.

Die Grabstätten (s. S. 344) liegen im Osten der Insel Mogemog, zwei weitere an der Westseite.[1]

Von *Falalap* hat der 1. Offizier des »Peiho« die Siedlung aufgenommen, aus dem Plan (Abb. 444) sind die Namen der Grundstücke und die Zahl der daraufstehenden Gebäude ersichtlich. Hambruch erhielt folgende Namen für einzelne Hütten: 1 = Ulivál, 2 = Mauvíl, 3 = Ravâñ, 4 = Péi (Friedhof), 5 = Lidél, 6 = Fál, 7 = Lódiél, 8 = Orón, 9 = Ipôl (Bluthäuser), 10 = Bermât, 11 = Olepél (Friedhof).

Nach Tetens und Kubary[2] hat Falalap die größte Siedlung, Velli genannt; sie soll in zwei politisch getrennte Teile, den westlichen Mathillewel und den östlichen Mototar zerfallen.

[2] Tetens und Kubary 1873, S. 36.

Kanuhaus
Versammlungshaus
Wohnhaus
Vorratshütte
Kochhaus, Schuppen
Begräbnisplatz

Abb. 444. Siedlung auf Falalap (nach Aufnahme W. Lorenzen, 1. Offizier des „Peiho").

VI. Waffen.

Die Insulaner stritten Hambruch mit aller Entschiedenheit ab, jemals Kriege geführt zu haben; ihre Waffen bezögen sie von Yap und nur deshalb, weil sie nicht wüßten, ob sie an feindliche Gestade verschlagen würden! — So sind die Speere (He.: *gł, kłł*, Abb. 448) mit Bambusspitze typische Yapstücke; die Spitze hat innen einen senkrechten schwarzen Strich und der Schaft unter der Kokosumschnürung schwarze Ringe.[1] Häufiger sind mit kurzen Widerhaken versehene Speere, die das typische Yapmuster tragen (Abb. 445—447). Die Speere dienen auch zum Fischen.[2]

Keulen aus Areca-Holz gibt es verschiedener Art: a) *chŏth* (s. Abb. 449, 450); sie werden auch mit ihrem spitzen Griffteil in die Erde gesteckt, während das zugeschärfte Schlagende zum Kokosöffnen genommen wird; — b) *methefanthĕl* aus Areca-Holz s. Abb. 451; — c) Hellwig sammelte noch eine Haizahnkeule, die aus einem angetriebenen Boot stammen soll, es ist das Stück eines Gilbert-Speeres![3] — d) Einen anderen Irrläufer sammelte Hellwig in Nr. 5174, *solrdn* genannt (Abb. 452); diese Keule soll aus Oleai stammen, doch dürfte ihre Heimat Westpolynesien (Samoa) sein (vgl. Krämer, Samoa-Inseln Bd. II, S. 214 Abb. 80).

Schlagringe[4] *(riserds)* mit Rochen- oder Hornhechtstacheln unterscheiden sich in nichts von den zentralkarolinischen Formen, daneben kommen noch Fingerdolche *(zŏs,*[5] s. Abb. 453) vor, sie werden zum Stoß zwischen 2. und 3. und 3. und 4. Finger gehalten.

Schleuder *(chŏŏn*, Abb. 454) aus Kokosschnur; mit ihr werden beliebige Steine geworfen.

341

Soziale Verhältnisse und Geisteskultur.

VII. Soziologie.

An **Verwandtschaftsbezeichnungen** nennt Hambruch folgende:

Großvater (väterlicherseits)	*tomôi tšilôi*
Großmutter (väterlicherseits)	*tomôl* (?)
Großvater (mütterlicherseits)	*tšilôi ma tomôi*
Großmutter (mütterlicherseits)	?
Eltern des Vaters	*bathil e tomei*
Eltern der Mutter	*bathil i tšilôi*
Vater	*tomôi*
Mutter	*tšilôi*
Bruder	*bŭthi*, auch *wŭthi*
Schwester	*elŏl*
Sohn	*lŏl u mŏl*
Tochter	*lŏl a feffl*
Vaterbruder	*u wŭthi tomŏl*
Vaterschwester	*lŏl u e wŭthi.*

Familie. Über die Empfängnis haben die Insulaner keine rechte Vorstellung. Sie glauben, daß ein Geist das Kind schaffe, wenn Mann und Frau zusammenschlafen, und zwar läßt der Geist das Blut der Frau gerinnen, woraus dann das Kind entsteht. Da sich beim Mann kein Blut wie bei der Frau zur Zeit der Menstruation absondert, so kann er keine Kinder zur Welt bringen. Nach Auffassung der Eingeborenen sondert der Mann nur »Wasser« ab. — Eine Frau kann auch ein Kind bekommen, ohne mit ihrem Manne zusammen zu sein. Das Kind stammt dann vom Geist Lugelén, der auch Zwillinge *(libuêl)* macht. Hambruch's Dolmetscher glaubte, daß der Geist das Kind in die Frau hineinsteckt. Bei der Geburt *(thadim'gelôl)*, die im Bluthaus vor sich geht, sind nur Frauen, keine Männer zugegen. Die Kreißende hockt auf einem Hola, Frauen stützen sie im Rücken und geben ihr Hilfsstellung. Sie sprechen ihr Mut zu: »Sei stark, dann kommt Dein Kind! Bist Du es nicht, dann stirbst Du! Sei stark!« — Totgeburten kommen vor; nach Eingeborenenansicht hat der Vater dann etwas Übles getan, es kann auch der Frau das Leben kosten. — Die Frau bindet nach der Geburt

ein Tau *(tharŏl)* um den Leib, um die Bauchdecke zu stützen. Die Nabelschnur *(mutŏl)* wird mit einer Muschel abgeschnitten, die Nachgeburt *(pds)* wird eingegraben. Die Mutter bleibt noch etwa drei Monate im Bluthaus, dann hält sie sich noch einen Monat im Kochhaus auf, ehe sie endgültig ins Wohnhaus übersiedelt.

Der Vater darf das Kind zunächst nur von weitem sehen, er ruft ihm zu, es solle wachsen und nicht schreien. Die Kleinkinder liegen in einem Hängenetz mit Pambusrahmen.[1] Sobald das Kind laufen kann, darf der Mann wieder mit seiner Frau geschlechtlich verkehren, hält er sich nicht an diese Sitte, dann würde das Kind nicht gedeihen.

Menstruation. Mit Eintritt der ersten Mensis erhält das Mädchen seinen ersten, zumeist selbst gewebten Schurz von der Mutter umgelegt. Es bleibt 14 Tage im Bluthaus, während die Frauen dieses nur zehn Tage aufsuchen.

Geschlechtsleben. Solange das Mädchen den Blätterschurz *(lŏl)* trägt, darf es mit Männern keinen geschlechtlichen Umgang haben, dagegen ist er ihr mit Knaben erlaubt. Sie wird für ihre Hingabe mit Kokosnüssen, Fischen und dergl. bezahlt. Abortivmittel sind unbekannt. Während der Schwangerschaft bestehen keinerlei Speisetabu.

Heirat. Der Mann muß zunächst das Einverständnis des Mädchens haben. Dieses spricht dann mit ihren Eltern und berichtet ihrem Zukünftigen darüber. Doch ist es notwendig, daß auch der Mann mit seinen zukünftigen Schwiegereltern spricht; sagen diese »nein«, dann darf nicht geheiratet werden, doch kann ihm das Mädchen als Geliebte angehören. Im andern Fall müssen die Verwandten des Mannes den Schwiegereltern Kokosnüsse, Fische und dergleichen als Geschenk bringen. Nach etwa drei Tagen erwidern die Schwiegereltern diese Aufmerksamkeit und bringen dem Schwiegersohn Essen aller Art. Mit einem großen Schmaus und Reigen *(xofārŭx)* findet dann die Hochzeit ihren Abschluß.

Solange das Paar (Mann = *mdl*, Frau = *fĕfil*) kein eigenes Haus hat, wohnt es bei den Eltern des Mannes oder der Frau; doch sorgt jeder dafür, recht bald zu einer eigenen Hütte zu kommen. Für alle Bedürfnisse des jungen Paares sorgt die Mutter des Mannes. — Bei schlechter Behandlung darf die Frau den Mann ohne weiteres verlassen. Bei Ehebruch der Frau kann sie ohne weiteres fortgeschickt werden.

Arbeitsteilung. Die Männer verrichten alle Holzarbeiten (Häuser, Boote, Kästen), stellen Netze her, erklettern Palmen und holen Früchte herab; die Frauen bestellen Felder[2], kochen und weben.

Tod und Begräbnis. Mit Eintritt des Todes wird die Leiche zunächst gewaschen und zwar ist das Sache der Frauen des Hauses. Die nächsten Fami-

[1] Museum Hamburg 5149.

[2] Die Angabe Senfft's, nach der Mogmog-Frauen nur kochen, aber keine Feldarbeit verrichten, ist falsch (1901, S. 814).

lienmitglieder (Witwe bzw. Witwer und die Kinder) sitzen dabei, weinen und singen einen Totengesang, deren es sehr viele gibt. Hambruch schrieb folgenden nieder:

Athülëi mdleu orën onulelâ apëi thimôn	Mit Blüten vom Baum und mit *rën* schmücken wir dein Haupt,
Lâlü olâ mdrëi	Legen dir um den Kranz.
Tëi ü mathël nei uathlri	Alle Leute sind im großen Haus,
Tëi ü mathël nei uathlri auall	Alle Leute sind im großen Haus.
Fëfël igëi eolôx	Frauen gehen ins Haus und klagen.
Pllo lôi eithûr re oalü nalâ ethôx	Ich bin arm, mein Sohn ist verschieden.
Striue rert e mdt	Zwei Söhne hatte ich, der eine ist tot.
Xramt lelaliûx emdn	Sie lebten bei mir, nun fehlt der eine.
Xrôi ertë lelëx ferôx	Um meinen Sohn traure ich,
The uellm meitetlr	Stets werde ich traurig sein,
Itherl gathl gathûx	Rastlos wandre ich hin und her,
Fëli xaëi iolôx	Gehe hierhin, gehe dorthin.
Mâ pllo lôi erethûr	Die Leute sind im großen Haus
Ra oallñ aleûx rethôx	Und ich bin traurig, wie von Sinnen.
Tomll lëi i ma e rdlu	Mein Sohn ist nicht mehr im Haus.
Mll erewathl eathôx	Oft und viel werde ich an ihn denken.
Fox xôi â jomâ mdirëi	Traurig bin ich, traurig über den Kranz,
Na tomll eâ erdlu	Der nun nicht mehr im Hause ist.
Mll ert uathl eathôx	Oft und viel werde ich an ihn denken.
Thëri llux mëi erôi	Kinder hatte ich zu beiden Seiten.
Re therâ uâ moiûx	Ich soll schlafen und ich vermags nicht.
Mll erë wathl eathôx	Oft und viel werde ich an ihn denken.
Ferôx xôi ûjômu mdirëi	Traurig bin ich, traurig bin ich über den Kranz.
Iert llm mëi erôi	Beide Kinder saßen zu meiner Seite.
Thathûri uôi i mdlür	Ich soll schlafen, aber ich schlafe nicht.
Nëi tëi uolopôx	Ich wälze mich hin und her.
Tëi χathalâ matâi	Ich vermag nicht müde zu werden.
Roalâ le illle rd roflm	Mein Sohn ist verschieden, er ist weit fort,
Buge lôi ik taliû mâl thûk	Sie graben ihn ein, ich darf nicht hinschauen.
Nathuellm malë uerdñ matriëi.	Blüten vom Baum, *rën* im Gesicht.

Dann legt man den Toten mit dem Gesicht nach Westen auf eine sehr große Matte *(maxrôs)*, die nur diesen Zwecken dient, und bemalt ihn, wie das im Klagelied angedeutet wurde, mit *rën*-Farbe (Abb.455). Mitunter werden dem Toten

auch einige Haare abgeschnitten und als Andenken in einem Körbchen aufbewahrt. So bleibt der Verstorbene ein bis zwei Tage aufgebahrt, dann wird er völlig in Totenmatten eingehüllt und vier Männer der Familie tragen ihn auf den Armen zum Friedhof *(oli pêi)*, deren es mehrere unweit des Dorfes gibt.[1] Den Zug eröffnen die Träger mit dem Toten, dann folgen die Mutter und die nächsten Familienangehörigen und schließlich unter fortwährenden i huhuhu-Rufen die übrigen Dorfbewohner. Auf dem Friedhof heben die Träger das Grab aus und betten den Toten hinein, es wird ihm nichts mitgegeben. Die Gräber *(lügûlo mêth)* machen den gleichen Eindruck wie auf Yap (s. Taf. 30). Die aus starken Korallenkalkplatten bestehende Steinkiste, in der der Tote eingebettet ist, steht auf keiner Plattform, sondern ist in den Boden eingelassen. Zum Teil sind die Gräber von einem Steinkranz eingefaßt. Derartige Begräbnisplätze wurden auf Mogemog (einer im Osten, zwei im Westen der Insel) und auf Falalap festgestellt. Während für den Witwer keinerlei Bestimmungen bestehen, hat sich die Witwe das Haar abzuschneiden, zu weinen und zu klagen. Sie bleibt dann einen Monat lang im eigenen Haus, das sie nur des abends zur Verrichtung ihrer Notdurft verlassen darf. Sie lebt vollkommen abgeschlossen für sich, selbst ihre Eltern dürfen sie nur von weitem sehen. Nach Ablauf dieser Trauerzeit kann sie frei leben oder sie wird die Frau ihres Schwagers.

Abb. 435. Totenbemalung (nach Skizze Hambruch).

Die Namen der verstorbenen Eltern dürfen nicht genannt werden, was die Aufstellung von Stammbäumen unmöglich machte.[2]

Der Staat. Die Inselgruppe befand sich, wie bereits erwähnt wurde, in einer gewissen Abhängigkeit von Yap, die in regelmäßigen Tributlieferungen ihren Ausdruck fand. — Die beiden am stärksten besiedelten Inseln der Gruppe wurden von Häuptlingen regiert, die Hambruch von 1909 rückwärts in folgender Reihenfolge aufzählt:

Mogemog	Falalap	Mogemog	Falalap
Râûe	Sebón, er wurde 1909 durch seine Frau Ategeluôl, die auch auf Ponape gewesen war, vertreten	Tagóu	Thôx
		Tarûr	Âsûx
		Jümâx	Uôl śemâl
		Tâûuwé	
Thârêx	Moliefân	Ulupâp	
Thûâr	Thamés	Puñ e sâû	

[1] Chamisso (bei Kotzebue 1821 Bd. III, S. 135) erwähnt die Erdbestattung nur mit wenigen Worten.
[2] Thilenius usw. 1927, S. 238.

Hellwig[1] erwähnt außerdem noch einen Mogemog-Häuptling namens Aúlemâl, der »vor langen Jahren auf einer Reise nach Truk verschlagen und auf der Heimreise Lamutrik anlaufend hier verstarb.« — Zur Zeit des Cantova soll baschattel „Herr von Mogemug" gewesen sein.[2]

Die Angaben Hambruch's über die soziale Gliederung der Bevölkerung sind leider sehr dürftig. Der Hinweis in der älteren Literatur (bei Lütke und Tetens) auf zwei gleichzeitig regierende Häuptlinge ist noch ungeklärt. Oder sollte die Notiz bei Tetens und Kubary[3], daß die Siedlung auf Falalap in zwei politisch getrennte Teile Mathillewel und Mototar, die von Distriktsvorstehern verwaltet werden, eine Erklärung dafür geben können? Nach einer anderen Beobachtung von Tetens[4], daß nämlich der »König« die ihm von Tetens gemachten Geschenke nicht annahm, sondern von seinen Häuptlingen auf einer Matte ausbreiten ließ, scheint die eigentliche Herrschaft von einem Oberhäuptling geführt worden zu sein, dem Distriktsvorsteher als eine Art Unterhäuptling ähnlich wie auf Sorol zur Seite stehen.[5]

Der gute Ton verlangt, daß man vor dem Häuptling niederhockt und nicht aufsteht. Will man mit dem Häuptling sprechen, so tritt man in gebückter Haltung herzu, in der gleichen Weise geht man auch an ihm vorüber. Kommt ein Boot von einer andern Insel zu Besuch, so erhalten die Insassen Schlafstätten im großen Haus angewiesen, ebenso haben sie freie Verpflegung, Frauen sind davon ausgenommen. Von den Fremden erwartet man, daß sie dies mit Gaben für Yoneláp (Matten und Tabak) vergelten, die der Häuptling an sich nimmt. Wird das Gastrecht von den Besuchern verletzt, so gibt es nicht selten Kämpfe, an denen sich aber der Häuptling nicht beteiligt. — Begegnet ein Fischerboot einem Reiseboot, so gebietet es die Sitte, daß es diesem einen Fisch abgibt.

Will man jemandem, sei es Mann oder Frau, seine Zuneigung beweisen, dann führt man die Hand des andern an die eigene Nase *(naldi poón iwéth thoúbi)*.

Es war bereits davon die Rede, daß es die Pietät verbietet, die Namen der verstorbenen Eltern auszusprechen, sollte dies versehentlich geschehen, so erfordert die gute Sitte sofortige Trauer- und Schmerzbekundungen durch Weinen und Klagen aller anwesenden Frauen.[6]

Rechtsverhältnisse. 1. Diebstahl. Stiehlt jemand einem Dritten Nüsse oder Taro, dann nimmt man einen Kokoswedel und befestigt diesen am Hause des Diebes. Dieser darf dann nicht eher sein Haus wieder betreten, bis er den Ge-

[1] Bei Thilenius usw. 1927, S. 261.

schädigten durch Zahlung einiger guter Kleidmatten ausgesöhnt hat. Mißachtet der Dieb dieses Zeichen und betritt trotzdem sein Haus, so wird die Dorfschaft zusammengerufen und der Dieb getötet. — 2. Mord wird durch Blutrache vergolten; Frauen- und Kindermörder werden erschlagen. — 3. Ehebruch. Der betrogene Mann nimmt dem Ehebrecher das Kanu weg, andernfalls kämpfen die beiden miteinander. Wird der Betrogene dabei getötet, so wird der Ehebrecher sofort erschlagen, falls er nicht seinen Grundbesitz an die Witwe und ihre Kinder verteilt. — 4. Blutschande kommt nicht vor. — 5. Kanubeschädigung. Zerstört jemand mutwillig das Kanu eines andern, so hat er seinen Grundbesitz abzutreten, falls er kein eigenes Boot als Gegenwert geben kann. — 6. Brandstiftung als Rache von Frauen kommt vor. — 7. Körperbeschädigung wird durch Wegnahme von Haus, Boot und Landbesitz bestraft. Bei Verlust eines Armes oder einer Hand wird der Täter in gleicher Weise von den Angehörigen des Verletzten verstümmelt, ferner wurden ihm Boot und Haus weggenommen. Der Verlust eines Auges oder beider Augen wird durch die gleiche Verstümmelung gesühnt, außerdem durch Wegnahme von Land geahndet. Ausreißen der Ohrläppchen mußte durch Zahlung von *rẽñ*-Ballen gebüßt werden, Verlust der Nase durch Hergabe von Boot oder Haus, Verlust eines oder beider Beine durch Landhergabe, bei Verstümmelung des männlichen Gliedes wurde der Täter von der Dorfschaft erschlagen.

Schimpfwörter sind: du hast mit deiner Mutter geschlafen = *talẽla xamethîr mela thîl;* — du hast mit deiner Schwester geschlafen = *talẽla xamethîr mela mẽñal;* — beschlafe deine Schwester = *thâ fẽ mẽñal!* — beschlafe deine Mutter = *thâ fẽ mela thîl!* — beschlafe alle Leute in deinem Hause = *talẽla fêr djôl bogutâl!* — O, du alte Suse = *mela mẽñal rematâle!*

VIII. Zur inneren Geschichte.

Über die ältere Geschichte der Inselgruppe wissen wir nichts. Hambruch erfuhr lediglich eine Erzählung durch den Merir-Mann Maleilêṅ, die von einer starken Übervölkerung unserer Inselgruppe spricht, was Abwanderung zur Folge hatte. Maleilêṅ berichtet: Es waren drei Boote, die über Yap nach Sôngosor kamen, zwei von ihnen mit den Kapitänen Pelâû und Mareteifêṅ blieben hier, das dritte unter Führung von Dâûgepît mit drei Frauen und zwei Männern kam nach Merir. Da Pelâû Songosor beanspruchte, fuhr Mareteifêṅ weiter und kam nach Bur. Von Dâûgepît weiß man, daß er wieder in seine Heimat zurückfuhr, um seine Mutter zu holen. Auf der Rückfahrt schlug das Boot um und die Frau starb, dagegen gelangten die übrigen Insassen, darunter Dalabêth und die beiden Schwestern des Dâûgepît, wieder nach Merir und wurden von dem durch den Tod seiner Mutter betrübten Dâûgepît nach Tobi abgewiesen.

Über den wichtigsten Abschnitt der Geschichte von Mogemog, den Beginn der Missionierung und ihren tragischen Ausgang berichtet Krämer ausführlich in seiner Entdeckungsgeschichte.[1] Im Mai 1722 fuhr Pater Juan Antonio Cantova mit einigen angetriebenen Mogemog-Leuten nach der von diesen bezeichneten Heimat. Nach vergeblicher Suche strandete das Schiff auf einer der Philippinen-Inseln. Als einziger rettete sich Cantova und erreichte am 6. Juni Manila. Am 11. Februar 1731 wagte er nochmals die Fahrt in Begleitung des Pater Victor Walter und eines der vielen angetriebenen Mogemog-Leute. Am 2. März 1731 wurde Mogemog erreicht (s. Entdeckungsgeschichte), auf Falalap wurde die Niederlassung gegründet. Bald waren 127 Kinder getauft, die älteren Insulaner fanden sich zum Unterricht ein. Als nach drei Monaten die Lebensmittel ausgingen, wurde Pater Walter nach den Marianen geschickt, er wurde jedoch nach den Philippinen verschlagen und erlitt auf der Weiterfahrt nach den Marianen angesichts des Zieles Schiffbruch. Er konnte sich retten und trat am 31. Mai 1733 in Begleitung von Pater Schrevel und 44 Soldaten die Reise nach Mogemog an, das in neun Tagen erreicht wurde. In der Zwischenzeit war das Unglück über die Mission hereingebrochen. Die Eingeborenen hatten Cantova und seine Begleiter (8 Spanier, 4 Filipinos und einen Sklaven) ermordet und die Station zerstört. Die Mission wurde erst in viel späterer Zeit wieder aufgenommen.[2]

---

[1] Krämer 1917, S. 105ff.

[2] Vermutlich beziehen sich die von Chamisso gemachten Angaben aus dem Munde des Oleai-Mannes Kadu auf diese Zeit (bei v. Kotzebue 1821 Bd. III S. 123).

Ulupâp ging nach Yap und starb dort. — Unter Tarûr ging ein Taifun über die Insel, der jedoch keinen allzu großen Schaden anrichtete. — Unter Tagóu strandete ein großes Schiff, von dem die Eingeborenen ihr erstes Eisen holten. Das Schiff war gekentert, über das Schicksal der Mannschaft wußte man nichts. Möglicherweise ist Tagóu identisch mit dem »Tasso« des Kapitäns Lütke. Als dieser die Gruppe anlief, machte er die Bekanntschaft mit den »beiden herrschenden Häuptlingen« Tasso und Thyg, außerdem erwarb er sich die Freundschaft eines weiteren Häuptlings namens »Eloubouot«[1]. Die von Lütke gebrauchte Bezeichnung »Häuptling« kann nach dem oben Gesagten kaum stimmen, vielleicht handelt es sich um Distriktsvorsteher (s. S. 345).

Unter Thûar war der Wasserschout und Händler Tetens auf der Insel; dieser Häuptling muß also um 1870 gelebt haben. Tetens spricht in seinen Berichten von den beiden »regierenden Häuptlingen Giurr und Rönnemé«[2]; ersterer kann nur mit Thûar identisch sein. Die Angabe von zwei Regenten kann in ähnlicher Weise wie bei Lütke (s. oben) erklärt werden. In dieser Zeit liefen häufig japanische Schoner die Gruppe an.

Tharéx erlebte den schweren Taifun von 1907. Das Unwetter kam in den Morgenstunden von Westen her, knickte die Palmen und sonstigen Bäume um und zerstörte die Hütten. Eine Flutwelle ging nicht über die Insel. Um die Mittagszeit flaute das Wetter ab und drehte nach Westen, am Nachmittag ging das Wetter nochmals über die Insel, um dann am Abend endgültig vorüber zu sein. Nun kamen von allen Inseln Boote zu Tharéx und bestürmten ihn, er solle Yonelâp bitten, sie zu schützen. Tharéx machte einen Zauber und es kam Regen. Man lebte damals von abgefallenen Nüssen und Kürbis, die sehr stark gebaut wird, kümmerlich dahin. Der Dampfer »Germania« nahm Eingeborene auf ihren freien Entschluß hin mit nach Yap und Saipan, so daß eine Hungersnot nicht eintrat. Tharéx starb später auf Yap, seine Frau war Urûx, beider Tochter Xathâx führte die Regierung und zwar noch solange, bis ihr Bruder Râûe, der in Yap mit Lolumâr verheiratet ist und eine Tochter namens Foróiethâl hat, heimkehrt. — Sollte Râûe sterben, so wird sein Bruder Eân Nachfolger; sofern er kinderlos sterben würde, gelten die Söhne der Xathâx als Anwärter.

IX. Zur Religion.

Die Erhebungen über religiöse Fragen sind zwar etwas ergebnisreicher ausgefallen als auf sozialem Gebiet, geben aber kein abgerundetes Bild über die Vorstellung vom Weltall und all die überirdischen Wesen, die es beleben. Hambruch schreibt in seinen Aufzeichnungen nicht ohne Bitterkeit: »Nach dreistündiger Unterhaltung ist das Resultat, die Leute hier wissen nichts; die einzigen, die darüber Angaben machen könnten wie Marafél, vor allem Pôl und Rûx sind in Palau und Yap. Das Bezirksamt in Yap hat mit der Transportverweigerung der Verschlagenen der Expedition einen bösen Streich gespielt.«

Über die Schöpfung der Inselgruppe s. Sagen.

Die Zerstörung dieser Welt droht durch Taifune und diese entstehen dann, »wenn ein Stern entzwei geht«, das geschieht ohne irgendwelches Zutun von dritter Seite. Sternschnuppen *(ellûth)* entstehen nach anderer Version dadurch, daß ein »Geist« von einer Stelle des Himmels zu einer andern fliegt. Es kann dann nach Eingeborenenansicht auch Elueláp, der Himmelskönig, nicht helfen. Besonders gefährlich ist die Zeit, wenn der Abendstern *(therôbol)* nahe am Horizont steht (August, September).

Über **Himmelsbewohner** konnte man nur folgende bruchstückhafte Angaben machen. Der Mond hat eine Frau Lamelûl; sie brachte eine ganze Reihe Kinder zur Welt: zuerst Palôolôp, dann Lugelêñ, Yolufâth, Rupeiû, Kubureliêl, den Regenbogen Regûm und die Wasserhose Olthawêx. Sie wohnen in einem Hause namens Olemethañ. Der angesehenste von diesen Kindern ist Yolufâth, er ist ein »großer Zauberer«. Über die Jugend des Yolufâth, des bekannten Olifat der Zentral-Karolinen, berichtet folgende Erzählung:

Yolufâth wurde geboren und lief seiner Mutter sogleich fort. Er lief in den Busch und schnitt sich die Nabelschnur ab. Er blieb immer im Busch und sah hier häufig kleine Knaben. Mit dem einen fing er Streit an. Da sagte der Geist Mâi: »Laßt uns Yolufâth töten, der immer mit den Knaben Streit anfängt!« Er faßte Yolufâth und band ihn an einen Pfahl. Die Mutter suchte aber ihren Sohn und fing zu schreien an, konnte aber ihren Yolufâth nirgends finden. Ein Mann erzählte ihr dann, daß Yolufâth an einen Pfahl gebunden sei und zwar auf dem Platze des Geistes Mâi. Drei Monate suchte die Mutter ihren Sohn, bis sie ihn endlich fand. Da sagte sie zu ihm: »Warum bist Du denn im Busch?« — »Was willst Du denn

machen, alle Leute haben mich ja angebunden.« — »Sieh, Du hast stets Streit mit ihnen gehabt, Du hast sie bestohlen, was kannst Du dann anderes erwarten?« Die Mutter band nun ihren Sohn los und schärfte ihm ein, nicht wieder in den Busch zu gehen. Yolufáth erwiderte: »Du kannst jetzt nach Hause gehen, ich komme bald nach!« Yolufáth blieb noch einige Zeit auf dem Platz des Maí und kehrte darauf zu seiner Mutter zurück.

Dagegen ist die folgende Mythe nur mit Vorsicht zu bewerten; der Gewährsmann scheint die Rollen der handelnden Personen vertauscht zu haben, denn die Mythe ist im Aufbau die gleiche wie auf S. 202.

Yolufáth kam vom Himmel nach Losióp. Hier heiratete er eine Frau Thāwûx. Eines Nachts nahm er das Tatauiergerät und tatauierte sich. Als die Sonne aufging, nahm er einen Schaber und legte ihn in eine Bambusdose, damit ihn niemand sehen solle. — Seine Frau brachte einen Knaben zur Welt, es war Lugelén. Yolufáth sagte: »Wenn Lugelén Kokosnuß trinken will, während ich im Himmel bin, dann gibst Du ihm das Wasser in einem Blatt zu trinken!« »Doch Lugelén machte ein kleines Loch in die Nuß und trank. Wie er den Kopf in die Höhe hielt, um sich das Wasser in den Mund laufen zu lassen, sah er seinen Vater in den Himmel steigen. Lugelén rief: »Komm Yolufáth!« Er rief so laut, daß die Mutter herbeikam und ihn fragte: »Warum schreist Du denn so?« Lugelén sagte: »Ich trank eine Nuß und da sah ich den Vater!« — »Willst Du denn zum Vater?« — »Ja, ich will nicht hier bleiben, ich will zum Vater!« — »Gut, bring alle Kokosschalen herbei!« Er brachte eine Menge Schalen herzu. Die Mutter sagte: »Zünde sie an und mache ein großes Feuer!« Die Frau warf darauf eine *(felá)* Medizin ins Feuer und der Rauch stieg senkrecht zum Himmel empor. Lugelén setzte sich auf den Rauch und dieser trug ihn zum Himmel empor. Lugelén kam nicht wieder zur Erde, er ist der Abendstern.

Lugelén ist Zimmermann; er baute das erste Boot für die Himmelsbewohner, es hieß Limatotšíx. Über ihn und seine Brüder berichtet uns die folgende Sage. Der Bruder von Lugelén, Palōolóp mit Namen, hatte aus dem Himmel eine Frau, namens Ilthabugelfl, mitgebracht, mit ihr lebte er in Mál auf Ponape. Ihre Kinder hießen Ligāvés (♀), Fārouá (♂), Gilegí (♂), Eoním (♂), Zivós (♂), Thegúru e láń (♂), Ganéa (♂). Als die Kinder groß waren, bauten sie aus dem *fetóń*-Baum (Calophyllum) mit Muscheläxten ein Boot. Der Baum wurde auf zwei Rundhölzer gelegt und behauen. Die Seitenteile wurden abgeschlagen. Dann wurde ein zweiter *fetóń* gefällt und daraus zwei Bretter für das Auslegergeschirr gemacht. Als das Kanu fertig war, wurden zwei Blöcke (mit einer Kerbe in der Mitte) unter das Boot geschoben. Dazu wurde ein Zauber für Lugelén und für den Geist Thelán gesprochen, der den Leuten beim Bootbau hilft. Das Segel machte Paluolóp (Vater und Sohn haben denselben Namen); der Sohn kam in einem steinernen Kanu vom Himmel nach Ponape. Der Vater zeigte ihm das Segelmachen, und

so wurde der Sohn auch der Erbauer des ersten Segelbootes auf Ponape. Der alte Paluolóp weihte dann seine Söhne in die Geheimnisse der Schiffahrtskunst ein. Sie segelten darauf von Ponape nach Nitíts, kehrten zurück und fuhren nach Xugunós, dann nach Muxóts. Auf allen Inseln zeigten sie den Insulanern den Bootbau, unterrichteten sie in der Nautik und über Bootszauber, dann suchten sie Truk und all die andern Inseln auf und unterwiesen die Mogemog-Leute und zuletzt die Bewohner von Yap.

Bemerkenswert ist die Vorstellung, daß Lugelén mitunter die Frauen schwanger macht, ohne daß sie mit einem Mann Umgang gehabt haben. Der Dolmetscher meinte: Er steckt das Kind in die Frau hinein.

Über Kubureliél hat man eine besonders eigenartige Vorstellung, er hat keine Knochen und besteht nur aus Haut und Fleisch, so ist er zu keiner Arbeit fähig. Er schickt jedoch den Menschen die Brotfrucht.

Dämonenglauben gibt es noch, wenn auch die Eingeborenen nicht mehr so recht an derartige Unholde glauben wollten. Hambruch wurden von Sebón noch folgende Dämonen genannt. Mâi (s. auch die Sage S. 349) haust in der Erde, häufiger jedoch auf hohen Bäumen. Wird ein solcher Baum umgeschlagen, so macht er die Betreffenden krank. Ein anderer Baumgeist ist Marélan. Die Leute haben keine Vorstellung von ihm. Er selber ist »wie der Wind«, jeder große Baum auf den Plätzen *lebâu*, *burâth*, *erelogûi*, *pigirêk* gilt als sein Haus. Deshalb dürfen auf diesen Plätzen keine Bäume gefällt werden. Das Betreten dieser Plätze war jedoch erlaubt; Kokosnüsse durften ebenfalls auf diesen Plätzen gepflückt werden, dagegen war schon das Abreißen von Blättern verboten.

Eletidjét ist besonders gefürchtet, denn er zieht die Menschen ins Wasser und schlachtet sie. Um ihn zu versöhnen, schlagen die Eingeborenen sich gegenseitig mit Kokosfiedern und singen dazu einen Zauberspruch (Hambruch konnte den Text dazu nicht erfahren). Dieses Schlagen mit Kokosfiedern scheint eine besonders zauberische Bedeutung zu haben, denn sie wird verschiedentlich z. B. beim Haus- und Bootbau angewendet vgl. S. 324, 332.

Abb. 456. Tapu-Zeichen an Kokospalmen (nach Foto Hambruch umgezeichnet).

Sebón wußte noch folgende Buschgeister zu nennen; sie werden mit bestimmten Krankheiten in Verbindung gebracht. Elufáu geht im Bluthaus um und macht die Frauen krank. — Ealán läßt Diebe von Nüssen an Pocken erkranken, das trifft aber nur dann zu, wenn die Palme vorher besprochen und durch Umbinden mit Blattfiedern geschützt worden ist (s. Abb. 456). — Xrét macht Diebe von Kokosnüssen ringwurmkrank. — Liép bringt die Elefantiasis. — Rónela und Maltaféi fahren in die Menschen und machen sie irrsinnig. — Ipethét bringt Erkältungskrankheiten. — Ilefilumár bringt besonders schwere Krank-

heiten. — Thareliôr veranlaßt Kopfschmerz. — Thülûr verursacht Fußausschlag. — Liâr verursacht Schüttelfrost.

Rētēsûf ist ein Regengeist, der mit folgendem Zaubervers angerufen wird:

Fathâ thepathôx Retesûf	Du Regengeist Retesuf!
Vilê te ferâl hoatjü lâṅ elê.	Ich mache meinen Zauber, damit kein Regen in mein Boot kommt.
Xôthelethôx themôl ijê thagorû	Alle Leute sehen mich, ich will keinen Regen im Kanu haben,
I bâle xaṅelogôr	Meine Gefährten frieren sonst.
Lemûth ijê xalamotôṫ i jêl	Geist im Himmel trink das Wasser, das nicht kommen soll!
Mâ ue leijûe eusâm, emusâm	Regen sei zu Ende, komme nicht!
Trōjâ uijâ pugelomâl	Regen komme nicht, du bist ein schlechter Regen!
Xobulê thî	Komme nicht über uns!
Xobulê fôr	Wir frieren!
Paṅelês xobules thepâl	Bring uns in einen Raum, wo es nicht regnet!
Panelê pethogûr	Komm nicht, wir sind sehr müde.
Hobolhîthi šepe thepêu	Wir klappern mit den Zähnen vor Kälte.
Pugêl pethogûr	Geister im Himmel, bleibt von uns fort!
Malôṫ ûlu methû ne malôx	Maloi ulu geh nicht von uns fort!
Methâu olôx	Geh auf die hohe See!
Falü ülü i gâx	Regen komm nicht mehr zu uns!
Te âṅe pî	Sonne komm wieder!
Tha râte menê i serâl!	Bescheine unser Kanu!

Yoṅelâp.

Über die Herkunft und Abstammung dieses Gottes, als dessen Wahrzeichen Hambruch die Sonne bezeichnet wurde (vgl. die Muster am Geisterhaus Abb. 439), gibt es verschiedene Versionen. Hambruch erfuhr auf Yap (!) im Dorf Gatšapâr von dem Priester Ruepôṅ und anderen folgendes. Die Frau Mâregêigi und der Mann Mâralâûgk sind die Eltern des Yoṅelâp[1], der in Goutšâm, einem kahlen, baumlosen Platz bei Gatšapâr geboren wurde. Seine Geschwister sind die Wesen Mâregorgôi in Tomil, Uitherêi in Nolôk, Temaîr in Toru, Âth (= Rauch) in Arôth, Nâl in Mâki, Aberîk in Gilefith, Baîl (= Hai), Molâûp (= großer Vogel), Tšôi (= Pandanus), Garegâr (= ein Vogel) und Liomuiôr. Vgl. auch die Sagen S. 359.

[1] Bei Chamisso (v. Kotzebue 1821 Bd. III S. 128) als Engalap angegeben.

Auf Mogemog erhielt Hambruch folgende Angaben. Bagâû, die Erschafferin der Inselgruppe Mogemog gebar hier einen Knaben Yoñelâp mit Namen. Sein Vater hieß Yolâñ (Eolâñ) und lebte auf Yap. Während Bagâû in ihrer neuen Heimat blieb, ging ihr Sohn nach Yap zurück. Hier wies ihm sein Vater Tomfl, das damals mit Gatšepâr eins war, als Wohnplatz an. Ferner erhielt Yoñelâp von seinen Eltern die Inseln (nach Osten zu) Mogemóg, Fêis, Soról, Euripík (Aurepik), Añáñâî (Oleai), Ifalûk, Fathalôp (Faraulip), Gunemerâû (Olimarau), Eolâth, Namerík, Fêeiû, Pugelír, Thetuâl (Satowal), Pugelôt, Poluâs (Polowat), Thûx (Truk), Woolôp, Thamethâm (Tametam), Uololôt, Peserât, Mogûr, Faloból (Ponape), Rûo, Lamuíl, Feowês, Murelâû (Murillo), Losap, Límo, Gatšelûx, Limelûx, Githû, Eotâl, Moxôt, Nugunótš, Nuguór, Nutšíg, Piñelâp, Gatšâû (Kusae), Taroa (Tarawa), Rathâk, Epón, Parák, Urâx, Imâl, Mathaliôl; (nach Norden) Saiipín (Saipan), Luotâ (Rota), Tšiliôl, Uón; (nach Süden) Buñât, Merír, Toxóbi, Pûn (Pur), Soñetšól (Songosor).

Das »Bereich« des Yoñelâp erweist sich damit als weit größer als es z. B. von den Polowat-Insulanern angegeben wurde. Auf den genannten Inseln soll Yoñelâp bekannt sein und von ihnen Tribut erhalten haben. Wie es zu diesen Tributlieferungen kam, kann die folgende Erzählung erklären.

Mogemog ist der Platz Yoñelâp's. Er kam zuerst nach Feis, dann nach Losiop und Falalap. In Losiop blieb er eine Weile, als es ihm nicht mehr gefiel, begab er sich nach Falalap. Auf allen Inseln war nur Sand, er mochte daher die Inseln nicht leiden und begab sich nach Mogemog. Als er hier ankam, pflanzte er eine Kokosnuß, die er aus Yap mitgenommen hatte. Die Nuß keimte und eine Palme wuchs empor, die viele Nüsse trug. Als die Nüsse reif waren, öffnete er sie, trocknete das Fleisch und legte die Stücke zwischen Kokosschalen, um das Öl auszupressen. Dann nahm er das Öl und begab sich nach Gatšapâr auf Yap. Hier wohnte er in Numaûi. Eines Tages wollte er auf Mogemog nachsehen, wie es um seine Palme bestellt sei, aber die Leute von Gatšapâr sagten: »Du bleibst hier, Du gehst nicht!« — »Ich will aber gehen, meine Mutter ist in Mogemog, ich muß sie besuchen!« — »Du bleibst hier!« — »Wer will von Euch meine Mutter besuchen?« — »Demnächst werden einige sie besuchen!« — Es gingen dann einige Leute nach Mogemog, um Bagâû, die Mutter des Yoñelâp, zu besuchen. Bagâû weilte noch auf Mogemog; sie machte Öl, Segel, Schlafmatten und Kleidmatten. Sie sagte zu den Leuten aus Gatšapâr: »Wenn Ihr zurückgeht, dann nehmt Öl, Kleidmatten, Segel, Schlafmatten und Tauwerk mit, es soll dem Yoñelâp gehören!« So geschah es auch. Yoñelâp sagte: »Was Ihr bringt ist gut. In zehn Monaten fahrt Ihr wieder hin und holt alles das ab, was meine Mutter gemacht hat!« Yoñelâp gab den Leuten für seine Mutter *rêñ*-Farbe, Taro und anderes Essen mit.

Jetzt müssen nun die Mogemog-Leute all die Sachen, die die Leute von Gatšapâr holten, nach Yap bringen, denn Bagâû, die Mutter des Yoñelâp, ist böse und

schlecht. Halten die Insulaner die Tributlieferungen nicht ein, so würden sie alle krank werden, alle Pflanzen würden verdorren, die Fische wegbleiben und die Boote würden verschlagen werden. Hin und wieder sucht Yoṅelâp die Inselgruppe Mogemog auf und zwar schließt er sich heimkehrenden Tributfahrern an. Wenn solche Boote zurück erwartet werden, säubert man alle Hausplätze, bestreicht die Hütten mit *rên*-Farbe, damit Yoṅelâp zufrieden ist. Man pflückt Kokosnüsse, fängt Fische und legt sie zusammen mit Matten, Öl, Tabak und Kränzen in das reich verzierte Haus Fathüülüs (Taf. 28)[1]. Hier wohnt Yoṅelâp, wenn er auf Mogemog weilt, außerdem wohnt hier auch sein Enkel Liogefalû (s. Sage) und der Geist des verstorbenen Mogemog-Mannes Maréthûpar. Im Monat *mâl* wird ein eintägiges Fest *(erelû)* mit Schmausereien für Yoṅelâp veranstaltet, es nehmen daran alle Inseln der Gruppe teil. — Ein eigentliches Tanzfest *(kapâlidl)* hat man nur im Monat *tumûr*, wenn Oleai-Leute anwesend sind. (Eine Erklärung dafür gibt Hambruch nicht.) Außer diesen nehmen auch Feis- und Yap-Leute teil. Der Tanz heißt *ganâthôk*.

Yoṅelâp wird in der Not angerufen, vor allem wenn Hungersnot droht, sei es, daß keine Fische gefangen worden sind oder die Pflanzen welken und keine Früchte tragen. Ein solches Gebet heißt:

Ma pilln galôx ge Yoṅelâp	Ich rufe Dich, Yoṅelâp!
Uêr itothôk, thêu ualû ädle mêm	Gib wieder Nüsse an die Palme, die wir essen!
Ko falû xomêm itothôk	Gib uns zu essen, damit wir nicht sterben.
Themdl iχ ualemêm.	Gib Fische, die wir essen.

Tetens hörte auf Mogemog zwei Traditionen, die sich um »Loropp und die Wunderangel« und »Isserie und das Wunderbeil« ranken.[2] Darnach wären religiöse Anschauungen und Furcht Grund für die Abhängigkeit von Yap. Es scheint jedoch, als ob die Yapleute diese bewußt zur Stützung ihrer Macht gepflegt und betont hätten. Da beide Sagen an wenig zugänglicher Stelle veröffentlicht sind und Hambruch nur wenig positives Wissen auf religiösem Gebiet unter den Insulanern vorfand, sollen sie wörtlich zum Abdruck kommen.

Loropp und die Wunderangel.[3]

Vor langer Zeit existierte auf einer Insel Losiap eine Göttin, Loropp genannt, welche drei Söhne hatte. Der jüngste derselben, Mathikethik, war der Liebling der Mutter Loropp. — Eines Tages gingen diese drei Brüder aus, um zu fischen, da sie aber nichts fingen, kehrten sie unverrichteter Dinge wieder nach Hause zurück und wurden daselbst angenehm überrascht, indem sie eine Menge Lebens-

[1] Chamisso (bei v. Kotzebue 1821 Bd. III S. 129) spricht von „eigenen Tempeln" und meint damit wohl das oben genannte Geisterhaus.
[2] Tetens und Kubary 1873, S. 53/55.
[3] Vgl. dazu die Sage auf S. 360.

mittel in der Hütte vorfanden, die ihre Mutter daselbst gelassen hatte. Da zu dieser Zeit auf der Insel Losiap nur Kokosnüsse zu finden waren, wurden die Brüder neugierig zu erfahren, woher die Mutter die Lebensmittel hergeschafft, und beschlossen, daß der Jüngste Mathikethik zu Hause sich verstecken sollte, um das Treiben der Mutter zu beobachten. Als daher die Mutter Loropp wieder in der Hütte erschienen war, folgte ihr der jüngste Sohn in der Entfernung und sah, daß sie an den Strand ging, dort bis vier zählte, worauf sie augenblicklich unter dem Wasser verschwand. Nun folgte er ihr nach zur Stelle, wo sie so rätselhaft entwichen war, zählte fünf, dann drei, aber vergeblich, wie er zuletzt nur bis vier zählte, ward er sogleich unter Wasser gezogen. Er kletterte dort im Grunde auf einen Baum, Bulk genannt, um sich den Blicken seiner Mutter zu entziehen, die er dort sah. Diese bemerkte seine Gegenwart, aber erkannte ihn nicht und wollte denselben fortjagen, behauptend, dieser Ort gehöre ihrem Sohne Mathikethik. Er gab sich ihr nun zu erkennen. »Wenn solches der Fall«, antwortete sie nun traurig, »muß ich noch heute sterben, und dieser Platz hier, auf den Baum weisend, ist mein Grab und von jetzt ab in Deinem Besitz, erzähle aber nie Deinen Brüdern, wo dieser Ort ist.« Nach diesem Gespräch kehrten Mutter und Sohn nach Losiap ans Land zurück, wo die Göttin alsbald starb und von dem Sohn ihrem Wunsch gemäß begraben wurde.

Nachdem dies geschehen, kamen die beiden älteren Brüder nach Hause und fragten sogleich nach der Mutter, der Göttin, worauf Mathikethik ihnen erzählte, daß sie gestorben und von ihm in dem Meere begraben worden sei. Über diese Nachricht waren dieselben sehr bestürzt und blieben drei Tage zu Hause, den Tod der Mutter betrauernd, bis endlich der Hunger sie wieder zum Fischen hinaustrieb.

Die beiden älteren Brüder hatten jeder seine Fischleine und Angel, nur dem Jüngsten fehlte beides. Er verfertigte sich daher eine Leine aus Bast und eine Angel aus der harten Kokosnußschale. Also ausgerüstet fuhren alle drei in einem Kahne nach ihrem gewohnten Fischgrunde.

Die beiden ältesten Brüder fingen jeder nach dem ersten Wurfe gleich einen Fisch, der Jüngste zog aber einen Korb voll Feldfrüchte hinauf. Beim zweiten Wurfe fingen die anderen gar nichts, der Letztgeborene hingegen eine Bananentraube, ebenso beim dritten einen Korb voll Ignamen, nach diesem einen weiteren mit Taro-Wurzeln. Als er aber wiederum seine Angel herabgelassen, schien sie sich am Grunde festgehakt zu haben. Er zog daher aus allen Kräften an seiner Leine, so daß der Kahn umzustürzen drohte und die Brüder, ängstlich werdend, ihn baten, damit nachzulassen. Sich nicht an ihre Bitten kehrend, arbeitete Mathikethik weiter, bis das Ende einer Insel auf einmal über die Oberfläche des Wassers kam. Wie dies der älteste Bruder sah, sprang er gleich vom Kahne auf dieses feste Land und erklärte es als sein Eigentum. Immer weiter hob Mathikethik, bis auch das andere Ende der Insel hervortauchte, welches nun der zweite

Bruder in Besitz nahm. Wie endlich beim weiteren Einziehen der Angelschnur die Mitte der Insel sich über Wasser hob, erklärte sich Mathikethik selbst zum Herren derselben. Da dies aber der beste Teil der Insel geworden, so machten die neidischen Brüder ihm denselben streitig, worauf dieser eingedenk der Bevorzugung, welche die gestorbene Mutter für ihn gezeigt, vorschlug, daß Loropp den Streit entscheiden möge. Hiermit einverstanden, riefen die älteren Söhne ihre Mutter herbei, aber alles blieb still, nun ließ auch Mathikethik seine Stimme erschallen: »Loropp o oo Loropp!« Da erklang mit dumpfem, fast brüllendem Tone ein Wahrspruch aus der Tiefe, der folgendermaßen lautete: (folgt Eingeborenentext ohne Übersetzung). Mit dieser Antwort war aber der Streit der Brüder geschlichtet und sie lebten fortan zufrieden auf dieser neuen Insel, die sie Fais nannten.

Über das weitere Schicksal jener merkwürdigen Angel erzählt die Tradition ferner, daß nach einiger Zeit die drei Brüder die Insel Falalap auf Ulithi besuchten und auf dieser Reise dieselbe mitnahmen, aber unglücklicherweise dort verloren und ohne solche nach Fais zurückkehrten. Die Angel wurde in späteren Zeiten von einem Eingeborenen Falalaps gefunden und von diesem nach Yap gebracht, wo sie ihm nach Erzählung der wunderbaren Geschichte, die sich daran knüpfte, ebenfalls abhanden kam. Eine Frau von Gassapar, einem kleinen Orte auf Yap, die mit einem Häuptling von Eil-eil verheiratet war, fand dieselbe und brachte sie nach Gassapar. Die Erzählung von der fabelhaften Kraft des Fischhakens verbreitete sich rasch über die Insel, so daß die Häuptlinge von Gassapar ihren Göttern ein Dankopfer brachten, in den glücklichen Besitz dieses mächtigen Hakens gelangt zu sein. Noch heutigen Tages ist ein solcher Haken dort aufbewahrt und erklären die Priester, daß mit dem Untergang desselben, auch der der Insel Fais verbunden sei. Um einer Zerstörung derselben, mit welche Yap stets drohen kann, vorzubeugen, sind die Bewohner von Fais allen Wünschen der Yaphäuptlinge gehorsam, so stark ist noch der Glaube an diesen Mythus.

Eine ähnliche Sage knüpft sich an die Göttin Isserie und an ein Beil, das auf Yap vergraben liegen soll, bei dessen Ausgrabung die Ulithi-Inseln in der Gefahr stehen von der See verschlungen zu werden. Mit diesem Glauben hält Yap auch jene Gruppe in fortwährender Tributpflichtigkeit.«

Totenreich und Seelenvorstellung. Die Eingeborenen glauben, daß nach erfolgter Beisetzung (S. 342) der »Geist« des Toten noch vier Tage am Grabe weilt. Er begibt sich dann nach N'gaûr (Palau), wo er eine Waschung vornimmt, und steigt zu Lugeilên in den Himmel empor. Das Haus Foltumân dient den Totengeistern als Wohnung, doch werden sie nicht ohne weiteres eingelassen, denn am Hauszaun stehen zwei Posten *(rumân)* und ebenso am nahen Wasserloch, sie heißen *mamô*. Kommt nun ein Totengeist, so wird er von den Posten festgehalten und muß sich erst durch Zahlung von Muschelgeld loskaufen, kann er das nicht, so wird er ins *lôu* gesperrt.

Zauber. Unheil droht von den verschiedensten Kräften her, besonders gefürchtet sind die Dämonen, denn sie bringen Krankheiten. Zur Zeit der Hamburger Südsee-Expedition gab es noch einen Medizinmann, der sich auf Krankenheilung verstand. Es war Talfñ, er bediente sich dazu des Totengeistes Ûlûrañ, eines auf der Fahrt nach Yap umgekommenen Mogemog-Mannes. Talfñ nahm im Falle einer Konsultation eine Kleidmatte und sprach folgenden Zauber:

Imelê Ûlûrâñ, i forô ratht	Komm Ûlûran, ich bin traurig.
Uolûtharê rûa mâl	Mach den Kranken gesund, zwei Menschen (= Vater und Mutter)
Re mdathôt tanindl	Rufen und schreien. Die Sonne geht.
Thewô le ferâ a fêl	Laß ihn schlafen, er ist zu krank.
Referô ra atht	Sie sind sehr traurig,
I thoê ralêñ a sâûorû!	Mach ihn gesund und geh!

Der Kranke ist während dieser Zeit mit dem Medizinmann allein und hat ihm als Honorar *rên*-Farbe, Kleidmatten und dergleichen zu zahlen.

Folgender Spruch wird gegen Schwäre angewendet:

Thaguithêth xâxô	Thaguiethêth geh fort!
Haralû Meralû	Auch Haralû und Meralû
Legetourdl vâl lamôni	Bleibt nicht bei dem Kranken!
Perâs neremdth	Geht ins Meer, hinters Riff!
Lôge le methâu!	Und kommt nicht wieder!

Gegen Irrsinn sagt der Medizinmann folgenden Vers her:

Ubuê limî Marêlañ	Nuß trink Marêlañ!
Xo buêthû moûwol ere mataloî	Geh Du fort von dem Mann!
Xo loxbûge tômi le momâ thepîni	Geh Du in Dein Haus, das ist gut, sei zufrieden!
Ubûe limî Marêlan	Nuß trink Marêlañ!
Ueloxûge tômi le momâ.	Geh in Dein Haus, das ist gut!

Bemerkenswert ist auch das Auftreten von Propheten. Als Tetens auf der Gruppe weilte und seine Geschenke vor dem »König« ausgebreitet hatte, »erschien ein sog. Hoherpriester, der nach dem Glauben der Insulaner von irgendeinem Geist beseelt, in seinem wahnsinnigen Zustande die verschiedenen Fragen des Königs beantworten mußte.«[1]

Über Wetterzauber s. S. 330.

Über Hauszauber s. S. 332, dazu wird ein Kokoswedel *(popêi)* mit Blattknoten verwendet.

[1] Tetens-Steinberg 1889, S. 371.

Amulette zum Schutz gegen Krankheiten gibt es in verschiedener Form: a) *beliiteremál* aus einfacher Kokosschnur;[1] — b) *chamillalall:* Korallenstein mit Seetang (Abb. 457). — c) *tavál e messi a lák:* aus Kokosblattstreifen (Abb. 458, 459), es soll besonders gegen Syphilis schützen.

457. 458. 459.

X. Sagen.

357

Sagen um Yoṅelâp.

a) Wie Mogemog entstand: Bagâû aus Yap war irrsinnig; sie nahm Sand, ging nach der Ululsi-Gruppe und streute hier und da den Sand aus. So entstanden all die Inseln: zuerst Falalap. Als alle Inseln da waren, blieb sie auf Mogemog. Der Geist Xâṅko, der in der Passage Thâû e lûx haust, brachte einen großen *idl*-Fisch zur Bagâû nach Mogemog. Der Geist erhielt dafür kleine Kokosnüsse. Dann brachte er ihr Wasser, das sie nötig brauchte, damit die Pflanznüsse gediehen. Bagâû sagte: »Ich werde das Wasser nach Djalṅ u mâr bringen.« Da brachte Xâṅko das Wasser dorthin. Schließlich brachte er ihr eine Schildkröte. Sie gab ihm wieder dafür Kokosnüsse. Dann brachte er ihr wieder Fische *(e isâl, e iôp* und *go gûs)*. Stets erhielt er Kokosnüsse dafür. So ergänzten sich die beiden, der eine Teil erhielt Fische zum Essen, der andere Kokosnüsse zum Essen.

b) Eine andere Version zu diesem Thema ist die folgende Erzählung. Liomarâr (Yap) und Ilabulûe (Mogemog) sind die Schwestern des Yoṅelâp. Sie wohnen beide in Numaṅi. Eines Tages fangen sie eine Schildkröte, die sie zubereiten. Alle Hausbewohner lassen es sich gut schmecken, nur die Frauen werden gering bedacht, sie erhalten etwas von den Flossen. Sie können nur schwer ihren Ärger darüber verbergen. Am nächsten Tag fangen sie wieder eine Schildkröte. Wieder essen alle, aber die eine der beiden Frauen, die gerade im Haus anwesend ist, bekommt wieder sehr wenig. Da nimmt die Frau eine Kokosnuß, schabt sie, nimmt eine Schildkrötenflosse, eine Kokosschale und ein wenig Geschabsel. Damit begibt sie sich an einen Platz zwischen Gatṅapâr und Oneṅṅ. Sie füllt die Schale mit Sand und begibt sich zu Fuß hinaus aufs Meer. Sie geht so weit, bis sie Yap nicht mehr sieht, dann streut sie den Sand aus. Da kommt Land zum Vorschein, eine ganze Inselgruppe. Nun preßt sie das Geschabsel aus, die Milch läuft über das Land; auf diese Weise kommen die Speisen ins Land. Sie besucht nun alle Inseln, zuerst Mogemog. Sie nahm dann die Schildkrötenflosse und ging nach Eôr und legt sie hier auf den Sand. Seitdem besitzt diese Insel viele Schildkröten. Die Frau ging darauf nach Mogemog zurück.

c) Yoṅelâp und der Vogel *gareglr*. Yoṅelâp sagte zum Vogel *gareglr:* »Fliege nach Mogemog und schau nach meiner Schwester!« Der Vogel tat es und ließ sich auf dem Sande zwischen Mogemog und Thoroloṅ nieder. Dort gebar er ein Mädchen,

2: Damm et al. OR21 Woleai

Liogefalû. Das Mädchen wuchs in kurzer Zeit heran. Da sagte der Vogel zu ihr: »Ich fliege jetzt nach Yap, ist wieder Wasser, dann begebe Dich nach Mogemog, dort findest Du eine Frau, bei dieser bleibst Du, sie soll Deine Mutter sein!« Der Vogel flog nach Yap zurück und sagte zu Yoneläp: »Ich habe Liomarâr gefunden.« — Liogefalû ging nach Mogemog und sah dort Liomarâr. Da sagte die Frau: »Bist Du ein Geist oder ein Mensch? Wie heißt Du?« — »Liogefalû!« — »Dann bist Du meines Bruders Kind!« — Liogefalû erhielt das Fathüülüs[1] als Haus und kochte für Liomarâr. Sie durfte wohl kochen, aber nicht mitessen. Eines Tages bereitete sie wieder das Essen zu und kostete etwas davon. Liomarâr merkte es und sagte: »Du hast von meinem Essen genascht! Jetzt mußt Du allein bleiben und ich gehe nach Yap!« So ließ sie das Mädchen allein. Diese bekam einen Knaben Tsegêb, der sehr schnell heranwuchs. Er stieg morgens in den Himmel und kam am Abend wieder herab, um zu kochen, dann begab er sich wieder in den Himmel. Eines Tages kamen zwei Geister von Medân und die beiden Frauen fürchteten sich sehr. Sie gingen zum Riff und machten mit einem Stein einen Zauber, der verwandelte sich in ein Boot. Da setzte sich der Knabe hinein und fuhr zu seiner Mutter nach Yap. Im Livinâu-Kanal liegt noch heute das große steinerne Boot. Sie begaben sich nach Gatšapâr in das Haus Maâu.

2. Wie Fais entstand.[2]

(Erzählt von Refel.)

Unten im Meer wuchs eine Frau auf, die hieß Loróp, sie hatte weder Vater noch Mutter. Es war eine Frau, aber ihr Kopf war eine Koralle, ebenso waren Augen und Zähne spitze Korallen, dagegen waren Nase und Ohren, Arme und Beine wie beim Menschen. Sie stieg aus dem tiefsten Meer empor und begab sich nach Losiop, wo es damals noch keine Menschen gab. Die Frau rief: »Eins, zwei, drei!« Aber es kam niemand. Drei Monate später bekam sie ihren ersten Sohn und nannte ihn Fathûx, er sah ganz wie ein Mensch aus. Nach zehn Monaten gebar sie den zweiten Sohn Thepflumal und nach weiteren zehn Monaten ihren dritten Sohn Mâtîx.

Loróp suchte häufig ihren Platz auf dem Meeresgrund auf. Hier gab es zwar kein Haus, aber viele Taro; sie schlief dann in einem großen Calophyllum-Baum. Hier lebte sie allein, während die Söhne oben auf dem Land blieben. Ihnen brachte sie oft Taro und andere Nahrungsmittel hinauf, denn auf Losiop gab es nur Kokosnüsse. Die Söhne wußten nicht, wo die Mutter hauste, schließlich bemerkten sie es doch. Eines Tages schlich der jüngste Sohn hinter der Mutter her, ohne daß die Frau etwas davon merkte. Sie sagte: »Eins, zwei, drei!« und

[1] Identisch mit „Geisterhaus", vgl. S. 334.
[2] Vgl. dazu die Sage auf S. 334.

ging dann ins Wasser. Der Sohn tat dasselbe und gelangte auch ins Wasser. Die Frau sah ihn, drehte sich um und sprach: »Nun muß ich sterben! Du sollst mich hier begraben!« Nach zehn Tagen starb die Mutter. Da sprach der Jüngste zu seinen Brüdern: »Wir müssen die Mutter begraben!« Der Älteste sagte: »Ach, was! Wir werfen sie einfach weg!« Der jüngste sagte: »Gut!«, doch grub er die Mutter unter ihrem Calophyllum-Baum im Meer ein. Als die Brüder nach einigen Tagen zum Fischen fuhren, zog der Jüngste Taro und Bananen empor. »Ache, sagten da die beiden andern, »Du hast das, was uns fehlt, emporgezogen!« Und so fischten sie vier Tage in derselben Weise und jeden Tag mit demselben Erfolg. Als sie nach einigen Tagen wieder fischen gingen, befestigte die Mutter Loröp daran den *dö*-Baum. Da sagte Mâtfx: »Mein Haken sitzt an einer Koralle fest!« Seine Brüder sagten zu ihm: »Schneid' ihn ab!« Er aber antwortete: »Der Stein ist wohl schwer, aber er kommt nach oben!« Da brauste das Wasser auf und das Boot mit den dreien saß plötzlich auf dem Trocknen. Der Stein war gehoben; es war ein großer Platz, in dessen Mitte das Boot lag. Der Älteste sagte: »Das ist mein Platz! Er heißt Fais!« (Denn die Mutter hatte einst gesagt: »Wenn ich sterbe, nennt den Platz Fais und in der Mitte will ich wohnen!«) — Mâtfx erwiderte: »Nein, das ist mein Platz!« — »Was, ich bin älter und der Häuptling!« — »Neine, sagte der Jüngere, »es ist mein Platz!« Und so stritten sie sich hin und her. Da sagte der Jüngste: »Wo ist die Mutter?« — »Wir haben sie doch fortgeworfen.« — »Wir wollen aber die Mutter aus dem Geisterland rufen!«

So taten sich alle drei zusammen und riefen. Der Älteste rief, nichts rührte sich, der Zweite rief, nichts zeigte sich, da ließ der Dritte seine Stimme ertönen: »Loröp, Loröp!« Da antwortete die Mutter: »Hmmm!« — Der Jüngste sprach: »Wem soll das Land gehören, Loröp?« Da antwortete die Mutter: »Das Land gehört nur dem Mâtfx!« Da sagte der Jüngste: »Also bin ich der Häuptling!«

Später kamen drei Geister, man weiß nicht woher. Diese vertrieben die Söhne der Loröp von Fais und zwar nach Mogemog. Die drei Geister Temagûr, Sonsonmâl und Marôa mit Namen, blieben dagegen auf Fais.

3. Wie Fais zum Taro kam.

Als die drei Geister (s. oben) auf Fais wohnten, gebar dort eine Maus ein Mädchen, namens Teninfntho; die drei Geister wußten nichts davon. Eines Tages fanden die drei das Mädchen. Dieses erschrak heftig. Da sagte der Geist Marôa: »Warum ängstigst Du Dich? Ich will Dich zur Frau haben!« Sie sagte ja und blieb bei ihm. Bald wurde sie jedoch traurig und hatte Sehnsucht nach ihrer Mutter. Da sagte der Geist: »Wo ist Deine Mutter?« — »Meine Mutter ist eine Maus!« — »Komm, zeig mir Deine Mutter!« — »Du darfst sie nicht sehen. Gib mir einen Fisch; ich allein darf sie nur sehen!« — »Welchen Fisch willst Du denn haben?« —

»Den Haifisch mag die Mutter am liebsten.« — Der Geist fing einen Haifisch und gab ihn seiner Frau, die ihn ihrer Mutter brachte. Diese gab der Tochter dafür hundert Körbe Taro. Als ihr die Tochter noch eine Schildkröte gab, erhielt sie von der Maus noch zweihundert Körbe Taro für den Geist. Der Geist fing nun einen Wal und sagte: »Der ist für Deine Mutter!« — »Der ist zu groß! Nur die eine Hälfte bekommt die Mutter, die andere behalten wir!« Der Geist schnitt deshalb den Wal zwischen den Flossen entzwei und gab die eine Hälfte, den Schwanzteil, seiner Frau und diese gab ihn an ihre Mutter weiter, die dafür tausend Körbe Taro hergab. Die Frau gebar nun eine Tochter Ferethûm mit Namen. Als sie zehn Monate alt war, wurde sie dem Geist Temagûr zur Frau versprochen. Dieser hielt sie zunächst wie seine eigene Tochter und als sie groß genug war, heiratete er sie. Temagûr ging oft fischen und gab die Fische seiner Schwiegermutter. Diese brachte sie zur Maus und sagte: »Ich habe von meiner Tochter viel zu essen bekommen.« — Die Maus gab für die Fische dreitausend Körbe Taro, denn sie hatte zwanzig Haifische erhalten. Teninfûtho bekam noch eine Tochter, sie gab ihr den Namen Torumâl. Diese heiratete den Sonsonmâl, der machte es ebenso wie Temagûr. Torumâl bekam eine Tochter Luelerâm und Ferethûm einen Knaben Lulâk. Die beiden Kinder heirateten einander und hatten eine Tochter Leâd, zu der sich noch viele Kinder gesellten. Sie fischten häufig und gaben dann von der Beute der Maus ab, die ihnen dafür Taro schenkte. So hatte Fais stets Überfluß an Täro.

Chamisso[1] gibt eine Erzählung aus dem Munde des Oleai-Mannes Kadu wieder, die auf Mogemog spielt und einen Diebstahl zum Inhalt hat.

363

XI. Spielzeug, Musik und Tanz.

An Spielzeug kennt man:

1. Spielboote *(ud murrufdi* oder *a pellr)*[1];
2. Windrädchen *(le ganedjäredjur)* von der gleichen Form wie auf Kusae[2];
3. Blattflechtereien z. B. Tabakpfeife *(fogdla)*, fliegender Fisch *(manär)*, Flöte u. ä. (s. Abb. 460—462);

464.

460.

463.

461.

462.

465.

Abb. 460—465. Blattflechtereien (nach Skizze Hambruch). 460 = Tabakpfeife, 461 = fliegender Fisch, 462 = Flöte. — Abb. 463. Brettopfel (Hamburg 20411, 1/6 nat. Gr.). — Abb. 464. Spielmaske (Hamburg 32791, 1/4 nat. Gr.). — Abb. 465. Spielscheibe (Hamburg 32661, 1/6 nat. Gr.).

---

[1] Museum Hamburg 5145.
[2] Vgl. Sarfert 1919, Bd. II, S. 496.

4. Brettspiel *(pâp)*, das wie auf Ngulu gespielt wird (Abb. 463);
5. Spielmaske *(mêlle metâu)* aus Kokosbast für Knaben (Abb. 464);
6. Spielscheibe *(tagâl)*: dieses Gerät (Abb. 465) soll in Falalap gemacht sein; Hellwig glaubt jedoch, daß dieses Stück zum Geisterhaus gehört und eine Sonnendarstellung ist.

Musikinstrumente im eigentlichen Sinn des Wortes hat man nicht; man benutzt das Muschelhorn aus Tritonschnecke *(tâui)*, jedoch zum Signalisieren.[1]

Tänze haben mit denen auf Yap Ähnlichkeit[2], der Tanz mit dem Tanzstab *(xaûu·âl)*[3] ist bekannt.

365

XII. Lieder.

Die Gesänge sind mit dem phonographischen Apparat aufgenommen worden; die Walzen lagern im Museum für Völkerkunde zu Hamburg.

1. Gesang: von einem jungen Mann namens Olieſâñ vorgetragen.

Gâ the bosôu i aṅ i mômc	Alle Leute fahren, gut ist der Wind.
Xêl mêle ŋâma dûô	Ruhig ist die See, wir fahren gen Yap.
Namê melt ue mâle e mô	Ruhig ist die See, in der Luft schwebt ein Vogel.
Ne šâlôp thêpâmen xotâûlr	Er freut sich, aber den Platz,
Nolâ̂ no udr igelâp	Den er sieht, er erreicht ihn nicht.
Ne xo kathî o polô̂ ne ſâhie	Im tiefen Wasser sieht er einen Fisch,
Ijethêx mogôueli pololô̂	Er fragt, wo ist das Land: vor dem Fisch, hinter dem Fisch?
Ragâu ilull côdj, ragâu ilull thîlîk	Alle Leute fahren, das Kanu erreicht das Land.
Ra bugebâx uôt djuṅdî	Es kommen die Leute mit Beilen an den Strand.
Ncâux taliṅuê e djûx	Sie schlagen die Haltetaue des Mastes entzwei.
Pogô osâ fathîl mull liôdj	Wie Haifische fallen sie mich an.
Eadja loûm mâ̂ eât	Wie Blitze eilen sie an das Kanu.
Ra malaxagâ ragldj na vêṅ esâr	Die Insassen gehen ins Wasser,
Na rê ualê ragadjâ madjê	Alles trifft sich nahe am Kanu,
Mei edṅ vôlô môdj.	Sie lassen das Kanu im Stich und gehen an Land.

2. Gesang: von einem Mann Matudjêl aus Falalap vorgetragen.

Oro mâthuuêla fithî uôro mârct	Ist das Spiel zu Ende, kommt die Frau zum Mann.
Redjâ momô̂ elulmal	Schon früh am Morgen bei Sonnenaufgang;
Thi i talê thupâl	Sie wollen sich nicht trennen

Thememôliâr	Auf Thememôliâr (Platz im Busch)
Irêthumêth thi e pât	Beide haben Angst.
Thelâi uerâr marîs	Ein kleines Mädchen sieht die beiden.
Ma pelân mê tleriâx	Die Tatauierung der Frau ist sehr schön.
Redjîri me thelôx	Beide gehen an einen anderen Platz,
Re thelêi loilêi i mâl	Im Wasser waschen sie sich.
Ealân thethêipal	Beide sind schlau und klug.
Thiuâl tê uthithâx	Die Frau zerbricht dem Mann den Penis,
Lâne lumâl fethê uâr mâr êti	Der Regen kommt. Zum Stelldichein dreht er den Kranz.
Fithibân e thupâl.	Fithipân ist klug.

3. Gesang: vorgetragen von dem jungen Oliefân. (Das Lied dichtete eine Frau aus Thorolôi.)

I bôth e thixêx filê thithôx	Junge Kokosblattfiedern sind um die Oberarme gebunden.
Uôi e liûm Mogirân	Sie gehören dem Mogirân.
Thelne mudân meuîlsi	Die Frauen mögen ihn leiden und wollen ihn haben.
E mâl egâi Mogirân	Im Kanu wollen sie Mogirân sehen,
E fâi erâi uruldn	In den Busch gehen sie und tanzen den Reigen.
Felân pôlr e thâiân	Es hebt der Mann die Hände, wie schön.
U githêthi magêiiâl	Die Frau erblickt den schönen Mann,
Legourû matêi mêtî	Zwei Frauen sagen: »Sieh den hübschen Mann!«
Teitâi iandx.	Sie bleiben stehen und sehen ihn sich an.

4. Gesang: vorgetragen von drei 9—13 Jahre alten Mädchen.

Re uelegâ moân rûlû umâl	Jede Frau liebt etwas.
Uelês theulige xôle mellt toêjôx	Den Beischlaf liebt sie nach Sonnenuntergang.
Thakîi mâthûgurfîth	Die Tatauierung der Frau ist sehr schön.
Uerîx mâl e gôiân	Ein Mann schaut sich nach einer Frau um.
Elîch îjê ater û mâdj	Die Knoten im Tau, sie zählen die Anzahl des Beischlafs.
Eêr oim melîân	Der Verstand ging ihr verloren.
Felê alê ile mâl	Sie flicht schnell eine Matte und legt sich hin.
Neâ êr thoiûldal	Der Mann schaut zu, er will sie beschlafen.

367

Eolôx makâth llup	Sie bittet, sie sogleich zu beschlafen.
Fân e rüthâ ne thatâl	Nun hat sie Angst vorm Samen und will fort.
Ueli logô nêi.	(Es spricht der Mann:) »Nun ist mir leichte und geht weg.

5. Gesang: vorgetragen von dem Mann Elañumâr.

E mârathe rê foijâtî	Ein Mann und eine Frau unterhalten sich
I thêi matâk u thuthâx	Weit vom Dorf entfernt.
Re fêl mâr ougîthi	Sie schlafen. Es deckt der Mann die Frau auf.
E mâr ougîth re fêi	Doch er beschläft sie nicht.
Te gê fâli u mâr îl	Einen Kranz setzt sie ihm auf das Haupt;
E fêl irê ubelêlôx	Die Blüten sammelte sie selbst am Baum.
Ualâ e môx u mâl	Ihm schenkt sie die Blüten. —
Tha umeiên uiejôr alâ.	Nun wartet der Mann und die Frau kommt nicht.

6. Gesang: Vorgetragen von zwei 12—13 Jahre alten Knaben.

Idû i fêl mâk momâ e rolôx	Mann und Frau schlafen, der Wind weht.
Xolaxê maligâl the ƥman	Beide unterhalten sich.
E tê u mâtî fole lôtâ le geſti	Und der Mann will die Frau beschlafen.
Thithê mo oll lôt ûrû	Sie entfernen sich aus dem Dorfe;
Thithê leſti tale xâtî	Sie begeben sich an den Strand.
Eve thûlâx tue gêl e rauâr	»Hier sollst Du mich beschlafen!
Mâre e mâm erâk urû fân e tîlx	Ich schenke Dir einen Kopfkranz!«
Erâk ûrû mâle ei ûrâl eôr le fâth	Der Mann beschaut sich die Tatauierung der Frau.
Thâl a fol mâ i lâl	Nun beschläft er sie.
E rârthorôr ma rindî	Die Augen der Frau glänzen vor Wollust,
Nolô tewel tiidn	Schnell beenden sie nun den Beischlaf.
E oglîthi fân e mâm	Er betrachtet die schönen Schenkel der Frau;
I ƥligiri fân e tîlx	Er salbt die Schenkel mit Öl.
I tjâl le thâk bogâk uli	Nun nimmt er Abschied, begibt sich zum Kanu.
Urâ leiâk fithî u werbi thipâl	Er setzt das Segel. Er ist zufrieden.
Hm, hm! Hbi, hbi!	Hm, hm! Hä, hä!

7. Gesang: vorgetragen von drei Knaben im Alter von 12—13 Jahren.

I jõ ãũ mãr e mẽm	Allen gehört der Kranz.
xuluthãl thavẽ̃ lili ua le mõl	Gut riechen die Blätter, gut munden die kleinen.
Mãr e momã̃ walẽ e olõx	Von Thorolõ̃ kommt der schöne Kranz.
Mõ̃ i gũ talethãx thewu taledù	Die Frauen von Thorolõ̃ fürchten nicht die Frauen von Mogemog.
The te ma tĩlx e agĩli e	Hier ist man friedlichen Sinns; kommen die Frauen hierher,
O vẽi lĩ i wulanã̃ mẽi mãle	Werden alle sie schätzen wissen,
Ue mõlũ mõna xatĩãx	Werden alle sie gut bezahlen.
Sigãl lirã̃ butĩl	Unter jungen Palmen sitzen sie.
Thamẽ resã̃ me fe lail	Und werden warm und schwitzen,
Xalẽs thitherõù	Sie sollten ins Wasser gehen.
Fegithithãr thamuſãl	Drei Männer folgen der (!) Frau ins Wasser.
Lali kalĩth	Sie haben nichts Arges im Sinn.
Thitherõu fogĩ.	Alle setzen sich hin.
Thitãr le rĩl ũ li mathãù	Sie mögen sie leiden und schwatzen.
Uvẽi giligeldù	Sie blicken auf die helle Haut
Tha fithi gĩi re rõoù	Und die leichte feuerrote Kleidmatte
Eth taliu gutĩã̃ i mẽm	Gut riecht sie wie Taro.
Ne tõuur le methãù.	Heim geht die Frau nach Thorolõ̃.

8. Gesang: vorgetragen von zwei Mädchen und zwei Knaben im Alter von 9—13 Jahren.

E modno nethãù nõlo dirak	Im Geiste sieht ein Mann eine Frau,
Mẽi thiũe uru lõno lipĩi	Es sagt der Mann zur Frau,
Ĩli mavẽ̃ momã̃ e	Sie solle in den Busch gehen und wohlriechende Blumen holen.
Ónо tligĩ mãù e rĩn	Die duften wie die *ónо tligĩ*, die *mãù e rĩn*
Thelolãl thamirẽs	Und wie die *thamirẽs*.
A eorõr mãli elẽ nesẽ werĩxua	Er überlegt sich, was er der Frau sagen will.
Tall elthe mãle tlall fãle	»Ich sehe an Deinen Beinen die Fische.«
Mõlo malẽ initĩige methẽ	Er salbt mit Öl die Tatauierung
Ligõu mavi kinẽ nodr lãgu	Mit Fasern vom Platz Thorolõ̃.
Elẽ tõle nodr mãmi	Hübsch sieht die Frau aus.
Drie dart tãle bolõu walẽ	Er setzt sich zu den Füßen der Frau.

Eđle e rân̄ lolô ulû eôro
Era egê mâli eđle soûr
Raûr urû eolôu era urû

Ńeêi xathe rou ſân̄e le
Mêle xulü ſâle tâü uwô

Filł matšâ neñâx.

Die so schön ist wie ein Kanu.
Mit *rân̄* reibt er sie ein, sie sieht gut aus.
Die Frau singt ein wenig und flicht ihm aus *era*-Blüten einen Kranz
Und er sitzt nahe bei der Frau
Er zaubert, daß sie ihm ins große Haus folgt,
Denn diese Frau mag er gern leiden.

370

XIII. Verschiedenes.

Kunst. Wenn auch alle Gegenstände des täglichen Bedarfs von wenigen Ausnahmen abgesehen (S. 316) unverziert sind, so wäre es falsch, daraus auf ein Fehlen jedweden ornamentalen und plastischen Schmuckes zu schließen. Die erstgenannte Art ist in den üppigen Tatauiermustern und an dem reich verzierten Geisterhaus hinreichend vertreten und letztere kommt, wenn auch nur selten vor z. B. beim janusartigen Zaubergerät.

Medizinische Kenntnisse sind den Familienmitgliedern, die auch die Krankenpflege übernehmen, nicht fremd. Man wendet sich gern auch an alte Leute, die auf diesem Gebiet über eine besonders reiche Erfahrung verfügen. Kranke umsorgt man in jeder Weise und auch Sterbenden läßt man bis zur letzten Minute liebevolle Pflege angedeihen. In der Krankenpflege lösen sich die Familienmitglieder gegenseitig ab. Eine Heilung kann jedoch nur eintreten, wenn der Zauber nicht vergessen wird.

a) Knochenbrüche werden ebenfalls behandelt. Einige Leute verstanden sich darauf, Brüche zu schienen. Die Knochen wurden aneinander gepaßt, geschient und gewickelt; dazu wurde ein zerquetschter Pflanzenbrei *(xoalú)* als Paste aufgelegt;

b) gegen Frambösie *(ijelaú)* werden *úúth, vát, witéi, lúx, xiaúb* verabreicht;

c) gegen Rheumatismus wird der Absud von *ethuúth* und *karáx* getrunken, oder man reibt den Körper mit *arifát* ein;

d) gegen Buschmucker *(mái)* helfen die Medizinen *túrtür, xóól, djídjí.*

e) die Treibholzkrankheit *(xo péipéi)*, dadurch hervorgerufen, daß die Fischer dem »heiligen« Treibholz zu nahe kommen, kann durch jedes Mittel geheilt werden;

f) bei Ringwurmkrankheit *(faguthír)* hilft *xáttr*, das eingerieben und getrunken wird; ein weiteres Mittel besteht darin, daß man Blätter von *tholegúl* zwei Monate hindurch auf die Hauptstellen bindet und dies alle vier Tage erneuert;

g) Schwären *(marágús)* werden zunächst mit einer Muschel ausgekratzt und dann mit *livos* eingerieben;

h) Pocken *(methinau)* werden folgendermaßen behandelt: eine alte Kokosnuß wird über dem Feuer geröstet, dann bricht man den Inhalt heraus, trocknet ihn, rührt ihn mit Kokosmilch an, wickelt ihn in Bananenbast und legt ihn auf den Ausschlag;

i) gegen Schuppenringwurm *(gil thebô)* wird *thôlepul* angewendet, was jedoch wenig nutzt, so daß die Krankheit als unheilbar gilt;

k) gegen Durchfall *(thêr)* hat man kein Mittel, man läßt den Kranken viel essen;

l) Verstopfung *(pilâd)* wird dadurch gebessert, daß man etwas vom Hauspfosten *(tabethûm)* und vom Schwimmer seines Kanus abschabt, die Pulver in Kokosmilch anrührt und das Ganze trinkt.

m) gegen Schnupfen *(mañerôth)* hilft das Einatmen des Geruches geschabter und zerstampfter Papaya-Wurzel;

n) bei Augenentzündung *(djodjêl i matâl)* wickelt man kleine *thâth*-Beeren zwar je vier Stück in Bast und legt diese Päckchen auf die kranken Augen;

o) gegen Zahnschmerz *(uarêx e ni)* hat man kein Mittel;

p) gegen Kopfschmerz *(thareliôr)* wird blühender Ingwer zerrieben, in Wasser getan und aufgeschnupft;

q) gegen Schüttelfrost *(liâr)* wendet man aromatische Blüten an.

Als »unheilbar« werden angesehen Dysenterie *(pogothâ)*, Auszehrung *(thêi omerîñ)*, Elefantiasis *(methulôp)*, Influenza *(misilipîg)*.

Eine **Schrift**, wie sie einige Zentralkaroliner benutzen, haben die Mogemog-Leute nicht gekannt, jedenfalls berichtet Hambruch nichts darüber. Dagegen hat man Knotenschnüre[1] aus Kokosbastfaser: die einzelnen Knoten bedeuten tragende Palmen.

Zeiteinteilung. Zur Tageseinteilung notierte Hambruch folgende Ausdrücke: Tag = *thabûñ*, Morgen = *ualethû*, Sonnenaufgang = *thataôt eâl*, Mittag = *thaû'leâl*, Sonnenuntergang = *thathuedl*, Nacht = *thâm methûr*. Das Jahr *(thatîr e marâm)* zerfällt in die Regenzeit *(thawuthôx u ûth)* und Trockenzeit *(toaguthôx)*, die Rechnung erfolgt in Monaten *(thartêra e marâm)*. — Mond = *marâm*, Neumond = *e ulût*, erstes Viertel = *eotûx*, Vollmond = *ulerîñ lâp*, zweites Viertel = *eotûx metarâl*.

XIV. Zur Sprache.

Die Mogemog-Sprache steht der von Südwest-Mikronesien (Merir, Pur, Sonserol, Tobi) nahe und weist nur dialektische Unterschiede auf. Es konnte sich, wie ein Beispiel zeigte, ein Merir-Mann sehr gut mit einem Mogemog-Mann unterhalten.[1] — Bei den Sprachaufnahmen ist zu bedenken, daß es die ersten sind, die Hambruch auf der Reise vornahm, hinzu kommen noch technische Schwierigkeiten, auf die schon Pater Clain hinweist.[2] Ein kurzes Vokabular der Mogemog-Sprache hat Tetens zusammengestellt[3], der Wortschatz ist verschiedentlich zum Vergleich neben Hambruch's Material gesetzt.

Personalpronomen.

ich	*ṅdṅ*	wir	*paṅdtš*
du	*kēl*	ihr	*χamdm*
er	*aīr*	sie	*tīr*

Hambruch hat noch weitere Formen notiert, jedoch dazu bemerkt, daß er sicher nicht richtig von den Eingeborenen verstanden worden sei; diese Formen sind wegen ihres zweifelhaften Wertes deshalb nicht angeführt worden.

Possessivpronomen.

mein	*iēi*
dein	*edm*
sein	*edl m'mateléi*
ihr	*feſēl e keléi*
sein	*ealēl lūdtš*
unser (inkl.)	*edl itēi*
unser (exkl.)	*edl e pdṅ a lerimdt*
euer	*ear o thokeléi*
ihr	?

[1] Thilenius usw. 1927, S. 187. — Größer ist der Unterschied zu den zentralkarolinischen Sprachen; Lütke (1835, Bd. II, S. 350f.) geht darauf näher ein.

3: Thilenius and Hellwig--245 (1909-10) 1927 Woleaians 1-4
116, 161, 609, 142 Aurupik

Only Aúrepik and Oäo, the two larger ones of the 5 islands of this atoll, are inhabited. The people of Aúrepik received the strangers hospitably, and they were courteous and communicative...and even the smallest children did not show the slightest fear...The population consisted of some 60 - 80 estimated persons. With regard to their appearance two types could be distinguished: one, very frequent type was brachycephalous and had a stout stature; the other type was less brachycephalous and somewhat slenderer. In general the skin of the women showed a lighter color than that of the men, and sucklings had almost the color of white babies.

3: Thilenius and Hellwig--245 (1909-10) 1927 Woleaians
116, 302 Aurupik

The slightly waved hair is in most cases cut short with the exception of the part above the forehead; several women had their hair somewhat longer and parted, and a few waves were hanging over the forehead.

3: Thilenius and Hellwig--245 (1909-10) 1927 Woleaians
116, 361 Aurupik

The inhabitants live in two farmsteads, Valiâureg and Rongali, where there are but a few well-built and neat houses... The house of the chief is built on a stepped stone-foundation which is ca. 2 meters high. On a...well-cultivated place, neatly covered with coral gravel, Hambruch discovered a house with a grave nearby.

3: Thilenius and Hellwig--245 (1909-10) 1927 Woleaians
116, 173, 782, 226 Aurupik

[LEM: Concerning an isolated house and grave, Hambruch was told:] the god Yongelap gave orders to the man Choiss in Yap to travel to Aúrepik and there to create men and women out of a Spondyl shell so that the island would be populated. This was done, and Choiss became the father of a son, Raigumeng, whom Yongelap appointed as protector against typhoons. Raigumeng is revered like a god. The natives invoke him before they go fishing: "Raigumeng, give us fish!" On other occasions, e.g. before a sea voyage, offerings are made to him. Within the house many offerings were suspended: wreaths, necklaces, mats, coconuts, etc. Since Raigumeng's death his house and grave have to be kept in good condition.

3: Thilenius and Hellwig--250-251 (1909-10) 1927 Woleaians
116, 731, 261 Woleai

Hellwig went over to the island of Wolé́a, the western part of which he visited first. The devastation caused by the typhoon (March 28, 1907) was to be seen everywhere.

....Several varieties of taro and sweet potatoes in well-kept fields showed that agriculture and food conditions had improved. Coconuts were scarce and swine were lacking completely so that the population will have to live on meager rations for years to come. As on Mogomog and Aúrepik, here, too, the menu was made complete by a series of forest plants....several chickens had survived the typhoon flood, and their offsprings had increased considerably since....Hellwig was told...that the typhoon had not struck at night, otherwise the entire population would have been killed. When the waves had grown higher and higher and when the flood had become imminent, ropes had been fastened around the strongest trees, and the inhabitants had tried to cling to them.... Of the 6-700 inhabitants of the island group about 200 were said to have died. There was loud wailing, and it did not cease during the subsequent period of famine, when the fruits of the fields, with difficulties recovered from the mud- and stone-covered ground, were soon eaten up, and when the fish supply was low and had to be eaten raw, since the fishing implements had been lost and there was no dry wood around to make fire with. Even today when, on occasions, the women again become conscious of the consequences of the catastrophe, [251] a general loud lamenting sets in.

3: Thilenius and Hellwig--251 (1909-10) 1927 Woleaians
116, 609, 562 Woleai

The natives Hellwig had to deal with were friendly and courteous, and the children were by no means shy. The visit of the whites was a rare event and due to this event everybody seemed to be stimulated into a good mood. It became apparent that the women were allowed a great deal of freedom. It did not matter that a white man was sitting alone with a [native] woman in a hut, or that a woman sold her property to the white on her own accord. They joked and laughed... and on every occasion they mixed songs, recited or sung, into the conversation or with business, and sometimes these songs were accompanied by rhythmic dance movements. The information which was given about a weaving loom on which a mosquito net of Hibiscus fiber was woven, was constantly and in the most funny manner interrupted by an old lady. Her flow of words had been acclaimed by the women with laughter even before the woman had squeezed herself in through the low door opening. She seemed to be a popular "jestress." In front of the narrow door of another house another gray-haired woman sat weaving so that Hellwig was unable to enter. In her stoical calmness she remained unimpressed by the persuasion of either Hellwig or the female occupants of the house. Finally, Hellwig pushed the old woman aside and went into the hut; with a little gift he atoned for his tour de force, and, after that the old woman became the friendliest person of all.

3: Thilenius and Hellwig--252 (1909-10) 1927 Woleaians
116, 103 Woleai

[AN: According to our native informant] the name Woleai (Wolea, Wolaa) is applied to the entire group by foreigners only, who name an island or an island group after the name of the village which they either visited first or most frequently - in this case, the island of Wolea -. The natives themselves, however, use just as often a second name for the group, namely, Falálap.

3: Thilenius and Hellwig--253 (1909-10) 1927 Woleaians
116, 574, 609 Woleai

The Watoai natives endeavoured in every way to make the stay of their guest a pleasant one....As was the case on Máriam and Wolea, here, too, a pathway, lined with stones run in west-easterly direction through the whole length of the island.

3: Thilenius and Hellwig--253-254 (1909-10) 1927 Woleaians
116, 262, 241 Woleai

On that point where, during the last typhoon (1907), the sea had flooded over the south coast, a pond was formed, 300 meters long; framed with woods, it offers now an idyllic sight. The surrounding swamp-taro plantations thrive quite well, just as on several humid places in the proximity of the houses. Two more taro varieties and sweet potato fields in the dry ground along the pathway and in the neighborhood of houses yield an ample supply. On the other hand, there are only a few papaw trees, and, at present, there is not a single fruit-bearing breadfruit tree on the whole island....[254] Coconuts, the chief article of food, are still in abundance for the small population. On each farmstead supplies of drinking and eating nuts can be seen. As it is customary on most of the Caroline Islands, the sap of the palmtrees is collected one to three times a day for the preparation of the favorite fermented drink. Many fruit trees have escaped the devastation... Three lizard varieties were so frequent that, standing still in the bush, one could sometimes find oneself surrounded by up to 10 lizards. Sometimes a plentitude of heavily populated formicaries could become a bother. In a saltwater hole (diameter: 1 1/2 m., depth: 1/3 meter) on the farmstead Mauxean, Hellwig was shown a fish of dark-green-bluish, almost black color; it was about 30-40 cm. long; its caudal fin was placed horizontally, and it also worked in this direction. Two years ago, the typhoon had thrown this fish into this waterhole, and since then, it was said, nobody had fed the animal. Never before had the natives seen such a fish, and we felt justified in assuming that it belonged to regions which are beyond the reach of fishermen...

3: Thilenius and Hellwig--254 (1909-10) 1927 Woleaians
116, 361, 342 Woleai

The north-eastern section of the island. . .is part of the Pūyod region which belongs to the chief Mătewerit who is in Elato at present. There are eight farmsteads in this region.

Adjoining to the south-west--the boundary line runs across the middle of the inland lake--is Lūyapūdam (Lī́yab pídăm) with five farmsteads; this region belongs to Wučliyar (Uélīyar); Tăwoxāb, the south-western end of the island with its six farmsteads belongs to the chief Iyĕrimar. Each one of these three regions has two canoe houses, and several farmsteads consist of work- and cook-houses or sheds. Ghost- and menstruation-houses could not be seen. The wooden walls of these houses consist of planks which were vertically inserted between frame-beams.

3: Thilenius and Hellwig--255 (1909-10) 1927 Woleaians
116, 423, 565 Woleai 1-2

The counting of the palm-trees... revealed that there were 9480 palms on the island (several hundred very young palm trees and seedlings had not been counted). The three chiefs owned 3430 big palm trees; 5 "minor chiefs" own 3600 pieces; 40 pieces were the property of the unmarried sister of a man from Watoai who though he is living here does not own a single palm tree; he is, however, married abroad. According to the rule of inheritance, palm trees as well as landed property of men who had died without sons or brothers are said to become the property of the chiefs of those who had died. Evidently, however, women, too, could become heirs to their husbands; for each one of 2 widows owned 300 and 850 palms respectively.

3: Thilenius and Hellwig--255 (1909-10) 1927 Woleaians
116, 163 Woleai

A survey of the island's settlement conditions...brought the following result: 21 dwelling houses, 27 men, 29 women, children under 12 years of age: 6 boys, 11 girls; a total of 73 persons.

3: Thilenius and Hellwig--256-257 (1909-10) 1927 Woleaians -1-2
116, 535 Woleai

[AN: A lively crowd had gathered in front of the canoe house where dancing and singing were in full progress.]....It was a marvellous sight...to view this column of some twenty young, well-built men who, clad in foliage-skirts and adorned with flowers on the breast and on the head, accompanied their singing now with graceful, and now with brisk motions; they often emphasized the rhythm by striking with their hands more or less loudly the parts of their bodies; each dance was terminated with a final stanza which was marked by wild yelling and clapping and which was appended with an additional "a hăka"-cry. These column-dances, many of them of an erotic nature, alternated with sitting dances and with dances with a stick (nauru). Hellwig was surprised to find here dances with a stick, since he had been told on Wolea that since the typhoon this kind of dance was not practised anymore. And here he saw not only the neatly worked dance sticks, but he witnessed also the rhythmic accuracy of beat which indicated considerable practice.... the first two sections of the dance could not be seen clearly. In the third section each one of the two groups of dancers of 8 and 10 men respectively formed two concentric circles which moved around a common point in opposite directions. This made it possible for the dancers who met after a few steps to stop and to beat stick against stick, thereby alternately turning the hands up and down: click-clack, click-clack; thus four blows sounded before the circles moved on. The fourth section was similar to the third one, but the four small circles had united into two large ones each, and the tempo had been increased, while a chorus of small boys was singing a frequently repeated text to the

accompaniment of the click-clack-rhythm... The sitting dances had an amazingly large selection of texts and movements. Immediately after the final cry "a hăka" which concluded each of the generally quite short sitting dances, one of the dancers proposed another text in a loud voice, and this proposal was instantly accepted and carried out. Two boys, 3-4 years of age, were the most fervent ones: they attended to their business ardently; they did everything more accurately and more carefully than the grown-ups, they made proposals and provided humorous incidents, for instance by singing faster toward the end and by gesticulating, so that they might come to the end eariler than the others, and this always made a very comical effect for, at the end, they always sang at the top of their shrill voices. [257] The evening before, Hellwig and especially the old people had been diverted by these two droll youngsters who had entertained them with solos and duets....Another specialty was offered by seven little girls. They had seated themselves behind the column of dancers and at first they accompanied several pantomimes with their clear and loud voices, afterwards they accompanied motion-dances during which the dancers jumped and turned so briskly that they were dripping with perspiration. Later on, during the sitting dances, they seated themselves at the side of the row of dancers and were able to bring a wonderful contrast and yet harmony into the tone-color (timbre) in a manner which cannot be described. Around midnight the spectacle was over.

3: Thilenius and Hellwig--257 (1909-10) 1927 Woleaians
116, 533 Woleai #2

A native from Wolea informed Hellwig that various lyrics had been quite new to him [LEM: in the spectacle on Utagal], and he went on explaining that new songs were constantly springing up and that just as many would be forgotten again due to the preference given to those tunes which were liked best, due also to the death of the composers in case they did not have any male relatives. Occasionally, one of the many old, forgotten songs was recalled and studied again; he himself [the Wolea man], like any other man, knew several songs since his days of youth, and these airs were studied anew, so that certain songs had a long life, though, frequently, they were not understood anymore since the acting persons and the basic events had become unknown.

3: Thilenius and Hellwig--257 (1909-10) 1927 Woleaians
116, 161, 177, 441 Woleai

[AN: Considerable increase of ethnographic material noted by Hellwig].... There were many similarities to Truk culture, and we found material proof of the earlier direct relations with the remote Truk group. Many ornaments had come from Aúrepik and the rather distant Ngulú and Poloot (Puluwat) groups. A Spanish and a Japanese merchant, who before the typhoon had trade stations on the group, are said to have imported special ornaments of Spondyl shell. To this Japanese, the natives apparently owed the iron kitchen pots and the other European implements that could be found in every household.

3: Thilenius and Hellwig--258-259 (1909-10) 1927 . Woleaians
116, 161, 361, 621

On Faraulip Hambruch had counted 2 villages under one chief and two lesser chiefs; 18 dwelling houses, 4 menstruation houses, 1 ghost house. Population figure: 96 (14 of them had gone to Yap). The island of Pig is smaller than [259] Faraulip...17 dwelling houses, 14 cook houses, two ghost houses, and 59 inhabitants were counted. In earlier times the population was larger. The deserted station of a Japanese merchant could also be seen. The third little island of this group, Eat, is uninhabited since the typhoon.

3: Thilenius and Hellwig--259 (1909-10) 1927 Woleaians
116, 167, 177, 755 Faraulep

The entire group had been resettled by persons from Ifaluk after the original inhabitants had annihilated each other in lasting feuds. In discussing this question the chief advanced the opinion that many a sickness had been imported through contact with European vessels, and he also made the presence of our ship responsible for the prevailing headcold and coughing epidemics. In earlier times there had been many old people; at present, however, this was not the case anymore, and people died off while they were still rather young. This is an old complaint, and not altogether without justification. ...Hambruch had gained the impression that a high percentage of the population had been infected with syphilis. After a few days the chief himself caught a headcold, and the sorcerer spoke his magic formula, passed a bunch of leaves gently over the sick man and sang at the same time his monotonous exorcising chant.

3: Thilenius and Hellwig--259 (1909-10) 1927 Woleaians
116, 784, 423 Faraulep 1-2

A taboo-sign which had been posted by the owner of the island [LEM: of Eat], the chief Sauerū, debarred the inhabitants of the sister-islands from entering Eat; at certain times only they were permitted to collect there coconuts, turtle-eggs, or tobacco-leaves.

3: Thilenius and Hellwig--260 (1909-10) 1927 Woleaians
116, 161, 167, 342, 731 Ifalik 1-3

Feladjik has 109 inhabitants, the second island, Falāláp, 99, while Elā, the third island of the atoll, was uninhabited. In 1904 the population figure was still as high as 281. During the last typhoon (March 27, 28th, 1907) 35 persons perished.... The atoll was settled from Yap... Only Wólea, Lámutrik...and Faraûlip had been settled from Ífaluk ....Fraûlip had been depopulated by civil wars, Faladjik and Felāláp are inhabited only to the north; the farmsteads are dispersed at intervals along the coast. House construction is little developed.

3: Thilenius and Hellwig--260 (1909-10) 1927 Woleaians
116, 755 Elato

In one of the houses [LEM: on Elato Island] there was a sick man, and the sorcerer was ready to exorcise the devil. For that purpose he made use of a great mat-fan which was placed in front of the house, and he also drank the contents of a coconut bowl which stood in front of the fan and which was decorated with wreaths of flowers. When he had emptied the cup he hung magic medicines, wrapped up in banana leaves, on the wall of the house.

3: Thilenius and Hellwig--260 (1909-10) 1927 Woleaians
116, 131, 137, 484 Elato

Elato is the largest of the four islands which rest upon the reef that extends itself in a north-southern direction. Elato, situated to the north, is densely covered with forests; breadfruit trees and coconut palms predominate.... The natives [AN: who had come in canoes with trading intentions] did not look very trustworthy. They were importunate and begged constantly for tobacco... Trading attempts were made, but the prices were too high and consequently only a few objects could be bought.... On certain stretches the breadfruit trees reminded us of a German forest. On other places attention was drawn to thickets of Hibiscus which supply the textile fibers for mats and waistcloths.

3: Thilenius and Hellwig--261-262 (1909-10) 1927 Woleaians
116, 165, 177 Lamotrek

At present, many inhabitants are affected by influenza; in recent times 14 people died of it, and children may die within one day. [626] In addition, dysentery has killed victims. Thus the probability that diseases are spread by the voyages of the natives is much greater than the alleged importation of all kinds of diseases by the vessels of the whites. Only for venereal diseases the whites may be made responsible.....In earlier times the population of Lamutrik amounted to 1000 persons; twenty years ago there were only about 300 left, and now there are only ca. 220.

3: Thilenius and Hellwig--263 (1909-10) 1927 Woleaians
116, 361, 162 Elato 1-4

There were on Elato 26 farmsteads with 19 permanent dwelling and sleeping houses and a number of primitive mat-houses. The population consisted of 87 persons. In addition there were two Wólea families whose members lived alternately in Elato or in Wólea, and there were finally 180 typhoon-refugees from Wólea.

3: Thilenius and Hellwig--263 (1909-10) 1927 Woleaians
116, 484, 177 Elato

Prior to the typhoon the islanders had been in close contact with Wólea, Aúrepik, Poloot (Poloat), Sátuwal, and the near island of Lámutruk; with Truk, however, they stood only in loose contact.

3: Thilenius and Hellwig--263 (1909-10) 1927 Woleaians
116, 609, 867 Elato

The natives were courteous, but the women displayed at first a certain shyness which was due to the presence of the five whites and their colored company.... We noticed the good behaviour of the children on the islands which we had recently visited; they obeyed older persons willingly.

3: Thilenius and Hellwig--263 (1909-10) 1927 Woleaians
116, 164, 755 Elato

On Elato much ethnographic material could be acquired though an influenza epidemic had impaired our work. Many patients had been quartered in the four large canoe houses, and their relatives surrounded and nursed them. The "King" had taken precautions against the spread of the disease; the preventive measures consisted of exorcism ceremonies, dances, and songs. Several times a day mussel-horns were blown.

3: Thilenius and Hellwig--271 (1909-10) 1927 Woleaians
116, 424, 438 Lamotrek

Certain songs are, as it were, family-property; they are bequeathed to the son only, but may be imparted to others if suitable return is made for it. The intercourse with Yap is rather intense. From Yap even the red paint is obtained which, made durable by an admixture of breadfruit tree sap, is used for coloring the outer sides of the canoes .....

3: Thilenius and Hellwig--350 (1909-10) 1927 Woleaians
116, 276, 438 Lamotrek

The natives almost begged for tobacco, and Krämer made high offers; but they rather denied themselves the pleasure of tobacco and kept their good articles for themselves. Krämer offered, for instance, 6 pounds of tobacco for a good Aúrepik belt, but without success.

4: Krämer-1 (1909) 1937 Woleaians 12
116, 131 Lamotrek

1. Notes from the Sailing Directions Südsee-Handbuch and British Pacific Islands Pilot (1933).

Position: Lamotrek in the middle approximately at Lat. 7° 27' N. and Long. 146° 23' East, and Elato exactly at Lat. 7° 29' 30" N. and Long. 146° 19' East; The Pacific Islands Pilot gives it as 7° 28' and 146° 24'.

Südsee-Handbuch, page 34: The Lámutrik Islands (Lamotrek, Swede) are located approximately 42 nautical miles west of Sátuwal on a triangular atoll. The corner of the triangle in the southeast is the island of Lámutrik, and in the north the island of Puch, and in the west the island of Falaite; the latter two are uninhabited. In the center of Lámutrik, we have a swamp, where taro and sugar-cane grow. On Lámutrik there is a trading station of the Westkarolinengesellschaft which is directed by a white dealer.

There are several entrance passages into the lagoon. The best is the passage southeast of Puch; the channel further to the southeast and closer to the island of Lámutrik is dangerous owing to the cliffs in the lagoon at that point. In the south of the atoll there are a number of inferior boat passages in addition to one good one.

There are anchorages in the lagoon.

4: Krämer--1 (1909) 1937 Woleaians
116, 161, 167, 731 Lamotrek

[MR: From the Südsee-Handbuch, p. 34]: Natives: Lámutrik has a population of no more than 200, who may be looked upon as new arrivals. Sixty years ago the tidal wave of a typhoon had in part destroyed the population and in part had forced it to emigrate to Truk, Jap, and Saipan; later on some of them returned to their home islands.

4: Krämer--1-3 (1909) 1937 Woleaians
116, 132 Lamotrek

[MR: From the Südsee-Handbuch, page 34]: The wind and weather are similar to conditions on Jap: from May to September calms and indefinite winds prevail, but mostly they are those of the southern quadrant; from December to May, on the other hand, the northeastern monsoon is dominant. *

*It would more accurately be called a trade wind instead of a monsoon, because the true monsoon season--such as it occurs in the Indian Ocean--is lacking.

In 1903 the northeastern monsoon blew from January until the middle of April; from then on until November eastern winds prevailed, but the air currents were irregular and southwestern winds were frequent. Between November and January the wind blew principally from southeast to northeast. Typhoons on the whole are rather rare, but the depopulation of the islands around the year 1845 is explained by just this type of natural catastrophe. The violent typhoon of March 1907 also wrought devastation on these islands. [3]

Rain falls during all months, but hitherto limited measurements have shown that 1,540 millimeters or 56% of the total are to be attributed to the five months from April to August. The driest month is February with no more than 52 millimeters of rainfall. January, February and March with 331 millimeters receive only 12% of the total.

4: Krämer--3 (1909) 1937 Woleaians
116, 131 Elato 1-6

[MR: From the Südsee-Handbuch, p. 34]: The Elato Islands, approximately 5 nautical miles from Lámutrik, are located on a reef extending north-south and having a length of 4 nautical miles. The group consists of four islands of which Elato in the north is the largest.

4: Krämer--3 (1909) 1937 Woleaians
116, 132 Lamotrek

The Südsee-Handbuch on page 5 after Hans Meyer Das Deutsche Kolonialreich gives rainfall measurements for Lámutrik, lat. 7° 26' W, long. 146° 30' E.

Month	I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII
	144	52	135	294	236	342	327	341	153	264	208	244

Total: 2,741 millimeters

Following these statistics is a treatment of the winds.

4: Krämer--3 (1909) 1937 Woleaians
116, 161, 731 Elato

[MR: From the Südsee-Handbuch, p. 34]: In 1903 the population [MR: of Elato] amounted to 90 heads; probably it has decreased even further through the typhoon of March 28, 1907.

4: Krämer--3 (1909) 1937 Woleaians
116, 131 Elato

[MR: From the Südsee-Handbuch, p. 34]: Taos and Uler are located south of the Elato Islands on a reef separated from that of the others.

In this connection see the special plan on map 93 of the Reichsmarineamt of 1903, in the upper right hand corner.

4: Krämer--3 (1909) 1937 Woleaians
116, 131 Elato

[MR: From the Südsee-Handbuch, p. 34]: The entrance passage to the [MR: Elato] lagoon is in the east; it is approximately 90 meters wide and the water is 9 to 11 meters deep.

Anchorages: The British warship "Sphinx" threw anchor in February 1862 in the lagoon in a depth of 20 meters. The anchoring place was located about 1/2 a nautical mile south of the western tip of the island of Elato. Here the ship stayed for 10 days and cut firewood. Water was provided by digging pits.

4: Krämer--3 (1909) 1937 Woleaians
116, 131, 161 Olimarao

[MR: From the Südsee-Handbuch p. 34]: The Olimaráu Islands (Hambruch: Olimaraue, story 2 of Füs) are located northeast of the Elato Islands; they are uninhabited. To this group belong the two islands of Olimaráu and Falipi. The former is located in the northeast and the latter in the southwest of the same reef.

4: Krämer--3-4

(1909) 1937

Woleaians
Lamotrek

Pacific Islands Pilot, Vol. I, page 504: The Lamotrek Islands, approximately 5 miles east of the Elato Islands consist of 3 weeded islets on a triangular atoll. The island of Lamotrek, with an elevation of 107 feet (32.6 meters) up to the tops of the trees, is located at the extreme eastern tip of the atoll. The passage approximately 3/4 of a mile south of Puguet Island, the northernmost of the islands, is the widest and best of those leading into the lagoon. During the time of the northeastern winds the high seas set through it into the lagoon and special care is necessary. There is an entrance in the middle of the south side of the atoll; it has a width of about 2 cable lengths. This entrance is hard to find but is good when the winds are strong. Westward of the latter there is another entrance which is approximately 1-1/2 cable lengths in width. All the other entrances are narrow. [4]

Off the western side of Lamotrek (Lat. 7° 28' N and Long. 146° 24' E.) there is an anchorage with shelter from northeast winds, but it is reported that when westerly winds are blowing the sea may become rather high. Landings are possible on the sandy beach at the western side of Lamotrek Island. In 1930 Lamotrek had a population of 165 including one Japanese.

The islands of Pugue and Falaite were uninhabited. There is little fowl and few pigs, but fish are abundant.

4: Krämer--4 (1909) 1937 Woleaians
116, 133 Elato 13

[MR: From the British Pacific Islands Pilot, p. 504]: The Elato Islands, approximately 20 miles southeast of Olimarao, consist of two atolls. There are four islands on the northern one of the atolls and the largest of them is Elato at the northern end. Its elevation is 101 feet (30.8 meters) up to the tops of the trees and the ground is sandy.

On the eastern side of the atoll, approximately one mile southwest of Elato there is an entrance to the lagoon; it is about half a cable length in width and has a depth of 5-6 fathoms (9.1-11 meters). In February 1862 H. M. S. "Sphinx" sailed into the lagoon and anchored in a depth of 11 fathoms (20.1 meters) approximately 1/2 mile south of the western tip of Elato. In 1930 the population numbered 72.

The southern atoll with the islands of Toas and Uler on its southeastern side is separated from the northern atoll by a passage about 1-1/4 mile wide. A narrow passage through the reef is found about 2 cable lengths north of the island of Taos [sic]; all but small boats have trouble steering through it.

In this connection see the special plan on map 772 of the Admirality made after that of Japan. Map of the year 1925.

4: Krämer--4 (1909) 1937 Woleaians
116, 133 Olimarao

[MR: From the British Pacific Islands Pilot, p. 504]; The island of Olimarao is located on the northern side of the atoll-forming reef approximately 95 miles south southeast of the island of Gaferut; it is covered with coconut palms and other trees. Around the entire island the ground is steep and ill fitted for landing purposes.

On Falifi at the western extremity of the atoll trees grow luxuriantly, but there are no coconut trees included in the lot. . . .

There are irregular depths at the northwestern side of the atoll, where the reef is marked by breakers at all times; there is no entrance to the lagoon on this side. On the southern side there are two shallow entrances; the eastern one is one half mile in width and the western one three cable lengths. It is reported that the depths in the lagoon are regular with no dangers (map 772).

4: Krämer--4 (1909) 1937 Woleaians
116, 161 Olimarao

[MR: From the British Pacific Islands Pilot, p. 504]: The atoll [MR: Olimarao] does not have any permanent inhabitants, but is occasionally visited by the natives of Elato.

Meinicke, on page 358 says: "Lamotrek (Lamurec, Namurek) was discovered in 1797 by Wilson and was called Swede, Haweis and Lew." (Krusenstern, Haweio).

In my book Palau I, pages 14, 15, and 180 it is related that the names of the islands of the Lamotrek group had been told as early as 1696 to Peter Clain on Samal (Philippines); some Carolinians had been cast adrift, who had used the names of Puc and Falait...for Lamurrec and Ylatu (Elato) and Lamuliur. On Clain's map (Palau I, page 17) of 1706 Falú or Lamuirec is given with Taramit (Falait?) and at the top of the map, separated from it, there are the two islands of Olutil (Oletel) and Falipe (Falipi) instead of Elato, and for Lamolior the two islands of Tauas (Toas) and Olor (Olor), and next to them in the west is Olimarau (Olimarau). At the same time it is claimed that Lamurrec was the largest of the islands and that the king of all the islands lived on it (Palau I, page 15). Kotzebue, Entdeckungsreise, III, page 99 states that in 1800 the sovereignty had been passed on to king Toua of Oleai....

Wilson's report indicated that the group was known to whites before 1797; Wilson was received here as capitaine. Thus it is possible that French ships had called previously. One of them under Capitaine Le Gentil de la Barbinais had visited Guam in 1715 on the way from Peru to the Marianas. When the French ship took its course WNW after its voyage through the Ralik-Ratak north of the Carolines it had reached Guam. Most of the Spaniards who sailed around the globe took the same course (see Palau) and that is the reason why the Central Carolines were discovered so late.

After Le Géntil Bougainville 1766-69, La Pereuse 1780-90, and d'Entrecasteaux 1791-93 sailed through the Pacific; but they kept their course south of the equator. It was not until 1780-81 that Maurelle once more reached Guam, and he was followed by Marchank 1790-92 on his voyage from Hawaii (1828). There is no mention or indication in their reports that they went southward into the region of Lamotrek and Oleai. It is probable that on Guam they met some Central Carolinians; the latter in any case must have been well informed about the whites due to the fact that they had drifted ashore on the Philippines. But they should really have used the word capitano and thus the French use of the term remains unexplained. [6]

Captain James Wilson of the ship Duff was coming from the south and reports as follows (page 293ff.): October 1797: "On the 25th we sighted a shallow boat in W to N and soon afterwards observed some boats taking their course towards us. About 8 A. M. one pulled up alongside without the slightest fear or hesitation which led us to the assumption that they must previously have had some contact with Europeans; their frequent mention of the "capitaine" substantiated that idea. This first group was followed by several others who exchanged their fishhooks(made of shell) and their fishing lines and coconut fibers for anything that we chose to give them. When several of them were allowed to come on board they showed inclination to refrain from stealing for a considerable length of time. But the natives in the canoes soon gave us reason to change out good impression since

they stole the rowing rings, which the skillful Tonga islanders had tried in vain. One boy was caught as he was trying to pass a pump into his own canoe. Since we were used to this sort of thing we merely drove them off the deck for these first plunderings; but when we were busy in the cabin eating we heard them at work trying to chop the belt-head off the rowing ring; when the captain noticed this activity he fired a few little shots in the direction of the islanders whereupon they immediately fled. At this very time William Tucker and John Connelly were discovered swimming under the stern of the boat with the intention of escaping to the boats; their hesitation proved that they were afraid that they might also become the objects of the shots. The captain, as in the past was furious at their ingratitude and their attempt at deception, but was willing to put an end to the latter and told them that if they wanted to leave they should go ahead and do so; he would not fire on them. Connelly answered: "Thank you, Sir" and both swam to the boats and were received by wild shouts of the natives. Soon afterwards when a breeze from northeast arose, we continued on our course and left the two men behind. (On Elato the natives told Hambruch that they remembered Anari because he had always quarreled when he was the helmsman.) Connelly we had removed by force from Tongatabu because he threatened the missionaries. During his stay on board he had been quiet and in the ship's reports was listed as a good seaman who was satisfied with his position until his last action proved him to have been a pretender.....[7]

The spot in which the two men had chosen to spend their last days is a small island

at the bosom of the deep; it has a circumference of no more than 2 to 3 miles. The comforts and necessities of life are so scant that we must assume that their means of subsistence were limited to fish and roots, coconuts and possibly some breadfruit.

The natives do not belong to a strong race. The color of their skin is dark copper, and they are lively. We did not see any women. Their boats were different from all those we had hitherto seen, because they rose high at both ends and were painted red. They have outriggers and may sail with either of their two ends in front. Their sails are made almost in the same fashion as the sailing canoes of the Tonga Islands. The location of the island is at Lat. 7° 22'N. and Long. 146° 48' E. We called it Tucker's Island after the member of the crew who had run off.

Carried by light winds from the northeast we continued on our course having left Tucker and his companion behind to think about the poor choice they had made. . . .

October 26, 1797. When we had advanced approximately 10 leagues westward we sighted another island* in the north and at 4 A. M. two more appeared in the NW; soon after that, at daybreak, we could count six of these small islands, their extreme tips oriented from NW to N to NE to E: we took our course towards the southernmost of these islands (Lamolier) and soon the boat was surrounded by a large number of

*Lamotrek group

canoes. [ER: Here one of the members of the crew went ashore to live among the natives.] [8]... The natives of this island group, their boats, utensils and their desire for iron are the same as on Tucker Island. The afternoon was cloudy and rainy, but this was by no means of concern to the canoes; many of them followed us until their island was out of sight. When we noticed them stopping in a bay in the north we came to the conclusion that they wanted to visit a village in that part of the island region.

27. At 10 A. M. we sighted another low island in the southwest and changed our course in order to sail south of it. When it was to the west of us it appeared as if there were two islands. Once more many natives approached us and traded with us just as the others had done. One peculiar and noteworthy thing we had observed on our voyage through this island region was that we had not seen any women; this fact led us to believe that either the men were more jealous than their eastern neighbors or that they held their women in higher esteem. Possibly some time ago they may have had to protect them against some over-anxious visitors. The latitude of these sister islands is 7° 14' N and Long. 144° 50' E (Ifaluk). At 4 P. M. the latter lay E to N at a distance of 2 leagues. Just before dark we saw another island WNW at a distance of 3 or 4 leagues. We took our course with the intention of sailing south of it and thus more easily to avoid all danger along the route; around midnight the island lay to the NNE.

28. At 4:00 A. M. on the 28th we discovered other islands and by means of our night instruments we could distinguish the ones closest to us from WNW to N to W. At this

time a calm prevailed which continued for some time. At daybreak we counted six areas of land which according to their size deserved to be called [9] islands and 7 islets or keyes; all of them together we called by the name of "13 Islands" (Oleai).

4: Krämer--9 (1909) 1937 Woleaians 12
116, 175 Lamotrek

In line with the procedure of the voyage of the "Duff" and the landing of the Swede Cornelius on October 26, 1797, Lamotrek was called Swede Island,.....At that time Ilematip... seemed to have been chief of Elato, as Hambruch learned.

According to Espinosa (see Palau I, page 175) an American frigate, "La Lidia," in 1801 came to the Carolines and passed Iselook (Ifaluk) and Lamursek. But the discovery does not seem absolutely sure and nothing was reported on the islands as far as it is known.

In 1828 Dumont d'Urville passed the location of "Lamoursek," but did not see anything. Cheyne (see Palau II, page 364) gives Swede Island (6 islands)...

The English warship H. M. S. "Espiegle" under Captain Ryle is said to have visited the group. For unknown reasons this man is said to have felled the breadfruit trees on Elato.

On April 5, 1880 the Englishman Lewis, after adventurous voyages around Australia and Samoa reached the group and became the first trader. He lived on Lamotrek for about 11 years and married a Chamorro woman (daughter see source Plate 3d), whose sister was married to the trader Friedländer on Yap; Lewis himself later went to Yap but there lost all his money so that he returned to Lamotrek around 1900.

4: Krämer--9
116, 133

(1909) 1937

Woleaians
Ifalik

Sëteval (Sätewal) in the east of Lámotrek is at a distance of only 37 nautical miles from the latter, which is approximately the same as the distance of Ifaluk from Oleai. On map 93 a shoal is marked ten nautical miles NNE of Ifaluk...and it is said that it is covered by 12 meters of water; but a note is added which reads "supposedly even more shallow." Naturally this shoal is well known to the natives. On Lamotrek I learned that it was called Fas (=stone?) and that it lay dry at low water. The waves come together in this spot so that water columns shoot up to such a height that sometimes they may be observed from Ifaluk.

After 1900 government representatives have rarely visited the remote island. The Deutsche Kolonialblatt 1906, page 263, records one visit; the main reasons were the scale insects of the coconut palms and the prevention of the consumption of toddy. The visit lasted from December 1-3, 1905 (see Oleai).

A. and E. Krämer stayed here from November 21 to December 10, 1909; Hambruch was on Elato from November 20-25. [10]

The fact that, making the voyage with my wife, I did not use the ship of the expedition but the mail steamboat "Germania" for my crossing to Truk, indicates that Lamotrek at that very time was included in the main service lines. It is true that the boat only called for copra. The island was not yet visited by whites.

4: Krämer--10 (1909) 1937 Woleaians
116, 142 Lamotrek / 1

The inhabitants [MR: of Lamotrek] are light brown Central Carolinians. The pictures show that some refined types are represented. The hair of the natives in a few cases... is curly, but the faces do not have negroid features. Even big beards occur as the face of Ikisera shows [MR: see source, plate 2b]; his face may well be aligned with some European types. Noses are well formed and do not have the Malayan upturned forms. The latter is a little more pronounced with Bóesu and Urúpo [MR: see source, Plate 1a] but Sukurang of the same family does not have it; in his case we observe a more projecting zygomatic arch, which is enhanced by the thinness of his face. Also the girls... have very pleasing forms and agreeable features; the same is true of the woman on plāte 3c [MR: see source] with her wide face. In the case of the half-breed Bessie Lewis [MR: see source, Plate 3d] the British mixture does not appear to an advantage.

4: Krämer--10 (1909) 1937 Woleaians
116, 161, 175 Elato

We heard that no more than 220 natives were left on Lamotrek; it is said that in 1890 they still numbered 300 and that in former times the figure was a high as 1000. These statements are in line with the information received by the shipwrecked who reached the shores of the island in 1787 and who gave the population as 1400. Freycinet on page 101 says that Lamoursek had 2000, Elato 1200 and Ulor 180 inhabitants, and that 170 people lived on Puk and 130 on Falati; his figures would apply to the time around 1800. Even on Goulimarao (Olimarau) the natives were supposed to have numbered 225. During our stay on the island there were many cases of influenza and dysentery so that we may assume a further decrese in the population figures. The Pacific Islands Pilot (page 4) says that in 1930 there were no more than 165 inhabitants on Lamotrek and 72 on Elato.

Accordingly in 1800 when the king of Lamotrek ruled over almost all the coral islands, the population was undoubtedly very large and possibly we were dealing with overpopulation which later was reversed (see Oleai).

4: Krämer--II (1909) 1937 Woleaians
116, 194 Lamotrek

[ER: Hambruch and the trader Lewis have made studies of the language of the natives of Lamotrek.]

With reference to the consonants it must be said that l is very commonly used for n; that means that Lamotrek is to be read for Namotrek, wherever the latter appears. Furthermore alus is used instead of anu "spirit"; Wilson earlier had complained that l and n often could not be distinguished.

It is noteworthy that the Englishman Lewis usually used r's for the sound dj; similarly he preferred n to l, although l was definitely predominant on Lamotrek.

th is formed similarly to the English, but in the back of the palate is subject to a gutteral stop.

The frequent opposite alignment of good and bad on Lamotrek is expressed by the words starting with ila and tip; the meaning is that of good and evil thoughts.

ilālang	in heaven	tipenlang
ilālal	on earth below	tipelal
ilafalū	on land	tipelifalū
ilafang	in the north	tipélifang
ilāeaur	in the south	tipeliaur
ilagóteu	in the east	tipeligóteu
ila ilitou	in the west	tipelilitou

Other good characters are:

ila mellau	life
ilafegér	attentive, honest
iladjóafidj	industrious
ila talingafi	obedient
ilagotŏdjig	saving, benevolent
ilamamai	good natured, noble
ilagŏggo	loving, peaceable

Bad characteristics, on the other hand, which nevertheless also begin with ila...are the following: [12]

ilamēs	death
ilangau	bad thoughts
ilāmau	harsh
ilamodjog	thievish
ilatalingeai	inattentive, not hearing
iladjorau	lazy
ila gatŏlap	scornful, proud ...

Elisabeth Krämer listed the following:

4: Krämer--14 (1909) 1937 Woleaians
116, 177, 797 Lamotrek

There is no [MR: mission] station on the island [MR: of Lamotrek] but influence is extended from Truk and from the west.

The largest and at the same time the principal island of Lámotrek does not have a special name, but is called after the lagoon, at the eastern end of which it is located. From S to N it is approximately 1250 meters long and in the middle it is a little over 700 meters wide. From south to north it becomes narrower in form. The northern cape is called Lugliong. In the west of the northern half, at the inland water, there is a bay which serves as a landing place. Here the village is located. A sketch map of the island was made between November 20-26, 1909 by the First Officer of the "Peiho" [MR: see 4: Krämer 15]. It showed the relative depths of the bay; its southern cape is [16] called Paliauei, whereas the northern corner is known as Uŏlebugui, "at the corner." [MR: see house 30 on map 3. 4: Krämer 18]

A sandbank separates the bay from the approximately 30-meter-deep lagoon; the sandbank from north to south has depths of 9, 3, 7, 12, 14 and 16 meters; inland from the sandbank the depth is 19 meters, which quickly decreases towards the land. This depth is called Mólog as the plan of the settlement on map 3 shows; southward it ends in a boat canal tauali vá. Thus conditions are similar to those of the eastern basin of the Onoun atoll at the island of Pisaras, except that the latter is much smaller than Lámotrek and projects eastward out of the line of the encircling ring.... The settlement is located inside the western bend [MR: of the bay] in a wide swinging arch. Inside the latter, in the

south, there is a small additional bay; it is less obvious on map 3 but is definitely shown on plate 1b [MR: 4: Krämer 413, Plate 1b]. Here the boathouse Aboi in which we stayed is located. Southward the bay ends in the wide sandy beach of cape Paliauei, where the Faktaipu and the house of the trader Lewis are located.

In the east: a. Lamotrek. . . or Namotrek, correctly Lamodjek. . . from lámo or namo, "the lagoon"; it is called trek, tjek, "small," although it is the largest of the three and longer (7 nautical miles) than Oleai which has a length of only 5-1/2 nautical miles. But it is shorter than well known Mokemok in the west, which from south to north measures about 20 nautical miles. Sometimes it is said that rek is the same word as rak, the season, i. e. the season, because the weather is always good; in that case it remains unexplained.

b. Falaite. . . in the west of the atoll; more correctly called Faleit or in former times Faleitabut; the word is derived from feiabut "unlucky child," because in the past the people on the island were wild; at the present time Falaite is uninhabited.

c. Puch. . . Pik small island in the north of the ring and usually pronounced Búiug; the word is derived from buik "boy" (Palau) and also sounded like it. Puch is uninhabited. In the east of the island is the good entrance Taualibúiug and in the west the boat passage Metaliár. Between Pik and the main island there is another entrance which on map 93 [MR: of the Reichsmarineamt 1903] is called the "dangerous entrance" [MR: 4: Krämer 2] [17]

Sailing southeast in the lagoon on the reef east of this entrance and on the southern side one comes to a projection of the reef which is covered with sand. It is the sandy cape of Mongalepi. If one draws a line from here southward which crosses the inland water and

reaches the southern reef--formerly at the rock Faisar (which disappeared in the last typhoon)--one gets the sósor boundary. . . which is the western limit of the district of the island of Lamotrek. East of the line no taboos need to be observed, but west of it one must fast if one sails early in the morning westward across the boundary. Smoking, too, is forbidden under such circumstances.

4: Krämer--17 (1909) 1937 Woleaians
116, 103, 131 Elato 1-2

Elato, sometimes simply pronounced Elat, because that is the word used for the seaweed after which the atoll and the main island are called; the latter is located in the north of the reef. The reef is reniform and has a bay opening to the east with a boat entrance into a small lagoon, which occupies only the northern part (Japanese map [MR: of 1925 on which the Admiralty map 772 was based]). In the southern part, which is separated from the northern, there seems to be little inland water. At the southern end the sandy island of Falipi is located; in the center (East). The island of the German map [MR: map 93 of the Reichsmarineamt of 1903] in the middle (w)Oletel (Hambruch: Oletul). Kari (Hambruch: Kare Reef) and Tamas are not given on the Japanese map. Hambruch, in addition, mentions Merekang "sharp point," Toeirul "calm quiet water" and Oilipi "on the sand."

Lamolior is uninhabited and located 2 nautical miles south of the atoll of Elat. "Lagoon of the south" with the islands of Toas and Olor (German map: Ulor).

4: Krämer--17 (1909) 1937 Woleaians
116, 103, 161 Olimarao

4. Olimarau is uninhabited*; the name is derived from vol "opposite the blue sea" (Truk: madau). It is located 26 nautical miles northwest of Elato. The natives visit the island for turtle fishing, Hambruch learned that the last native of Olimarau had died in 1899 on Lamotrek.

* According to Freycinet Goulimarao around 1800 had 225 inhabitants

4: Krämer--17-19 (1909) 1937 Woleaians
116, 361 Lamotrek

The settlements of Lámotrek. Study of 1909.

The large village...is located at the western shore of the lagoon and mainly in the bend of the bay.... The uninhabited part of the island is called gápilam (see house 19).

A unit of buildings with its surrounding land is called bókut or búkut (illustration 51 page 109 [MR: in source]).

A building unit comprises a living house, supply house, cooking house and a menstrual lodge.

The village is divided into the "south" Jaur, where the fal canoe houses a. Faletaipu and b. Jalói (abei) [MR: 4 Kramer 413 plate 16], which is beautifully decorated in the interior (see color plate II [in source]) are located; [19] in addition there are here properties 1-12. In this section there also stood the house of the trader Lewis which was called Ngalangisét "near the sea" and south of it on cape Paliauei the burials of lot 5 were found. On the land of the headchief Sukurang stood the fal'lap Marólipei, the house of the spirits.

In the "center" Lúgalap there were the canoe houses c. Lúgal and d. Kulong, and properties 13-20. This is also the location of the grove with the house of the spirits fal'lap Lématak (or Lámetag)which in 1890 already lay in ruins. Dense virgin forest like cordia shrubbery was found here [MR: 4: Kramer 413, plate 46].

The "North" is called Jefang: it comprises the canoe houses e. Falemára, f. Gatia rákes, g. Vorietag, and h. Gauárag (or Gauósag), i. Falemáreg, and k. Uelibugui, lots 21-30. The boundary of the land is called róros.

List of Houses on Elato

In the main they are primitive huts since no real reconstruction work has been done since the typhoon of 1907.

1. Etsatiù, bush hut
2. Kŭ ŭei, birth hut
3. Cooking house, măl ŭm, which at the same time is used as sleeping quarters for menstruating women.
4. House for women in childbed, im a fătsŭ...
5. Ilaroéi, visitors from Oleai
6. Bŭŏl i bŭgi, visitors from Oleai
7. Tsŭiĕrăs, visitors from Oleai.
8. Fazefăl, 1 ♂ (♀. died)
9. Faliŏp, 3 ♂, 3 ♀, --, 1 girl
10. Im mo gitigit
11. Legóŭria, 5 ♂, 3 ♀, 1 boy, 1 girl
12. Făl e gílĭau, 1 ♀
13. Gitoŭ, 4♂, 2♀, 2 boys. It is owned by Oleai islanders from Uazagor, who also have property and a house there, and who at times live on Oleai and at times on Elato
14. Pâùūĭl, 3 ♂, 4 ♀, --, 1 girl

The cooking house is built from the hut found on deck of a ship-wrecked boat.

Stone foundation of the former " great house" maifŭrz.

Remnants of the former "great house" --eâur e lăp.

15. Olegešārs, 5 ♂, 5 ♀, --, 1 girl
16. Nogŭr, 5 ♂, 3 ♀, 1 boy, 1 girl
17. Lugăl; Japanese trading station, now deserted
18. Uŏlĕl, people from Pâu i ĕl come here
19. Kătogālū, 2 ♂, 2 ♀, 1 boy and 1 girl
20. Kolūng, 1 ♂, 1 ♀
21. Uŏlipār, 4 ♂, 3 ♀, 1 boy, --
22. Kŭsorŏlo, 4 ♂, 4 ♀, 1 boy, 1 girl
23. Kăti e făl, house of the chief, 4 ♂, 1 ♀, --
24. Rolegorăl, belongs to 23

On the house there is a drawing of a vulva, māk e boār.

25. Matal ie eăl, is inhabited only at the time of the mosquito plague since then a fresh wind blows there
26. Merekam. Birth hut, house for women in childbed and menstrual lodge of the visitors from Oleai. [31]

Families, ge i leng

On Elato there live four families of which always two and two intermarry; in addition there are two families which constitute the lower class.

The nobles:

1. Mailupūe
2. Gemairēng
3. Mańau li fùs
4. Zau fēle

The lower class:

5. Ali ti lia
6. Zau üil

In the past No. 2 ranked higher, but in the course of time it has been replaced by 1. The first chief on Elato is a member of the family Zau fēle.

4: Krämer--31 (1909) 1937 Woleaians
116, 585 Elato

The marriage contract takes the form of an exchange of two baskets of food, (nuts, taro, mar). That is all there is to the ceremony. At the wedding the man announces his wishes and the woman hers; the relatives of the couple prepare food, which is exchanged. Nor are payments made upon the birth of a child.

4: Krämer--3f (1909) 1937 Woleaians
116, 565 Elato

All men may marry into the highest ranking families, although they themselves may come from the lowest.

4: Krämer--31 (1909) 1937 Woleaians
116, 591, 428 Elato

The woman is the owner of the house. When he marries, the man goes to live in the house of his wife (see Truk); an exception to that rule may be that he continues to live in his own house, which upon his death is inherited by the next oldest man of the family of the husband. The children are the heirs of the mother. The eldest son leads the list and then follow the younger boys, who have first claims before their sisters.

4: Krämer--31

4: Krämer--32 (1909) 1937 Woleaians
116, 177, 167 Elato

At the time of Ilematip the first whites came to Elato.

In the old times chief Teiar came from Truk with his people subjected Elato and ruled over the island. When he was in office the natives of Ifaluk came over and killed all the inhabitants of Elato. Elato was settled anew by the people of Ifaluk. Mŏz was the chief. At that time all the natives of Nămeliaur were also slain and those of Lamŭtsik were greatly decimated. Elato is a colony of Ifaluk.

116, 291 Lamotrek

European dress is not seen [VMM: on Lamotrek]

The costume of both sexes is similar to that of the natives of Truk and the surrounding islands. The men wear the G-string and the boys go naked; women wear their plaited mats, and growing girls like to cover themselves in front and in the back with bunches of leaves. This protection is known as titi; it is the same word that is used on Samoa for the girls' apron.

Girls' skirts are made in the following manner: fern leaves are dried in the sun and then the stalks are chewed (Elisabeth Krämer: nürei) until they become soft. Then two of the leaves are tied with two others and two new ones are placed on them from both the right and the left and the stems are plaited into a braid while the tips are held between the knees. On Plate 3b [MR: see source] one can well see the stems sticking out on top and the picture shows very well the type of ornamentation that the girls put on. Parinarium nuts were named as scent; they had drifted ashore and were hung up on women's houses. Elato: aiss.

4: Krämer--34-35 (1909) 1937 Woleaians
116, 301 Lamotrek

The natives wear flower wreaths, headbands, earrings, and necklaces of coconut rings (Hellwig: éffirre) and little slabs known as dagág or as madja, if they are made of white shell; [35] in addition they like little perforated slabs of conus shell, which are called mat and vul, and small rings of red shells, which are called faibar (faubar, Truk).

1.2

4: Krämer--35 (1909) 1937? Woleaians
116, 301 Lamotrek

Exaggeration in ornamentation such as is usual in the region of Truk, neither occurs on Lamotrek nor farther west; it gradually decreases in the direction of Palau, where ornamentation no longer plays any part and of which the telau, an ornament of two little balls (Palau III, page 21, illustration 12) is reminiscent. [MR: in source.]

(=fish tail) and known by the name of pera lig; 2224 burai, 2135 borói, which are large rings of tortoise shell (Truk: bodj) that are sometimes worn as breast ornaments; 2233 tortoise shell rings boral lágelag, which is also another name for the tortoise shell arm rings which are otherwise known as lagál; 2260 and a necklace of 80 coconut beads with a few scattered faubar; 2319 is a red cockle shell.

Necklaces are not worn very much; they are called marremarre and are made of three to seven strands of coconut beads [36] (Hellwig; 2158 billigorru); in the latter case a piece of shell (lure) is attached to one of the tying ends. Hellwig 2280-6053 remarks that it comes from Ifaluk. Also triangular pieces of faipar serve as ornaments similar to those that are worn as earrings (see Oleai-Feis). A simple necklace (Hellwig 2260-6035) has only a few coconut rings plaited into the necklace at certain intervals from one another (Hellwig: éffirre); the plaiting material is made of banana fibers.

Arm rings: see above, the section on ear ornaments. See also Plate 3b [VMM: see source]; they may be made of tortoise shell (very small ones are worn in the ears) and trochus.

We had occasion to see some charming flower wreaths that are worn in the hair; among them was a green and white one of premna leaves and umbels of the fragraea (a); another one was green, white and yellow and made from the white blossoms of the salt water shrub scaevola and yellow buds of the Trionfettia procumbens (b)....; here the two are represented on drawings, figure 1 [MR: see source].

A native gave me a strange head wreath. The end of half a coconut frond is bent into the shape of a circle, and small cylinders are fastened to the pinnae that are removed from the area of the leaf; the cylinders are supposed to be young breadfruit. [See source, figure 2.] Young breadfruit are very precious on all coral islands and are the objects of taboos so that it is not likely that the islanders pick them without good reason. Either we are dealing with some sort of breadfruit magic about which we could not learn anything or a branch of young fruit had broken off.

Ears: Earrings, suasua, are worn in the elongated earlobes: the ornaments may take the form of rings and little chains of coconut shell, tortoise shell and conus, but we do not find them in the same abundance in which they occur on Truk. Rings resembling watch wheels and tebau occur. The beautiful ear ornaments in Müller 25, Figure 19 do not come from Oleai but from Sovol.

Hellwig mentions various names for the ornaments: 2162 udjaudj of coconut beads and conus shell in four sections; 2194 marrigiau or madsi... with pteroceras knobs; 2199 large coconut rings called lelle mangar (watch wheel: leli mangal); halfmoon shaped

4: Krämer--34-37 (1909) 1937 Woleaians
116, 301 Elato

[VVM: For a discussion of ornaments worn, see 4: Kramer 34-37]

The natives generally wear their hair short; they do not give special attention to hair-dress even in case their hair is long. Figure 5 shows the weaver Dailemar [VVM: see source] who wore her hair particularly short. [37]

According to Cantova, page 312, the chiefs of the Western Carolines grow long beards in order to enhance their prestige.

Combs are used as ornaments, but they are neither as frequent nor as varied in form as they are on Truk. Plate 10a shows a wide comb with three finger-like teeth; for a single pronged decorative comb with a frigate bird and cock feathers see illustration 6; a similar one (Hellwig 2333) is the only one that could be picked up.

For depilation, shell tweezers are used (Figure 7 [VMM: see source]; they are called kúm'u see kom. The two shells close very well and tightly and are connected by a cord of hair; the shells are taken from the species Tapes litterati kum.

4: Krämer--37 (1909) 1937 Woleaians
116, 291 Lamotrek

Belts are called gabidj (Hellwig: xapéss, worn--tetár) and are usually made up of three strands. I was told that the name for one of the three strand belts, which was said to have been imported, was tagágapaki; paki or pake are the little bridges that hold the strands apart and in place, and which have previously been discussed in Truk page 109, where they were called fëken. They are made of white shell or of leang (Truk: Leangeéo Pteroceras) or of mother-of-pearl or tortoise shell. The strand of the belt are generally made up of little pieces of coconut shell, or beads, and more rarely of tortoise-shell as is the case with the fine, precious and beautiful belts of the Western Carolines, the taral of Oleai.... Whenever these more elaborate belts are worn it is certain that they have been imported. Plate 3b [VMM: see text] shows such a belt, of seven strands, worn by the girl on the right, while plate 3c shows a woman wearing the more ordinary belt of three strands; see also Figure 8 [VMM: see source]. The girl on the left of Plate 3b has a single strand for holding up the titir...and another one of this type is shown on photo 372 (Plate 3c) [VMM: see source]. Usually they are twisted from human hair like the handles of the baskets in Fig. 42 [VMM: see source]. These hair belts are known as toradja djiem. (Hellwig: tetáre sim of Elato.)

4: Krämer--38 (1909) 1937 Woleaians
116, 304, 531 Lamotrek
1-2

It is noteworthy that on Lamotrek the Mons veneris is ornamented with the black triangle puáre, which also occurs on Ponape, but was not observed on Truk. Hambruch noticed it on Elato where it was used as house ornament Mák e boár [VMM: it is illustrated on page 30--see source.]

4: Krämer--38 (1909) 1937 Woleaians
116, 304, 531 Lamotrek

Tattooing and painted ornamentation on the island are not, or rather, no longer subject to the strict rules of the West Carolinians; I say no longer, because Lütke shows that 100 years ago it still at least partly existed on Lukunor. The truth of this thought seems also to be expressed by Kittlitz. But by now definitely inscribed patterns are no longer in effect and ornamentation is confined to groups of it on the legs--examples of it are given in the illustrations--; the patterns of women are more elaborate. Men, on the other hand, wear little or no ornamentation of their legs, but instead have designs on their arms; see Figure 9 [VMM: see source] of two insides of arms, which show numerous rows of patterns one above another and among them apparently spear heads rastim (Figure 9b [VMM: see source]): The outer sides of the thighs [VMM: see source Figure 10a-d] usually have only two vertical pattern rows of shark teeth or fish; the favorite species are the pup and the küe. These patterns are included in the ornamentation of the women, Fig. IIa, b [VMM: see source] (the woman Netailemoar) and Fig. 12, and rank next to the many other patterns which are presented in Figure 79 [VMM: see source], The illustrations mentioned show the arrangement that on the woman Loalimul (Figure 13 [VMM: see source]) is particularly elaborate. In this instance we see ornamentation on the side and extending forward from the seat so that it occupies the space over the hip bone; from here a wide decorative stripe runs down the outside of the thigh to the knee, where a few rings--open to the side--encircle the entire leg. Around the back of the leg there appear a few unconnected patterns.

In the discussion of ornaments (Fig. 79 [VMM: see source]) we might add that the species of fish mentioned with the same name occur on Truk, but that in the latter instance the fish are dolphins, but not in double form. Another feature identical with Truk is the shark tooth that is so common. But the other patterns are usually different and the same is true of the names. [41]

With the exception of those mentioned above, no interpretation is possible for the many types of ornaments given in Figure 79 [VMM: see source]. An ornamented house gable (as is known, for instance, on Palau) is called tabau and the fact of the existence of the term proves its occurrence.

4: Krämer--41 (1909) 1937 Woleaians
116, 531, 386 Lamotrek

No details are available on the subject of painted ornamentation. Turmeric is acquired by trade transactions and is thus available like on the other islands, but it is rarely used. The red paint of the canoes has its origin in red earth, lap, from Yap or Truk; that of Yap is considered better in quality. From it the expression tabbi en lap, paint bowl, is derived and the word for paint brush is golelië.

No details are known concerning the method of tattooing. The instrument used is a pick which looks like the tool used to open ulcers. (Fig. 134 [VMM: see source]). Soot for the black color is not obtained from savani nuts but from drifted sap, hurú, which is placed over a small fire and then is covered up with a coconut shell; the coconut, in turn, is isolated by a layer of leaves. The soot settles inside. Also paraffin rās or matiga (= fat, because the natives thought that it was fish fat) drifted ashore but was not used for the same purpose.

4: Krämer--41 (1909) 1937 Woleaians
116, 252, 415 Lamotrek

To cook--um. The container for flint and steel is called gaigers and is No. 2210 in Hellwig's catalogue; it is also known as gulegul.

The cooking snail, Cassis cornuta (Hellwig: maiále, méal, on Truk: moéal), in the past was very commonly in use for cooking and today is in favor as a water container.... [42] Opener for coconut husks--kóăt (see spade); wood-kaingi.

The coconut grater is very simple and two-legged; Figure 15 [VMM: see source] (Hellwig: waigin or wegang; seat of breadfruit wood). It is 67 centimeters long and 20 centimeters high. Hellwig 2319 for blade material uses a red shell called belig* (Truk: perri Venus m.). But most often a piece of coconut shell is used as a grater, metál, and it is held fast by lashing (gāgā Hellwig 2092).

A spatula in the form of a fish is called falalio (Hellwig 2252: itik eü le wong) and is made of the armor of a turtle belly; the specimen in Figure 16a [VMM: see source] is 17 centimeters long. In Figure 16b [VMM: see source] it is rihshaped, has an ear and a length of 21 1/2 centimeters and is used to grate food. The knob of the instrument is known as arrepél. Hellwig has a specimen of pearl shell....

The word for spoon is itĭt. (Hellwig: 12 centimeters long.) The type represented in Figure 17 [VMM: see source] is made after the Palau fashion by means of a wood press. Hellwig lists the following terms: handle--erál, brim--narél, concavity--lăl, bowl--

*Hellwig 2113: pelig, the end of a coconut is used for grating: the tip is known as topälle.

lúgul. A Sorol man who came as a visitor to the island introduced the spoon. Previous to that spatulas had served as spoons.

Pounders of coral stone (Hellwig: vai lu pó (a), vairúpo) are not as beautiful as those of Truk, but they are characteristic since they are stepped and have caps at the ends; the specimen pictured in Figure 18 [VMM: see source] has a height of 15 1/2 centimeters. Most of them are of wood (Hellwig: wood--kil tia mangle?) they have cylindrical heads as in Figure 19 [VVM: see source] or they are cone-shaped and have perforated ends as in Figure 20 [VMM: see source]; the height is 20-23 centimeters....

Ikisera made himself a large mortar (75:65 centimeters); the word for mortar is annif. Figure 21 [VMM: see source].

Tongs made from coconut frond stalks (Hellwig: umăr).

Fire fan (Hellwig: saipe, on Truk: sĕiva).

The word for knife is ser; for the type made of pearl shell see Figure 40 [VMM: see source,] the fiber grater, djĕle, resembles the instrument in Truk. The blade of the knife, the tangitangi lü djĕle is peculiar and is made either from the larynx of a turtle or of coconut fibers üdi.

Drinking tubes (Hellwig: mangauru) are bamboo tubes used to suck up water from pits with dirty top water at the time of water shortages.

4: Krämer--42 (1909) 1937 Woleaians
116, 241 Lamotrek

The cultivation of taro resembles that on Palau. Work in the field is called gelligel. Taro is usually grown in swamps, which are known as buorŭ. The general term for a field is bol, and a single unit is buonnŭ djemalū, whereas a complex is called bonnap.* When the taro is ripe, the following steps are taken: digging up--ŭiŭi (uot), gebuá (bullok), cutting, djarŭ, of the leaves (=shoot--bagŭ), scraping off the mud from the fruit --uiŭegarre, and washing--djiri. Fertilizing by means of green leaves (as on Palau) is called uállŭ uot, i.e., the leaves are spread out after they have been removed from the plant--go uallŭ--and are gathered in baskets--djuge; the mud (Leberkässchlamm?) is scraped off and this is known as djioie medjaro. Then the young shoots are planted. The best species of taro needs about 6 months; it grows lateral shoots--tŏallag o li uot; burak and fillë need longer; it is said that fillë is good even before the forest blossoming and still shortly after it, or about nine months after it has been planted.

*The following distinctions are also made: a field is composed of a large piece of land which is called djeadjŭval, a small piece of land ádjalo and eabellüngüpei, and a very small one eagullung.

4: Krämer--42 (1909) 1937 Woleaians
116, 252, 192 Lamotrek

lū	coconut palm	figs	gouall
mei	breadfruit	crataeva	gavudj (Truk: abut)
uidj	banana	sugar-cane	uóu
uot	finest kind of taro	plant	fatogi

fille big taro (Truk: forest taro) resembling burak, bullok (Truk: pula and and mulek).

Hambruch mentions:

Edible plants

swamp taro	uŏt, file	papaya	papuâi	
mountain taro	bulăk	sugar-cane	uâu	
breadfruit	mai	sweet potato	gamŏti	
banana	uĭs	pandanus is not eaten		
fig	faliap	coconut palm	liu	
cucumber tree	awŭs (Krämer gavudj)	chicken	măluk	animals
		dog	gălăgo	animals
pumpkin	kălăvăs			

...[45]

The coconut palm claims first place as a source of food, but breadfruit, mai, is very important. For that reason, the taboos which the breadfruit god Sauaur imposes are of special importance. In September one tries to find magic and an oracle for the voyage to Guam and to discover which boats are good and lucky. Then the period of the breadfruit taboos sets in. During that period no trees may be felled, no bulis extracted, no wooden bowls and wooden boxes must be made and no nets may be woven (no handle nets may be made either). Cords must not be twisted, clay cannot be fired and sails must not be made of pandanus leaves. The end of the breadfruit harvest comes in July and is known as the eamóimai.

Then follows a solemn banquet, the iles, which is held in the evening and which is mainly given for returning fishermen and navigators who have fasted up to this time. At the banquet a prayer is said in order to avert evil.

On the island, breadfruit dough, mār, is prepared in the same manner as on Truk; it is said to be especially good when it is eaten together with tak, Belone fish.

Breadfruit dough is prepared for preservation on Elato and is known as mār (Hambruch)

4: Krämer--46. (1909) 1937 Woleaians
116, 241, 251 Lamotrek

When the breadfruit is ripe, it is picked; the bark is scraped off; it is placed in baskets and soaks for five to six hours in salt water; after that the salt water is left to evaporate. The fruit are put into shallow pits, lined with leaves and are covered with earth. They must stay in the pits for twenty-four hours until the fruit has become very soft. Then the soft mass is thoroughly kneaded together with leaves and packed into deep, lined pits; the holes are covered up with stones and the breadfruit preparation keeps in them for many months and years.

For immediate consumption, one part mar is mixed with three to four parts of water and the resulting mass is thoroughly wrung out in an old dress mat; then it is baked or cooked and is said to be a nutritious, though not very delicious dish; in the main it is eaten together with fish.

Elisabeth Krämer studied the preparation on Lamotrek and reports on it in the following manner; unripe breadfruit is peeled and the pits are removed; it is filled into a basket which is placed in stagnant sea water for half a day. Then the fruit is changed into another basket which is lined with fillē leaves and which is hung up for twenty-four hours. Once more the fruit is changed into another basket, lined with breadfruit leaves, which is hung up for a week. A hole one meter deep is dug and lined with a thick layer of breadfruit leaves; on this foundation banana leaves are placed and on them the breadfruit; then there is another layer of breadfruit and banana leaves. Instead of breadfruit, gull leaves may be used which last even longer. But in the course of a year the leaves are renewed every three months. Too much rain makes the mar rot. When the dough is taken out it is washed in fresh water until most of the acid has gone out of it; it is cooked once more before it is eaten, but only as much as is needed for one meal is prepared at one time. One of the dishes is called lūggum melli mare: the water of two old coconuts is kneaded into the mar; half a nut is grated; one part of the dough is mixed with a little water and cooked and the other part is kneaded with more water and mixed

with the mar. The latter type of dough is placed in layers on piles of leaves; on every layer some of the first part, and cooked coconut milk are added, and altogether there are about three layers. Then it is tied with coconut fibers, filled into approximately four breadfruit leaves and one banana leaf and cooked in the oven.

Word List--Cooking

oven	um
to dig a hole for an oven	earüe um
fire wood	saffi
fire	eaf
stones for the oven	faiül um [47]
hot	apuósch
lay out hot stones	räggu puori
scraping of taro*	faletti uot
wrapping of taro	tüggutuggu uot, ifferi uot
leaf	drö (droa--ripe coconut)
cover leaves	üff el um

A large amount of taro is cooked with expressed coconut milk when special feasts are

*With the shell pelligelli eralet

held, e.g., on the occasion of food presentations, pailügogo to the people who have helped with a funeral.

rouari uidj, green bananas are peeled and cooked in a pot together with water and expressed coconut milk.

The alu Saulal* is responsible for many of the fishing taboos. He has close contact with the ocean into which, deep down, he was banned because of his evilness; to him come the souls of the evil after their death. He has three servants: Alusitét, who is thought of as his son, who comes whenever someone breaks a taboo and Pónerol and Lepériperúodj (from périper "to cut"=falafal see the discussion of boat construction, and uodj "reef" which would give it the meaning of "reef cutter"); they are sent to help the humane beings. Soulal gave mankind the turtle which he made hard and strong. But if men want to get the benefit of his deeds they must obey his taboos; e.g., a man must wait for 10-20 days after having had sexual intercourse before he is again allowed to go out fishing; he must not touch the lure pa which is used for bonito fishing during one month, and by no means before the next new moon; in the case of the flying fox fishing, the fisherman must wait for two to three months before he may return to his house.

The fisherman must not touch the water holes in which coconut fibers are soaked; if he does he must wait for 4 days and for the same length of time may not eat any bonito in case he has beaten coconut fibers; the same taboo applies to any person who has touched excrement. The regulations apply also to women; they may not eat any bonito at all as long as they are in the imatamai, nor for three months after they leave. When a woman has been in the imafatiu she must wait for ten days.

*He is thought of as the elder of the two brothers of Aluelap.

We have reported on the taboos west of the sósor boundary; sósor is the word for the fishing ground in the inland water mainly west of the mentioned boundary. If one wants to go fishing in that area no fire may be lit in the village after 10:00 o'clock at night [48] and no food may be eaten at that time. The boats that sail to the spot must first call at the islands of Puik (Búiüg) and Faleit before they may get started on the actual fishing trip. If the taboo is broken, legs and abdomen are believed to swell.

Among the sacred activities is the killing of fish with the ceremonial axe tellé i lolomai which is also used for the boat construction.... Taboo for women on Elato are the gorurĩap, sonmalot sóu (mackeral) and the skipiia which is held sacred on Satoan and before whom the natives must bow.

4: Krämer--48-50 (1909) 1937 Woleaians-14
116, 226 Lamotrek

Reef Fishing; guis Catch.

The holes on the reef are marked by pebbles that lie next to their entrance. By means of a long, thick stick two to three meters in length one investigates whether anything has been caught in the hole. The octopus comes out and is speared. The following are some of the native terms used in connection with this form of fishing: bow--liketáfedj, arrow--eâuten which is a very simple instrument; fishspear Hellwig: tolig, wood--vas, prongs--rûmul, obailitóto lig of coconut wood, tip--metale obai, end--sabille.

Hook fishing,

The fishhooks used in the west have previously been discussed in connection with fishing on Lukunor. A few illustrations 23a, b, c, [VMM: see source] show big lures and hooks that are pressed down; hooks used on Lukunor on the other hand, like those of Ralik (see there) are turned up more (cf. Hambruch: Nauru); the length of the hooks used in this area is about six centimeters.

Keeping of the hooks in boxes--sóp. The original hook was cut from a piece of coconut shell as it is pictured in connection with Feis, which is said to have been pulled up with a hook of this type.

Fishing lines are mainly made of fibers of coconut husks. . . . Hellwig's catalogue has some from the island of Elato and calls them by the name of djaluig. . . . Also fishing rods are known and used.

For kite fishing gedjeg, a thin line known as dja luga and made of aroma fibers is

necessary; new kites are always made of an artocarpus leaf; [49] for bait goilul lu baggo is used and the garfish locks its teeth into it.*

Fishing with a Hand Line from a Boat

The best bait on the hook is octopus. The hook with its bait is tied to a stone with a slip knot and the stone is carefully dropped into the water. When it has fallen to the bottom of the ocean, the fish gradually push down in order to get at the bait. When the first stirring of the line is felt, it must be pulled in with one sudden movement. If the hook has caught the fish, the fish is pulled up, although it frequently happens that sharks catch it as it is on its way up to the surface of the water; there seem to be sharks in the waters around Lamotrek. If that is the case, the sharks must be caught first if the fishermen want to get their prey and to recover their fish hook. But after no more than half an hour, the fish has been digested in the stomach of the shark to such a degree that

*Catching is also done with the loop lóma pãgo with the purpose of later making strings, gúiluil, from the skin and of using them for tag fishing (Belone); the lines made from this skin are as thick as pencils and are often one to two feet long.

it can hardly be recognized. For that reason a black shark modjog, is feared greatly.

lukapá hooks (Hellwig: pa sar, see figure 23a of source) are used for fishing of gali and etam which are principally caught at night. The etam red surmullet swims around the region where the waves run high in the calm water of the reef opening at night; at low tide it stays inside and at high tide it goes out. Lure of pearlshell is called a passär, faipar, or sárrurod. Hellwig has a pearlshell lure with an iron hook without barbs; Krämer has nine hooks of tortoise shell, one of which has a barb rom, near the tip on the outside; the lures were black or reddish of meleagrina. The paluk (Figure 23b [VMM: see source]) is used for etam fishing which is done during the night. Figure 23c [VMM: see source] is used for the same purpose with a brown shiny lure of cowrie shell (cypraia), which is called upuil. For flies, the feathers of chickens or frigate birds are used (Elato) or else grass, búgor, as is the case with the pa wai hook of black mother-of-pearl, wai.

Hooks of tortoise shell are called gŏbodj, and one specimen is given in Figure 24 [VMM: see source], (Hellwig: ă bors, alü daidjau), They are used for larger fish, daidjau, and have a width of about five centimeters. The tips are strongly bent inward and are called lámagap. In the year 1910 they were no longer in use.

Fishing of flying fish, mangar, is done with an angle hook (see Krämer, Palau, III, page 77, Figure 62) in the month of December. On Sëtowal it is continued later in the season when the boats have returned from Poloat. Then the fishermen go into the

canoe-house and the sorcerers begin to sing their songs. [50] [ER: some of the songs are given in the German text, but are omitted here.]

The fishing line with float called pil which is similar to the one pictured for Onoun, is now made ready ... The angle shaped hook is cut from coconut shell and tied as float to the coconut bottle that is stopped up. Of course, it is a piece of a young coconut kernel, which is scratched out of the shell with a spatula and which is given the shape of an octopus by means of a bamboo knife; the bait is tied to one end with a fine banana fiber. Then the angle with the float is laid out and observed from the direction of the sun.

Customs in Fishing

Later on there followed further taboos and magic and fishing at night to the illumination of torches.

Fishing of flying-fox starts in December and continues almost through the entire season of the trade winds. When the fishing period is finally over, the fisherman, after an additional waiting period of four days, may return to his house.

Fishing (búil) of bonito, garangap is still practiced. The fish is considered sacred only if it is caught with the lure pa (bā) on sea; this is quite in line with the Polynesian customs. We have already discussed the taboos; they are exceedingly strict.

Soon after a fish is caught, it is cleaned of all dirt with an ear branch. The catch is greeted with a special exclamation. A fisherman, who comes home feeling cold is the object of mockery. The men who have not caught anything are not in favor with the women. Fasts are prescribed for the time of the trade winds but are not necessarily observed from March to September. With reference to the banquet, iles...

After reaching the shore one carefully lays down the fish with their heads facing inland. They are seized by the tail and carried. Fish may not be swung to the sides as they are carried. If the person who carries them meets someone on his way he must not stop. When the fish is laid down by a house, it must be placed alongside the building with the head pointing in the direction of the sea. Then the stove, um, is started. When the fire is lit and the stove is getting hot, the fish may be cut. The animal is laid on its back and

the bamboo knife (not an iron knife) is held in the right hand. The stalk of a coconut frond may be used. One cut each is made lengthwise and across and then the fish is peeled out with the first finger and the skin of the belly together with that of the throat is removed, is whirled in the smoke of a fire that is lit on a coconut frond róurou, wrapt in breadfruit leaves, magárigar, and put in the stove. [51] The insides of the fish and particularly the roe are eaten raw, after they have been waved through the smoke for just a little while; the heart is given a similar treatment. The other insides are cooked. The head which is cut off, the shoulder pieces, the tail without bones and the back pieces are all laid out on leaves, wrapped and cooked on hot stones. The dress for the karangap fish is called magárigar. That finishes the taboos.

If a fisherman has broken the taboo and been near women and is taken sick after his fishing trip, Alusitét is thought of as the originator of illness and a sorcerer addresses a prayer to him while he stands holding two bunches of coconut leaves in his hands.

4: Krämer--58-59 (1909) 1937 Woleaians
116, 533, 789 Lamotrek

I present here some poems in their original text although they are said to have come from Oleai; but Agupelior of the latter island was not familiar with them.

[ER: The songs are omitted here. Their subject matter includes the following:

1. Songs sung on fishing trips.
2 Song to drive away rain.
3. Song to drive a wind spout away.
4. Song against sharks.
5. Canoe song sung when passing a shoal.
6. Song sung when a boat starts out on a fishing trip.
7. Fish song.
8. Catching of the Bonito.
9. Bonito song.
10. Song about turmeric leaves. [59]

This is followed by a breadfruit prayer, the gatóketok ali mai which refers to the growth of breadfruit. At the time when the prayer is uttered crushed ongorik leaves are shaken up and scattered.

4: Krämer--59-60

(1909) 1937

Woleaians-1-3
Lamotrek

Nets djauo, djrou.
Float--úgopēs, sinker--faurem.

The nets are made in the usual manner (according to Hellwig) with the netting needle, djaf, which must have the width of the mesh metal ("his eye") which is held secure by the knot búgabug. The yarn is wound around the shuttle kadjap; the split ends of the shuttle are known as ewále or kadjap.

The netting needle is generally of arur wood, but the shuttle is of bamboo, buái, which comes from the west (Yap).

The yarn, gologól, is made of the husk fibers of young coconuts, which must soak in water for three to four months before they may be treated with the fiber beater, the pelai or komang. Then they are twisted into thin cords, mut, on the thigh (or by a special mechanical device); [60] two or, more rarely, three or four mut constitute the gologól.

Made from coconut yarn.

garom	mesh is as thick as a pencil and is square; the net is approximately two meters long and one meter wide and is held by two men.
ugali vomei	the mesh is as thick as a finger (vómei--deep water)

ugalei — mesh of the thickness of four fingers.
ieting (aating) — mesh of the thickness of six fingers.
gal — a net made in the Ifaluk manner. It is a net bag attached to three handle cords, by which it is hauled in. Into the netting, at the bottom, a live fish is placed. The diameter of the net is two to two and a half feet. For bait, ro and gidjegidj are used. The fish caught are mainly scarus species; often five to ten varying in length from a half to one foot are hauled in at a time.

swimmer above
uápes
sinker below
baurem

ū til (tin) is used for catching the small (5-8 centimeters long) til fish which resemble our sardine. gosi met a til is to be translated as "catching the eye of the til" and is the name of a song, which the women start singing on the fourth day after fishing has begun, and which ends with a general scream; for the first four days no til may be eaten, especially since at the start the returns are rather poor. til is eaten with its bones; the head is put into the mouth first; otherwise fishing will be unsuccessful. The net is a long sack held open by two parallel rods. A third stick lies across the two like a handle. Counts up to one billion (see Feis at the end) indicate the nature of catches of this fish.

ugalei (like garom above) serves as a net sack which comes handy when by means of rul lines--which are called rob here--a funnel is set up on the reef platform at low tide; through it the fish are driven into the net. The ugalei net is often laid out in a semicircle. In place of a second net often a basket u le moróuel (see above) is added; in the

case of garom they are mainly modj, márafas, etc.

A frame net, djrou soiloile is shown on Plate 5a [VMM: see source].

The frame is called atil, the fork ekan, the wooden section underneath the lashing básebas, the lashing vövò, the mesh metál, the knot bugabug, the tips of the net fangál, and the handle komásu.

Hellwig calls the fishing net djrauŏ, the front part of the frame gatille, and the back part viabále.

Hellwig: fishing net djrauŏ, frame atil.

Plate 5b [VMM: see source] is a net for catching the souls of Ikelur, which is called djrou i alus, because with it evil spirits may be caught that have been driven away.

A large fishing net was another specimen picked up.

Fish Baskets u ul marauel (moróuel)

Angular baskets are not emptied by being turned over, but by means of a bent rake, tangak. [61]

Driftwood with Fish Baskets (gabeibei).

In the past driftwood trunks were looked upon as the welcome bringers of fish, which gathered around them. When the natives are out searching for floating logs and when they find them the natives take off their hats; they must not stand up in the boat, because alu Tautup might resent it. Before they tie the baskets to the logs they sing a song to Tautup. [ER: one of the songs sung on this occasion is given in the original text, but is omitted here.]

When the singing is finished, the fish baskets, ū le morouel, are tied to the side of the tree trunk. A few of them are in one line, with the bottom of the baskets up and the opening in the back on the leeside. The basket furthest aft is considered best. Then the tree trunk is fastened and taken in tow. The most common fish caught in this manner is the bream, rell.

Tying of the baskets to the drift wood is considered a task not without all danger, because sharks swarm around the logs. The natives tell that recently a shark bit a fisherman who had a fish in his mouth.

Fish baskets are submerged in the inland water, let down to a depth of 1-2 fathoms. The natives remember the distance from the land and then have no trouble recovering

their traps. Handing in of the baskets bue or pio, is done with the kafáigo lifter. The word pio has given the name to the basket u lepio, which is otherwise known as ū le fato. (Then there is a rake tangak in Hellwig's catalogue with which the fish are taken out of the basket.)

At the entrance and further out towards the sea, baskets are dropped down to a depth of 7-8 fathoms and occasionally to a depth of 20 fathoms. The stones that weigh down the baskets, the faipăs, must be large and heavy. These depths are chosen only during the months of March and April when the current is slight and when the water is at low tide. Generally the natives know the exact spot where they have cast their baskets; they search for them with the hook, heave it up a little and let it drop back down so that the hook may find a secure position before the basket is hauled up. The following are additional types of baskets: [62]

ūs'sõ for catching the sand mullet. No bait is used to attract this fish but sand is piled up around the opening. In spots where seaweed, pom, floats around off the sandy beach, the baskets are placed in it instead of in the sand.

ū le pam is used to catch small sand barbels uorik, which are attracted by a bait pa (=pa lure) of rakum or raking le bëap; of land crabs. The opening is called úasig.

ulam are small baskets with which boys go fishing in shallow water, and which have bait in them. They are round in form.

4: Krämer--62 (1909) 1937 Woleaians
116, 412, 372 Elato 1-2

The pump drill is known as burabüra and comes from Elato. The wheel is of tortoise shell and the tip of the drill is of sharks' teeth. See Figure 134e [VMM: see source] for the hand drill.

4: Krämer--62 (1909) 1937 Woleaians
116, 412 Lamotrek

I was able to pick up an axe blade, ëtiligi.

Hellwig: tridacna--djim (Truk: sim).

Hellwig 2114 5891 is an axe made of conch shell called korolimang; on Elato it occurs made of lëang shell.

Hellwig's catalogue has a shell axe from Elato, marăli délla (blade--délla), terebra--talingawat, blade joint--rodjăl ĕ (rosăl e), neck of the handle--apirri güle, handle--erälle, lashing--vava, wood--djálo. The ceremonial axe is called tellë i lolomai.... The word for blade, chisel is pérogol, and the blow of the axe is tellë i falefal; apúnga sillë is the sound of the blow.

Coral stones, faiürr (Truk: fauir), ray skin (Hellwig: gillivai) or pumice stone miūr, mür, which drifts ashore... are used to smoothen the rough surfaces of the wood.

The fiber beater is called kománg; the wood is kaini and the tool comes from Pik.... At the end of the handle there is a knob, see Figure 94 [VMM: see source].

4: Krämer--62-63 (1909) 1937 Woleaians
116, 322 Lamotrek

Main products of manufacture: wooden bowls, houses and boats, small idols, and birds (Color Plate 2) [VMM: see source]. Among the small special objects there is a chair which Ikesera imitated from the model of a deckchair that he happened to see on the ships. [63] Photo no. 1026 shows Ikesera sitting on the chair (Figure 25) [VMM: see source].

Vessels tëbbi (Hellwig: tapi), Plate rölig.
(cf. Plate 7.) [VMM: see source]

These vessels are made of wooden blocks or boards; see Plate 8b [VMM: see source]. bóati--lugs are found on them as the illustrations show (the same as on Truk, Palau etc.). Bowls may vary in shape: the foot may be roundish and raised; the total height is 13 centimeters, and the width of the bowl amounts to 32 centimeters. The brim of the bowl is often almost hexagonal, as the specimen in Figure 26 a [VMM: see source]; the base sometimes is two-legged (b). The round bowl in Figure 27 (Kramer 452=3207) has two high feet which stand on a base and which facilitate eating; the entire height of the bowl is 25 centimeters, and the length of the roundish bowl amounts to 24 1/2 centimeters (Hellwig 209k: foot--perël).

The bowl in Figure 28 shows a somewhat lower foot, for the latter is only 6 1/2 centimeters in height; it is actually a low stool with four legs on which rests a longish bowl which has a length of 21 centimeters and a width of 13 centimeters. Hellwig 2336 is similar in shape.

Figure 29 [VMM: see source] shows a tray for eating fish which does not have a high base; nevertheless, we may notice a slight elevation at the right of the illustration. The plate is oval and pointed at the ends, 42 centimeters long and 22 centimeters wide and has a low molding along the edge, which in effect seems to be [64] a little fence; there is a hole in it at one side for the suspension cord.

Hellwig 2226•6006 is called tapi lemálu wulól; it is longish in form but is not painted red and does not have any inlay of mother-of-pearl.

There are three bowls in the Linden museum in Stuttgart which are said to come from Lamotrek: one is flat and oval, one is round and flat and shallow, and one is deep and oval in shape and has two bird heads instead of lugs; in the latter case the foot is low and represents a closed square.

Bowls with lids. The box in which the fish hooks are kept, the sóp is such a chestlike vessel; see Figure 30. The length of the specimen pictured is 12.4 centimeters and the width may vary from 3.8 centimeters, while the height is 4 centimeters; Hellwig has a bowl with a lid which he calls sáp; for the box itself he uses the word bassobasso, the lid is gárebal, the knob bóatil, the brim nadjel, and to open is sugi.

A peculiar bowl is a specimen with a lid and a decoration of Greek figures; one of the figures is represented seated on the long side whereas a person is shown standing on the short side. It is said to have been made by the Spaniard Gulio, who happened to be on Lamotrek at the time of the typhoon of 1907; the box is 77 centimeters long, 27.6 centimeters high and 27.5 centimeters wide. Figure 31 [VMM: see source].

The bird bowls resemble those from Truk. Kramer 493•3247" has a horse-shoe shaped base formed by the two feet of the bird as in Figure 32 [VMM: see source]. The length of the bowl is 37 centimeters, and its height is 20 1/2 centimeters. The model

must have been a frigate bird; Hellwig calls the bowl tapi a gataf and says that it is meant to hold the color substance that comes from Yap. Krämer 453-3208 is called tapi e lāp; it does not have a foot and for that reason is suspended; it is 48 centimeters long and has a piece of wood which is used for painting since the bowls are used for paint. One specimen is pictured in Figure 33 [VMM: see source].

A bowl very similar in form to the one last mentioned is in Berlin, and one with a bird hiding its head and a pointed head and forked tail comes from Elato; it is 50 centimeters long.

Among the vessels we must also count coconut shells; one of them, known as dagág a lūl, is set on a round base as in Figure 34 [VMM: see source], and has [65] a handle. It is said to have been invented by the boy Malüvit, when he was between 7 and 8 years old; this boy is credited also with having started this type of vessel in trade. Naturally we are in this instance dealing with foreign influences or else we must interpret it as an old Indonesian motif since bowls on stands and some with handles occur in West Indonesia. It is used as a drinking cup for water or garri (palm juice) (13.5 centimeters wide).

Containers of coconut are called ware; their shape may be that of a nut as in Figure 35 [VMM: see source] where the length is 15 centimeters and the width 8 centimeters; in other instances they have lids (pelipelal) and bottoms; Hellwig 2246-6023 Figure 36, has a height of 7 centimeters. Purpose: for keeping fish hooks, medicine etc.; they are also used as containers for fire wood, gulegul. In addition there are containers of

bamboo which are decorated in the same manner as in Indonesia. [66] Hellwig 2228-6008 Figure 37, has on it arepél e bulugale "tails of the b." and shark's teeth, and the patterns are arranged in six rows. Hellwig 2330-6099 Figure 39 shows various ornamental patterns, e.g., 9, 11, 22, 33, 43 and the pup-like little men of 23; they are either half or double. Hellwig 2118 has a scratched decoration of tirigi points.

In Berlin there is a bamboo stick with many designs scratched into it including birds, crosses, suns, teeth; it is similar to the specimens that have come from Oleai,

Measures

gat, sigat	length of a finger = 3 inches
ruagát	length of two fingers = 6 inches
siligat	length of three fingers = 9 inches
fægat	length of four fingers = 12 inches
ang, siang	1 span
ruang	2 spans
siliang	3 spans etc.
rolibos	1/2 Elle [ER: an elle equals about 0.7 yards]
gopa	1 Elle
sipap	from the finger tips to the middle of the chest
singaf	1 fathom
sigip	1 foot

Plaiting feifoi or feifeu
to split--gassiet

Pearlshell baura (?) used to smooth the pinnae and to scrape the fibers; Figure 40 [VMM: see source] (especially used for the treatment of banana fibers; the shell has not been pictured previously).

a. Mats

Mats, coconut fiber mat, girre, made of two parts (on Truk: kinni or kiri).

Hellwig 2278=6051 Figure 41 [VMM: see source] is called gilli and is a small mat of coconut pinnae which is used for water drainage; in rainy weather some of the ground maybe washed away at the wall of the house, and the water may enter the interior of the building. With one movement the mat is pushed into the breach at the house wall so that the water may be diverted. Hellwig observed its use in house 24a which is known as Imeilap (size of mat 30 centimeters).

Hellwig 2258=6033 is a mat of coconut pinnae, ülaf, for the protective huts on the canoe platform (Ifaluk man). Like all pandanus plaiting, the pandanus mat kiĕki is made exceedingly well on the coral islands; this is also true of Truk although, in fact, it is only the population of the reef island of Pis that knows a great deal about this work.

b. Baskets

Some of the baskets from Lamotrek and Elato are here pictured on Plate 5 [VMM: see source]. First we shall mention the bags made of pandanus, the containers with lids

that look like our étuis, and the open bags.

Containers with lids.

Plate 5c: this container is called sigerára; the same term is used for the strips of pinnae of the measuring line tal i felefel.

c. Open Bags

Plate 5 l, illustrates gaigérs from Lamotrek; Hellwig collected an identical gaigérs from Elato. Plate 6 m gaigérs with handle. Hellwig lists [68] another bag of this type, gaigérs. The pandanus leaf strips that are plaited into it are known as faivoi; those pointed down are the ealle and those pointed up are the ifak. Hellwig, uses the word gaigerre* whereas I have noted gaigadj for Plate 6 [VMM: see source]. The r of Hellwig's points towards the dj sound, cf. Truk and Djuk.

Plate 6k gatofadj, is more coarsely plaited and is used to carry food. m. gaigérs, f. gaigadj and k. gatofadj have a handle; in the case of f. it has two legs on both sides at the point of joining. k, and m. have the handle joined to the basket at the corners of the bag-shaped basket, but the four legs of f. are in the middle of the sides, which, however, appear as if they are open.

The same is true of the baskets of coconut pinnae. Plate 5n, büro and 5e gad, which are used on the occasion of wedding banquets; and they seem to be somewhat coarse and

*Hellwig 2III 5888 gaisérse or gaigerre djelū with an inner compartment djelū; with a hair cord.

more careless work as compared with the pandanus plaiting. The word gad or gadŏ (Hellwig: kad) was not heard on Truk.

On Oleai, a basket is called gad or kaporro (Hellwig: kaporro, a small basket plaited from coconut pinnae coming from Lamotrek) gad-gado appears above (k) in the word gatofadj; the analysis of the word would give us a gato of pandanus fadj and indicates that the gad basket is made of pandanus and therefore is finer and better; it is probable that fadj is hidden in gaigadj in 6f.

A bag djotuárĕ (Hellwig: drottŭare) from Elato has an opening ewálĕ and rings talinal.

No. 5e gad show the two ends of the bag pointed up whereas the three handleless coconut baskets g, h, and i are pointed exactly in the opposite direction, namely down.

These are the baskets which are called the wotau; one of them, plaited of pandanus, it resembles the one here given on Plate 6e [VMM: see source] which above was called gaigers (gaigadj). The coconut fiber basket is called boddou (Hellwig bóatau and bodau); Hellwig has the same type from Lamotrek where it is known as watauro with the handle djale; that means that a basket of the form pictured both of coconut pinnae or fibers is called wotau or boatau.

In the collection the following baskets are included which are plaited from coconut pinnae: Plate 5g is called votau; Plate 5h also known as votau tied with a hair cord from which hang some snails. Plate 5i Hellwig 2267-6041 watau; also Hellwig 2202-2976 has a hair cord; in the latter instance the following comment is given: the basket can be

tied three times by [69] means of hair cords sīm and snails tigere (Elato). Hellwig 2321 6091 is such a hair cord, which is shown in Figure 42 [VMM: see source] and which occasionally may be seen worn as a bracelet; it is 75 centimeters long and the snails resemble dolia.

Since the process of plaiting a wotau basket was not included in the Truk volume it shall be treated here. The first four plaiting stages a-d are given in the Truk volume, page 172.

[ER: The discussion of the technique of basket making is omitted here.] [72] We should add that the round basket, Hellwig 2109-5883 which is called kapéas or apéase, occurs; it has been discussed in Kramer where it is known as abéas.

Finally there is the fan, saipe (Truk: áliba or saiba); the point is known as botili á lipe (Truk: áliba), and the handle as eráll (e). A gáliba fan (Truk: áliba) is used for magic practices (see Figure 68). [VMM: see source]

116, 164 Lamotrek

"We," [VMM: says Elisabeth Krämer] "arrived on the island of Lámotrek on November 22, 1909 immediately after a great epidemic which had resulted in a large number of deaths and had killed men, women, and children."

4: Kramer--74 (1909) 1937 Woleaians
116, 286 Lamotrek

That weaving is very important on the island is indicated by the many ornamented looms, or looms of types that we have not observed on other islands of the Carolines (Figure 45h-l). [VMM: see source]. Their wooden frame work serves to receive the warp and as a foot rest for the women weavers. Figure 46 [VMM: see source]. Setting up of the (continuous) warp is done, as on Truk and Tobi and most of the other islands, on pegs that have previously been described. They are driven into the ground at certain distances from each other and the continuous warp thread is wound around them in a prescribed manner. As everywhere in the South Seas mats are woven from Hibiscus and banana fibers.

a. Preparation of Hibiscus Fibers [VMM: for mats]

One takes switches of bush hibiscus or preferably some from the tree-like species which is rarer; the bark is removed in as big strips as possible. [75] For four to eight days these strips of bark are soaked in salt water or in the taro swamp; when they are taken out, the fibers are separated from the land, outer bark so that they become flexible. When these fibrous pieces have been washed in sweet water and all juice has been rinsed out, they are dried, cut, split into thin threads which are knotted together and thus provide the material for the warp. Their natural color is a light yellowish-grey but they are sometimes dyed black.

b. Banana Fibers.

The effect of these fibers [ER: as compared with hibiscus fibers] is lighter, finer and more silky and in the case of many of the mats of women they constitute an interesting contrast to the paler hibiscus fibers.

For use, the outer seven to eight leaf shafts are taken off a banana trunk; the ones that are left, the inner ones, are too soft to be useful. Each one of these meaty shafts is placed over a round piece of wood and is treated with a pearl shell which has been ground so as to have a concavity at one end (see Figure 40 [VMM: see source]). All the flesh of the leaf is scraped off, and the treatment is continued until most of the fibers appear; then the latter are washed, dried, cut in a certain length and thickness, knotted and thus give the banana yarn.

uidj	banana yarn
gassäi uidj	separate banana shafts from the trunk
ligâtang	side edge of every shaft
raruidji and ra ri uidji	scraping (of the shafts)
puai	pearl shell with ground edge
bigugal	banana yarn dyed black
gilifer	hibiscus fibers
tafä engang	split with a nail (hibiscus yarn)
litelli moei	loose material for knotting torn threads on the loom.

c. Dyeing [VMM: of fibers to be used in mats]

Both gilifer hibiscus fibers and uidj banana yarn are dyed black when special designs are to be brought out in the textile. The yarn is first dyed in a greenish juice which is brewed from crushed terminalia leaves and water. Then black pumice stone with water is scraped on iron and young coconut husks are thrown into the liquid; a special greasy type of soil that drifts ashore is added; the fibers are put in this liquid with its coloring substance for twenty-four hours. Then they are rinsed and dried. In more recent times occasionally red threads have appeared in mats; they have been dyed with artificial dyes --red, green, blue, and violet--that must have been acquired through trade and are not readily available on the island. [76]

An example is Krämer 518, a mat with three red stripes, which resemble Krämer 519 (najelle malu galapal with small stitches gukudj); Krämer 460 dõr peig...has three green stripes and the same applies to Krämer 520; Krämer 521, paliälüf, has a red stripe along the edge and three stripe patterns--1 red between two green ones (similar to the mat on Plate 7e [VMM: see source]); Hellwig 2272 along the edge has two green and, in the middle, three stripes--green, black, green--; Krämer 515 is similar; it has spotted stripes and red transverse ornaments which are known as galut ma dab.

First Type of Mat

(cf. Plate 6, 7, 10 [VMM: see source]).

Mats of hibiscus with a pattern of seven stripes are worn by women, whereas mats with seven stripes worn by men are made of banana fibers.

The éllepat a le gílifer is such a hibiscus mat for women; it has seven black stripes and six light stripes of yellowish natural color between them; the effect in the case of the latter is produced by some groups of white, shiny, banana fibers. Some white banana fibers. Some white banana threads are even introduced into the black stripes; they are used either one or two at one time and are so fine and thin that they do not weaken the impression of blackness. The effect of most of the double threads in the black fields is purely ornamental. In order to produce this effect, four shed formations are necessary, whereas the entire remaining part of the mat is woven with the two sheds of the plain weave. To weave ornamental stitches by means of the four shed formation is known as gásuitieb, two shed or plain weave--aláli pelách. From now on I shall talk about these types of weaves using the native terms; the word for banana fiber is uidj, that for hibiscus fibers gilifer.

garier is the name for the seven striped men's mat which is made of uidj. It is woven with finer threads than the women's mat and, when especially fine, it is known as garier kénusch (Plate 6i [VMM: see source]).

Most common are plain weaves, aláli pelách, but also three and four shed patterns,

gásuitiĕb, with the above described ornamental effect in the black stripes occur. galut is the term for a seven-striped mat, in which the pattern appears as in gásuitiĕb on both sides. It is a four shed pattern.

The following types of striped mats are known: marŭp made of gilifer with five or six stripes; it is a coarse, plain weave which is often dyed with traded dyes. The black, green or dark blue stripes are broken by white, red or other colors and the intervening sections appear uniformly light. I did not see these mats in the unfinished state while work was done on them; they occur identically on Sëtoval and thus it is possible that they have been traded on that island. They look very modern; I learned that on the surrounding islands of Sëtoval, Pollap and others no weaving had been done, because it was taboo. [77]

I shall now go on to describe the characteristic mats with three stripes; additional ornamentation of them are the black patterns which are produced by fibers introduced in the direction of the weft, which constitute the transverse bands at the beginning and the end of the mat. In the course of weaving black gilifer fibers are sent through the warp threads between every weft by means of a little wooden rod; they are fastened and held secure by the following weft. This is plait weaving known as dab.

Second Type of Mat.

The peig mats have three stripes and are woven of fine, white uidj fibers with narrow black marginal stripes and a wider black stripe in the center* and very narrow red threads may be used in the center; Plate 6a-f [VMM: see source].

*Plate 6b [VMM: see source] has three wide stripes peig na tas.

We must add in the case of the majority of the peig the dab pattern, latitudinal stripes at the beginning and the end of the mat, which are very delicate in these fine mats.

The black stripes in the longitudinal direction may either be weaves of uidj or gilifer; the dab patterns are always made of gilifer fibers, which in their dull blackness contrast very nicely with the glossy, light uidj.

My studies of native weaving were greatly aided by the assistance of Bessi (Plate 3d [VMM: see source]), the half-breed daughter of the English trader Lewis. . . . In order that I might become familiar with the various dab patterns, she wove for me an exceedingly beautiful, abundantly ornamented mat (Plate 7d [VMM: see source]) with a great variety of latitudinal designs (Figure 49 [VMM: see source]). It has the name najile malugelep al--dab o fasch and belongs to the group of the three-striped peig alali pelach (with plain weave). The wide stripe in the center is broken by two white, and one red, lines. In the plaiting work, dab, red and green threads have been used in addition to black ones and this variety is a concession to modern times. The patterns however are of the true old type and have names and significance. Some of them are said to have originated on other islands. [VMM: see source Figure 47, for illustrations of the following designs.] When one begins at the upper end, one comes first to

1. A. uasslich pattern for the beginning of the mat
2. B. langodab a very narrow border which serves to outline a pattern

and which appears immediately above C.

3. C. sepasse iliuil — canoe sails of several boats that sail together.
4. B. langodab — see B, directly underneath C.
5: D. uadj — neck tattooing of a man
6. B. langodab — see B. [78]
7. E. fäsilümat — eye (from Faraulap)
8. B. langodab — see 6. B.
9. D. uadj — see 5. D.
10. F. uägüpä — unexplained
11. G. garrach — plant design from Ifaluk
12. H. ngingi — neck tattooing of a man
13. J. bub (pup) — a fish (see Truk, page 150 X) [79]
14. K. päülümel — a flying bird
15. J. bub — fish, see 13.
16, C, kusae — pattern from Kusae
17. M. fäülümat — eye, from Ifaluk (see 7)
18. C, kusae — see 16
19. N. gogotjub — see 12
20. O. pöulul — "round thing"
21. P. ngilipaggo — shark's tooth (Truk, page 188 b).

22. Q. ligongare Ifaluk pattern
23. R. B =Bessi, the plaiter
24. S. fatarigavŭong small animals of the sea lined up

The majority of these plaiting patterns definitely have a left side, but there are some among them which look alike on both sides. If the latter are used for a fine peig mat, and if the decorative stitches appear alike in the black longitudinal stripes on both sides, then we are dealing with a rare and valuable mat, which is called peig galut.

It has been mentioned above that peig also exist without dab patterns; they are shown on Plate 6d and f [VMM: see source]. Finally we want to refer to the lugŭllŭ uidj, mats of coarsely split banana fibers, which may be compared to the peig, except that they are much coarser. As in the case of the peig, there exist various sub-types: 1. completely white without any ornamentation, 2. with black stripes along both sides and with or without dab (Plate 6h [VMM: see source]) 3. with a central stripe in addition to the stripes along the edges, which makes the mat three striped, 4. three-striped and ornamented with dab, having at both ends coarse, simple patterns of black gilifer fibers (Plate 6c [VMM: see source]). All these mats have plain weaves. In addition to the local weaving products, one sees mats imported from Truk; especially men are fond of the plain, white banana fiber mat, which is called aliel; a yellowish type is known as garite. ngŭremus and pagutiu are two types of mats for women that come from Truk.

djuidab	needle used for the lattice weave
famalúdab	pattern of the dab

The Technique of Weaving
Winding the Warp

Pegs are called maiuel. For winding the continuous warp, five pegs are used which, here, as everywhere in the region of the South Seas, are driven into the ground at a certain distance from one another. I measured 4 1/2 hand spans from the first to the fifth peg (Figure 48).

Figure 48. Winding the Warp

[80] Counted from right to left, the warp is wound for a plain weave in the normal manner so that the heddle threads are introduced at no. 2, no. 5 is the cross, no. 3 the cloth beam (transferred to the warp beam) and no. 4 the shedding stick.

The two sheds of the plain weave on the warp are prepared by a double tour. 1st half: the warp thread begins in front of 1 and runs in back of 2, in front of 4, and from behind

around 5; then it crosses and in back of 3 runs back to 1, 2nd half: in back of 2 (warp threads laid around it) and 4 and 5 and back to 3. These double tours always remain the same, with the one difference that the heddle threads hold the warp threads alternately right and left of peg 2.

Two double tours can be expressed in the following manner by numbers; only the peg which remains in front of the thread is mentioned. 1, 2, and 5 are always alike and therefore are not mentioned. Wound from right to left the system is:

```
                2
4       L       2
                2
4               2 L x
```

If the color of the thread is to be changed, for instance from white to black, then the old thread is cut immediately behind no. 1 and the black thread is knotted on at this point (x to the right of 2).

For the fine white uidj threads in the black stripe only one half double tour is needed; thus one winds 2 1/2 double tours in black, 1/2 in white uidj, and once more 2 1/2 black. In the finished textile, e.g. the striped mats of the men, white threads will appear in the black stripe.

In the women's mat described, first thin single threads in the black stripe alternate with decorative stitches; for this 2 white uidj threads are necessary and are wound in

one double tour. In order to produce this effect two more shed formations are necessary. They are not considered when the warp is wound, but are added later on when weaving has begun.

When the warp of the width of the mat to be has been wound around the pegs it is taken off by two women; they go about their job in the manner prescribed and very carefully transfer the warp to the loom and straighten it out. To straighten out the warp is known as gaporette. Two flat sticks and several thick fibers are woven in; they serve as shedding sticks and around them the warp threads are distributed and moved in such a fashion that they are finally arranged in the desired [81] width of the mat. Weaving is begun with a shed held open by the shedding stick and one produced by the heddle; both are maintained until the very finish of mats of plain weaves.

Then there are the gasuitiĕb mats with black decorative stitches. The sheds necessary to produce this pattern are formed after weaving the mat in a plain weave has progressed to about the width of a hand. The sword is sent through the shed of the heddle, most of the decorative threads of the warp (the black threads) are on top, whereas on the other side the black threads run under the sword and over the shedding stick that is moved back. A flat piece of bamboo, the gasuitiĕb is sent through the warp in back of the shedding stick in such a manner that it covers only the black threads that are meant to produce the decorative stitches (those that lie next to the white uidj threads) whereas all the others are over it. (Figure 49 [VMM: see source]). After the stick has

been inserted it is used in the next shed together with the shedding stick, so that the threads which it covers up cannot come to lie on top, but must remain underneath where they produce the black stitches on the lower side of the textile. The next weft in the heddle shed leaves them again underneath and it is not until one comes to the third shed that the stick is pushed back so that the threads may reappear. That means that they have been covered up three times and thus formed the stitches on the back side of the mat.

Manner of treading:* shedding stick with gasuitiĕb
heddles
shedding stick
heddles
shedding stick with gasuitiĕb, etc.

In this manner weaving is continued until almost at the end, at a hand's width from it, one changes back to the plain weave used at the beginning. The final product is a mat with loose stitches on one side. The wrong side becomes the right side of the mat. It has three shed formations. If the mat is meant to look the same on both sides, a second heddle thread is added [82] which holds the same black threads as the former and lifts

*A technical expression taken from the plain weave loom; it denotes the sequence of shed formations.

them together with the heddles so that the decorative stitches are also brought out on the right side of the mat.

Treading method: shedding stick with gasuitieb
heddles
shedding stick
heddles with 2 heddles
shedding stick
heddles
shedding stick with gasuitieb, etc.

In this manner loose stitches result on both sides, and the threads which otherwise remain underneath because they belong to the shed are lifted so that for three turns they remain uncovered by the weft.

4: Krämer--82 (1909) 1937 Woleaians
116, 438, 574 Lamotrek

Trade is carried on principally with Truk. Attention is given to the question of tribute paid to Yap. I learned the following story in this connection: a woman, Lefagemai from Lamotrek drifted west and reached Yap, where she was hospitably received by the chiefs. When she was ready to sail back home she received presents of turmeric (reng) for herself and for all the chiefs of the islands, who in turn were obliged to make tribute payments.

4: Krämer--82 (1909) 1937 Woleaians
116, 484, 651 Lamotrek

Hambruch learned the following on Elato: Yongelăp (the oldest and highest god) stays on Yap, and tribute payments must be sent to him there. The Lamotrek islanders and natives of Sëtowal do not take their goods directly to Yap but only as far as Oleai; from the latter island they are taken west and are landed in Gatspar. Natives of Ifaluk, Fáraulip and Aurepik undertake this voyage and everybody meets on Oleai. The voyage is by way of Sorol, Uĕjü and Mogemog.

4: Krämer--82-83 (1909) 1937 Woleaians
116, 438, 484 Lamotrek

From early times on, the Lamotrek islanders have undertaken voyages to Guam with the purpose of trading ropes, fibers, mats, shells, etc. The goods which they wanted to trade they took to Poloat and exchanged them for turmeric (rang) and red shells (faibar) although this fact did not keep the natives of Poloat from undertaking their own voyage to Guam. But, as it were, they asked for permission to sail their ships from Lamotrek, which ruled over the sea as far as Poloat and Ifaluk.... With reference to Yap the following ought to be added: they sent their trade goods to Oleai, to Vótagai, for they feared the Yap islanders, thinking that they had at their disposal more effective mádjemadj magic for typhoons and illness. [83] The things of Lamotrek belong to the chiefs Ruébong and Inefel; Ruébong is the head and Inefel is his assistant.

When the trader Lewis came to Gogilrau* and reproached him for spoiling the children on the island he answered: it is not us, but their own gods who spoil them, because they have broken the old taboos; Aluelap gave them women for natural use, but they abused them.

* Another name for Agupelior on Oleai?

4: Krämer--83-84 (1909) 1937 Woleaians
116, 342 Lamotrek

On Lamotrek a frame house of timber which stands on the level ground is predominant; it is shown on almost all photographs. Its parts are best seen in Figs. 52 and 59 [VMM: see source]. They show the upper and the lower frame work, walls of wooden boards, and in them a door both on the gable side and the long side of the building (see Fig. 51 [VMM: see source]) . [84] The gable is covered with a grating and coconut pinnae or mats over it. Fig 72 [VMM: see source] clearly shows the gable side of the house Lemar from the outside; on this picture we may also observe the growth of young ubud leaves, because the house has been subject to magic. Usually the lower longitudinal beams stick out beyond the side of the gable, so that one can place a plank on both ends and thus make a seat (Plate 8c [VMM: see source]): Pillars may rest on the ends of the beam (Plate 8a [VMM: see source]) or another beam may be laid across them on which the king post stands in order to support the ridge piece which is also projecting (Plate 8d, [VMM: see source]), the result is a porch which may be open or covered over as Plate 9a shows. All these features of buildings have already been discussed in relation to Lukunor, which is the easternmost of the islands on which these frame constructions occur. Sometimes a hipped roof is added to the gable and is untidily supported by a few thin posts.

(1909) 1937

Woleaians
Elato

On Elato there may be a semi-conical roof so that the gable slopes; here the lower part of the house, the wall, is made of coconut mats (Figure 12a [VMM: see source]). Sometimes coconut fronds are hung directly from the ridge, and their stalks are pointed up.

Such semi-conical, sloping roofs may also be observed on the canoe-houses (Figure 53 [VMM: see source]) which are open all around, e.g., they do not have any walls. In this case, the lower frame beams do not exist [86], but only the upper framework is there and consists of square roughly worked beams (Plate 9c [VMM: see source]). They are often elaborately ornamented and the same is true of some of the square purline (Color Plate 2 and Plate 4a) [VMM: see source].

Many of the small houses stand directly on the ground and the eaves almost touch the ground (see Figs. 50 and 51 [VMM: see source]) or on stone platforms. A storage house erected on a foundation is shown in Fig. 54 [VMM: see source]. On the other hand, coral stones are frequently scattered around the house; more rarely the houses have a stone enclosure (óror), Fig. 68 or as a low log fence (Fig. 52 [VMM: see source]). In the case of the im, the eaves of the roof are often 1-1 1/2 meters above the ground.

The hexagonal houses in Fig. 55 [VMM: see source] which are more common on Oleai and are described in that connection, often have ornamentation on their gables underneath the overhanging roof; two examples of this kind are given in Fig. 56, a and b [VMM: see source]. The designs of the ornaments are fish, lozenges, sharks' teeth, etc. Details of arrangement are given in the section dealing with Oleai. One might be inclined to assume that [87] we have here an instance of borrowing from Oleai, if it were not for the love of decoration which may be observed elsewhere, e.g. on the canoe-house Aboi; Elisabeth Krämer has made a water color painting of the latter (Color Plate 2 [VMM: see source]) in order to convey the correct impression. The ornamentation which decorated the inner sides of the beams of the framework and the rafters is rendered in detail in Fig 57 [VMM: see source]. We did not observe anything similar on Oleai, nor did we see on the latter island the beautifully decorated looms which were shown in the chapter on weaving. [89]

Types of Houses.

fal lap	"large houses," probably a sort of temple
fal	the canoe-house, house for visitors
im	the living-house
meripann aie, imepō	the storehouse (planks in Fig. 51 [VMM: see
malimes, malum	the cookhouse (hearth--nim, lim) source]
fëlang	for the place of fire, reminiscent of the
im ali pel and im fatiu	the menstrual hut falâng (1009 Krämer 221)
imareipel	house for pregnant women
imutamái	birthhut
imaligat	house for the child (Sëtoval: im alipel)
imalifam and im ale gogóbong	
im ali bólebol	house of magic

[ER: A list of the parts of houses is omitted here.]

House Construction*

In the construction of houses, a strange device is used; it is a scaffold which represents some sort of beam lifter (Fig. 58 [VMM: see source]). Hellwig 2305 6071 is a model 72 centimeters high. Hellwig noted the term ligāse rumrum for the beam raiser; its frame is called wusal, and the top piece with its transverse poles is known as vaip. The lifter is used to raise the heavy beams into position. Crab-bars from both sides are brought into a position of leverage between the rungs of the scaffold and the ladder; the beam placed on the top part and lashed to the cross poles is lifted. For new construction on a fairly large scale (canoe-houses) they used beam lifters of different sizes. The initial lift of one beam end from the ground by crab-bars ended with the placing of the end on the lowest rung of the lifter; for the purpose of hauling it up to the next rung the whole framework is moved closer and the same system was followed to the top rung. Most commonly this mechanical device was used for the renewal of poata, sul, in the canoe-houses, but it was always constructed in adjustment to the beam height of the building in question. It is said that for years this sort of apparatus has been out of use.

Housedoors may be quadrangular frames, filled by gratings of parallel poles and 90:50 centimeters in size.

---

* The builder is called séllap...

4: Krämer--91 (1909) 1937 Woleaians
116, 352 Lamotrek

Interior of houses (Fig. 59) [VMM: see source] usually empty.

In addition to wooden hooks, taumi on which baskets, etc, are hung (objects of Fig. 25 ff.) [VMM: see source] there are gratings of bandanus wood (=suspension grates) which are called váng and on which small objects are kept. We even found an armchair, li-masa (Fig. 25; [VMM: see source]) which Ikisera had made for himself in order that he might be able to sit like a white man.

Lamotrek

In the discussion of navigation... Alúluel has been identified as the god of the navigators but also Lugeileng is closely connected with navigation.

As the builder of boats he is most important. He has many assistants among them Sëlang, Semalegóror, Semadjek, etc., who have been characterized in more detail in the chapter on religion, where there offices are explained in some detail. [92]

The head construction man, the séllap, (Truk: silelap) and his assistant, the rolifé-lefél, must not do any other work while they are engaged in the construction of a canoe; the one possible exception to this rule might be roofing. After the 5th day of taboos, the póufar... álisulap (Alúelap) conducts the ceremony lulur which frees the assistants from the taboos, whereas the headman is subject to them until the canoe is completed.

4: Krämer--92-97 (1909) 1937 Woleaians-1-7
116, 396, 784 Lamotrek

On Palau the felling of the tree from which a canoe is to be made is a sacred action, but on Lamotrek it does not involve any kind of ceremony. Felling of a breadfruit tree is called komádj ali mai, and transporting the felled tree is urur ali mai. Everybody lends a hand in the latter. The trunk is hauled to the beach where the rough work is to be done. In order to be able to move the tree, the trunk which is lying on the ground, is surrounded by coconut fronds and their pinnae are plaited together. Both the tree trunk and the stalks of the fronds are notched and fastened by tying, so that they may not slip as the tree is dragged away. This system makes hauling ropes unnecessary and the weight of the tree is somewhat lightened. The roughest work on the tree is done in the bush itself in the spot where it has been felled and is under the supervision of the god Simalegodjúat.... When the trunk has finally been transported to the beach, the actual construction work begins with rough-hewing with an ax. On this occasion the ceremonial ax sometimes is displayed...

The work on the beach is begun by instituting a fast. Women may not come to the place of construction but otherwise no special taboos are imposed. After the fast is over, the juice of young coconuts is drunk and their meat eaten. Cracking of the first nut, the giligel, is a solemn action; the term includes the word for stick got, and because it is an action it is made into molegot. The nut is placed in front of the person selected to crack it and the spirit Tautúp, the giver, is invoked.

[ER: a short prayer is said before the coconuts may be eaten, but it is omitted here.]

4: Krämer--92-97 (1909) 1937 Woleaians-2
116, 396, 784 Lamotrek

[93] Then follows the first blow of the ax, the kakilet... and the rough work on the canoe is done before the line is used.

Now is the time for further work on the breadfruit tree trunk which in the songs is simply called mai. The explanation of the second song by Faragau (house 1) revealed that in earlier times the tree trunks were soaked with oil inside and outside and charred in order to simplify the later treatment with the adze. But the work of the ax, the first blow, and the first steps at least were always important and done in as expert a fashion as possible. Another important step taken without special ceremony was

1. the laying of the keel known as tilegab (solegab, "the keel"). The keel is roughly worked.... When the keel is laid, the workmen fast all day long and may not touch any food but coconut juice; this fact is most strictly enforced when the line (Leine?) the tal e fálefal has been laid. It is not until the evening that food may be taken and then the banquet, iles, is held. On the second day, the day after the laying of the keel is the time of
2. the gapileval, which means the "keel of the bush." It refers to the measuring of the trunk in order to determine the length of the hull of the canoe, the bul, which is done with the line talefélĕfel.*

*There are four different types of measuring lines, tal: a, tal i motaisam (spirit of the 1st sib.... b. tal i ngulu c. tal i gedj (connected with it is the 4th song of the canoe construction collection.... d. tal i gudj (with it the 2nd canoe construction song). For every measuring line a song is necessary; similarly the taboos change with them.

(Fig 60 [VMM: see source] which may not be used for anything but canoes. If the line tears, it is a bad omen for it may not be knotted. First the entire length of the canoe is measured off and then the line is folded and the halves are determined by finding the center, the lug. (Fig. 61a) [VMM: see source]. In a similar fashion the quarter sections are measured and marked off. Straight underneath two of these quarter section marks there are the two ends (fétang, Oleai; fátang) of the lowest keel, gapiálei. From the fétang ends the keel rises a little bit on both sides in the longitudinal direction and to the further end, gom; the part between the two ends, fétang and gom (Oleai: falegóm), is called gapiléisap and the section from the gom end to the bow with the figurehead is known as faisap (Oleai: fatob) (Fig 61a [VMM: see source]). It is important that the fétang end be laid correctly and that the keel between [94] the fétang is straight so that the canoe will not yaw. On both sides of the upper longitudinal line, a red line is painted on with a brush... for measuring the length; the paint must not be black because it would strangle the spirits. In a vertical cross section through the middle of the hull of the canoe, through the lug, the following lines appear: the keel, gapiálei, and above it the hollow djölifadj, which looks like a pandanus leaf; and above it as the upper margin the edge, úlut, which has been indicated in the longitudinal cross section in Fig. 61a [VMM: see source]. The úlut line in the interior is the boundary line

of the bilge. Above it is the side of the hull known as órol which at the upper end is thickened, lugulepal; on this edge rests a wooden pole serving as gunwales, mesep (papa le vá) which is fastened by a string, ngareliva. Special care is taken when the bilge, the space above the keel is hollowed out. (Hellwig: niua). The bottom, lauâilol grating, is divided by means of coconut frond stalks into three sections similar to the space of the deck which has three red lines. Then the space is hollowed out and the bulkheads, the kábong, are not forgotten in the process. The line is used on the orol side. Attention is given to the thwarts, to:

1. tolefatefat
2. metangór often with failo reinforcement (Truk, page 229: fauílo)
3. tipalefang
4. ti válim
5. sáragio
6. fatamat with the lower bail seat

All this is taken care of on the second day. Then the measuring line is rolled up. While the hull of the canoe is dug out many mats are often laid out as a sign that work is under way. The people who pass the spot are greeted with the greeting of fâiro, in order that they may not spoil anything by their possible evil thoughts. [95]

3. velap. The work of the preceding days is improved and the exact sizes of the areas are determined. The uppermost line indicates the boundary for the

work. Everything underneath it is sacred work and everything above it does not matter. That is to say that attention is concentrated on the lower búl section of which as much as possible is left standing. Then the planks are cut and the figureheads for both bow and stern; their lower parts are called padj and the term applies to the section where they are fitted into an echelon-like groove above the gom, and then they constitute the section called faisap. Like a thigh they extend to the knee, borolemet, where the wood turns to the inside so that the heel, monga Selang... changes into the foot pointing to the outside or the forked metál i va, the "ship's eye". The two prongs of the fork are called mongarëdj and the upper sole of the foot seapolimet.

4. vëdjik. A day of taboos because the finer work is done on the keel section. Everything is checked and finished, including the planks. The god Meseiseit supervises this work....
5. póufar. It is not until this day that the boat rests on the keel. It is another day of taboos, no rough hewing may be done, but only detailed work on the superstructure. The planks that were previously cut are put in place but for the time being they are only temporarily fastened with hibiscus fibers (gilifau) and provided with wedges, djib or kadjór, which necessitates strict attention and supervision. One prays to Bórumai* "rising water," bor, and "good,"

*Belongs with Semalegóror...

mamai, i.e., good tide; [ER: a song, lulur, is sung on this occasion but is omitted here.] The canoe is filled up with coconuts and food for the god. Now the construction head may dismiss his assistants. In the final placing of the planks, coconut husks are utilized (pal ali va), they are laid down after artocarpus sap, bilis* has been put on the wood. The sap may be applied after the planks have been moved into place; in this case a smouldering leaf-sheath is held close to the stick with bilis. Now the péret approaches; the sewing on of the figurehead, padj, which is known as bau ipadj, is very difficult. Stitching through the holes with the gólemong cord...is known as yógeyog. [96]

6. kabukio with taboos. In order that the kio, the outrigger beams may be fitted in, kabuk, notches úoș, must be cut. One tries to do the fitting as tightly as possible. The kio on the leeside rest on the geligeaá and on the weatherside on the faramoe. In order to allow lashing "holes," ngata le olotráol, (Fig. 61c [VMM: see source]) are drilled underneath the uós. The drill resembles a chisel; in recent times it has been made from a piece of iron, búrubur, which

*The juice of the breadfruit tree trunk, the ralimei...is collected in coconut shells. One allows the milk to settle, pours off the water and washes the deposits in salt water; then they are filled into coconut sheaths and are kept in this condition; juice treated in this manner is called bilis.

usually is used only for the making of coconut slabs...in the past it was a piece of madrepore which had to fill this purpose. As the drill pierces the material, magic is made. It attempts to chase the evil spirits away. This is done by shouts of all present; eho! eho! eho! The calls are followed by a great deal of noise, more shouts and beating of the arms, etc. Then everything is lashed on temporarily or permanently. The sórang are made for it, the cuts between the holes through which the lashing is put.

7. votap. The hull is set up, the keel placed on longĕs beams; the longĕs are short wooden beams with grooves into which the keel is to be fitted. If it is impossible to fit the keel exactly, the error of cutting is repaired by coconut husks. If the canoe stands well and correctly, it is easier to do the work. At this point everything is done with a veiw to permanency. All shaping is done well and accurately because the wood shrinks as it dries. Now all small pieces are added.
8. kámor with taboos. The main job on this day is the smoothing of the hull of the canoe. Stretching out the line reveals the irregular spots; wherever wood is left standing high it is chopped down, but this work is done most carefully, a little at a time. This is known as the kalúl ali metál e boédj "the beautification of the face of the cement." For the caulk used on the canoe, the cement, boédj ali va, "cement for the boat," is prepared from burnt clay, which is mixed

with a great deal of coconut wood coal and is mixed with the liquid gained from young coconut husks. This caulk is pressed into the holes and cracks and any residue is removed by means of calophyllum leaves. Caulking may not begin until it is certain that the boat will not be a subject to future strong movement and the "beautification" must have been finished. [97] In this connection ray or shark's skin may be used, or corals. "Scraping" is called fe'r; see faiür.

After the caulking, the painting is done. But before this step may be taken, the outrigger must be provided with the float, tam; this action is known as the fai eám (connected with the taboo val e vē', the "bush magic")....And the stanchions ám must be fastened to the outrigger boom kio. At this time the men fast, for anganga sórosol, "work in the early morning," is necessary.

Painting of the Canoe

Now the painting may begin, but usually is postponed for some time. After cement has been applied, bedjë vā, on both sides of the hole, the boat is lowered into the water after at least four days have gone by. At this time the ceremony, gafē'fei, is held; the canoe is decorated with young coconut pinnae, úbudj...all the fishing canoes that happen to pass throw fish over so that after a little while there are quantities of it large enough to provide for a banquet. And indeed a great banquet is given by the owner of the new canoe to the sellap and his assistants, and gifts to the gods are not forgotten on this occasion.

4: Krämer--92-97 (1909) 1937 Woleaians-9
116, 396, 784 Lamotrek

At that time, the rigging and sails are still lacking, but their names will soon be given.

Then follows the tárabos song...as a dedication ceremony and the last step before the canoe starts sailing. At this time all the taboos are ended.

4: Krämer--97 (1909) 1937 Woleaians 1-3
116, 396, 386 Lamotrek

Unless the canoe has been painted earlier, now is the time for it; the lower part of the hull, le djól le va, is painted black and so are the upper edge, mated, and the laterally sloping parts, lellap; above this area is the longitudinal band, far, and below it the hull is painted a shiny red (1010 Kramer, Color Plate 2).

The red color substance, lap, comes from Yap... and the painting itself is known as madjagoi (from dja red). Red earth is mixed with water in the paint bowl, tabbi lap, and is applied with the brush, gololie, of the coconut sheaths. If one is dealing with large areas, one uses the husk of a coconut. When the paint has dried, it is covered with artocarpus milk, ralimei, which has been mentioned above in a different connection,

The black paint, rel, made from hibiscus wood (marafai) or coconut husks (not coconut shell) is also mixed with water. It is fixed with a preparation of scraped skin and the juice of crushed Ipomoea, djaival; Ligadjelap is the god of the painters.... When the black-red coat of paint is applied, the boat is ready for the big voyage ahead of it. Paint bowls and paint brushes must not be misplaced.

4: Krämer--97 (1909) 1937 Woleaians
116, 552, 396 Lamotrek

The name of the boat is chosen after the tree whose trunk was used, or the land on which the tree stood.

4: Krämer--97 (1909) 1937 Woleaians
116, 465 Lamotrek

The boat builder and his assistants receive their payment upon completion of the work; the former receives 10 or 20 or 30 pieces of trade goods depending on the size of the boat.

[ER: A glossary of canoe parts follows in the text, but is omitted here.]

[100] The Sail

The sail, ua, (longaliu two long poles on which the sail rests) is hoisted on the mast with the halyard (Fig. 61d), úrur, which is fastened to the yard by means of the timber hitch, kolliva (l); there is also an auxiliary halyard, sós (d). The sheet, moél (d), is tied to the boom, lim; next to it towards the neck there is a loop, talitor (d), a piece of rope fastened by both ends and hanging down like a bow so that the tackle can be attached and ease the sheet. At the tip of the boom there are two more cords or small ropes, ápiteg (d), used for lashing the sail to the notched end, gobur, of the yard or the bow (cf. Kramer, Samoainseln, Volume II, page 258, Fig. 29). The gobur end is like the handle of a knife; it becomes thinner towards the yard and is dagger-like in shape and this part is lashed on in order to lengthen the yard; fefe is the word for the lashing together of two wooden parts. As a matter of fact both the yard and boom show several lashings which serve to fasten the sail and which are called mop; the various rings are connected by means of longitudinally extending pieces of rope (i), vl (see Kopfschlage (?), kat). Soon after completion the sail is fastened to the mop of the yard but not to that of the boom, in order that the latter may yet be removed and the sail fitted to it. The latter consists of the "dresses" sail, salil, ruiel, the mat strips screw together in the shape of a triangle by means of the seam góruseg (see Plate 17d); [VMM: see source] the horizontal seams all end with a bow, gakit (Fig. 61h) [VMM: see source] and the

sewn strips are stretched between these bows. When the wind is very strong, a rope taligakit, is sent through them which is fastened to the two upper cringles [101] and serves as a substitute for the lacking wooden support on the third side. In order to straighten the dresses little rods, djifel, are used; stretching is known as gameil and the cracking that accompanies it is called sangarenger.

In order to give firmness to the sail in a fresh breeze* about 62 telap ropes (d)t, are used extending vertically down from the yard one rope each runs through two mop rings (Figure 61e [VMM: see source]), whereas below on the boom they have free ends (d); every end is fastened to the line vatelap (e) vt (not shown on d); the rope ends, tabotelap are twisted like a cord, turned together and laid along the vatelap on the bolt rope, dautel. The edge of the whole triangular sail is reinforced by a rope, the so-called bolt rope, dautel (see Kramer Samoaianseln, II, page 258, Fig. 29), which like our leech

*In a strong wind the sail is shortened; this is done by untying the mat-sail from the yard and boom to about the spot of the halyard, urur, and the sheet, moél. The end of the sail that is thus freed and hangs loose is folded back towards the neck, and, if possible, is held here by a net in order that the sail does not bulge too much, because it would send the canoe too far over on the luff side. Naturally the sail area is also limited by taking in the reef; talitarak is the term for the reef line (the same as in Ralik).

ropes are used to fasten the sail to the boom and yard. Since the mat is rather fragile as compared with our sailing lines it is turned in, the bolt-rope is treated in a similar manner and the ends are used up (f). But on top two ropes are lashed on as may be seen on e and f, The vatelap vt and the valifarafar vf; the former, as mentioned, the telap ropes are fastened below; but the valigafararfar serves to connect the sail to the lashing of the yard and boom (i) and its connecting lengthwise rope is also known as valiga f fárafar (vl). The ends of the bolt rope and vl are fastened to the fork of the boom (d lower right) and vt is tied to the yard-arm and boom since it is non-existect on the third side which does not have any wooden reinforcements; here the bolt-rope and vf are also known as tali metalu.

lalebógol	the rope used to lift the halyard close to the mast and the eangelap in the course of paying out the sail-rope.
tal e rúopin*	rope filling the same purpose, with the one difference that the two ends are free and gird the mat and halyard.
talitarák	reef line (like Ralik)
paddle	fatúl; as is the case further east paddles with knobs occur
rudder	fatul e bupo (on Truk: fedil a bú), fatul ulul; storage space fo; bulkhead, gábeung; bail, gámat; lower thwart, iselimát,

*djukupin is the term for canoe on Yap.

for "to bail," gamát.)

The figurehead is the well-known forked tail with the fork seapolimet; at its foot it becomes narrow and the narrow spot is called mong a Selang "forehead of the Selang" after the god of that name who is considered the inventor of the figurehead. [102] The two prongs of the fork are called mong a redj, "forehead of the seabird redj"... third day.

4: Krämer--102 (1909) 1937 Woleaians 1-2
116, 533, 396 Lamotrek

There are many canoe songs, because the principle is that everyone should invoke the gods' assistance in his own particular way in order that the canoe may turn out to be beautiful, luck may be with its passengers on their voyages, etc. In particular, every measuring line has its own song....

Woleai

On Oleai the prongs of the fork [VMM: of a canoe figurehead are also known as mongo Sëlang; it is actually the notch of the fork which is known by that name of gilimel and the rabbet extending from the outside from the notch to the keel is the falegilimel (fale="below"). Inside, in the direction of the hull a small quadrangular slab, nalimat, is found lying underneath the prongs and the sloping area further down is known as ataúlibodj. The points of the fork prongs are called móngoros. I learned all these terms on Oleai.

4: Krämer--107 (1909) 1937 Woleaians 1-4
116, 592 Lamotrek

As on Truk, we have very pronounced matrilineal rights.... The woman owns the house, etc.

4: Krämer--107 (1909) 1937 Woleaians
116, 843 Lamotrek

The sorcerer...stays on the lot next to the house of the pregnant woman; in his hut he prepares medicines. All people around here may only drink the juice of coconuts and no other liquid. Once a month, for three or four months, the sorcerer makes the tafei i lólomei...as a precaution against loss of blood, for the liquid of the broken stalk of the plant is red like blood. Fasting is prescribed for all as the magic is practiced. The sorcerer, vak, has an ax similar to the one used in the construction of canoes; with it he shapes a djep fish, a Caranx, takes a wooden bowl, lifts it four times and then starts his magic. The fish is tied to a fishing rod, (Fig. 62 [VMM: see source]) and placed on the abdomen of the pregnant woman with the head pointed up. Then the sorcerer takes the ax in his right hand and with it beats the fish three or four times; then he lifts up the fish on the angle rod as a symbolic expression of removal of the illnesses. djep is the term for "to leap" from which the Caranx, as a leaping fish, has derived its name. The action is meant to have the effect of making the child jump out; first comes the water, djal.

4: Krämer--107 (1909) 1937 Woleaians
116, 857, 881 Lamotrek

No initiation ceremonies are held.

Young girls early go out to gather fire-wood and they also take care of the hearth, cook, etc. When they are ten years old they are sent into the taro fields. For the sake of solemnity at the time of puberty, gabuitiu, a little banquet is held and taro, bananas, etc. are served; the men occasionally contribute young coconuts, fish and pigs. For three or four days the girl is bathed three or four times daily and is rubbed with the yellow turmeric color substance known as rong. The women at that time often perform dances....

4: Krämer--107 (109) 1937 Woleaians
116, 844 Lamotrek

According to Elisabeth Krämer, Ilolumai is an old medicine-man who was the first to have prepared the medicine (taffe). Payment for the efforts of the medicine-man are 1-2 mats. When labor pains have set in, the taffi ale ngërak prepared by the husband takes place. In order to hasten labor and the birth of the child, the taffi ali gauli ali medak is used. jitengi, to press.

Midwife, vãle malãu.

4: Krämer--110 (1909) 1937 Woleaians 1-3
116, 595 Lamotrek

The word for marriage is rŏle kannei, from rŏlim, the member of the house and kannei, to give, because the man receives everything from his wife. In connection with the description of the village, it was mentioned that usually the man moves into the house of the woman. For that reason polygamy is rare.

4: Kramer--110 (1909) 1937 Woleaians
116, 587 Lamotrek

Thus all relationships in the sense of blood relations are matrilineal. According to Cantova... the levirate does occur.

4: Krämer--110 (1909) 1937 Woleaians
116, 582, 836 Lamotrek

Girls marry as young as ten years and up, whereas the men wait until they are grown up. The parents simply express their consent or disapproval when the question of marriage is put to them without any further ado. Close relatives do not marry. Before marriage, there is complete freedom. Faithfulness in marriage is a rare occurrence. Marriages between close relatives are possible if this relationship is on the side of the man, in the sense of the totemistic matrilineal right. It has been mentioned that marriages may not take place between members of one gailang, one clan; in the same way it is possible within the first clan, but only between members belonging to different ones of the three branches.... That means that as close relatives as cousins may marry, if they do not derive their relationship through two sisters, but rather from a brother or sister, or best from two brothers.

4: Krämer--110-111 (1909) 1937 Woleaians
116, 585 Lamotrek

No special marriage customs are observed. The families of the man and the woman usually [111] exchange presents of food after the man has slept in the house of the woman for two nights; this food exchange is called autéli got after the contents of the basket, got, which by the way, is expected to be new.

4: Krämer--111-112 (1909) 1937 Woleaians-1-1
116, 846 Lamotrek

As on Tobi, we found special birth-huts on Lamotrek; they are called imu or imatamái and are included in the plan of the village. It was mentioned that the im no. 30 is frequently used by the women of the leading families; here they spend a few days of the tenth month before they move into the imatamai for the actual confinement. Here especially women who are giving birth to their first child receive their medicine, the tafei ilólomai, which is generally given to them once a month...Naturally magic, bólebol, is involved in the practice...and for that reason the im no. 30 is also known as im alï bólebol. As long as they stay in the im, the women may not have any visitors; at the most their mother and sisters are allowed to see them and, of course, the servants who pick up the food that the relatives put down on the boundary, róros of the lot. All the fruit trees on the grounds of the house are taboo. Generally the woman stays away from her normal living quarters for one month (Elisabeth Kramer: ten to twenty days). The word for month is aliulang; but there are also little months, aliulang a ket, which last only ten days and constitute the minimum period of absence. There is a difference in the regulation affecting the wives of the chiefs and the ordinary population....

If a child is born when the moon is not visible, that is to say at the time of new moon and up to two days before and after it, the woman in childbed stays in the birth-hut for only 10 days...But if she gives birth when the moon first appears, e.g., on the second or third day after a new moon, then the mother must wait until the 26th day, the

romálefal... and in this case we are dealing with a "long month," aliulang e lap. If, on the other hand, the child is born [112] after the romálefal, the waiting period is a short month. Upon leaving the imatamai the mother is cleansed with a magic bunch of ferns and coconut pinnae, which is known as eafuju lubobo, Figure 63 [VMM: see source])... The separation of husband and wife after birth lasts for three or four months. Divorces are rare. The children stay with the mother.

[ER: A magic song of purification is given in the original text, but is omitted here.]

4: Krämer--112-113 (1909) 1937 Woleaians
116, 586 Lamotrek

A separation, moemoe, is initiated by the family of the husband which tries to free him by presents. To absolve someone from a marriage or to break it is known as moemoe; unless this is done well and the issue is absolutely settled, it may happen that [113] years later one party is punished by the other when a new marriage is to be contracted or even in the case of death; then they may confiscate canoes and take similar steps. The man is not free until a real separation has been effected.

Poor women, the ordinary people, remain in the im ale gogóbong for four days to "fill the nights" for purification; during that time their name must not be pronounced and not until that period is over do they return to their living quarters. On them lies the sëgë bõbõ, the taboo of the chiefs. The evening of their departure from the imatamai the wives of the chiefs subject themselves and their servants who have been with them, to the ceremony of the frond of legát; then they go directly to the im. After the birth of the first child the wife of a chief moves as soon as possible into an imalifam (see Oleai), which is located far out on the beach on the weatherside; at night a fire is always kept burning in order that the child may be kept warm and the spirits may be scared off by the flames and smoke which they fear. The husbands do not work in the taro fields during this period of time and all fruit trees are considered taboo; the cutting of toddy is allowed as the one exception. The woman stays away from her house for four months. During the first month she may not go to the waterhole and during the second month she may go out into the taro field but may not do any work. After the fourth month the child is gauák and may be taken away. The cradle of the child is a square frame with net; the type we observed in use is shown in Figure 64; another specimen is in Stuttgart no. 41250 see above photo 7 [VMM: see source],

The woman Ledjelimar of house 10 knew how to practice conjuration of the spirits and the purification of the women after they have left the birth-hut imatamai. Elisabeth

4: Krämer--113 (1909) 1937 Woleaians-2
116, 565, 846 Lamotrek

Krämer noted the following: Generally several women together leave the hut as the moon is waning completely and with their mats and food assemble around the menstrual hut of one of them. Here the female conjuror sits and makes four elulape, magic knots from coconut pinnae out of ferns (see Figure 63 [VMM: see source]) and a bunch of them ealus uru poepoe* which she slowly moved in a circle; [ER: her action is accompanied by special magic words, which are omitted here].

*alus, the spirit, böe, the oracle knot... sometimes knots are made of young coconut pinnae; cf. above sarüjü lü böbö.

116, 614 Lamotrek

The Clans, gailang.

1. Mongaulifadj, on Truk: Mongulufadj; it comes from Poloat (see Oleai), on Pollap is is given as no. 2 but is not represented on the other eastern atolls. As for the origin, it is said that it must be traced back to the north of Eap to the island of Gáferudj--probably Sëpen--which on clear days was visible from the northern tip, from Rumung. The entrance was winding, like a snail. It is said that the island of Sëpen still existed in 1830 and occupied the position of the Hunter Reef of the maps. The word Gáferudj probably means "end of land" and is supposed to be the stem of the word Fároilap. On the island grew many coconut palms and also a large pandanus tree, fadj, with three branches:

1a. The middle main branch was called ngolifadj and to it belonged the head chiefs Sukurang and Joseph (see house no. 24a page 26); with their deaths, the branch came to an end.

1b. The head is Urupo (see house no. 10); furthermore there are Sopong (house no 11), Volimar (no. 24b), Somar, Rangemai (no. 24b), Sukulubou (no. 14) and Ikisera (no. 25).

1c. The head Boésu (no. 4), Tilipou (no. 14), Gasepabau (no. 9), and Alefamal (no. 26).

It is said that the two heads Súkurang and Boésu are descended from two sisters and that that explains the formation of the two principal branches 1a and 1c.

Members of the three branches may marry, but inter-marriage within one of the branches is not possible. The spirit, alus, of the clan is Mótaisam, who in his lifetime was a powerful chief; his father Uâisam is the spirit of 3. This clan is represented on the island of Sëtoval by the branch of Katamáng (see 1009 Kramer 260 31: Ketemang). [115]

2. Saúfadjik is not represented in the east. It is said to be a branch of 1 and therefore everything mentioned applies in this case; on Ifaluk Gofalü is supposed to be in second place, whereas on Soról it is no. 1; and here Mangaufadj is listed as no. 2.
3. Sâuel on Truk: Soualei; Uâisam see above. On Sëtoval: Volira.
4. Boll extinct; on Truk-Póloat: Boël; Pollap: Boal.
5. Sorr, see 1009 Kramer 258 10 etc. The spirit is Lebá which really applies to all.
6. Gailang ali oléa see Oleai; on Sëtoval: Falemei, see 1009 Krämer 263, no. 32: Sou Oley.
7. Uisúsu, Pollap 8. Spirit the same as for no. 1.
8. Rak; on Truk: Rek, spirit Gabós on Ifaluk no. 5.

4: Krämer--115 (1909) 1937 Woleaians 1-2
116, 643 Lamotrek

The Chief, tamol.

Cantova, on page 312, talks about the tamol, the different positions of sitting on the throne, approaches with stooped walk, foot and hand kiss, and long beards....

The list of chiefs...is not long, which means that traditional information in this respect is limited. In daily life the offices of the chief and his powers do not play an important part. For instance, the chiefs do not receive a larger share of food than anyone else. Nevertheless they are held in respect. One form of respect is the custom of not setting sail, mótog, on the bank, but of paddling on until the canoe is clear of the shoal. A report of Father Clain of the year 1697, shows that they may exert considerable power, especially during war time, and that Lamotrek at the time was considered the ruler of the Carolines (probably only of the central parts from Murilo to Feis.) Thus it is likely that in early times a kingdom was established in this region.

The chief calls the islanders to assemblies. When they are called, the natives come in rank and file arranged according to age and position. They carry baskets under their right arm and the left hand grasps the back of the right. Thus they move along in a slow procession.

4: Krämer--115 (1909) 1937 Woleaians
116, 622 Elato

Hambruch learned the following on Elato: two chiefs rule over the island, the head chief, tamŏl oi i lap, Mailipue and the assistant chief, tamŏl i gitegit, O'Mairang; after him follows the ou rongäre tamŏl; previously it was the deceased Saporóu, but now it is his brother Djigedjügol.

4: Krämer--115-116 (1909) 1937 Woleaians
116, 643 Lamotrek

The head chief gives orders for general work to be done: clearing of the bush, work on the palm trees, in the taro fields, the construction of houses and canoes, fishing, etc. The assistant chief is the speaker who transmits the orders, fadjoual, of the head chief to the people. The third chief passes on the orders of the [116] second and supervises their execution. Occasionally the men hold council, fagilili e tö and discuss the affairs of the present. Succession is handled in the same manner as on Faraulip. If the family of the first chief dies out, the second moves up to the place of the first. The third chief remains the third chief and a new second tamol is chosen from the family of the second.

116, 674, 578, 152 Lamotrek

Murder, limalau, is said never to have happened because hatred and greed are practically nonexistent. On the other hand manslaughter is known when two parties fight each other over some dispute or another.

4: Krämer--116 (1909) 1937 Woleaians
116, 684 Lamotrek

An adulterer is deprived of all his belongings, bowls, canoe, and even his sleeping mats.

The natives will stand insults against their mother, but not against their sisters.

4: Krämer--116 (1909) 1937 Woleaians
116, 721, 174 Lamotrek

War is said to have been introduced by Olifat.

Warfare is rare among the natives of the island group, and therefore weapons...are most limited. But it must have been different in the past, at least as far as outside affairs were concerned, when the king of Lamotrek...ruled over extensive territories. We heard that not too longago Ifaluk had attacked the people of Lamotrek because the latter had killed the crews of two of their canoes.

bailigógo*	fixing up the dead
bailikelik**	to take the dead out to the sea
bailigóifar	carrying of the dead (áfar, shoulder)
bai li róro	lifting of the dead to the shoulder
bai li djup	holding of a dead child in the arms
kábong	the farewell, goodbye to the dead.

The first death of a new moon is mourned by a work taboo of four days.

Some families, who were close to the dead, gather many thousands (20-30,000) coconuts; this may take many months or even as long as an entire year. All the coconuts are piled up in front of the canoe-house and as soon as possible are distributed among all the islanders, including the children, in honor of the dead.

The same procedure is followed with taro; 200-1000 taro are collected in one spot and then are distributed. When the bai taboos are over, all the natives who have brought mats receive coconuts and the same is true of the women who cover (angefüllt=stuffed?) the dead with reng, yellow turmeric powder. Some of the persons, who have given

*pai legogo, payment, pai, for the fastening, gogo: first banquet for the assistants in the preparation of the body, held as soon as possible.

** likelik, leaving, throwing away of the body, pai, payment-food, often together with the pai legogo.

special attention to the dead are awarded for their efforts by food payments.

Beloved relatives are washed with the water of young coconuts and then the water is drunk. Mummification was practiced in the past; frequently mummies were hung up on the ridge-piece of the canoe-house and were buried after they had been there for some time. High ranking chiefs were laid out on stretchers, and wooden bowls were placed underneath them to catch the water of the body. The terrible smell caused the relatives to stick lavender (uārong) in their noses, which had to be pierced for that purpose. Lewis had seen a dead child laid out in this fashion. We saw the body of a child which was painted yellow and ornamented in an elaborate manner; Figure 65a and b show it [VMM: see source].

4: Krämer--116 (1909) 1937 Woleaians
116, 643, 766 Lamotrek

The importance of the chiefs is expressed by the taboos declared upon their death, which are called tap, and the most important of which is the bai (bei); the bailimas is the taboo imposed on the land in the possession of the deceased which is extremely indicated by the fastening of coconut fronds....

Death of a Child
by Elisabeth Krämer

For some time I has heard the weak cries of a child; when it had left the birth-hut with its mother it lived very close to our own dwelling. It was whining a great deal of the time. The house in which it stayed was not very solidly built and during the night there was a downpour.

The following night all of a sudden we heard loud dirges; in the distance torches became visible. Soon many voices joined in the lamentations which continued all night long. The next morning I found the dead child in the hut surrounded by two women who were mourning loudly in a penetrating and ugly way. The child was painted with some reng (turmeric color substance) and somewhat ornamented. [119] During the time I stayed in the hut, the parents picked up the child and added some more paint and ornamentation. Many gifts were brought in--faubar chains, arm-rings, belts, fishhooks and especially a large number of mats. The child was laid on a seven-striped, yellowish black mat and a young taro shoot was placed on each side of it (a). The father had a very sad expression on his face, but the mother soon lit a cigarette, while the mourning women picked up the child and continued their lamentations. The mother took little part in the weeping and the other women and children of the house maintained absolute silence. The child was not to be buried, but to be kept in the house, as it is the custom on Truk. The rumor

circulated that the mother was responsible for the death of the child because at one time she had become very angry at poor food given her. This anger had gone into the milk and the child had been taken ill. The custom prevailed of wrapping the dead into a large number of mats; occasionally bodies were buried in the ocean....

Woleaians
Lamotrek

Unless a dead person has a burial hut his spirit roams about at night roaring and howling and scaring the living.

4: Krämer--119-120 (1909) 1937 Woleaians-1-2
116, 764 Lamotrek

Burial

Figure 52 [VMM: see source] shows a house to the right of the house on piles; this is the burial hut of Saualik who was connected with Sopi and on the extreme right there is a hut over the tomb of Sopi's mother who had adopted him....

On the grave of Rólimei there stood a hut áruat (photo 9d [VMM: see source]). This photograph shows that a small saddle roof was supported on two roof columns; the cornerposts cannot be made out accurately and of the framework only the transverse gable-beam is seen; it is connected with the column and the apparently leaning corner posts by diagonal poles. The gable ends in vertical sticks which are connected with each other by three cords in an awning-like fashion. Below the burial hut is surrounded by coconut mats.

The navigator Rolimei intended to sail from Yap to Mokemok, but missed this island group and finally reached Poloat; when he wanted to return home from this island he drifted to Lamotrek where he died.

Unless a dead person has a burial hut his spirit roams about at night roaring and howling and scaring the living.

For that reason the dead are frequently wrapped into mats and the bundle with the body is weighted down with a stone and dropped into the ocean.

Ocean Burial

The spot for ocean burials is south of the island of Lamotrek, 100-150 meters off the

shore, at a place called Taualiva; this is the same name as that of the canoe passage in that region (map 2 [VMM: see 4: Kramer 15]). The dead is wrapped up in woven mats.* The mourning relatives of the dead stay in the death house until the fourth day. Then the eldest of the family makes a long garland (mar) from [120] blossoms and leaves, and his people take it down to the spot mentioned on the ocean; as they move down in that direction they invoke the gods Aluelap, Saukal, etc. and request good fortune and protection from death by prayers. Then they toss the garlands into the sea. When this first group of people returns, the more distant relatives leave the house of the dead; only the very closest family remains there until the moon has reached its fullness. During this entire period of time work is not permitted.

After five to six months, the fi is held: the belongings of the dead are washed in the juice of young coconuts, and then the juice is drunk.

When the body is thrown into the ocean, some people dive after it as a final gesture.

Then the spectators of the burial quickly paddle back to the shore. They all make a blanket with a hole for the head (Truk, page 92) out of a sleeping mat, lúgelug, and cover themselves with it; they also cut their hair.

*When Lewis came from Yap he saw many strangers die of hunger on Lamotrek; because of a shortage of mats they were wrapt in simple coconut-plaited materials.

4: Krämer--120 (1909) 1937 Woleaians 1-2
116, 764 Elato

Hambruch learned the following on Elato...

The dead is laid out in the house and buried the very day of the death. The body faces south. It is sewn in mats, ornamented, weighted down with stones and dropped from the canoe into the ocean outside of the lagoon. Four days after this sort of sea burial, a big banquet is held, and all the people who have contributed mats and other things attend.

116, 764 Lamotrek

A short time ago the man Säperóu died. His brother was Zigĕlŭgŏl. 11 women provided mats (dress and sleeping mats) for the funeral; they were women of the clan of Saperóü and five were members of his closer family:

Zagabăs ♀,	roligaléa (Gattin)				
Tănewaga ♀,	măneai (sister)				
Leigomâu ♀,	fazrloāl (daughter of Saperóŭ)				
Tamilimôi ♀,	"	"	"	"	
Eoleiijĕn ♀,	"	"	"	"	
Loiifit ♀,	"	"	"	"	

Takŏf ♀
Păn̆ĕlioa ♀
Wŭimăr ♀
Elóubut ♀
Năn̆afelitip ♀
lagapéiumār ♀

Contributed the mats

Lagajüümāl o
Lagaleŭmār o
Lagatoiilŭl o
Lizéineŭzăk o

The older women on the other hand, are subject to the death taboo, ŏlelimĕs (...bailimas), while they stay with the son of Saperóŭ in the "Great House." The taboo is declared by the chief. The woman must stay in the great house because here Saperóu is laid out. After four days the women may return to their homes.

4: Krämer--121 (1909) 1937 Woleaians 1-4
116, 768 Lamotrek

Saperóū has gone to heaven.

Saperóū owned two houses, coconut palms, taro and a canoe. This property is distributed in the following manner: his brother receives the houses and the palm trees and all the other possessions and, in exchange, he must also take the widow and the son. After his death, the property passes into the possession of his sister and not until after her death is it returned into the hands of the son of Saperóū.

4: Krämer--121 (1909) 1937 Woleaians
116, 765 Lamotrek

The members of the clan of the dead are subject to taboo for four days, and the closer relatives until the end of the month. Garlands of coconut pinnae are hung up at the house in order to avert the spirits.

4: Krämer--121 (1909) 1937 Woleaians
116, 535 Lamotrek

Cantova, on page 315, tells us something about the dances of the West Carolinians, e.g., that the chief holds up a beautiful mat at the end of the performance which becomes the property of the person who manages to seize it first.

Müller, in Yap, page 309 says that Lugëlëng is tamë rang ko toru, the dancing sorcerer of heaven; the situation is similar on Lamotrek...

The word for dancing rod is gurrugurru, Wood, songo; knob, olále; piece by which it is hung up, tawólo.

4: Krämer--121 (1909) 1937 Woleaians

Woleaians 12
Lamotrek

Chamisso learned the following from Kadu, after he had talked of some unsuccessful voyages...(see Kotzebue, Entdeckungsreise, III, page 94:) "Every year more Carolinians sail to Guajan. Their flotilla of boats from Ulea and the surrounding groups, from Lamureck and Setoan, is assembled in Lamureck. From here the voyage starts in the month of April. From Lamureck to Fayo, the deserted island on which one stops over for a few days, the voyage is expected to take two days and from Fayo to Gajan three more days. The return voyage is again by way of Fayo and Lamureck. It falls in the month of May and at the latest in June, before the west monsoon that may be dangerous sets in."

Below he continued: "It was in this year (1807) or the following that a canoe of the eastern island of Tuch (Truk) drifted to Guajan. The canoe carried a crew of 15 and the name of the pilot was Kulingan. The strangers were received hospitably, but a procession which happened to be held during the days of their stay and which was accompanied by salvoes of artillery weapons caused fear and terror among them. They hid in the forest and that very same night, though without all necessary provisions, returned to the ocean. --It was their good fortune that as they fled from the island they happened to meet the arriving flotilla from Lamureck which provided them with food and gave them instructions about the voyage home. In the year 1814, the flotilla counted 18 boats. On Guajan the Carolinians exchanged iron, glass beads, and textiles, for canoes, shells and rarities; trepang transactions may develop into an important branch of their trade."

4: Kramer--123 (1909) 1937 Woleaians
116, 502 Lamotrek

Teachings of navigation: Similar to those on Pollap. Canoes drifting in rain and wind recognize the direction of the current from the great north-eastern ground-swell, lólablab, and from the south-eastern and north-western ground-swell which raises and lowers the canoe at the points in question.

Unsuccessful Voyages: In spite of the extensive knowledge of currents and stars...it is not a rare occurrence that canoes are thrown off their course, especially when the ground-swell has been changed by storms and the sky is overcast. One story tells that a year before our presence on the island, two canoes had sailed to Faiau to fish for turtles but the boats were shipwrecked. Six months before this accident, a canoe had set out for Oleai and Faroilap but had never arrived. Others that were considered lost: Uleisap with the canoe Falegaro-rong, two boats from Ifaluk, and one from Oleai.

Voyages: to Oleai and Ifaluk are undertaken at the end of November (bale aremoi...); the return voyage is made between July and September. If the destination was Guam, the canoes first took their course to Pikelot and then 3-4 course NNE-E and then NNW; in the latter position many birds are observed and as the boat follows them, the Marianas are soon sighted.

4: Krämer--124 (1909) 1937 Woleaians-1
116, 502 Elato

Hambruch learned on Elato that the following stars served as guide-stars on voyages to these islands:

Faraülip	möl	Vega
Ifalük	üliul	Orion's Belt
Uleai	between üliül and mai i lop	Orion's Belt and Altair
Auripik	zare u ol	Corvus

The following islands are known and in addition numerous rocks are named: eastwards, tuas:

Sëtoval*
Pikëlo** (lo anchorage) (NE)
Pik ("small island")***
Olóul or Voloul (Onóun Volume 61 page 191)

Mágur
Ulalu
Piserar
Fáiau ("stone")
Lámoil
Rua
Murilo
Rug or Djug (Truk page 19)

Póloat****
Sog
Tametam
Pol'lap [126]
Lémma (Nama
Lámolu (Námoluk)
Lukulór (Lukunor)
Lukuór (Nukuor)
Pikeram(Kapingamar-
Ingadjig(Ngatik)[angi)
Fálepei (Ponape)
Maki (Mokil)
Pingelap
Gajau (Kusae Truk page 53)

*East: Oraisaú, Suat, Póloat. North: Uraitúefu, Gaitag (east of Pikëlo (2)).
**Also Pikelot, supposedly named after the fish lot.
***West: Bãbã (near Gaitag), north: Sapan, Móul, east: Olipig, Fauriap, Onóun.
****South: Rúral, Sog.

	Ebon in Ralik	Aúrupig
	Salevis (Djalūt)	Sorol
	Laur	Feis ("Rocky")
North:		Ulūtiu or Ulutiu(Moke-
	Miriales (=Marianas Spanish)	Eap [mok)
	Faiau (high) and south of it	Ngólu
	Ralugoisong. (Vorolegeisam	Ban noe(Palau I, page
West:		Sóngorol [184)
	Oléa	Bul
	Faróilep	Merir
	Ifaluk	a Tógobei (Tobi)

A. V. Chamisso, . . tells us that the Ralik and Ratak Islands were known to a native of Lamureck whom he met on Guajan. On Arno. . . in the Ratak group, there lived five natives of Lamureck who had been cast adrift and carried to this island.

The Names of the Parts of the Ocean are:
between Lámotrek and Sëtoval= Oireg*
between Lámotrek and Olimarau =Goisa
between Lámotrek and Elat =Mëtol

* Woirä; but it is not mentioned that on Sätoval Lamotrek is said to be called Lamõireg.

The knowledge concerning the islands is supplemented by the following: According to Espinosa, II, page 15, 13 natives of the island of Lamursek (Lamotrek) on May 26, 1787 arrived at Cape Oroto on their way to Guam; and the captain of the boat Umal-Luyto, told them that Lamursek was one of the twenty-six islands of an archipelago. [126] In Kotzebue Endeckungsreise, page 93, it is said: In 1788 Luito, a navigator from the islands located south of Guajan whose fame lives on among his fellow-islanders, was able to retrace the route from Waghal or Guajan with two canoes, of which a song from olden times had spoken. Encouraged by the success of the first voyage and the reception accorded him, he returned in 1789 with four boats and asked leave from the governor in order that he might return every year. As they were about to set out on the return voyage the four helmsmen disagreed as to the rhumb by which they were to steer and they separated. The ocean did not allow any of them to return to his native island. This led to an interruption of the service recently established. Concerning the renewal, see Oleai.

Espinosa...was given a map on which all the islands and their population were marked; many of these islands were familiar to the captain [VMM: a navigator from Lamotrek). These were the islands:

1. Carao
2. Falopi
3. Ingerig
4. Oruzolua
5. Etat
6. Lamuluc
7. Luosap
8. Ohala, 1000 inhabitants
9. Ólcul, 200 inhabitants
10. Ponlap, 100 inhabitants
11. Poloac, 600 inhabitants
12. Sove, 500 inhabitants
13. Pig
14. Piguela
15. Satavan, 400 inhabitants
16. Lamursee, 1400 inhabitants
17. Falive, 1000 inhabitants
18. Fayao
19. Farroilap, 100 inhabitants
20. Olio, 1000 inhabitants
21. Fais
22. Falalap
23. Mugemugs
24. Jap
25. Ngulue
26. Palao

In the London Nautical Magazine of 1862, the well-known report of Rev. L. H. Gulick on Micronesia (page 174, Ulie-Wolea) was published and in the year 1866 (beginning the preceding year) there appeared a report of Captain B. Eugenio Senchas y Zayas of the corvette "Narwaez (Viaje de la corbeta de guerra Narwaez desde Manila a dichas islas), of the first steam-boat which was seen out on the high seas. In it he also reports on the settlement of the Carolinians.... In Garapan on Saipan they formed a colony of 415 heads (in January 1864, 433 were counted). At the very time when the captain and his ship were in Tinian Carolinians arrived from Elato-Lamotrek; they came aboard to see him and related their surprise at what they had seen. They were very muscular people, their entire bodies oiled and almost naked; in their ears they wore shell ornaments. On Saipan, where the captain visited the colony in Garapan, he heard a great deal about the navigation of these [p.127] courageous people. They first had come to Agaña in search of new land, because their own had been devastated by the typhoon. For all their islands, with the exception of Ilap, were very low. Arumiat was considered their best navigator who knew all the stars and that the Polar Star does not change its position and that the rising and setting of Orion's Belt indicated east and west. He rejected the compass claiming that it was dispensable for navigation. For the stars in the zenith, a bamboo stick filled with water was used. *

*Cf. Samoa, where one goes all the way down into the hull of the ship in order to observe three stars.

In Garapan there was a shipyard where the Carolinians could learn the construction of boats; connected with the shipyard was a school of Carolinian navigation. Anyone who wanted to be independent and in charge of a boat had to pass an exam before a council of pilots. Close by was a rope-making establishment. There the material for the ropes-to-be was hung high on a palm tree and the strands were twisted and each one had a circumference of 4-5 inches. Ropes were made up to a length of 100 fathoms.

116, 396, 502 Lamotrek

Anchors do not exist. If it is necessary to fasten a boat, one of the crew jumps overboard and belays one end to a rock. A similar procedure is followed when the canoe is to be cleared for departure. The islanders do not worry about deep water and sharks.

The boats built had a length of 30 feet in the keel, a width of four feet and a depth of 6 1/2 -7 feet from the deck to the keel, with a draught of 2 1/2 feet front and aft. The stern-post strakes are alike, and the bow and stern are identical in shape. No nails are used in the construction; the planks are fastened together by means of strong coconut yarn and the holes are stopped up with cement. The frame-planks are less than one half inch in thickness and do not have any ribs. All the work is reinforced by strong dollboard gunwales of considerable size; they are connected by thwarts, all of them in the same height. The two sides are different in form and one is more beautiful than the other. They do not attempt any tacking with these canoes. The weatherside is fuller and more rounded than the leeside and the ratio is almost 3:5. The outrigger is attached to the weatherside--on the Philippines batangas--and is a strong tree trunk; on the end rest two transverse beams, which are 8-10 feet outside of the canoe. On the leeside there is a platform outside of the dollboard gunwales and it is formed of long poles; on this platform a cabin--a bamboo construction--is placed. This little hut resembles a large basket and in it provisions, freight, and sometimes passengers are kept. The crew is generally crowded together in the hull of the boat. The mast usually has a height of 22 to 24 feet and is not planted on the keel, but on the gunwale of the weatherside. It

is kept in its position by stays, by means of which it may be lowered if the velocity of the wind requires it. The sail is made from very fine mats and is almost triangular; it is stretched between two bamboo poles and at each corner is manipulated by lines, halyard, tack and sheet. [128] The rudder is not at the stern* but on the leeside and has the shape of a paddle; the Carolinians say that it does not only serve to steer the canoe but also to keep it straight; the latter proves the skill of the person steering and requires a good deal of dexterity. It is difficult for navigators to establish a clear picture of this in their minds, but it is probable that we should believe the Carolinians. It is not unlikely that it is their intention to sail against the wind (in den Wind anzuluven?) when it becomes stronger, so that the lateral pressure on the sail may be decreased. In any case a good deal of experience is needed and all possible care and attention in order that the canoe will not capsize or be flooded over the leeside gunwales. Ten or twelve persons may stay on board and most of them sleep in the hull of the ship. They fill the basket with coconuts, and if they have a passenger who is not a Carolinian, he, too, is put into it. They loosen the anchor ropes, set sail and go out to sea. The sheet is never belayed: all day and all night during the entire voyage the person steering must hold it regardless of how long the boat is out sailing. Some of the steersmen have assistants on their long voyages. When he lets go of the sheet, and the boat capsizes, the crew has to swim like

*The meaning is that it is not all the way at the stern like our steering rudder.

the basket with provisions. The steersman without help re-establishes the balance of the boat; if the equilibrium is lowered on the weatherside the canoe is put back into position almost by itself and little aid is needed. Then the crew goes back on board, catches the basket, and the voyage is continued.

Thus the ships sail across the wide Pacific. They take their course by the sun, the stars, the direction of the wind and that of the currents. If the weather is bad and the sky is overcast for a few days, they haul in the sail and are ready for the coming storm. When the storm has passed, they need three days to sail eastward and make up for the time and distance they have lost. Then they make their observations: they fill a bamboo pole and observe the stars at the zenith and from them are able to calculate the position of the boat. Accordingly they are able to take their course. Naturally many of them are lost.
